as the bar is bent, substantially as shown and described." In the specification the sides of the angle-bar are designated by the letters A and B, A representing the uncut web and B the cut web. The outer opening of the cut C is made by lines at angles of forty-five degrees to the edge of the web, so that when the bar is bent the edges of this opening meet each other in a true miter. The inner opening, D, which extends outward within converging curved lines from the angle of the bar to where it meets the opening C, extending inward from the edge of B, and within converging lines, (the letter X suggesting the shape of the entire opening, excepting that the outer opening extends nearly to the angle of the bar,) has a dovetailed shape bounded by curved lines described from points upon the miter line and the face of the uncut web A. The curved ends of the web B abut against the uncut side when the bar is bent, making a close joint. The patentee states in the specification that "the shape of the opening or cut-away portions of web B may be varied at will so long as the meeting line or lines be not extended beyond the space bounded by the rounded corner and the edge lines extended to web A. The angle-bars cut out as described (it is stated in the specification) may be bent to the proper form by the machine represented by Fig. 6. In this, E represents a metal block having upwardly-projecting sides screw-tapped to receive clamping-screw F. The opposite corners of the block are rounded to fit the inner curve of the desired corner. G is a loose block of iron, between which and the side of block E the uncut web A is clamped by screw F, the other web, B, resting on the block, the cut-away part over the rounded corner. By force applied to the projecting end of the bar it is bent around until the severed edges meet in a close joint. The angle-bar herein shown is not claimed here, as it is the subject of a pending application."

The safes described in these patents are filled through the bottom opening with fire-proof cement. The bottom is then secured in place and the casters attached. The patentee states in the specification forming part of Letters Patent No. 281,640 that before his invention safes were filled from the back, and that his safe "can be completely finished before the filling is put in. The filling adds greatly to the weight. Much labor in handling is therefore saved."

The opinion of the circuit court then proceeds to say:

For the purposes of this suit these three patents may be considered as one, containing all the claims involved. As counsel for complainant suggests, the claims are for separate and distinct but not for independent inventions, at least so far as the manufacture of safes is concerned. They might have been all included in one application had the patentee chosen to so present them.

The first and second claims in Letters Patent No. 281,640 are for an angle-bar for safes, consisting of a right-angled iron bar, one of the sides of which is cut away, (the cuts being curved and meeting a right-angled cut,) leaving a curve facing the uncut side, whereby said uncut side may be bent to form a rounded corner. The patentee states in the specification that he is aware "that it has been proposed to make protecting corner-pieces for safes from angle-iron, from one side of which a triangular piece was cut out to permit the opposite side to bend." He also states that "the shape of the cut to permit the angle-bar to be bent to form rounded corners may be varied without departing from the principle of my invention," &c.

In the drawings accompanying the specification, forming part of Letters Patent No. 283,136, Figure 5 represents a templet of card-board or thin sheet metal, which the patentee states he uses to determine about the shape and size of the notch or cut which it is necessary to make to admit of the bar being bent to any desired angle and to make a corner of any desired curve. The templet is of the shape and size of a section of the angle-bar. One web is severed by a cut at right angles to its edge. The two webs are then severed at their junction for some distance upon each side of the cut. Then, by bending the web so that the cut edges will pass each other, the templet may be bent to any curve or angle desired, and the lines of the cuts required to make the proper shape of opening in angle-bars to be bent to the same curve or angle marked and fixed upon. Such use of the templet as a pattern is nothing new. It is clearly shown by the testimony that cutting an opening in one web of an angle-bar to permit the bending of the bar to an angle or curve was known and used before the date claimed by complainant's assignor for his invention. Different shapes of cuts and openings are shown in exhibits put in evidence by respondents. Unless the precise cuts and shape of opening shown in the drawing attached to the specification, forming part of the Letters Patent, are patentable, the claims are worthless. But the patentee shows how, by the use of a pattern of flexible material—an old method, and familiar as the use of the carpenter's miter-box—he determines the lines of the cuts and the shape of the opening. In this there is no exercise of the inventive faculty. It is only what would occur to a mechanic of ordinary skill. Moreover, if the precise lines of cuts and shape of opening shown in the drawings were patentable, the patentee does not, as we have seen, so limit his claim, but seeks to cover variations, which he says may be made without departing from the principle of his invention. Claims 1 and 2 in Letters Patent No. 281,640 and the claim in Letters Patent No. 283,136 are therefore adjudged invalid.

As to the combination claim being the only claim in Letters Patent No. 278,585, and claim 3 in Letters Patent No. 281,640, the parts are old, excepting only, and this is not material, that the precise lines of cuts and the shape of the openings of the angle-bar are not found in safes of prior manufacture. The sheet-metal cover is old. It is shown in respondent's exhibit, "St. Louis Safe." The bars C and lower removable plate D, claimed in No. 278,585, are old. See respondent's exhibit A and the depositions of John Hurst. The safes in the manufacture of which they were used were square-cornered, as was then the fashion; but that is not material. When the angle-irons were bent, the corners were round, and then heated and hammered upon both sides of the corners to make them square. Respondent's testimony also establishes that fire-proof safes were filled from the bottom as early as 1879 by the Cincinnati Safe and Lock Company, and in that year, probably also in 1878, by Hall's Safe and Lock Company. The complainant was the first to employ the combination claimed in the manufacture of round-cornered safes; but the change from square-cornered safes was only a change in form. The combination is nothing more than an aggregation, and falls by the application of the rulings in *Hailes v. Van Wormer*, (20 Wallace, 353, 368;) *Heckendorfer v. Faber*, (92 U. S., 347,) and *Pickering v. McCullough*, (104 U. S., 310, 318.) The bill is dismissed as complainant's costs.

It is apparent that the claim for the process in No. 283,136 is merely for the process or method of cutting away and removing the metal, so as to permit of the bending, and of doing the bending, and of producing the close joint as the bending takes place, such process or method being merely the process or method involved in making the article covered by claims 1 and 2 of No. 281,640. In other words, claims 1 and 2 of No. 281,640 are each for an article produced by a described method or process, and the claim of No. 283,136 is for such method or process of producing such article. The method is a purely mechanical method. No. 281,640 was applied for more than eleven months before No. 283,136 was applied for, and was issued twenty-eight days before No. 283,136 was issued. There was no patentable invention in No. 283,136 when it was applied for, in view of what was applied for by claims 1 and 2 of No. 281,640. After a patent is granted for an article described as made by causing it to pass through a certain method of operation to produce it—as, in this case, cutting away the metal in a certain manner—and then bending what is left in a certain manner—the inventor cannot afterward, on an independent application, secure a patent for the method or process of cutting away the metal and then bending it so as to produce the identical article covered by the previous patent, which article was described in that patent as produced by the method or process sought to be covered by taking out the second patent.

The circuit court, in its opinion, said that the use of the templet shown in Fig. 5 of No. 283,136, as a pattern, was not new; that cutting an opening in one web of an angle-bar to permit the bending of the bar to an angle or curve was known and used before the date of the patentee's invention; that different shapes of cuts and openings were shown in exhibits put in evidence by the defendant; that the claims in question—namely, claims 1 and 2 of No. 281,640 and the claim of No. 283,136—were invalid, unless the precise cuts and shape of opening shown in the drawings were patentable; that there was no exercise of the inventive faculty in using a pattern of flexible material in an old and familiar method to determine the lines of the cuts and the shape of the opening, and that the patentee had not limited his claims to the precise lines of cuts and shape of opening shown in the drawings, but had stated in the specification of No. 281,640 that the shape of the cut, to permit the angle-bar to be bent to form rounded corners, might be varied without departing from the principle of the invention. We concur in the view that claims 1 and 2 of No. 281,640 and the claim of No. 283,136 are invalid for the reasons thus given.

As to the claim of No. 278,585 and claim 3 of No. 281,640, which are claims to combinations, the opinion of the circuit court states that those claims are old, except in the immaterial point that the precise lines of cuts and the shape of the opening in the angle-bar

are not found in safes of prior manufacture; that the sheet-metal cover is old, being shown in defendant's exhibit "St. Louis Safe;" that the bars C and lower removable plate, D, forming part of the claim of No. 278,585, are old, it being immaterial that the safes in the manufacture of which they were used were square-cornered, the corners of the angle-frames, when bent, having been round, and having been then made square by heating and hammering the metal on both sides of the corners; that fire-proof safes had been filled from the bottom as early as 1879; that, although the patentee was the first to employ the combination claimed in the manufacture of round-cornered safes, the change from square-cornered safes was only a change in form, and that the combination was nothing more than an aggregation, and fell within the rulings of this Court in the cases cited that such an aggregation was not patentable. We think these views are correct.

The decree of the circuit court is affirmed.

Supreme Court of the United States.

HENDY *v.* THE GOLDEN STATE AND MINERS' IRON WORKS *et al.*

Decided May 14, 1883.

1. CUSENBARY AND MARS—ORE-STAMP FEEDERS.
   Letters Patent No. 140,250, granted June 24, 1873, to Cusenbary and Mars, for an improvement in ore-stamp feeders, adjudged invalid as to the first claim for lack of patentable invention.
2. PATENTABLE INVENTION—WHAT IS NOT.
   Merely putting rollers under an article to make it movable when without the rollers it would not be movable does not involve patentable invention.
3. PRACTICE—LACK OF INVENTION.
   The defense of no patentable invention can be made without setting it up in an answer.
4. AGGREGATION—NOT COMBINATION.
   There is no patentable combination between rollers which make the support movable and a feeding-cylinder mounted on such support.
5. INFRINGEMENT—WHEN NONE.
   The cylinder of the claim being described as having chambers or depressions, and the defendants' cylinder being smooth throughout, there was no infringement in this particular.

APPEAL from the Circuit Court of the United States for the District of California.

Mr. J. H. Miller and *Mr. J. P. Langhorne* for the appellant.

Mr. M. A. Wheaton for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought by Joshua Hendy against the Golden State and Miners' Iron Works, a corporation, and six individual defendants, in the Circuit Court of the United for the District of California, for the infringement of Letters Patent No. 140,250, granted June 24, 1873, to James D. Cusenbary and James A. Mars, for an improvement in ore-stamp feeders.

The specification, claims, and drawings of the patent are as follows:

Our invention relates to improvements in that class of ore-feeders for quartz-mills in which a part only is moved automatically

to operate the feeder automatically by the drop of the stamp. Our improvements consist, first, in mounting a feed-cylinder upon a movable frame or truck, so that it can be readily shifted from place to place when it is desired to repair the mill, and lastly, of an improved arrangement for operating the pawl-rod by the drop of the stamp without the use of springs.

In order to more fully illustrate and explain our invention, reference is had to the accompanying drawings forming a part of this specification, in which—

Figure 1 is a vertical section. Fig. 2 is a back view. Fig. 3 is a transverse section.

A represents the frame of a stamp-mill. B is the stamp. C is the stamp-stem with its tappet D. F is the cam-shaft, and G the cam which lifts the stamp, all of which are arranged in the ordinary manner of constructing a stamp-battery. H H are the foundation-timbers upon which the feeding-cylinder I is mounted. These timbers are mounted upon rollers so that the cylinder and frame can be moved about as desired. The cylinder I is made of cast metal, and has its outer surface formed into chambers or depressions J J, which are separated from each other by longitudinal partitions k. The cylinder and its carriage, when in working position, are placed below the hopper L, so that the ore from the hopper will fall into the chambers, and, as the cylinder revolves, be carried around until it falls by its own weight from the chambers upon an inclined apron, M, which directs it beneath the stamp.

This feeding-cylinder, being made of cast metal, will not wear out like the endless belts heretofore used in this class of machines, and as it turns upon journals like any common roller or cylinder, it cannot become clogged, as the endless belt is liable to do. To one end of the cylinder a ratchet-wheel, N, is secured, and this ratchet-wheel is operated by a pawl-bar, O, to revolve the cylinder.

In order to operate the pawl-bar from the tappet a horizontal shaft, p, has its opposite ends supported in boxes which are secured to the sides of the upright timbers of the frame, so that the shaft will pass across directly in front of the tappet transversely to the movement of the stamp-stem.

A fixed arm, q, extends backward from the shaft p, so that its extremity will terminate below the tappet in position to receive a blow from it when the stamp falls. Another fixed arm, r, extends forward from the shaft directly over the ratchet-wheel, and to the extremity of this arm the upper end of the pawl-bar o is attached by means of a trunnion-block, t. This bar extends down to the middle of the periphery of the ratchet-wheel, and has one or more upward-projecting teeth on its lower end, which serve to engage with the teeth of the ratchet when the pawl is lifted by the rock-shaft, and thus rotate the feeding-cylinder.

It will, therefore, be evident that at each drop of the stamp the tappet will strike the arm q and carry it downward, thus giving the shaft p a rocking motion, the weight of the pawl and its arm r serving to rotate the shaft in an opposite direction, thus feeding the ore automatically when it is needed.

When there is a sufficient quantity of ore beneath the stamp the drop will not be sufficient to operate the cylinder; but when the quantity of ore beneath the stamp is reduced the drop is greater, and consequently the tappet strikes the arm q and operates the cylinder.

Having thus described our invention, what we claim, and desire to secure by Letters Patent, is—

1. The feeding-cylinder I mounted upon the movable timbers H H, substantially as and for the purpose above described.
2. The rock-shaft p with its fixed arms q r, in combination with the pawl-bar o, ratchet-wheel N, and feeding-cylinder I, when arranged to be operated by the tappet D, substantially as and for the purpose described.

Fig. 1.

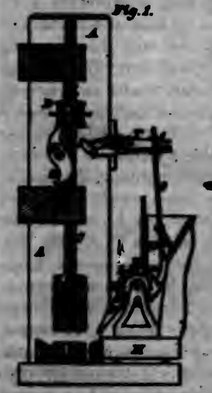

Fig. 2.

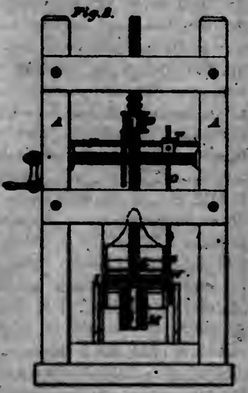

Fig. 3.

The answer denies infringement, and sets up two patents on the question of novelty, and denies the utility of the invention. After replication, proofs were taken on both sides, and the circuit court on a hearing dismissed the bill.

Infringement is alleged of only the first claim, namely:

1. The feeding-cylinder I mounted upon the movable timbers H H, substantially as and for the purpose above described.

The specification states in regard to the subject of the first claim that the improvement consists—

in mounting a feed-cylinder upon a movable frame or truck, so that it can be readily shifted from place to place when it is desired to repair the mill.

The specification speaks of the timbers H H as being the "foundation-timbers," upon which the feeding-cylinder is mounted, and it says that those timbers—

are mounted upon rollers, so that the cylinder and frame can be moved about as desired.

Therefore "the movable timbers H H" of the claim are timbers made movable by being mounted upon rollers.

The specification also states that—

The cylinder I is made of cast metal, and has its outer surface formed into chambers or depressions J J, which are separated from each other by longitudinal partitions K.

It is contended in defense that claim 1 of the patent is really a claim only for making the timbers movable by mounting them upon rollers, so as to be able to move the cylinder and frame about as desired, and that this required no exercise of any inventive faculty. This seems to be the purport of the invention, as stated in the specification. It is the movable character of the frame on which the feed-cylinder is mounted, so that the cylinder and frame may be readily shifted from place to place when repairs are desired, that is designated as the invention. When the mill is in operation, the movable feature is not brought into play. It is only when the mill is out of operation that the movable feature is to be used. The first claim does not appear to cover the functions or operation of the feeding-cylinder I as a part of the mill when in operation; and, interpreting it by its own language, as well as by that of the description in the specification, it covers only the mounting upon rollers of the timbers which carry the feeding-cylinder. Merely putting rollers under an article so as to make it movable when without the rollers it would not be movable does not involve the inventive faculty, and is not patentable. (*Atlantic Works* v. *Brady*, 107 U. S., 192, 200; *Thompson* v. *Boisselier*, 114 U. S., 1, 12, and cases there cited; *Yale Lock Manufacturing Co.* v. *Greenleaf*, 117 U. S., 554, 559; *Pomace Holder Co.* v. *Ferguson*, 119 U. S., 335, 338, and cases there cited.) This defense is one which can be availed of without setting it up in an answer. (*Dunbar* v. *Myers*, 94 U. S., 187; *Slawson* v. *Grand Street R. R. Co.*, 107 U. S., 649; *Mahn* v. *Harwood*, 112 U. S., 354, 358.) Moreover, there is no patentable combination between the rollers which make the timbers movable and the feeding-cylinder I, mounted upon the timbers. The union of parts is merely an aggregation. The feeding-cylinder mounted upon timbers which have rollers operates no differently from what it does when mounted upon timbers which have no rollers. (*Hailes* v. *Van Wormer*, 20 Wall., 353, 368; *Rochendorfer* v. *Faber*, 32 U. S., 297, 307; *Pickering* v. *McCullough*, 104 U. S., 310, 318; *Bussey* v. *Excelsior Manufacturing Co.*, 110 U. S., 131, 146.) There is nothing patentable in the aggregation.

The defendants' machine has a smooth cylinder and not a cylinder with chambers or depressions. The specification of the patent describes the cylinder I as having its outer surface formed into chambers or depressions separated from each other by longitudinal partitions. The cylinder of claim 1 is "the feeding-cylinder I," and to be such cylinder must be a cylinder substantially as described, and it is described specifically as having chambers or depressions. The claim cannot be construed to cover a cylinder with a smooth surface not formed into chambers. (*Fay* v. *Cordesman*, 109 U. S., 408, 420, 421; *Sargent* v. *Hall Safe & Lock Co.*, 114 U. S., 63, 86; *Shepard* v. *Carrigan*, 116 U. S., 593, 597, 598; *White* v. *Dunbar*, 119 U. S., 47, 51, 52; *Crawford* v. *Keysinger*, 123 U. S., 589, 606, 607.)

The decree of the circuit court is affirmed.

U. S. Circuit Court—Southern District of Ohio, Western Division.

MILLER MEGEE COMPANY *et al. v.* CARPENTER.

Decided May 7, 1888.

JURISDICTION—ACT OF MARCH 3, 1887.

The $2,000 limitation placed upon the jurisdiction of the court under the act of March 3, 1887, does not apply to patent cases or to suits for the infringement of patents.

SUIT FOR INFRINGEMENT OF LETTERS PATENT.

ON demurrer for want of jurisdiction.

Mr. J. H. Trohig and *Messrs. Howson & Howson* for the complainants.

Messrs. Parkinson & Parkinson for the defendant.

JACKSON, *J.*:

The question presented by one ground of demurrer in this case—viz., whether the jurisdiction of this court is defeated because the matter in dispute does not exceed, exclusive of interest and costs, the sum or value of $3,000—has at the request of counsel for the defendant been reconsidered by the court, and as the result of that re-examination the court is confirmed in the conclusion heretofore announced, that the $2,000 limitation placed upon the jurisdiction of the court by and under the act of March 3, 1887, does not apply to patent cases or to suits for infringement of patents. The exclusive jurisdiction vested in the courts of the United States in cases arising under the patent-right and copyright laws of the United States (sec. 711 Rev. Stats.) and the allowance of writs of error and appeals in such cases without regard to the sum or value in dispute (sec. 699 Rev. Stats.) were not repealed, either expressly or by implication, by the act of March 3, 1875. The act of March 3, 1887, only purports to amend the act of March 3, 1875, and by no fair or proper construction can it be held to repeal the foregoing statutory provisions relating to the exclusive jurisdiction of this court in cases arising under the patent laws without reference to the amount involved.

The acts of 1875 and 1887 both refer to that class of cases in which the Federal courts have concurrent jurisdiction with State courts. They do not apply to cases arising under the patent and copyright laws, as to which exclusive jurisdiction is vested in the courts of the United States, without reference to the amount involved.

The court accordingly adheres to its former ruling on this question, and overrules this ground of demurrer, with costs.

Order No. 480.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 28, 1888.

The attention of the Commissioner has been called to the fact that patent solicitors who are appointed attorneys in fact in applications pending in the Office upon revocation of powers of attorney to former solicitors in the same cases are in the habit of erasing from the drawings the names of the solicitors who prepared and signed the drawings at the time they were originally filed.

In *ex parte Wharton* (40 O. G., 977) I called attention to the impropriety of changing in any manner the drawings themselves, and while the appointment of attorneys to such drawings are not of especial importance, circumstances might arise which would make them of very great importance, as, for instance, were a question raised concerning the identity of the drawing.

It is hereby directed that the practice of erasing the names of attorneys, or writing upon the drawings the names of attorneys subsequently appointed, so as to make it appear that their names were present when the drawings were originally filed, shall be discontinued.

Examiners will observe that this order is not violated. They are instructed to report to the Commissioner all instances which come within their knowledge of such violation.

BENTON J. HALL,
Commissioner.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons professing to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so representing themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys debarred from practice under section 483 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and residences of all such persons, and the public is warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that [illegible]

16,372.—SAW-BOX.—*George A. Meyer*, Brooklyn, N. Y. Application filed April 19, 1888. Serial No. 271,295. Term of patent 14 years.

16,373.—CALENDAR.—*Frederick Mitchell*, Brooklyn, N. Y. Application filed March 17, 1888. Serial No. 267,567. Term of patent 7 years.

16,374.—WHISK-BROOM HOLDER.—*George C. Varwig*, Philadelphia, Pa. Application filed February 27, 1888. Serial No. 265,532. Term of patent 3½ years.

16,375.—TILE.—*Edward Wheatley*, Washington, D. C. Application filed April 24, 1888. Serial No. 271,741. Term of patent 14 years.

16,376.—CLAIM-FRAME.—*Pardon A. Whitney*, Southington, Conn., assignor to *The Peck, Stow & Wilcox Company*, same place. Application filed March 6, 1888. Serial No. 266,642. Term of patent 14 years.

16,377.—HEATING-STOVE.—*William H. Wilkinson*, Rochester, N. Y., assignor to *The Co-operative Foundry Company*, same place. Application filed April 19, 1888. Serial No. 271,286. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,362.—PREPARATIONS FOR THE TOILET.—*Jesse Accough*, Handsworth, near Birmingham, county of Stafford, England. Application filed February 17, 1888. Used since 1870.
"A label having its surface printed in a design representing crystals."

15,363.—CIGARS.—*M. Barranco & Co.*, New York, N. Y. Application filed April 27, 1888. Used since February 9, 1887.
"A portrait of the poet Heredia."

15,364.—CIGARS.—*M. Barranco & Co.*, New York, N. Y. Application filed April 27, 1888. Used since April 2, 1888.
"A portrait of President Monroe on the American coat of arms."

15,365.—TOILET AND LAUNDRY SOAP.—*Beaver & Co.*, Dayton, Ohio. Application filed March 5, 1888. Used since January 1, 1886.
"The word 'GRANDPA'S.'"

15,366.—PLUG CHEWING-TOBACCO, SMOKING-TOBACCO, CIGARS, AND SNUFF.—*Bitting & Hoy*, Winston, N. C. Application filed April 23, 1888. Used since January 1, 1886.
"The representation of a zebra."

15,367.—WHISKY.—*Blake, Bruce & Co.*, Omaha, Nebr. Application filed May 9, 1888. Used since September, 1887.
"The words 'MAY FLOWER.'"

15,368.—CIGARS.—*El Modelo Cigar Manufacturing Co.*, Jacksonville, Fla. Application filed January 21, 1888. Used since August, 1888.
"The words 'EL MODELO' in connection with the armorial bearings of the State of Florida."

15,369.—LIQUID MEDICINE FOR INTERNAL USE AND FOR CERTAIN DISEASES.—*B. Fragner*, Prague, Bohemia, Austria-Hungary. Application filed February 24, 1888. Used since March 15, 1872.
"The representation of a soaring eagle with the initials 'Dr. R.' in a shield on its breast, and bordered with the circle and the inscription 'ZYVOTNÍ BALSÁM LIBERMANŮV.'"

15,370.—LAGER-BEER.—*Cleps Brewing Company*, Peoria, Ill. Application filed April 26, 1888. Used since September 1, 1887.
"The letters and syllable 'A-M Brew. I-N.'"

15,371.—LEATHER, CLOTH, AND RUBBER BOOTS AND SHOES.—*John H. Hansen*, New York, N. Y. Application filed May 7, 1888. Used since January 1, 1886.
"The words 'HANAN'S NATURALIST' and the representation of the sole of the human foot."

15,372.—HAIR-TONIC.—*Martha Matilda Harper*, Rochester, N. Y. Application filed March 26, 1888. Used since January, 1888.
"A representation of the horn of plenty."

15,373.—WHEAT-FLOUR.—*George V. Hecker & Co.*, New York, N. Y. Application filed June 17, 1887. Used since 1886.
"The word 'CHAMPION.'"

15,374.—TOOTH BRUSHES AND POLISHERS.—*Horsey Manufacturing Co.*, Utica, N. Y. Application filed April 26, 1888. Used since November 1, 1887.
"The word 'ISRAL.'"

15,375.—TOOTH BRUSHES AND POLISHERS.—*Horsey Manufacturing Co.*, Utica, N. Y. Application filed April 26, 1888. Used since November 1, 1887.
"The representation of a tooth polishing and cleansing pad and holder combined and a tooth polishing and cleansing pad separated."

15,376.—WOOD-INCASED CARS AND GLASS VESSELS.—*William D. W. Miller*, New York, N. Y. Application filed April 19, 1888. Used since September 1, 1887.
"The word 'TRIPOLI.'"

15,377.—TOILET-PAPER.—*John T. Moore*, Bellows Falls, Vt. Application filed April 23, 1888. Used since April 1, 1888.
"The representation of a mortar and pestle arranged in a circle surrounded by a square with the word 'MEDICATED' placed above the square."

15,378.—CIGARS, CIGARETTES, SMOKING AND CHEWING TOBACCO, AND SNUFF.—*Morris D. Neumann*, Chicago, Ill. Application filed May 8, 1888. Used since April 16, 1888.
"The words 'THE BAT' in connection with the pictorial representation of a base-ball bat."

15,379.—FILLED GOLD CHAINS.—*William H. Robinson & Co.*, Providence, R. I. Application filed March 12, 1888. Used since October 1, 1887.
"The word 'SEAMLESS' associated with the abbreviated words and initials 'WM. H. R. & CO.'"

15,380.—FOLDING BEDS.—*William T. Salter*, New York, N. Y. Application filed May 1, 1888. Used since August, 1884.
"The words 'PLEASANT DREAMS.'"

15,381.—CHAMPAGNE-WINE.—*Veuve Pommery Fils & Co.*, Rheims, France. Application filed April 4, 1888. Used since February 28, 1883.
"The word 'GENUINE,' in white letters upon a black ground between parallel lines of white."

15,382.—CHAMPAGNE-WINE.—*Veuve Pommery Fils & Co.*, Rheims, France. Application filed April 4, 1888. Used since February 28, 1888.
"The word 'AUTHENTIQUE' in white letters upon a black ground between parallel lines of white."

LABELS.

5,618.—Title: "EL MODELO CIGAR MAN'F'G COMPANY."—*El Modelo Cigar Manufacturing Co.*, Jacksonville, Fla. Application filed January 21, 1888.

5,619.—Title: "EL MODELO CIGAR MAN'F'G COMP."—*El Modelo Cigar Manufacturing Co.*, Jacksonville, Fla. Application filed May 12, 1888.

5,620.—Title: "GENUINE PERFECT FITTING CHILLED EDGE SHARER." (FOR PLOWS.)—*The Gibbs & Ball Plow Company*, Canton, Ohio. Application filed May 12, 1888.

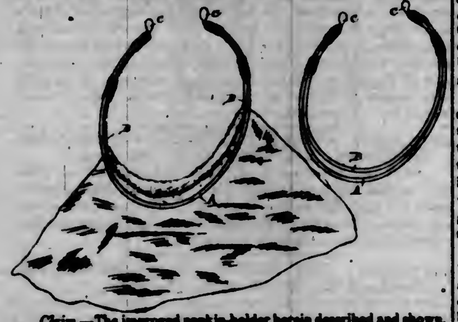
5,621.—Title: "MARCARO TONIQUE FOR THE HAIR."—*Martha Matilda Harper*, Rochester, N. Y. Application filed March 26, 1888. (Trade-Mark Registered.)

5,622.—Title: "GERMAN COCOA POWDER."—*Hawley & Hoops*, New York, N. Y. Application filed May 10, 1888. (Trade-Mark Registered.)

5,623.—Title: "DR. PARTRIDGE'S PAIN QUELLER." (FOR A MEDICINE.)—*A. P. Partridge & Co.*, St. Paul, Minn. Application filed May 14, 1888.

5,624.—Title: "NEW DISCOVERY FOR RHEUMATISM."—*James A. Whittington*, Montrose, Ill. Application filed May 11, 1888.

PATENTS



GRANTED JUNE 5, 1888.

383,846. CAR-WHEEL. BENJAMIN B. ALLEN, Indianapolis, Ind. Filed Aug. 9, 1887. Serial No. 246,559. (No model.)

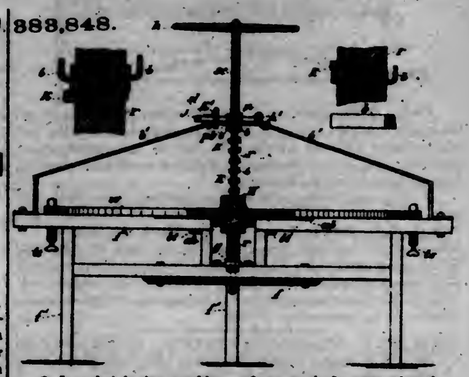
Claim.—The axle having the annular groove to receive the annular collar, in combination with the wheel having its hub provided with the annular flange and groove, and a clip embracing the said collar and flange and fitting in the groove of the hub to secure the wheel on the axle and permit the same to revolve thereon, for the purpose set forth.

383,847. NAPKIN-HOLDER. ALBERT P. BAKER, Trenville, Ill. Filed Dec. 27, 1887. Serial No. 259,126. (No model.)

Claim.—The improved napkin-holder herein described and shown, consisting of the curved round wire springs A B, having their ends joined together and wrapped with fine wire, and the knobs C C, secured on the ends of the springs A B, the said springs being slightly separated at their center to receive and hold the corner of a napkin, substantially as set forth.

383,848. HUB-BORING MACHINE. WILLIAM H. BARNHART, Indianapolis, Ind. Filed Jan. 23, 1888. Serial No. 261,994. (No model.)

Claim.—1. The hub-boring machine herein described, comprising the frame-work *f f'*, having adjustable arms *f*² for centering the hub, the braces *b'*, bolted to the ends of the arms *f*², supporting the plate *p'*, the clamp-nut *n*, having jaws *j*, hinged to the plate at *b'*, the key *k'*, for holding the jaws of the nut together, the screw *w*, working in said nut, carrying the rod *r*, having adjustable bits *b*, secured by keys therein, all combined substantially as shown and described.



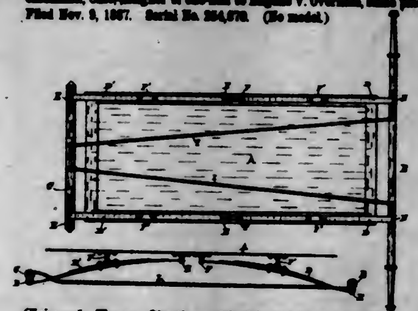
2. In a hub-boring machine, an auger composed of a rod mortised to receive bits held in place by keys and set so as to bore a tapering hole in the hub, the upper pair of bits set one upon the other, the cutter of the upper one connected near the base of its shank and the cutter of the lower one connected to its shank at or near the top, their cutting-edges formed on opposite sides, substantially as and for the purpose described.

3. In a hub-boring machine, a frame-work for supporting the wheel, its side arms adjustable as to length for centering the hub, an auger-rod carrying removable and adjustable boring-bits, the upper pair of them set one upon the other, the upper one having its cutter connected at or near the base of its shank, the lower one having its cutter connected at or near the top of its shank, the cutting-edges of the pair formed on opposite sides for forming an enlarged bore to receive the shoulder of the boring, the series of bits graduated so as to bore a tapering hole in the hub, all combined substantially as shown and described.

4. In a hub-boring machine, an auger-rod, *r*, carrying detachably-secured bits thereon, the upper pair set one upon the other, the cutter of the upper one connected to its shank at or near its base, the cutter of the lower one connected to its shank at or near its top, the cutters of the pair formed on opposite sides for forming an enlargement in the bore to receive the shoulder of the boring, such auger connected with operating screw mechanism above and its lower end moving in a guide-plate secured beneath the table to the frame-work, all combined substantially as shown and described.

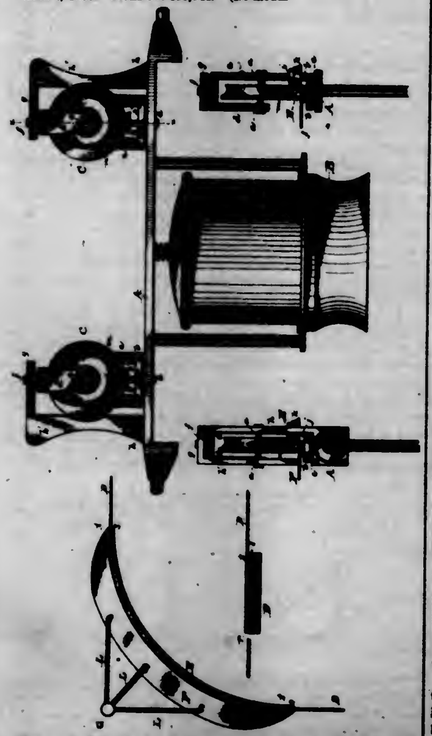
5. In a hub-boring machine, a frame-work for supporting the wheel having adjustable side arms for centering the hub, a boring-auger composed of a rod carrying adjustable boring-bits, such auger operated by a screw-rod working in a clamp-nut, its lower end having bearings in a guide-plate secured beneath to the frame-work, the upper pair of bits upon the rod set one upon the other, the cutter of the upper bit secured at or near the base of its shank, the cutter of the lower of the pair secured at or near the top of its shank, the cutting-edges of the pair formed on opposite sides for enlarging the bore to receive the shoulder of the boring, substantially as shown and described.

383,848.



383,849. CARPET-FASTENER. GEORGE BARROW, Stanfordville, N. Y. Filed Oct. 17, 1887. Serial No. 252,515. (No model.)

Claim.—The strip A, comprising the plates A' A², the former having the turned edge A' at its top, and perforations A³, and the latter spurs A⁴, in combination with the flap B, having the turned edge B', pocket D', and with the coiled spring C, resting in said perforations and pocket, substantially as specified.



383,850. VEHICLE SPRING-GEAR. GEORGE B. RAMBLOSSEW, Cincinnati, Ohio, assignor of one-half to Eugene V. Overman, same place. Filed Nov. 8, 1887. Serial No. 254,670. (No model.)

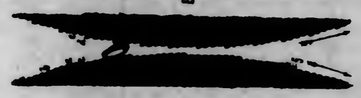
Claim.—1. The combination, with the vehicle gear and body, of the longitudinal side springs, D, the swinging shackles coupling the said springs to the body, and the rigid shackles E, connecting them to the rear axle, and the front springs and rigid shackles coupling the front of the body and the head-block.

2. The combination, substantially as specified, of the body and gear, the two pairs of side springs, one in front and the other at the rear, the rigid shackles E, and loose shackles F, for coupling the springs to the body and gear, respectively, the ends of said front springs being connected to the body and bolster by rigid shackles and their centers by swinging shackles, and the rear springs being coupled to the body by swinging shackles and to the rear axle by rigid shackles, substantially as hereinbefore set forth.

383,851. STORE-SERVICE APPARATUS. EDWIN S. BATES, New York, N. Y., assignor of one-half to Samuel Insull, same place. Filed Mar. 4, 1886. Serial No. 193,941. (No model.)

Claim.—1. In a carrier for store-service, the combination, with the body of the carrier, of the swiveled rollers adapted to travel upon a way above the carrier, the suspension being on one side only of said rollers, and said rollers having flanges higher on the open side than on the other, substantially as set forth.

2. In a carrier for store-service, the combination, with the swiveled rollers adapted to travel upon a way above the carrier, of the horizontal rollers at the side of the way, substantially as set forth.



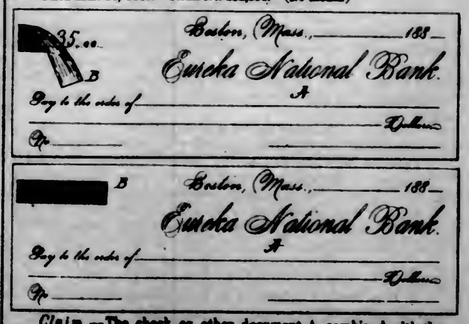
3. In a carrier for store-service, the combination of the body or plate, the vertical supports rising therefrom, each having an overhanging lip, the frames swiveled between said plate or body and said lips, and the rollers turning in bearings in said frames, substantially as set forth.

4. In store-service apparatus, the combination, with the track-wire, of a curved tube inclosing said wire and provided with a horizontal flange, said flange and tube being integral, and a radial support attached to the flange, substantially as set forth.

5. In store-service apparatus, the combination, with the stretched wire way, of the rigid curve-piece having an aperture extending through it from end to end and a slot near each end of said aperture, the wire passing through said aperture from one of said slots to the other.

6. In store-service apparatus, the combination, with the stretched wire way, of the rigid curve-piece having an aperture extending through it from end to end, a slot near each end of said aperture, and an upward-extending tongue at each end, over which the wire is bent to enter said slots, substantially as set forth.

383,852. ROLLS FOR GRINDING-MILLS. FRANK BEALL, Decatur, Ill. Filed Mar. 31, 1887. Serial No. 233,702. (No model.)

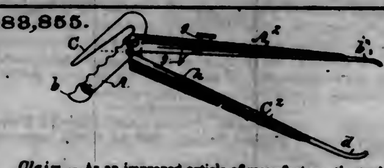


Claim.—1. A roll for grinding-mills, having corrugated longitudinal furrows and intermediate peripheral surfaces, the furrows being composed each of an abrupt terminal surface and a comparatively long surface approximately tangential to the periphery of the roll.

2. In a roller-mill, a pair of opposing rolls having differential rotation in opposite directions, the slow roll having longitudinal furrows longitudinally corrugated, and intermediate peripheral surfaces, also corrugated longitudinally, the fast roll having longitudinal furrows longitudinally corrugated, the furrows of each roll being formed each of an abrupt terminal surface and a comparatively long surface approximately tangential to the periphery of the roll, the abrupt surfaces of the furrows of the slow roll being presented in the direction of the rotation of the roll, and the abrupt surfaces of the furrows of the fast roll being presented in a contrary direction.

383,853. ANTISEPTIC SOAP. GEORGE C. W. BELSHER, St. Louis, Mo. Filed Apr. 6, 1885. Serial No. 161,363. (Specimens.)

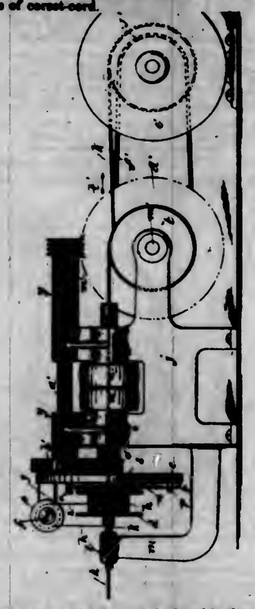
Claim.—As a new article of manufacture, the herein-described block or cake for neutralizing the noxious properties of substances to which it is applied, consisting of a matrix of soap or equivalent solvent and cohesive material having the chemical agents in a granular form embedded therein, substantially as described.



383,854. CHECK-PROTECTOR. WILSON I. BIRD, Boston, Mass. Filed Mar. 26, 1887. Serial No. 232,550. (No model.)

Claim.—The check or other document A, combined with the transparent strip B, gummed on the under side and attached at one of its ends to the check-body, and adapted to be pasted over the part to be protected on the document, substantially as set forth and described.

383,855. TOOTH. ALBERT BIRD, Des Moines, Iowa. Filed Sept. 12, 1887. Serial No. 249,892. (No model.)



383,855.

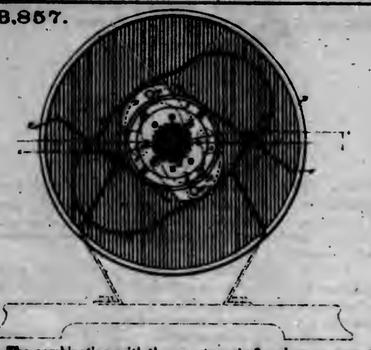
Claim.—As an improved article of manufacture, the tool comprising the jaws A, C, A^2, and d, the levers A^3 and C^2, the spring f, and the locking device g h, substantially as shown and described, for the purpose stated.

383,856. MACHINE FOR WINDING COTTON, &c., UPON A CORE. CORNELIUS F. BRADFORD, Plymouth, Mass. Filed Mar. 31, 1887. Serial No. 233,188. (No model.)

Brief.—The object of the invention is to produce an improved machine for winding cotton, &c., regularly and evenly on a cord or core of jute, &c., and is intended more particularly to be applied to the manufacture of corset-cord.

Claim.—1. The plate c, and the reel d, placed in the center of the said plate, in combination with the tension device, consisting of the rod n, attached to the plate c by the screw o, and the guide-wire p, substantially as and for the purpose above described.

2. The plate c, the reel d, placed in the center of the said plate, and the guide-wheel e, in combination with the tension device, consisting of the rod n, attached to the plate c by the screw o, and the guide-wire p, substantially as and for the purpose above described.



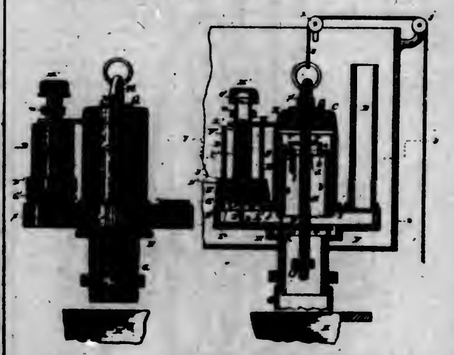
3. The plate c, the reel d, placed in the center of the said plate, the guide-wheel e, and the tube l, in combination with the rod n, attached to the plate c by the screw o, and the guide-wire p, substantially as and for the purpose above described.

383,857. GOVERNOR FOR ELECTRO-MAGNETIC MOTORS. CHAS. F. BROWN, Cleveland, Ohio. Filed Aug. 1, 1887. Serial No. 245,923. (No model.)

Claim.—1. The combination, with the armature-shaft and governor-casing connected therewith, of a commutator-sleeve loosely mounted on the armature-shaft, governor-weights pivotally connected with the commutator-sleeve, and links pivoted at one end to the weights and at their opposite end to the governor-casing, substantially as set forth.

2. The combination, with the armature-shaft and governor-casing connected therewith, of a commutator-sleeve loosely mounted on the armature-shaft, governor-weights pivoted to the commutator-sleeve, links pivoted to the governor-weights and governor-casing, and an endless spring engaging the governor-weights, substantially as set forth.

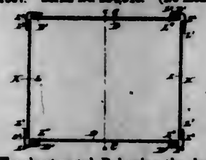
383,857.



3. The combination, with the armature-shaft and governor-casing connected therewith, of a commutator-sleeve loosely mounted on the armature-shaft, governor-weights pivoted at one end to the commutator-sleeve, and links pivoted at one end to the governor-casing and at their opposite ends to the governor-weights at a point between its ends, substantially as set forth.

4. The combination, with the armature-shaft and governor-casing connected therewith, of a commutator-sleeve loosely mounted on the armature-shaft, and governor-weights pivoted at one end to the commutator-sleeve and connected by links to the governor-casing, said weights being formed to partly encircle the commutator-sleeve, substantially as set forth.

5. The combination, with the armature-shaft and governor-casing connected therewith, of a commutator-sleeve having external flanges, governor-weights located between the flanges and pivotally connected therewith, and links pivotally connecting the weights and governor-casing, substantially as set forth.

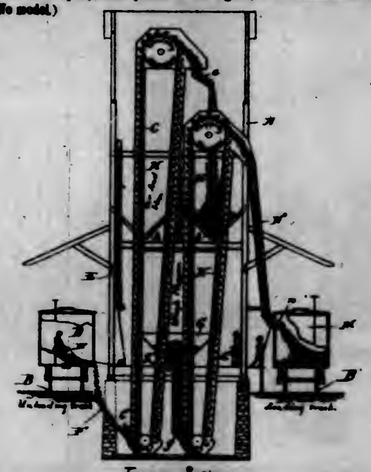


6. The combination, with the armature-shaft and governor-casing connected therewith, of a commutator-sleeve loosely mounted on the armature-shaft, governor-weights pivoted at one end to the commutator-sleeve, links pivoted to the governor-weights and governor-casing, and an endless spring consisting of two or more pieces riveted together and arranged to embrace the weights, substantially as set forth.

383,858. DOUBLE FLUSH-VALVE FOR WATER-CLOSETS. THOMAS CAMPBELL and JAMES H. MCFARTLAND, St. John, New Brunswick, Canada. Filed Aug. 5, 1887. Serial No. 246,219. (No model.)

Claim.—In combination with a tank, the double flush-valve consisting of a hollow base having end branches and an outlet leading to a basin, an overflow-pipe, D, a loaded cylinder, K, vertically movable and provided with a packing, J, and guides b b, as described, a piston, T, provided with a central opening, a vent, g, and a washer, P, a rod, M, secured to said cylinder and provided with a nut, O', a plate, U, provided with short uprights F' and adapted to be lifted by said nut for closing the passage surrounded by gland I, the loaded cylinder B, vertically movable and provided with a packing, G', the arm W, for lifting cylinder B, the piston J, with its hollow rod passing freely through said arm and provided with an adjustable nut, a vent and a cup-screw thereafter, the tube C, secured to the piston J', as described, and the central guide-rod, F, secured to the hollow base A, all constructed and adapted to operate substantially in the manner and for the purpose described.

383,859. BILL-FILE. CHARLES C. CHAMBERLAIN, Passaic, N. J. Filed Apr. 15, 1887. Serial No. 234,910. (No model.)



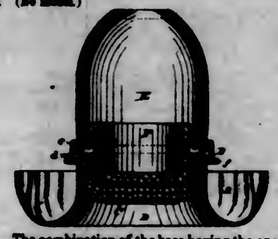
Claim.—1. The sheet metal, B, having the double fold B' B², extending along two edges, and a double fold, B³ B⁴, extending along the other two edges, in combination with an exterior surfacing material, C, adapted to serve in a bill-file or analogous structure, substantially as herein specified.

2. A bill-file composed of separate parts, the body of each part being sheet metal having the edges folded, in combination with narrow folded locking-strips engaging with said folds on the principal parts, substantially as and for the purposes herein specified.

3. In a rectangular sheet-metal box, the end piece, B, having the double fold B' B² B³ B⁴ along two opposite sides and the single fold B⁵ along the other two opposite sides, in combination with the two side pieces, D, each having a single fold engaging said double fold upon the end piece, the top and bottom pieces L, each having a single fold adjacent to the single fold B⁵ upon the end piece, and the locking-strips M, bent at right angles and provided along each edge with folds M', adapted to connect the single folds of the end piece with the folds upon the top and bottom pieces, substantially as specified.

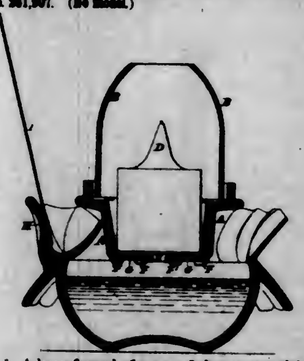
4. In a rectangular sheet-metal box, the combination, with the several sides and the end thereof, each having its edges folded, so as to lock with the adjacent pieces, of exterior surfacing-plates applied to each of said pieces, said plates being each smaller than their registering-piece by the width of the edge folds thereof, and each being retained in place beneath the folds of its registering-piece, certain of said folds being continued and extended around the edges of and at right angles to their pieces, forming a double fold engaging the fold upon the adjacent piece, substantially as specified.

383,860. GRAIN TRANSFERRING AND WEIGHING ELEVATOR APPARATUS. PHILANDER F. CRANE, Chicago, Ill., assignor to the Chase Elevator Company, same place. Filed Aug. 20, 1887. Serial No. 248,168. (No model.)



Transverse Section.

Claim.—1. The herein-described grain-elevator, having two weigh-hoppers and scales upon the first floor in proximity to the loading and unloading tracks, two car-load bins above each weigh-hopper, the receiving-elevator having a receiving-shoe next the unloading-track and adapted to deliver to any of said car-load bins, and the independent shipping-elevator arranged to deliver to the loading-track, said elevators being located between said weigh-hoppers, all arranged, as described, for the continuous transfer of grain from and to a series of cars.



2. The herein-described grain-elevator, having two weigh-hoppers and scales upon the first floor in proximity to the loading and unloading tracks, two car-load bins above each weigh-hopper, the receiving-elevator having a receiving-shoe next the unloading-track and adapted to deliver to any of said car-load bins, the independent shipping-elevator, the vertical self-loading spout into which the shipping-elevator delivers directly and downward, and the curved lateral branches at the lower end of the spout, said elevators being located between said weigh-hoppers, all arranged, as described, for the continuous transfer of grain from and to a series of cars.

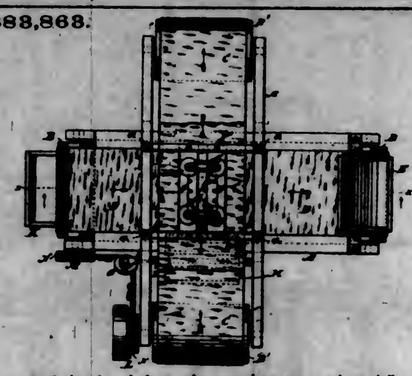
383,861. CANDLE-LAMP. SAMUEL CLARKE, Cobble Hill Works, London, County of Middlesex, England. Filed Apr. 6, 1887. Serial No. 233,904. (No model.)

Claim.—The combination of the base having the open-ended tubular post and provided with the receptacle about the post, the lamp-cup having the outwardly-projecting flange by which it is supported upon and within the post, and the dome resting upon the lamp-cup flange, these parts being separable and composed of translucent material, substantially as and for the purpose set forth.

383,862. CANDLE LAMP AND STAND. SAMUEL CLARKE, Cobble Hill Works, London, County of Middlesex, England. Filed Jan. 29, 1888. Serial No. 261,907. (No model.)

Claim.—1. A lamp formed of a cup of glass or porcelain with a dome cover, and having a hole formed centrally through the bottom for the admission of air, and with feet for the lamp to stand on when placed on a table, and projections on the upper surface of the bottom to allow air to pass between it and the inner cup or candle, substantially as described.

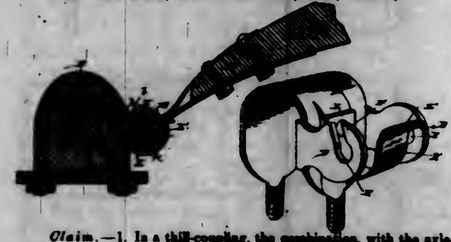
2. A lamp-stand formed of a bowl of glass or porcelain, having its upper edge corrugated and set inward at three points of its circumference for the top flange of a glass lamp to rest on, and with a projection standing up from the lower part of the bowl from below one of the points where its upper edge is bent inward, substantially as described.



383,863. MAGNETIC SEPARATOR. GARDNER CORNELIUS, Glens Falls, N. Y. Filed Sept. 30, 1887. Serial No. 250,811. (No model.)

Claim.—1. The combination, with a primary apron, of a secondary apron to operate transversely to the primary apron, a magnetized plate secured in proximity to said secondary apron, so as to draw the iron particles to said secondary apron, and suitable driving mechanism for actuating the aprons, substantially as set forth.

2. The combination, with a primary apron and a secondary apron made to operate transversely to the primary apron, of a magnetized plate secured in proximity to said secondary apron, so as to draw the iron particles to said secondary apron, suitable driving mechanism for actuating the aprons, and a scraper or brush made to act on said secondary apron, substantially as set forth.



3. The combination, with a primary apron, of a secondary apron made to operate transversely to the primary apron, a magnetized plate secured in proximity to said secondary apron, so as to draw the iron particles to said secondary apron, and means for adjusting the

383,863.

magnetized plate in relation to the secondary apron, substantially as set forth.

383,864. THILL-COUPLING. MARTIN G. CONRAD, McGrawville, N. Y. Filed Jan. 13, 1888. Serial No. 260,811. (No model.)

Claim.—1. In a thill-coupling, the combination, with the axle-clip and the ears D D on the front side of the clip, having rearwardly-inclined slots F F therein, of the thill-iron having lateral trunnions which are mounted in the said slots, and the U-shaped spring L, attached to the clip between the ears and bearing against the under side of the thill-iron in front of the ears, substantially as specified.

2. In a thill-coupling, the combination of the axle-clip having a perforation, *b*, in its front side and the ears D D on the clip, the U-shaped spring, comprising the arm L, having a perforation, *l*, aligning with the perforation *b*, and the arm L', having a hook on its free end, the rivet or its equivalent engaging the aligned perforations *b* and *l*, and the thill bearing on the spring between the ears D and having trunnions mounted in bearings in the said ears, substantially as and for the purpose specified.

383,865. PIPE-COUPLING. ALPHEUS CORY, Galway, N. Y. Filed July 5, 1887. Serial No. 243,703. (No model.)

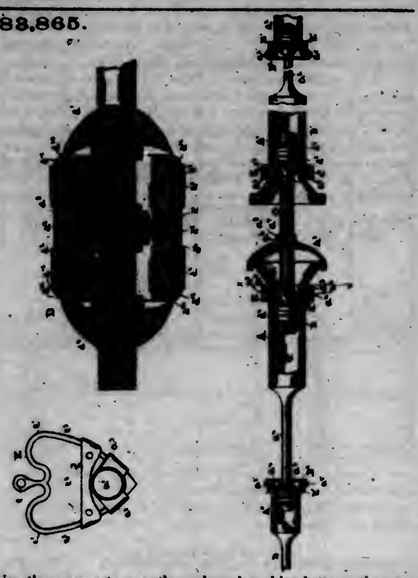
Claim.—1. In a coupling, the combination of a socket, a thimble, a coupling-pipe in said thimble, and the spring secured to the thimble and pipe, substantially as described.

2. In a coupling, the combination of a socket, a thimble, a coupling-pipe in said thimble, and a spring-disk secured to the thimble and pipe, substantially as described.

3. In a coupling, the combination of a socket, a thimble having washers upon the outer side, a coupling-pipe within said thimble, and a spring secured to the thimble and coupling, substantially as described.

4. In a coupling, the combination of a socket, a thimble, a screw-threaded coupling-pipe, and a spring attached to the thimble and secured to the coupling-pipe by clamping-nuts, substantially as described.

5. In a coupling, the combination of a socket, a thimble having rounded ends, a coupling-pipe secured to the thimble by a spring, and milled-edged clamping-nuts, substantially as described.



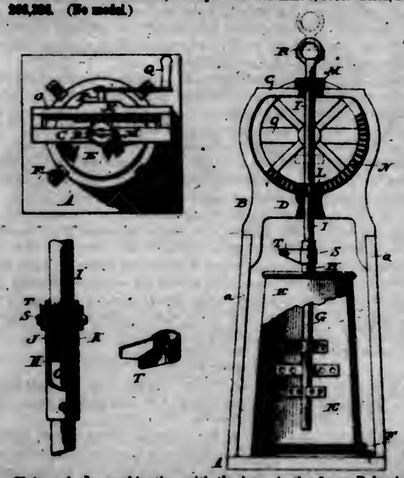
6. In a coupling, the combination of a socket, a thimble having rounded ends, a coupling-pipe having a spring-disk secured to the thimble, and milled-edged clamping-nuts, substantially as described.

7. In a coupling, the combination of a socket, a thimble having rounded nuts on each end, a coupling-pipe connected with said thimble by a spring, and milled-edged nuts upon said coupling-pipes, substantially as described.

8. The combination, in a pipe-coupling, of a socket, a thimble formed of two sections screw-threaded together and having rounded ends, a coupling-pipe secured to the thimble by a spring, and the milled-edged nuts upon the coupling-pipe, substantially as described.

9. The combination, in a pipe-coupling, of a socket, a thimble

383,865.



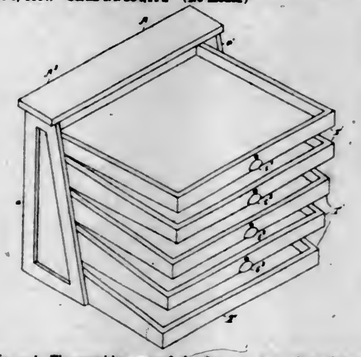
having the screw-nuts upon the ends and packing between the nuts, and a coupling-pipe fulcrumed upon and secured to said thimble by a spring, substantially as described.

10. In a pipe-coupling, the combination of two sockets having their mouths opposite each other, a cap upon one of said sockets, a coupling-pipe passing through said cap into the sockets, and a sliding thimble within the socket and secured to said pipe by a flexible connection which permits the pipe to turn, substantially as described.

11. In a pipe-coupling, the combination of two sockets pivoted at their rear ends, hangers for supporting the front ends of said sockets, a cap upon one of said sockets, a coupling-pipe passing through said cap into the sockets, and a sliding thimble within the socket and secured to said pipe by a flexible connection which permits the pipe to turn, substantially as described.

12. In a coupling, the combination of the sockets pivoted at their rear ends, the swinging hangers having the stops and clips, and a pipe having spheroids on its ends adapted to turn and slide in said sockets, substantially as described.

383,866. CHURN. WILLIAM H. CRAWFORD, Paris, Tex., assignor of one-half to John R. Snow, same place. Filed Mar. 6, 1888. Serial No. 266,359. (No model.)



Claim.—1. In combination with the base A, the frame B, having the cross-bars C D O, churn E, provided with a dasher-shaft, G, a sec-

ond shaft, I, passing through cross-bars C D and connected with the dasher-shaft, pinions L and M, secured to the shaft I and adapted to rest upon the cross-bars D and C, a shaft, P, journaled in the cross-bar O, and a mutilated gear engaging the pinions L M.

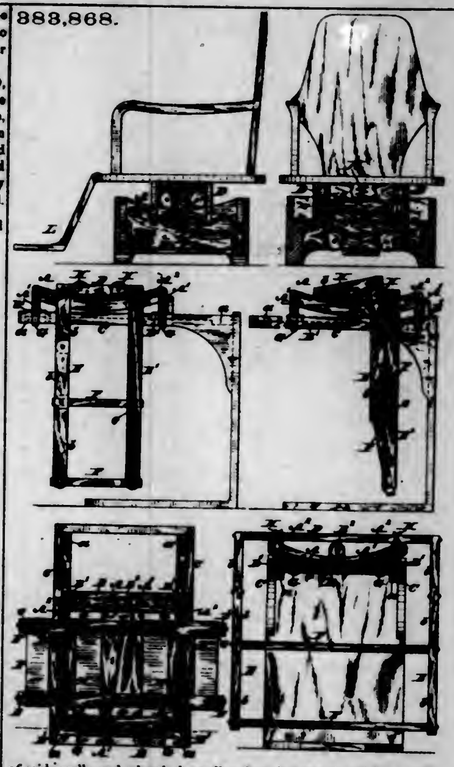
2. In combination with the frame B, having the cross-bars C D O, a churn, E, provided with a dasher-rod, G, a shaft, I, journaled in the cross-bars C D and connected with the dasher-shaft, a ring or handle, R, at the upper end of said shaft, pinions L M, secured rigidly upon the shaft and resting upon the cross-bars D and C, a shaft, P, journaled in the cross-bar O, a mutilated gear, N, engaging the pinions L M, and a winch or handle, Q, all arranged substantially as shown, whereby the shaft is adapted to be raised to permit the churn to be removed.

383,867. SHOW-CASE. FRED C. CUTTING, Lowell, Mass. Filed Apr. 8, 1887. Serial No. 234,714. (No model.)

Claim.—1. The combination of the frame, a tray pivoted in said frame, arc-shaped racks secured to said frame concentrically with the pivots of said tray, and pawls secured to said tray and engaging said racks to hold said tray in position when said tray is turned on its pivots, as and for the purpose specified.

2. The combination of the frame, a tray pivoted in said frame, arc-shaped racks secured to said frame concentrically with the pivots of said tray, pawls secured to said tray and engaging said racks to hold said tray in position when said tray is turned on its pivots, a three-armed lever pivoted to said tray, rods connecting said pawls and said lever, and another rod connected to said lever and reaching to the front of said tray to enable said pawls to be withdrawn from said racks by pulling said last-named rod, as and for the purpose specified.

3. The combination of the frame, a tray pivoted in said frame, arc-shaped racks secured to said frame concentrically with the pivots of said tray, pawls secured to said tray and engaging said racks to hold said tray in position when said tray is turned on its pivots, a three-armed lever pivoted to said tray, rods connecting said pawls and said lever, another rod connected to said lever and reaching to the front of said tray, another lever pivoted to the front of said tray and connected at one end to said last-named rod, whereby turning said last-named lever upon its pivot will draw said pawls out of engagement with said racks, as and for the purpose specified.



4. The combination of the frame, a series of trays arranged one above the other, each tray normally resting upon and covering the tray next below it, strips secured one to each side of each tray and extending back of said tray and provided with a hole back of said tray, and pivot-rods, each passing through the holes of the strips secured to one of said trays to enable each of said trays to be turned upon its pivot-rod without interfering with the tray next below the same, as and for the purpose specified.

5. The combination of the frame consisting of a bottom tray, uprights secured to said bottom tray, and a horizontal top connecting said uprights, a series of trays arranged one above the other and above said bottom tray, each tray of said series normally resting upon and covering the tray next below it, said last-named trays being pivoted in said frame and each being thereby adapted to be raised out of contact with the tray next below it, and independent means, substantially as described, for holding each of said pivoted trays in a raised position, as and for the purpose specified.

383,868. BERTH, CHAIR, &c. PETERRICK DAVEY, Philadelphia, Pa., assignor of three-fourths to Samuel W. Leedom, same place. Filed July 14, 1887. Serial No. 244,304. (No model.)

Claim.—1. In a device of the character named, a fixed support having a frame provided with rollers having V-shaped peripheries resting thereon, a cradle with rockers V-shaped on under surface resting on said rollers, and a frame with rollers resting on curved end pieces

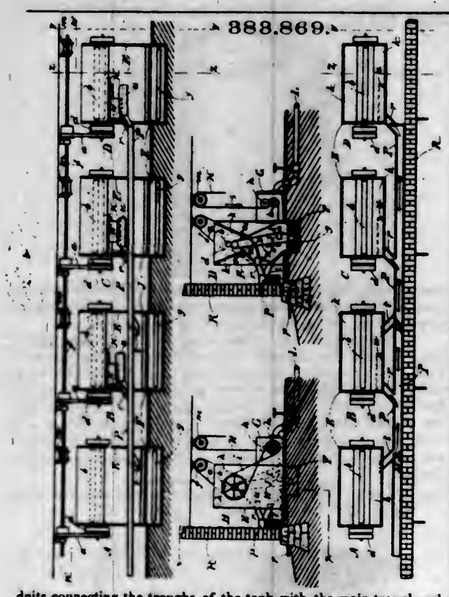
383,868.

of said cradle, and a berth depending from last-mentioned frame, substantially as described.

2. In a device for the purpose named, a fixed support having a frame provided with rollers and adjustable on said support, a cradle with rockers resting on said rollers and having curved end pieces, a frame with rollers resting on said curved end pieces, and a berth connected to said frame by sectional uprights, substantially as and for the purpose set forth.

3. In a device for the purpose named, a fixed support, a frame thereon, a cradle with rockers on said frame, a frame with rollers on said cradle, a frame having sectional uprights on one side connected to a berth, and uprights connected to said frame, and having stops *c*, on which one side of said berth rests, said parts combined substantially as described.

4. A pivoted berth with sectional side arms on one side thereof, a frame with rollers connected to said side arms, and a curved support on which said rollers move, said parts being combined substantially as described.



5. A rocking cradle and a support therefor, in combination with a berth, arms supporting said berth, &c., and a frame attached to the top of said arm and resting on the cradle, the berth being pivoted to the side arms, and the latter formed of jointed sections, the several parts being combined and operating substantially as described.

6. A fixed support, in combination with the frame B, the cradle A, with side rockers, A', and curved end pieces, A^2, the frame D, with rollers H, and the berth F, with sectional side pieces, E, substantially as and for the purpose set forth.

383,869. APPARATUS FOR BLEACHING AND DYEING. THOMAS DAVIES, Peabody, Mass. Filed Sept. 12, 1887. Serial No. 249,627. (No model.)

Claim.—1. The combination, in a bleaching apparatus, of a water-tank, a guide-roll therein, squeezing-rolls above the tank, a deflecting guide-board adjacent to said rolls for guiding the water therefrom, a collecting-trough for receiving the water from the guide-board, a secondary water-tank, a guide-roll therein, squeezing-rolls above said secondary tank, a deflecting guide-board adjacent to said rolls, a collecting-trough for receiving the water from said guide-board, a main trough provided with valved spouts leading into said tanks, and conduits connecting the troughs of the tank with the main trough, substantially as described.

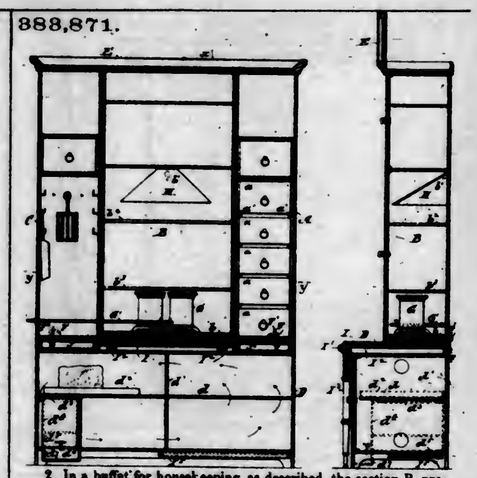
383,869.

2. In an apparatus of the character described, the frame-work E, having the splash-board *k*, in combination with the rod K, secured to said board and having the slots *q*, the guide-board N, provided with the brackets 43 and arms 45, trough M, spout *r*, and main trough P, substantially as set forth.

3. In a device of the character described, the main trough P, having the branch troughs *f r* and gates 25, in combination with the frame F, trough M, splash-board *k*, guide-board N, and means for adjustably attaching board N to the board *k*, substantially as described.

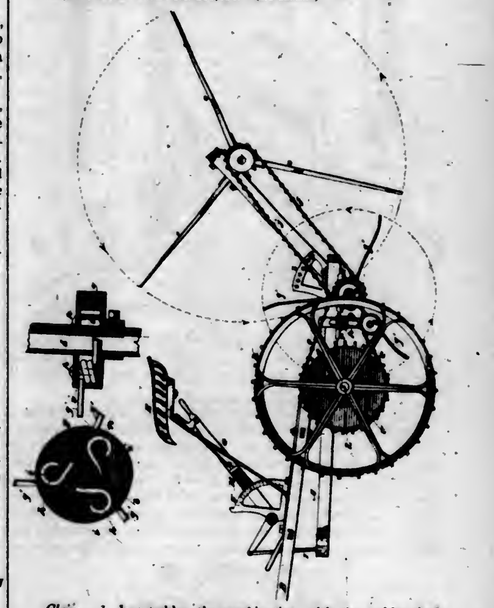
4. In a device of the character described, the trough M, provided with the tube *s*, having the mouth 40, in combination with the frame E, splash-board *k*, spout *r*, and main trough P, substantially as described.

383,870. VAPOR-STOVE. ZEBULON DAVIS, Cleveland, Ohio, assignor to the Consolidated Vapor Stove Company, of Cleveland, Ohio. Filed July 27, 1887. Serial No. 245,410. (No model.)



Claim.—In vapor-stoves, the combination of the oil can or reservoir A, having the pipe B downwardly projecting therefrom, a lateral opening at or near the lower end thereof, the tube H, with the air-chamber I, surrounding the pipe B and connected therewith at the lower end by means of the neck J and at the upper end to the can, the piston D within the pipe B, having the rod C extending through the can A and the tube H, and the means for holding said piston suspended, constructed and arranged substantially as and for the purpose set forth.

383,871. BUFFET FOR HOUSEKEEPING. ANNA L. DEY, New York, N. Y. Filed Feb. 5, 1887. Serial No. 226,615. (No model.)

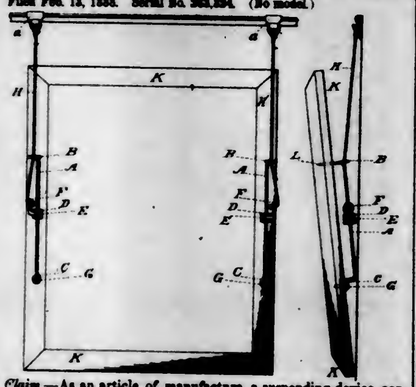


Claim.—1. In a buffet for housekeeping, substantially as described, a refrigerator divided into compartments by a vertical partition having an aperture near the top and another aperture near the bottom, and by a horizontal perforated metallic shelf on each side of said partition, one of the upper compartments having secured therein an ice-tray connected by a pipe with a filter communicating with a tank arranged beneath it, and the floor of the refrigerator in front of the tank being sunk to form a recess to admit of a cup or other receptacle being placed and withdrawn from under a faucet connected to the tank and inclosed by the doors of said refrigerator, whereby the water from the ice is filtered, collected, and utilized for drinking or other purpose.

383,871.

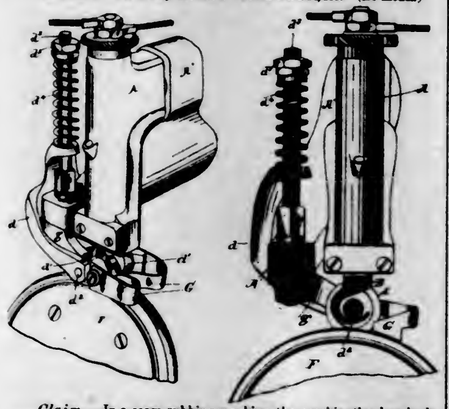
2. In a buffet for housekeeping, as described, the section B, provided with a supplemental metallic bottom secured to cleats attached to said section to support a cooking-stove, and a hood adapted to conduct vapors from said stove through an opening in the back of the section to the exterior thereof.

383,872. HAY-TEDDER. GEORGE H. RAHNEY, Springfield, Ohio, assignor of one-half to the Rogers Fence Company, same place. Filed May 31, 1887. Serial No. 239,737. (No model.)



Claim.—1. In a tedder, the combination, with the tedder-shaft, of the clearer-shaft adjustable concentrically round the tedder-shaft, gearing connecting the said shafts together, and means to hold the clearer-shaft in any adjusted position.

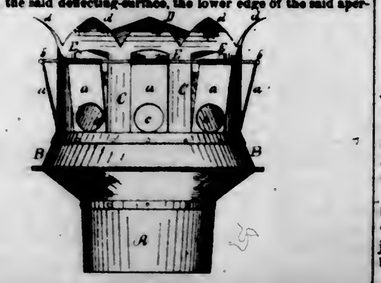
2. In a tedder, the combination, with the tedder-frame, a sector thereon, and the tedder-shaft, of beams pivoted on the said shaft and adjustably connected with the sector, and a clearer-shaft journaled in the upper ends of the beams.



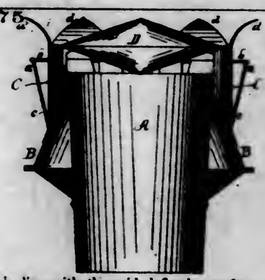
3. In a tedder, the combination, with the tedder shaft, of casings secured thereto, and forks coiled round studs in the casings, having a bearing at one end against the said shaft and extending out from the casing at the other end.

383,873. SUSPENDING DEVICE. CHARLES B. FAY, Auburn, N. Y. Filed Feb. 13, 1888. Serial No. 263,894. (No model.)

Claim.—As an article of manufacture, a suspending device consisting of a screw-threaded stem, A, adapted to be secured at both of its extremities to the object to be suspended, in combination with the nut D, the roller E, and loop F, adjustably arranged upon said stem, substantially as described.



383,874. SEAM-RUBBING MACHINE. CHARLES S. FITCH, Revere, Mass. Filed July 16, 1887. Serial No. 244,485. (No model.)



Claim.—In a seam-rubbing machine, the combination herein described of a work-support and a rubbing-tool, with a spool-shaped presser-foot held to its work by means of a spring, substantially as and for the purpose set forth

383,875. SELF-CLEANING SMOKE-JACK. LAODICEA B. FISHER, St. Paul, Minn. Filed Aug. 29, 1887. Serial No. 248,126. (No model.)

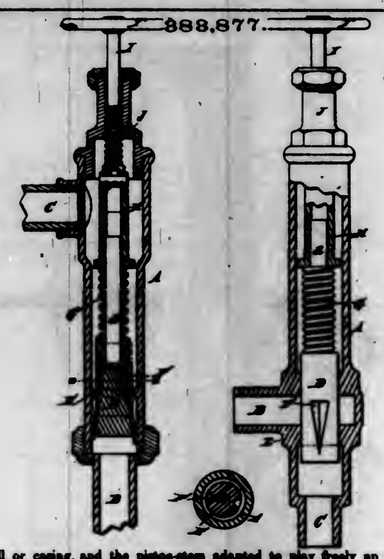
Claim.—1. The combination, in a chimney-cap, of a flue portion slightly flared upwardly and outwardly, and provided with an outer deflecting-surface around the top of the flue portion and extending downwardly and outwardly therefrom in the form of a truncated cone, and a slotted cylinder resting thereon having upwardly-extending apertured tongues outwardly bent from the point of contact of the said cylinder with the said deflecting-surface, the lower edge of the said apertures being in line with the said deflecting-surface, substantially as specified, whereby the cinders, &c., may pass downwardly over the deflecting-surface and be discharged through the apertures.

2. The combination, in a chimney-cap, of a flue portion slightly flared upwardly and outwardly, a deflecting-surface in the form of a truncated cone extending downwardly and outwardly from the upper edge of the said flue portion, a slotted cylinder resting thereon having apertured tongues extending upwardly and outwardly from the bottom of each slot, a deflecting-surface extending upwardly and outwardly over the top of each slot, and a double cone within the cylinder over the mouth of the flue, substantially as and for the purpose herein specified.

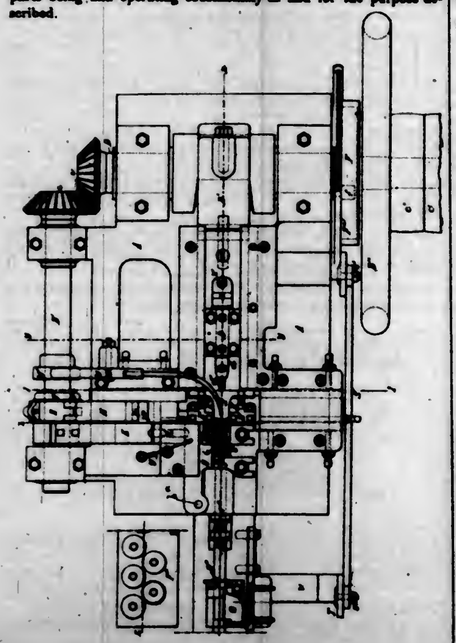
383,876. CARRIAGE-BOW. JOHN R. FOX, Milwaukee, Wis. Filed July 30, 1887. Serial No. 245,050. (No model.)

Claim.—1. As a new article of manufacture, the carriage-bows for the front and rear of a carriage-top having their central horizontal portion bent at an obtuse angle to their respective sides or ends, whereby when said bows are secured in place at an angle to the central cover-supporting bow the upper surface of said horizontal central portion of said front and rear bows will conform to the shape of the cover of said top affixed thereto, substantially as and for the purpose specified.

2. In a carriage-top, the combination of the central top-supporting bow, D, front and rear top-supporting bows, B and C, having their horizontal central portion, F, bent at an obtuse angle to their respective sides or ends, whereby said central portion is adapted to conform to the curve or angle of the cover E affixed thereto, and cover E, secured at its respective ends to said front and rear bows and at its center to said central bow, all substantially as and for the purpose specified.



3. The method herein described for forming the front and rear bows of a carriage-top, consisting in bending the same over a U-shaped form, the upper surface of the central portion of which form is beveled at an obtuse angle to conform to the desired shape of the central portion of said front and rear bows, and in drawing said bows firmly down upon said beveled central portion of the form until said central portion of the bow is bent at an obtuse angle conforming to the shape of said form, and securing and retaining said bow in such position upon the form until by seasoning its shape becomes permanently fixed, substantially as and for the purpose specified.

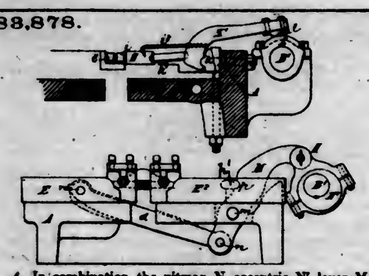


383,877. PRESSURE-REGULATOR. HORATIO GALE and CHRISTIAN D. WESLOSKI, Albion, Mich. Filed Oct. 31, 1887. Serial No. 253,896. (No model.)

Claim.—1. In a pressure-regulator, the combination of a piston-valve provided with a series of tapered grooves having their greatest cross-sectional area at the top of said valve upon its side, an adjustable spring having bearings on the upper end of the valve and the lower end of the follower H, adapted to assist the valve in resisting the outflowing steam, and a close-fitting partition, E, through which the valve reciprocates, substantially as described.

2. The combination, in a pressure-regulator, of a piston-valve having a series of tapered grooves, a spring having a bearing on the valve and a bearing on the lower end of the follower H, and an adjustable screw for varying the tension of said spring, said piston-valve being adapted to reciprocate through a close-fitting partition in the shell or casing, and the piston-stem adapted to play freely up and down in the hollow follower H, substantially as described.

383,877.

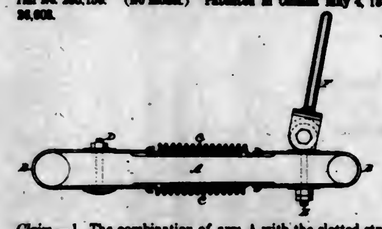


383,878. WIRE-NAIL MACHINE. ALBERT B. GLOVER, Stratford, Conn. Filed Jan. 9, 1888. Serial No. 260,194. (No model.)

Claim.—1. The spring reacting jaw H, pivoted at h^5, in combination with the dies i i', for gripping and holding the wire while the head is being formed and for releasing it, as and for the purposes described.

2. The dies i i', in combination with jaw H, toggle h', lever K', and cam L, the combination being and operating substantially as and for the purpose described.

3. The blank r, in combination with dies i i' and screw R, these parts being and operating substantially as and for the purpose described.

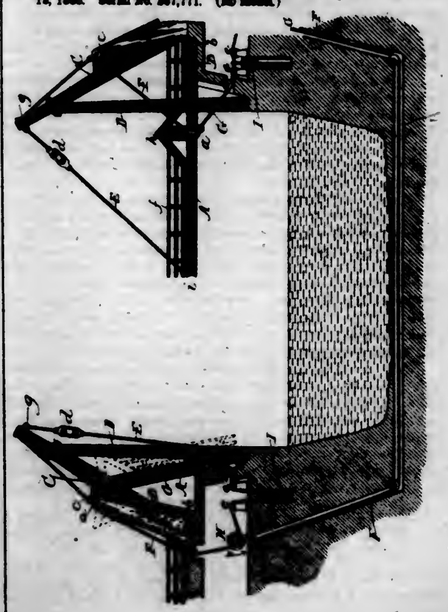


383,878.

4. In combination, the pitman N, eccentric N', lever M, rod d, toggle p', and slides E F', the bearing-point p of the toggle and the connecting-point n of the lever being equidistant from its fulcrum m.

5. The lever M, in combination with connecting-rod d, slides E and F', and toggle p, these parts being constructed and operating in the manner and for the purposes described.

383,879. LATHE-PITMAN FOR WIRE-WEAVING LOOMS. SAMUEL O. GLENDINNING, Hamilton, Ontario, Canada. Filed Apr. 16, 1887. Serial No. 235,159. (No model.) Patented in Canada May 4, 1887, No. 26,603.



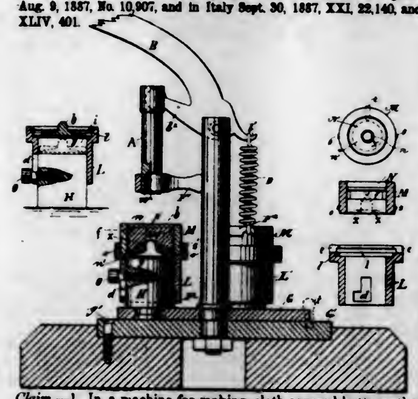
Claim.—1. The combination of arm A with the slotted straps B, bolts D and E, and the cam-lever F, substantially as described.

2. The combination of an arm, A, having straps B, with slotted holes and bolts for the adjustment of the same, with the springs c, attached to the ends of the strap, substantially as shown and described.

3. The combination, with the arm A, with its slotted straps and bolts, and the springs c, hooked to the said slotted straps, of the cam-lever F, substantially as shown and described.

383,880. BRIDGE. WILLIAM HARMAN, Oak Park, Ill. Filed Mar. 19, 1888. Serial No. 267,771. (No model.)

Claim.—1. A draw-bridge composed of halves or two parts, each part consisting of sections, as A B, hinged together, substantially as and for the purpose specified.



2. The combination of the sections A B, hinged together, standards C, rods E, and ropes F, for raising the sections B to open the bridge, substantially as specified.

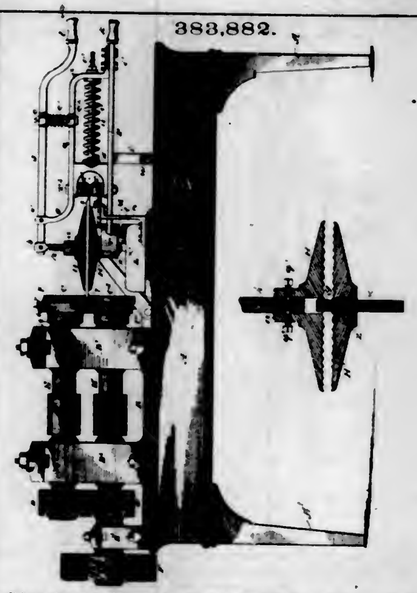
3. The combination of the sections A B, hinged together, standards C, rods E, and ropes G, for lowering the sections B to close the bridge, substantially as specified.

4. The combination of the sections A B, hinged together, standards C, rods E, ropes F G, and winding shaft or drum H, for raising and lowering the sections B to open and close the bridge, substantially as specified.

5. In a draw-bridge, the hinged floor-sections A B, supported and arranged to fold together when lifting-power is applied to the abutment-section, substantially as described.

383,881. MACHINE FOR MANUFACTURING BUTTONS. GOTTLIEB HEIDMANN, EMIL HÖTTGES, and CARL BOEX, Barmen, Prussia, Germany, assignors to Heidmann & Höttges, same place. Filed Sept. 5, 1887. Serial No. 248,869. (No model.) Patented in Belgium Aug. 9, 1887, No. 78,596; in France Aug. 9, 1887, No. 185,256; in England Aug. 9, 1887, No. 10,907, and in Italy Sept. 30, 1887, XXI, 22,140, and XLIV, 401.

Claim.—1. In a machine for making cloth-covered buttons, the combination, substantially as described, with a vertically-movable follower and a lower die comprising a stationary die-block and a tubular section adjustable vertically thereon, of an upper die detachably connected to and movable vertically in the tubular section of the lower die, whereby the follower is adapted to co-operate directly with the lower die or operate the upper die, for the purpose specified.



2. In a machine for making cloth-covered buttons, the combination, substantially as described, with the lower die comprising a die-block and a tubular section adjustable vertically thereon, of an upper die comprising a die-carrier, and a die detachably secured thereto and adapted to move vertically therein, and a locking device for locking the die-carrier to the tubular section of the lower die, for the purpose specified.

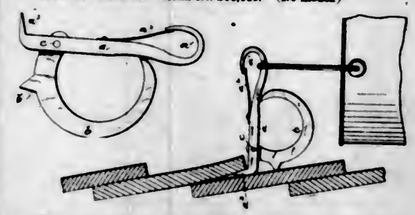
3. In a machine for making cloth-covered buttons, the combination, substantially as described, with a stationary standard and a follower movable in bearings on said standard, of a die-carrier plate revoluble on the standard, a locking device to lock said carrier into position relatively to the follower, a plurality of lower dies comprising a die-block secured to the carrier, a tubular section adjustable vertically on the die-block, and a plurality of upper dies detachably secured to the tubular sections of the lower dies and movable vertically therein, whereby the follower is adapted to co-operate with the lower dies independently of the upper dies, for the purpose specified.

4. In a machine for making cloth-covered buttons, the combination, substantially as described, with the lower die comprising a stationary die-block and a tubular section adjustable vertically thereon, said tubular section having its upper end enlarged, of an upper die, a carrier in which the upper die is movable vertically, a stop to limit the motion of said die within the carrier, a locking device for locking the carrier to the enlarged portion of the tubular section of said lower die, and a follower for operating the upper die, for the purpose specified.

383,882. MANUFACTURE OF HARROW-DISKS. WILLIAM J. HOGAN, Johnstown, Pa., assignor to the Cambria Iron Company, of Pennsylvania. Filed Nov. 1, 1887. Serial No. 254,004. (No model.)

Claim.—1. The process of manufacturing dished disks for harrows, consisting in heating circular flat blanks of sheet metal, then placing them in a proper machine and rolling their edges so as to consolidate the material and bevel them to a thin edge, which is thus rendered measurably hard by rolling compression and contact of metallic surface therewith, then removing the disks from the edging-machine, and dishing them in a drop-press or drop-hammer in dies, substantially as set forth.

383,882.



2. The process of manufacturing dished disks for harrows, consisting in first shearing or otherwise cutting circular flat blanks from unheated plate metal, then heating these blanks, and in a proper machine rolling their edges to bevel, sharpen, and consolidate the material and semi-harden these edges, and finally removing the disks from the edging-machine and giving them a concavo-convex form in dies under a hammer or press, substantially as set forth.

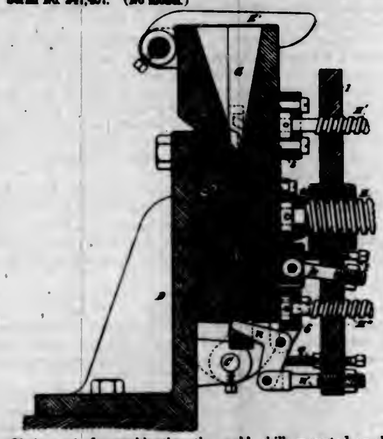
3. The process of manufacturing dished disks for harrows, consisting in first shearing or otherwise cutting circular flat blanks from cold sheet metal, then heating the blanks and subjecting their edges to a rolling pressure in a proper machine to bevel, sharpen, and semi-harden these edges by consolidation of their atoms and metallic contact of the rolls of the machine, at the same time removing the slight inequalities of the edges by proper means, and finally removing the disks from the edging-machine and drop-pressing them in dies to give them a dished form, substantially as set forth.

4. The process of manufacturing harrow-disks, consisting in heating flat blanks of metal and beveling their edges by rolling, substantially as set forth.

5. The process of manufacturing harrow-disks, consisting in heating flat blanks of metal, then beveling their edges by rolling, and finally dishing said blanks, substantially as set forth.

383,883. PAINTER'S HOOK. JOSEPH R. HOPPER, Newark, N. J. Filed Mar. 27, 1888. Serial No. 268,689. (No model.)

Claim.—1. A device for suspending articles, consisting of an arm provided with a hook at one end and claws or toes on the other end, in combination with an arm pivoted to it and adapted to serve as a brace between the supporting-body and the first-mentioned arm by resting against the said body and arm, substantially as described.



2. The arm *a*, provided with hook *a'* and claws a^2, in combination with arm *b*, provided with lug *b'*.

383,884. PILE. STEPHEN G. HUTCHINSON, Columbus, Ohio. Filed Oct. 3, 1887. Serial No. 251,262. (No model.)

Claim.—The combination, with the pile A, having one or more projecting lugs, C, of the ground-plate D, having depressions *f*, and locking-blocks *g'* or *g*, substantially as and for the purpose specified.

383,885. MOLD. MARTIN G. IRELAND, Brooklyn, assignor to the Improved Horse Shoe Company, New York, N. Y. Filed Aug. 20, 1887. Serial No. 247,407. (No model.)

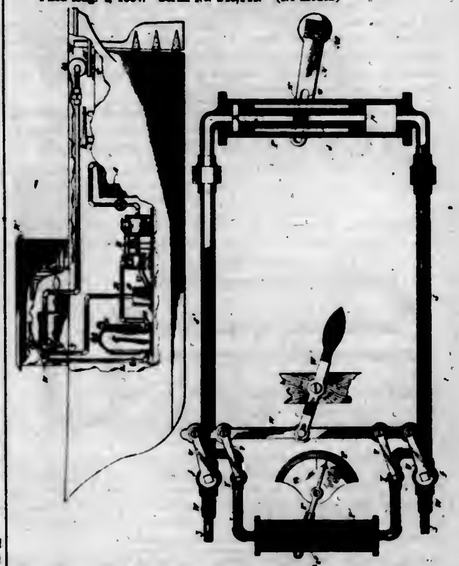
Claim.—1. In combination, the mold, chills mounted on slides adapted to move at an angle with each other, the plate I, a bolt or bolts whereby the slide or slides moving toward the plate I are connected therewith, and the lever or levers a and bolt or bolts a', whereby the motion from the plate is conveyed to the slide or slides moving in other directions, substantially as described.

2. In combination with a mold adapted for wrought-iron or steel casting, a chill adapted to form a seat for a key, and another chill adapted to form a mortise, said chills being respectively mounted on slides which move at an angle with reference to each other, whereby the chills may be withdrawn from the mold-cavity, substantially as described.

3. In combination with a mold adapted for casting horseshoes, chills for forming mortises for the calks, and chills for forming keyseats for the keys attaching the calks, said chills being mounted, respectively, on slides, whereby they may be withdrawn from the mold-cavity, substantially as described.

4. In combination, a stationary support, D, a mold-half, A, secured thereto in an upright position, the mold-half B, pivoted to A at the bottom, chills mounted upon slides, the plate I, connections between the chills and the plate I, the screw H, whereby the plate I is moved to and from the mold, and a bolt or bolts, U, whereby the distance of the chill-slides from the plate I may be regulated, substantially as described.

383,886. FASTENER FOR MEETING-RAILS OF SASHES. JOHN JACKSON, Clinton, Iowa. Filed Oct. 10, 1887. Serial No. 251,936. (No model.)



Claim.—1. A sash-lock comprising an outer casing or housing having pivoted therein a latch provided with a tripping-lug at one side of its pivot and a notch at its opposite side, and a gravity-pawl arranged above said latch and adapted to take into said notch, substantially as specified.

2. The combination, with the upper sash of a window recessed in one of its side rails, of a sash-lock mounted in said recess and provided with a latch pivoted thereto and formed with a tripping-lug at one side of its pivot and a notch at the other side thereof, and a gravity-pawl mounted above the latch and adapted to take into the notch of a lower sash provided with a projecting tripping-plate mounted to come into contact with the tripping-lug of the latch, substantially as specified.

3. The case C, having the perforated lip C^2 and the perforations C^3, C^4, and the plate C', having the similar perforations and connected to the casing, in combination with the latch D, formed with the straight and curved faces D' and D^2, the tripping-lug D^3, and the notch D^4, and the gravity-pawl E, having the lift E', and adapted to take into the notch D^4, substantially as specified.

383,887. MECHANISM FOR UTILIZING AND CONTROLLING HYDRODYNAMIC FORCES. WALTER M. JACKSON, New York, N. Y. Filed Aug. 4, 1887. Serial No. 246,141. (No model.)

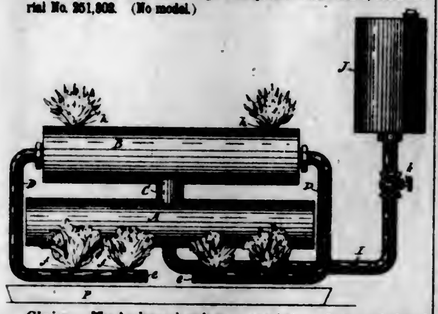
Claim.—1. In mechanism for utilizing and controlling hydrodynamic forces, the combination, with a suitable pump, conduits connected therewith, and a plunger located in a casing or cylinder connected at both ends with the conduits, of a series of valves located in said conduits and adapted to be simultaneously actuated to equalize or vary the pressure on opposite ends of the plunger, and thereby retain it either in a stationary position at any point of its travel or actuate it in either direction, substantially as set forth.

2. In mechanism for utilizing and controlling hydrodynamic forces, the combination, with a suitable pump, discharge-conduits connected therewith, and a plunger located in a cylinder or casing connected at both ends with said conduits, of valves located in the several conduits for governing supply and exhaust passages connecting with each end of the plunger, and means for simultaneously actuating said valves, substantially as set forth.

3. In mechanism for utilizing and controlling hydrodynamic forces, the combination, with a suitable pump, a receiver, suitable conduits connected with the pump and receiver, and a plunger located in a cylinder connected at its opposite ends with said conduits, of valves located in the conduits for equalizing or varying the pressure on opposite ends of the plunger, substantially as set forth.

4. In mechanism for utilizing and controlling hydrodynamic forces, the combination with the tiller of a vessel, of a plunger connected with the tiller, and a suitable pump, conduits, and a series of valves located in the conduits and adapted to be operated simultaneously for equalizing or varying the pressure on opposite ends of the plunger, and thereby move the tiller in either direction or hold it stationary at any point of its travel, substantially as set forth.

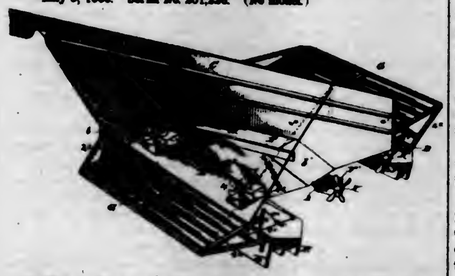
5. The combination, with a fluid-cylinder and means for constantly supplying this cylinder, of a double-headed plunger having pockets in each head and adapted to reciprocate in the cylinder, said cylinder having elongated slots formed therein between the heads of the plunger, and outlets leading from the pockets through the slots of the cylinder, substantially as set forth.



6. In a vessel, the combination, with a fluid-cylinder, a pump, and a receiver containing air or other elastic medium, wherein the water is forced from the pump, of a double-headed plunger adapted to reciprocate in the cylinder, and a system of valves located in the conduits and connected, so as to be operated simultaneously, and adapted to vary and equalize the fluid-pressure on both heads of the plunger, substantially as set forth.

7. The combination, with a cylinder having elongated slots therein, of a double-headed plunger adapted to reciprocate therein, said plunger having pockets formed therein and conduits connected to the opposite ends of said cylinder, substantially as set forth.

8. The combination, with a cylinder having elongated slots therein, of a double-headed plunger adapted to reciprocate therein, said plunger having pockets formed therein and pipes leading from the pockets through the slots in the cylinder, substantially as set forth.



9. The combination, with a cylinder having slots therein extending lengthwise of the cylinder, of a double-headed plunger adapted to reciprocate therein, said plunger having pockets formed therein, pipes leading from the pockets through the slots in the cylinder, and a stem located in the plunger and adapted to communicate motion to any connected mechanism, substantially as set forth.

383,888. HYDROCARBON-BURNER. CHARLES S. JARDON and JOHN McHALE, Terre Haute, Ind.; said McHale assignor to Ambrose H. Tuesh and Joshua R. Glover, Vigo County, Ind. Filed Oct. 8, 1887. Serial No. 251,902. (No model.)

Claim.—The hydrocarbon-burner consisting of the cylindrical retort A, gas-receiver B, having perforations *h h*, tube C, connecting said retort and receiver, supply-pipe I, and the bent pipes D D, having perforations *f f* and closed ends *e e*, all combined and arranged to cooperate in the manner and for the purpose specified.

383,889. AIR-SHIP. EDWARD P. JOHNSTON, Decatur, Ala. Filed May 5, 1886. Serial No. 201,236. (No model.)

Claim.—1. An air-ship having a vertical central blade, C, and parallel vertical guide-blades D D', secured to the top of the hull on each side thereof, in combination with fixed inclined sections B B', propellers K, for propelling said inclined sections against the opposing atmosphere, and propellers K', for lifting the ship, substantially as set forth.

2. An air-ship provided with fixed inclined sections B B' and movable guide-flanges E', hinged to the lower surface of the outer edges of the inclined sections and operated substantially as described, in combination with means for propelling said inclined sections against the opposing atmosphere, and a series of lifting-propellers, substantially as described.

3. An air-ship consisting of a hull, A, having top and bottom and sides extending in parallel planes, oppositely-converging ends, and outwardly-projecting fixed sections B B', extending at an angle with the longitudinal axis of the ship, in combination with a series of lifting-propellers, substantially as described.

4. An air-ship consisting of a hull, A, having a longitudinally-extending blade, C, secured to the top thereof and forward part of the air-ship, outwardly-projecting sections B B', secured permanently to and projecting beyond and at an angle to the longitudinal axis of said hull, and provided with a series of depending fixed flanges, E, and movable flanges E', and means, substantially as described, for operating said movable flanges, in combination with a series of propellers mounted on vertical shafts and another series mounted on horizontal shafts, substantially as described.

5. An air-ship having fixed inclined sections, in combination with inclined sections composed of movable portions, and means, substantially as described, for propelling the same against the atmosphere and elevating the ship, substantially as described.

6. An air-ship having a hull, A, provided with outwardly-projecting permanently-fixed sections B B', that extend at an angle to the longitudinal axis of the hull, in combination with sections G G', provided with movable slats *g*, and a series of propellers for operating the ship, substantially as described.

7. An air-ship consisting of a hull, A, having oppositely-converging ends, a vertical guide-blade, C, secured to the top of said hull and the forward part of the air-ship, outwardly-projecting sections B B', secured permanently to and extending beyond said hull at an inclination to its longitudinal axis, and having sections G G', provided with movable slats *g*, in combination with propellers K, operating in the vertical plane to move the ship in a forward direction, and propellers K', operating in the horizontal plane to move the ship in an upward direction, substantially as described.

8. An air-ship consisting of a hull, A, having outwardly-projecting inclined sections B B', permanently secured thereto, in combination with sections G G', consisting of a series of narrow strips, *g*, hinged together and capable of being folded together by means of outwardly-projecting longitudinally-moving rods I, operating within suitable supports, substantially as described.

9. An air-ship consisting of a hull, A, having fixed inclined sections B B' secured thereto and projecting therefrom, said sections being provided with outwardly-projecting hollow supports H, in combination with sections G G', consisting of narrow slats *g*, hinged together, rods I, and springs *i*, arranged within the supports H and connected with the slats *g*, substantially as described.

10. An air-ship consisting of a hull, A, having oppositely-converging ends, vertical guide-blades C D D', and outwardly-projecting sections B B', provided with sections G G', consisting of movable slats *g*, in combination with a series of propellers, K K', and rudders F F', substantially as described.

11. An air-ship having one or more lifting-propellers on each side of its longitudinal axis and each provided with an independent motor having means for controlling it, a pendulum suitably supported to swing in a plane transverse to the longitudinal axis of the ship, and connections between the pendulum and the means controlling the motors, substantially as described.

12. An air-ship provided with a series of parallel fixed flanges or corrugations extending longitudinally along the bottom of the same, a set of lifting-propellers, and an automatic regulator connected with said propellers for maintaining the equilibrium of the air-ship, substantially as described.

13. An air-ship provided with fixed inclined planes and means for propelling the same against the atmosphere, in combination with an automatic regulator for maintaining the equilibrium of the air-ship, substantially as described.

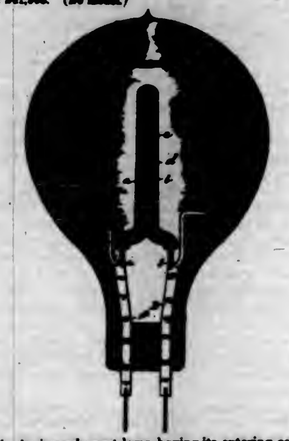
14. In an air-ship, the combination of fixed inclined planes provided with movable portions and an automatic regulator for maintaining the equilibrium of the ship, substantially as described.

15. In an air-ship, the combination of one or more lifting-propellers, each provided with an independent motor having means for controlling the same, and a device moved by the force of gravitation connected with and operating the means for controlling the motors for the purpose of maintaining the equilibrium of the air-ship, substantially as described.

16. An air-ship having, in combination with the operating-propellers thereof, a pendulum, a support therefor, circuit-closers secured thereto and connected by suitable conductors with the motor for operating the propellers, substantially as described, for causing the inclination of the ship from its normal position to automatically transmit currents of electricity to said motor to counteract said inclination, as and for the purpose set forth.

17. An air-ship having, in combination with the operating-propellers thereof, a series of metallic plates, *p p'*, suitably supported and adapted, as described, to receive and transmit currents of electricity, circuit-closers, conductors, electric motors *v v'*, suspended rod or pendulum M, and lifting-propellers.

383,890. AUTOMATIC SPRINKLER. CHARLES W. KENWORTHY, Chicago, Ill. Filed Apr. 2, 1888. Serial No. 269,269. (No model.)

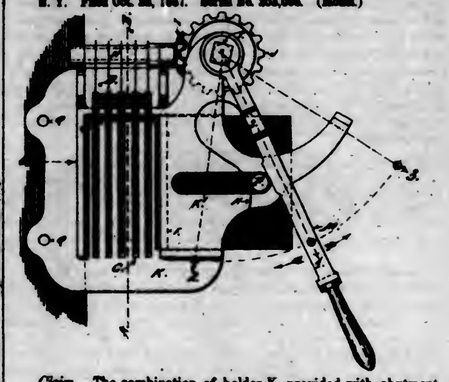


Claim.—1. In an automatic fire-extinguisher, the combination, with a nozzle having a removable cap or valve for the opening of said nozzle, of rigid bracket projecting upwardly from one side of the nozzle and provided with a deflector located above the nozzle-opening and provided with fixed lugs, an arm loosely engaged by one of said lugs and soldered to the other of said lugs, and a lever secured to bear upon said cap at a point intermediate its ends, one of its ends engaging the fixed stop and the other engaging said arm, whereby when the solder is fused and said arm is thereby released the pressure of the water in the pipes may raise the cap, substantially as described.

383,890.

2. In an automatic fire-extinguisher, the combination of the nozzle C, the bracket D, carrying the deflector E, the arm F, projecting from the bracket C on its side opposite the bracket D and provided with a shoulder, *f*, a lever, H, one end of which bears upon the shoulder *f*, said lever extending across and bearing upon the cap G, and the arm J, having the shoulder I, to receive the end of lever H, said arm being pivotally secured at one end to the bracket D and having its other end connected to a fixed part of the bracket by solder, substantially as described.

383,891. CUT-OUT FOR INCANDESCENT LAMPS. BENJAMIN LAMB and MERLE J. WHITMAN, Hartford, Conn. Filed June 21, 1887. Serial No. 241,968. (No model.)



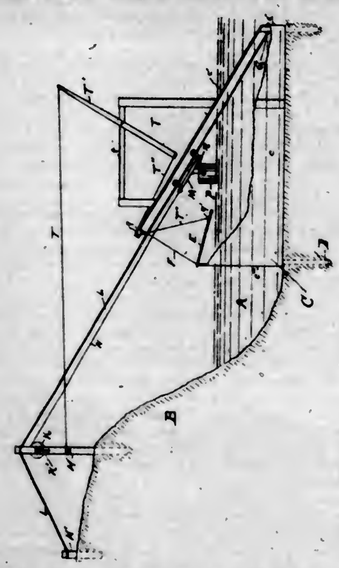
Claim.—1. An incandescent lamp having its entering conductors brought into proximity electrically in the space between the legs of the filament and sufficiently near to be electrically united by fusion under the influence of the arc formed between the broken ends of the conductor upon the rupture of the filament, as and for the purpose described.

2. An incandescent lamp having its entering conductors brought into proximity electrically in the space between the legs of the filament and continued in such proximity substantially the whole height of the filament, whereby they may be electrically united by fusion under the influence of the arc formed between the broken ends of the conductor upon the rupture of the filament, as and for the purpose set forth.

3. An incandescent lamp having its entering conductors brought into proximity electrically, and normally held in such proximity by a fusible cement, whereby they may be electrically united by fusion under the influence of the arc formed between the broken ends of the conductor upon the rupture of the filament, as and for the purpose described.

4. An incandescent lamp having its entering conductors brought into proximity electrically, said conductors being embedded in fusible cement at that point and insulated from each other by a thin sheet or layer of insulated material, whereby the conductors may be electrically united at that point by fusion under the influence of the arc formed between the broken ends of the conductor upon the rupture of the filament, as and for the purpose described.

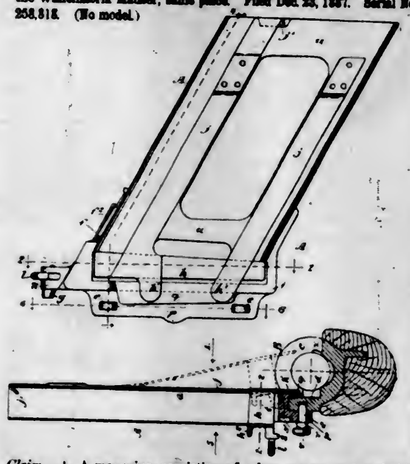
383,892. CUTTING-MACHINE. ADOLPH J. L. LOHSEN, Brooklyn, N. Y. Filed Oct. 22, 1887. Serial No. 253,066. (Model.)



Claim.—The combination of holder K, provided with abutment C, guards F, bottom gratings, G, back gratings, G', horizontal cutters E, vertical cutters D, lever M, springs N, gears J and I, and shaft H, substantially as and for the purpose herein set forth.

383,893. GARMENT-SUPPORTER. ALBERT G. LULL, Chicago, Ill. Filed Sept. 22, 1887. Serial No. 250,274. (No model.)

Claim.—The clasp A, having the projection *c* formed with the end thereof for the prevention of accidental unclasping, substantially as specified.



383,894. WATER-FETCHING MACHINE. CHARLES G. MATHER, Lindstrom, Minn. Filed Apr. 14, 1887. Serial No. 234,973. (No model.)

Claim.—The water-elevator comprising water-box C, as described, consisting of the vertical sides and ends *c c' c''* and inclined top *c'*, said box being fastened at a fixed depth in the lake, as by piling D, the door E, pivoted to the top of end *c''*, the eyebolt G, fastened to interior of *c'*, the posts H and H' on the adjacent shore, the cable L, extending

from post H to post H' through the top of post H, the traveler M, movable on cable L, provided with the stop R, the pivoted dipping water-bucket P, the drum or windlass K, journaled on post H and provided with the crank K', the wire or rope N, attached to said drum and to said traveler, the frame or lever support T, the lever T', fulcrumed on said frame, the sheave *q*, the rope T'', attached to the lower extremity of the lever T' and to upper end of door E by eyebolt G, and the hand-wire T''', attached to the top of lever T' and extending to a point within reach of the operator, all substantially as and for the purpose set forth.

383,895. DETACHABLE MAGAZINE FOR FIRE-ARMS. PAUL MAUSER, Oberndorf-on-the-Neckar, Würtemburg, Germany, assignor to the Waffenfabrik Mauser, same place. Filed Dec. 23, 1887. Serial No. 258,818. (No model.)

Claim.—1. A magazine consisting of a box constructed to hold a succession of cartridges one above another, in combination with a carrier consisting of a frame having open top and bottom arranged at the bottom of said box, adapted to hold a single cartridge, and mounted to move laterally from a position coinciding with the bottom of said box to a position to one side thereof and over the receiving-chamber of the gun.

2. A magazine consisting of a box constructed to hold a succession of cartridges one above another, in combination with a carrier consisting of a frame having open top and bottom arranged at the bottom of said box, adapted to hold a single cartridge, and mounted to move laterally from a position coinciding with the bottom of said box to a position sufficiently to one side thereof to permit a cartridge to drop from the carrier, and formed with a flange on its upper side arranged in position to uphold the remaining cartridges in the box while the carrier is moved out.

3. A magazine consisting of a box constructed to hold a succession of cartridges one above another, in combination with a carrier consisting of a frame having open top and bottom arranged at the bottom of said box, adapted to hold a single cartridge, and mounted to move laterally from a position coinciding with the bottom of said box to a position sufficiently to one side thereof to permit a cartridge to drop from the carrier, and abutting-stops on the box and carrier, respectively, adapted to limit the outward movement of the carrier.

4. A magazine consisting of a box constructed to hold a succession of cartridges one above another, in combination with a carrier consisting of a frame having open top and bottom arranged at the bottom end of said box, adapted to hold a single cartridge, and mounted to move laterally from a position coinciding with the bottom of said box to a position to one side thereof, and over the receiving-chamber of the gun, and guiding-fingers projecting downward from the said carrier and adapted to direct the cartridge into place as it falls therefrom.

5. A magazine consisting of a box constructed to hold a succession of cartridges one above another, in combination with a carrier arranged at the bottom of said box, adapted to hold a single cartridge and to move laterally from a position coinciding with the bottom of said box to a position to one side thereof, and over the receiving-chamber of the gun, and a retracting-spring acting against said carrier and tending to press said carrier into position coinciding with said box.

6. A magazine consisting of a box constructed to hold a succession of cartridges one above another, in combination with a carrier arranged at the bottom of said box, adapted to hold a single cartridge and to move laterally from a position coinciding with the bottom of said box to a position to one side thereof, and flat springs fastened to the side of said box and to said carrier and serving to support the latter in its movement.

7. A magazine consisting of a box constructed to hold a succession of cartridges one above another and of a carrier at the bottom of said box and mounted to move laterally to one side thereof, in combination with a lever for moving said carrier, arranged with one arm against said carrier and with the other arm in position to be encountered and displaced by some moving part of the gun.

8. A magazine consisting of a box for holding cartridges and a carrier mounted to move laterally from a position in coincidence with said box to a position at one side thereof, in combination with a lever for moving said carrier, arranged in position to be encountered and displaced by some moving part of the gun, and a block to which said lever is pivoted, connected movably to said magazine and arranged relatively to the gun in such manner that it may be moved to bring said lever out of engagement with the said moving part of the gun.

9. The combination, with a bolt-gun, of a magazine constructed with a laterally-movable carrier, a lever for moving said carrier, arranged in position to be encountered and displaced by the movement of the bolt of the gun, and a movable block to which said lever is pivoted, adapted to be moved so as to bring said lever out of engagement with the bolt.

10. The combination, with a bolt-gun constructed with a shoulder, *m*, on its bolt, of a magazine constructed with a laterally-moving carrier, an elbow-lever, *l*, for moving said carrier, arranged with its arm *l'* in position to be encountered by said shoulder *m* during the backward movement of the bolt and constructed to be displaced upwardly at will out of the path of said shoulder, whereby the automatic feed for said magazine may be thrown out of action.

11. The combination, with a gun, of a magazine constructed with a laterally-moving carrier, a lever for moving said carrier, arranged in position to be encountered and displaced by some moving part of the gun, a sliding block to which said lever is pivoted, constructed to be moved so as to carry said lever out of action, and a spring-catch for retaining said block in either position.

12. The combination, with a bolt-gun, of a magazine constructed with a laterally-moving carrier, a lever for moving said carrier, a block to which said lever is pivoted, and a spur projecting from said block and entering a socket in the gun.

13. The combination, with a gun, of a magazine consisting of a box constructed to hold a succession of cartridges one above another, a carrier at the bottom of said box mounted to move laterally to one side thereof and over the receiver of the gun, and a base-frame fixed to the bottom of said box and extending beneath said carrier, and reciprocal fastening devices on the gun and on said base-frame, respectively, for removably attaching the magazine to the gun.

14. The combination, with a gun and a detachable magazine, of reciprocal fastening devices on said gun and magazine, respectively, consisting of a projection on the one part entering a socket in the other, and a spring-latch on the one part projecting into said socket and adapted to engage a recess in the projection on the other part which enters said socket.

15. The combination, with a gun and a detachable magazine, of reciprocal fastening devices consisting of a recess in the one part, a laterally-moving latch, *c*, adapted to enter said recess, a lever carrying said latch and pivoted to the other part, a push-button engaging the opposite arm of said lever, and a spring acting to protrude said push-button and to keep said latch pressed into engagement with its recess.

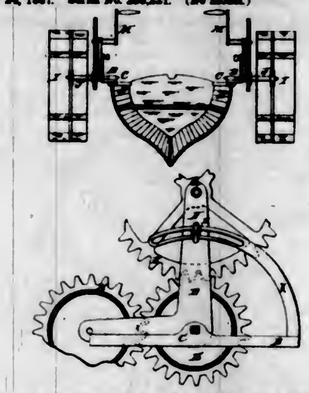
16. The combination, with a gun and a detachable magazine, of reciprocal fastening devices consisting of two recesses in the one part, two latches projecting into said recesses through coinciding openings in the other part, two levers carrying said latches on their outer arms and arranged with their inner arms projecting toward one another, a push-button arranged between and engaging said inner arms, and a spring acting to protrude said push-button.

17. The combination, with a gun having a wall, *d*, formed at one side of the cartridge-chamber, of a detachable magazine having its base-frame *t* constructed with flanges *p* and *q*, projecting downwardly on opposite sides and adapted to embrace said wall between them, and spring-latches carried by the one part and entering recesses in the other.

18. The combination, with a gun having a wall, *d*, formed at one side of the cartridge-chamber, of a detachable magazine having its base-frame *t* constructed with flange *p* and *q*, projecting downwardly and adapted to embrace said wall between them, spring-latches *e e*, projecting through openings in the flange *p* and entering recesses in said wall *d*, levers *r r*, pivoted to said flange *p*, a push-button, *v*, engaging said levers, and a spring, *u*, acting against said push-button.

19. A magazine consisting of a box, *a*, a base-frame, *t*, fixed thereto and extending beneath the open bottom of the box, a carrier, A, mounted to move laterally beneath the bottom of said box and within said frame, and stops for limiting the movement of said carrier, consisting of hooked projections *s* thereon working in grooves *s'* in said base-frame.

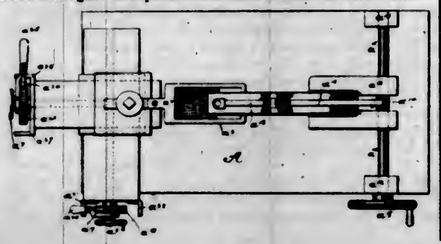
383,896. LAWN-MOWER. JOHN W. MCCLELLAN, Middletown, Ohio. Filed Mar. 31, 1886. Serial No. 197,236. (No model.)



Claim.—1. The combination, substantially as set forth, of a lawn-mower having rearward projections E, grass-receptacle M, attached at the rear of the lawn-mower, apron-frame D, having rolls and an apron, and bolts engaging said apron-frame and slots in said rearward projections.

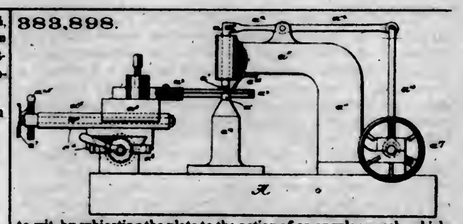
2. The combination, substantially as set forth, of a lawn-mower having rearward projections E, rollers F and G, journaled in such projections and having their ends geared together, grass-receptacle M, attached at the rear of the lawn-mower, apron-frame D, roller J, and apron K.

3. The combination, with a lawn-mower provided with a ground-roller in rear of its cutting-knife, of an endless-carrier attachment thereto, the driving-roll of which is connected with and driven by said ground-roller, substantially as described.



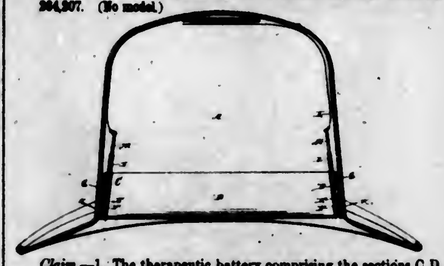
383,897. PADDLE-WHEEL BOAT. ISAAC G. MONROE and WILLIAM H. H. SMITH, Brooklyn, N. Y.; said Smith assignor to said Monroe. Filed Oct. 24, 1887. Serial No. 253,221. (No model.)

Claim.—In combination, the hull of a boat having a slotted curved arm supporting frame-piece affixed thereto, with a bell-crank and paddle-wheels connected therewith by intervening gear-wheels and bolts, constructed and operating substantially as and for the purpose hereinbefore set forth.



383,898. STOCK FOR SKELETON BURNERS FOR INCANDESCENT LIGHTING AND THE ART OF MAKING THE SAME. ROGERS MORGAN, Philadelphia, Pa. Filed Feb. 20, 1888. Serial No. 264,571. (No model.)

Claim.—1. The improvement in the art of forming stock for incandescent lights out of plates of thin metal or other suitable material—



to wit, by subjecting the plate to the action of an angular punch, which, at regular intervals and at proper distances apart, perforates the plate and produces angular meshes, leaving a skeleton of the plate in one piece, composed of a series—in continuity—of straight bars of substantially uniform breadth.

2. As a new article of manufacture, stock to be used in the making of skeleton burners for incandescent lighting, a plate of thin metal or other suitable material, offering at proper intervals and at proper distances apart angular perforations by which the substance of the plate or sheet is made to present a reticulated or net-like structure composed of an integral and continuous substance surrounding the meshes and of substantially uniform breadth.

383,899. ELECTRO-THERAPEUTIC BATTERY. HOWARD J. MURPHY and JOHN FLOYD, Lynchburg, Va. Filed Feb. 16, 1888. Serial No. 264,207. (No model.)

Claim.—1. The therapeutic battery comprising the sections C D, made of suitable metals, provided with the absorbent filling, having the buttons K to connect them to a hat, and provided with a conducting-wire, substantially as described.

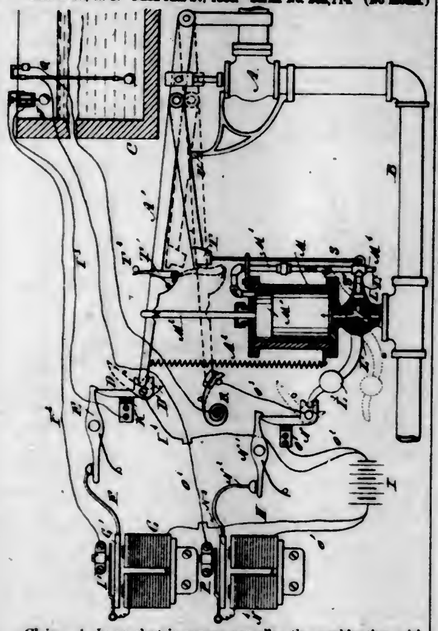
2. In a therapeutic battery, the case made of suitable metal, having the openings F on one side, and provided with a hinged back adapted to be opened to admit the insertion or removal of an absorbent filling, substantially as described.

3. In a therapeutic battery, a case made of suitable metal, having openings left on one side, and provided with projecting studs or spurs H, and having the hinged back adapted to be opened for the insertion or removal of an absorbent filling, said spurs or projections H being adapted to be bent over the back when the latter is closed, substantially as described.

4. A therapeutic battery comprising the cases D C, made of suitable metals, and having the absorbent fillings, and the tubular projections I, in combination with the conducting-wire L, having the pins M, adapted to be inserted in said tubular projections, substantially as described.

5. A therapeutic battery comprising the cases C D, made of suitable metals, having the buttons K to connect them to a hat, and having the tubular projections I, in combination with the conducting-wire having the pins M, to be inserted in the said projections, as set forth.

383,900. CLIP FOR WHIFFLETREES. WILLIAM M. MYERS and AUGUSTUS SMITH, Cosby, Mo. Filed Oct. 25, 1887. Serial No. 253,316. (No model.)

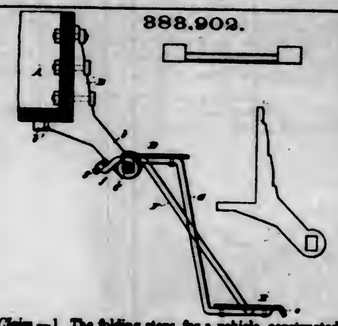


Claim.—1. In a clip for eveners, the combination, with the whiffletree and singletree, of a clevis having its upper portion curved outwardly and formed with a downwardly-projecting lug, and a plate on the singletree, substantially as shown and described.

2. In an evener-clip, the combination, with the doubletree, a bearing-plate secured thereto having outer and inner circular lugs or projections, of a singletree also provided with a plate having corresponding lugs or projections adapted to encircle those of a doubletree, a clevis having its ends passing through openings of the doubletree-plate, and a bolt passing through the opening of the clevis and through openings of the plates and single and double trees, as shown and described.

3. In an evener-clip, the combination, with the whiffletree having grooves in its sides, for the purpose set forth, and the singletree, of a clevis having screw-threaded extremities and consisting of a straight portion and a distended portion, the straight portion being partially embedded in the whiffletree, nuts on the said clevis, a plate on the bottom of the whiffletree having flanges at either extremity and formed with perforations for the reception of the extremities of the clevis, a bolt for securing the parts together, and a nut on the extremity of the said bolt.

383,901. ELECTRIC POWER-CONTROLLER. GERRARD S. HILL, New York, N. Y. Filed Jan. 27, 1888. Serial No. 262,114. (No model.)



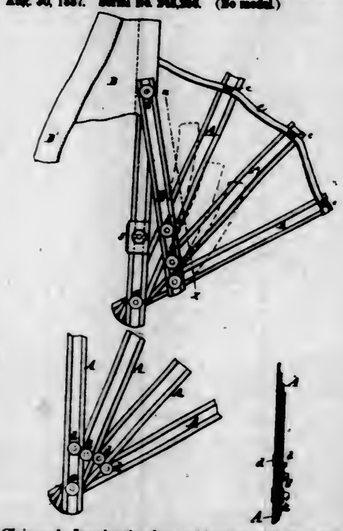
Claim.—1. In an electric power-controller, the combination, with a self-acting supply-valve and a catch for restraining the valve, of a vibrating hammer for tripping the catch, a vibrating armature for operating the hammer, an electro-magnet, and electric connections, substantially as described.

2. In a power-controller, the combination, with a supply-valve having a weighted or spring-actuated arm, of a pivotal lever having a fork to engage the arm, a catch for the lever, and tripping devices, substantially as described.

3. In an electric power-controller, the combination, with a supply-valve, of an auxiliary power-engine for working the same, a self-acting valve for controlling the engine power-supply, a catch for restraining the latter valve, electric tripping devices, and auxiliary-valve-working mechanism arranged to be operated by the main-valve-working engine, so that the auxiliary valve will be returned to the restraint of its catch with the action of the main valve, substantially as described.

4. In an electric power-controller, the combination, with a supply-valve, operating mechanism, and an electric circuit for closing the valve, separate operating mechanism, and a separate electric circuit for opening the valve, of self-opening circuit-closers in both the valve-closing and valve-opening circuits arranged to close by the action of the main valve as the same is respectively opened and closed, substantially as described.

383,902. FOLDING STEP. ALEXANDER H. NICHOLAS, RUSSELL, KANS. Filed Sept. 14, 1887. Serial No. 249,670. (No model.)



Claim.—1. The folding steps for a vehicle, constructed substantially as described and provided with the shaft C, having squared ends that rest within similar bearings in the outwardly-extending arms of the bearing-brackets, the said squared portions of the shaft C extending inwardly from their bearings sufficiently to form supports for the inner edge of the upper step, D, substantially as specified.

2. The folding steps for a vehicle, constructed substantially as described and provided with bearing-brackets to support the shaft C, which brackets have vertically-extending arms and horizontally-extending arms, respectively secured to the side and floor of the vehicle, as specified.

3. The folding steps for a vehicle, constructed substantially as described and provided with the brace-frame *f*, composed of the upper ends of the rods F F and G and the transverse bar *g*, and of suitable length for said bar to rest against the under surfaces of the outwardly-extending arms of the bearing-brackets when the steps are turned down, as specified.

383,903. BUSTLE. HENRY P. CLEVELAND, New York, N. Y. Filed Aug. 30, 1887. Serial No. 248,264. (No model.)

Claim.—1. In a bustle, the combination, with the approximately semicircular hoops A, secured together at each end by a single pin or rivet, *c*, of a waistband connected with the bent or curved upper portion of the first hoop, and braces applied to the hoops inward of their ends to connect each hoop with the next in the series, the braces on opposite sides of the bustle being unconnected with each other save by the hoops A and serving to prevent the collapsing movement of the hoops where they are applied, and by so doing to produce a torsional or bending action of the hoops by their collapsing movement between the braces, substantially as herein described.

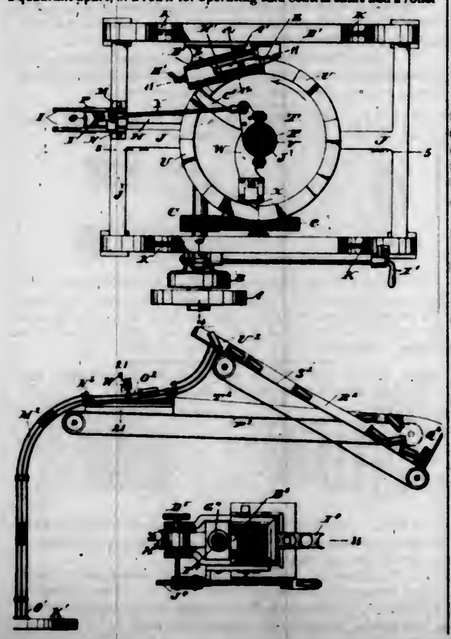
2. In a bustle, the combination, with the approximately semicircular hoops A, all secured together at each end by a single pin or rivet, *c*, of a waistband, B, extending from the bent or curved top portions of the first hoop A, and the bracing-strips D, applied in pairs

to the outer and inner sides of the hoops A inward of their ends, and serving to prevent the collapsing movement of the hoops at the point where applied, and serving, by limiting the collapsing movement of the hoops to the portions between the braces, to produce a torsional action or bending of the hoops between said bracing-strips, the pairs of bracing strips D on opposite sides of the bustle being unconnected with each other, substantially as herein described.

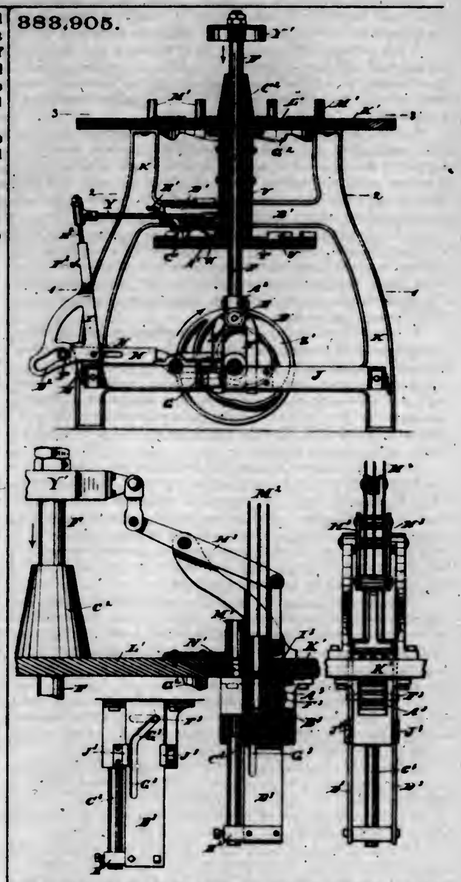
383,904. CAR-BRAKE. GEORGE B. GREEN, Thornton, assignor to himself, and JOHN H. YOUNG, Chicago, Ill. Filed Feb. 20, 1888. Serial No. 264,862. (No model.)

Claim.—1. In combination with a car, a pivoted yoke, D, carrying rollers *d d'*, and sliding rods E F, adapted to operate the yoke and bring one of the rollers in contact with an axle, substantially as and for the purpose specified.

2. In combination with a car, a pivoted yoke, D, carrying at its ends rollers *d d'*, sliding rods E F, adapted to operate the yoke, brakes G G', and a rope or chain, *m*, to operate the brakes, substantially as specified.



3. In combination with a car, a pivoted yoke, rollers *d d'*, sliding rods E F, brakes, a divided sleeve, *j k*, on one of the axles, and a rope or chain, *m*, substantially as specified.



4. In combination with a car, a pivoted yoke, rollers *d d'*, rods E F, brakes, a rope or chain, *m*, and ropes or chains *o p*, substantially as and for the purposes specified.

5. In combination with a car, a pivoted yoke, D, carrying rollers *d d'*, sliding rods E F, each having at its inner end a case, *f* and *f'*, on which is a hook, *f'* and *f''*, to engage with one of the bars or rods *e e'*, springs in such cases, a return-spring for each of the sliding rods, and draw-bars, all constructed and arranged substantially as shown and described, and for the purposes specified.

383,905. CARTRIDGE-LOADING MACHINE. G. MOORE PETERS, Xenia, Ohio. Filed Sept. 10, 1887. Serial No. 249,301. (No model.)

Claim.—1. In a cartridge-loading machine, the combination, with the actuating mechanism and a central shaft actuated by a cam-wheel provided with eccentric guideways and with in-and-out treads about a quadrant apart, of a roller for operating said central shaft and a roller

for operating a horizontal slide, each engaging such eccentric way, and said slide being connected with and operating a lever, I, in a reciprocating manner by means of rollers at the outer end of said slide playing in an ogee slot or slots in said lever, the other end of the lever being connected to mechanism for rotating a shell-supporting table, as and for the purpose set forth.

2. In a cartridge-loading machine, the combination, with a horizontal slide, H, having rollers P connected thereto, of the adjustable lever I, having slotted blades engaging the rollers, said slots being ogee in shape and acting as cams to impart motion to the lever I through the intervention of the rollers, and intermediate connections between the lever I and the revolving shell-carrying table, as and for the purpose set forth.

3. In a cartridge-loading machine, the combination, with the central shaft and its actuating mechanism, of a hollow shaft and rotating table secured thereto, a lug-plate having lugs corresponding to the shell-cases, said lug-plate being connected with the table by means of a hollow shaft, as and for the purpose set forth.

4. In a cartridge-loading machine, the combination, with the central and hollow shafts and their actuating mechanism, a rotating shell-supporting table, and a lug-plate connected thereto, of a lever pivoted to a hollow shaft having the extension C', for operating the catch A', and the spring-catch X, for engaging successively the lugs on the lug-plate and pushing them till caught and held by the catches Z and A', as and for the purpose set forth.

5. The combination, with the rotating shell-carrying table of a cartridge-machine, of the lug-plate connected thereto and having lugs U, a lever, W, pivoted on the shaft of the lug-plate, having an arm, C', extending therefrom and connected with suitable operating mechanism, and two spring-catches, A' Z, carried by the frame of the machine and embracing the lugs in succession, one catch acting hori-

zontally and the other perpendicularly, so as to stop the movement of the lug-plate and prevent its rebound, as and for the purpose set forth.

6. In a cartridge-loading machine, the combination, with the rotating table and lug-plate connected thereto, of an air cushion or chamber provided with a piston engaged and actuated by the lugs successively, whereby the jar of the lug-plate and rotating table is prevented as set forth.

7. The combination, with a rotating table, its lug-plate, and actuating mechanism, of a catch, A', provided with a piston moving in and out of the air-chamber, the lugs on the lug-plate, when the latter is rotated, alternately coming into contact with the catch, said cylinder having a slot to accommodate the sliding movement of the piston and hold the catch in position, as and for the purpose set forth.

8. In a cartridge-loading machine, the combination, with the driving mechanism, of a cam-wheel having variations from its center arranged in quarters, and intermediate connection between such cam-wheel and a rotary shell-carrying table, and the reciprocating shaft which supports the loading implements, whereby these parts are alternately operated, as set forth.

9. In a cartridge-loading machine, the combination, with the driving mechanism, of a cam-wheel engaging rollers actuating a central shaft and horizontal slide, said cam-wheel having a central variation arranged in quarters, the rollers engaging said variations at right angles and alternately, one roller giving the central shaft a vertical movement, the other giving the slide a horizontal movement, and such slide being in operative connection with the rotary shell-carrying table, as and for the purpose set forth.

10. In a cartridge-loading machine, the combination, with the central shaft, a hollow shaft surrounding the same, and slide H, having rollers I' connected thereto and engaging a rotary cam on the driving-shaft, of the adjustable lever I, having slotted blades engaging the rollers, said slots acting as cams to impart motion to the lever I through the intervention of the rollers and by intermediate connection to a rotary shell-supporting table carried by the hollow shaft, substantially as and for the purpose set forth.

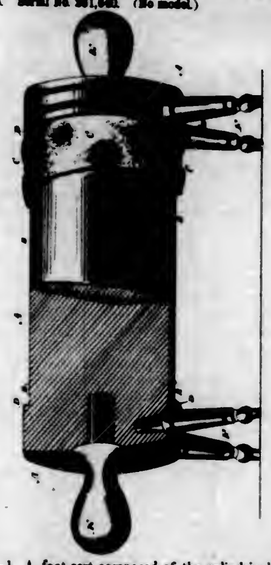
11. In a cartridge-loading machine, a shell-feeder consisting of a hopper gradually diminishing in width and depth from the receiving to the discharge end, a conveying and return belt, a wire cage for conducting the shells to the shell-placer, a hook for arresting said shells entering said cage wrong end foremost, and a tilting bridge for throwing out arrested shells or excess of shells.

12. In a shell-feeding device, the combination, with a cage leading to the shell-placer, of a tilting pivoted bridge provided with a balance-weight so adjusted that when more than one shell is on said bridge it will automatically tilt and displace the excess of shells.

13. In a cartridge-loading machine, a shell-placer consisting of a piston and shell-holding block, said block sliding horizontally in bearings beneath the shell-holder of the rotating table, the upper bearing of the block forming a cut-off to the shell-feeder when the block is moved beneath the shell-holder, as and for the purpose set forth.

14. In a shell-placing device, the combination, with the actuating mechanism, of a hollow block to receive the shell from the feeder, a piston for forcing the shell into the case, said block and piston being actuated by slotted double blades D^3 on the lever attachment to the central shaft, the block being connected thereto by a roller moving in the cam-slot, the roller in the upper portion of the slot moving the block forward into position, and in the lower portion of the slot holding the block while the piston passes through it, as and for the purpose set forth.

15. In a cartridge-loading machine, the combination, with a powder or shot hopper, of a feed-wheel operated by a ratchet, said feed-wheel containing four or more openings to the shell, said openings being graduated by slides radiating from the center of the feed-wheel and regulated by a cam-slotted wheel conforming to said center, and having a stem reaching downward through the bottom of the hopper, as and for the purpose set forth.

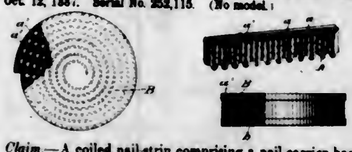


16. In a cartridge-loading machine, the combination, with a support for the wad-strip, of a wad cutter and placer consisting of a tubular cutter and an interior rammer, the rammer being actuated directly by the arm L^4, extending from the head-block of the central shaft, and the cutter being actuated by the same arm through the intervention of cam-slotted levers M^4, by which said cutter is moved to a certain distance and held in position for the return of the rammer, as and for the purpose set forth.

17. The combination, with the shell-supporting mechanism, of a shell-indenting device consisting of the rammer G^3, with flattened head R^2, the tripod F^5, for carrying the indenters, the bars I^5, for throwing the indenters in and out, the arm K^5, with bearings S^2, the cam-slotted arms M^5, the levers P^5, and the indenting-points with knife-like edges or projections A^6 at the end, as and for the purpose set forth.

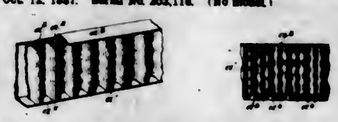
18. In a cartridge-loading machine, the combination, with the support for the wad-strip and feed mechanism therefor, of a wad cutter and placer consisting of a tubular cutter and an interior rammer, the rammer being actuated directly by the arm L^4, extending from the head-block of the central shaft, and the cutter being actuated by the same arm through the intervention of the cam-slotted levers M^4, by which said cutter is moved a certain distance and held in position for the return of the rammer, as and for the purpose set forth.

19. In a cartridge-loading machine, the combination, with the shell-holder and a reciprocating plunger for ejecting the loaded shell, said plunger carrying a wad-marker at its lower end, of a spring-pressed vibrating lever pivoted to the frame which supports the plunger and carrying an ink-roller in position to engage and be pressed aside by the plunger-head, as set forth.



383,906. FOOT-REST. JAMES B. PIER, Plymouth, Ind. Filed Jan. 23, 1888. Serial No. 261,662. (No model.)

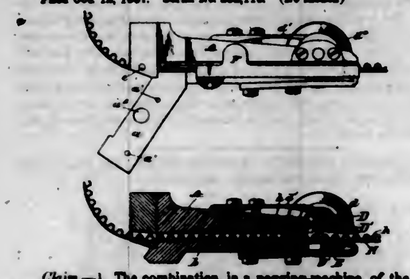
Claim.—1. A foot-rest composed of the cylindrical body A, the handles E, the legs F, the depression B, and the upholstering C, substantially as set forth.



2. A foot-rest composed of a cylindrical body and supporting-legs, and upholstering surrounding the body and adapted to be rotated thereon, substantially as and for the purpose set forth.

383,907. NAIL-STRIP. JOHAB R. PROUTY, Spencer, Mass. Filed Oct. 12, 1887. Serial No. 252,116. (No model.)

Claim.—A coiled nail-strip comprising a nail-carrier having nail holders or pockets *a* and nails therein, arranged or wound in the form of a coil, and a sheet of paper applied to one or both of its surfaces, to retain the strip in the form of a coil and to hold the nails in its pockets or holders, as and for the purposes described.



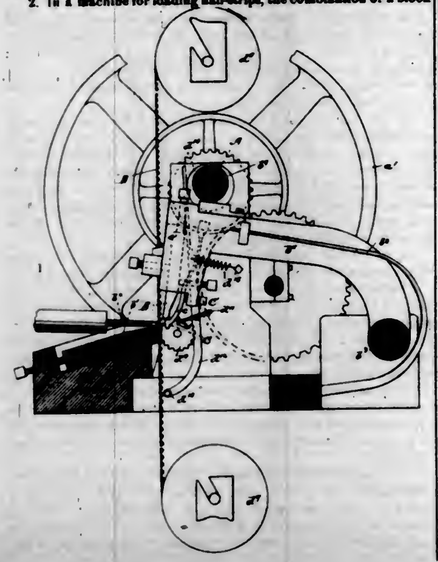
383,908. NAIL-STRIP. JOHAB R. PROUTY, Spencer, Mass. Filed Oct. 12, 1887. Serial No. 252,116. (No model.)

Claim.—1. A nail-strip having a series or line of holders or pockets closed at both ends and nails contained in said pockets or holders, as and for the purposes described.

2. The improved article of manufacture consisting of a flexible carrier having nail pockets or holders which are closed at their top and bottom by thin easily-destructible material, and nails loosely held in said pockets, as and for the purposes described.

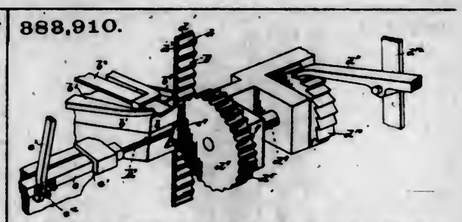
388,909. PEGGING-MACHINE. JOHAB R. PROUTY, Spencer, Mass. Filed Oct. 12, 1887. Serial No. 252,115. (No model.)

Claim.—1. The combination, in a pegging-machine, of the feed-box having a narrow feedway of substantially the same width and height throughout, open at both ends and extending across the line of the driveway, with the driver, and an intermittingly-operated feed-wheel having spacing feeding-teeth, and a spring, H, arranged opposite the feed-wheel, all adapted to feed a nail-carrying strip having one straight surface, which bears against the spring, and a corrugated or rack surface, which is engaged by the spacing feeding-teeth of the feed-wheel, substantially as described.



2. The combination of the feed-box having the feedway *b*, of a uniform height and uniform width throughout, open at both ends and extending across the driveway of the machine, the driver, the feed-wheel having spacing feeding-teeth D', arranged upon the left side of the box and adapted to be intermittingly turned, with the spring H, holding-bar F, and driver C, substantially as described.

3. The combination, in a pegging-machine having an awl and driver, of the feedway extending across the driveway, and a flexible nail-carrier having pockets or nail-holders arranged therein at a uniform distance apart, and the sides of each of which pockets form, successively, a continuation of the driveway entirely closed upon its sides during the driving of the nail therefrom, as and for the purposes described.



388,910. MACHINE FOR LOADING NAIL-STRIPS. JOHAB R. PROUTY, Spencer, Mass. Filed Oct. 27, 1887. Serial No. 253,494. (No model.)

Claim.—1. In a machine for loading a nail-carrying strip, the combination of nail-making devices, a recess or holder into which nails as they are made are fed in successive order by a nail-carrier, the nail-carrier, a plunger for removing the nail from the pocket or holder, and nail-strip-feeding devices for feeding a nail-carrying strip, having a series of pockets intermittingly to bring each pocket in line with the recess or holder, as and for the purposes described.

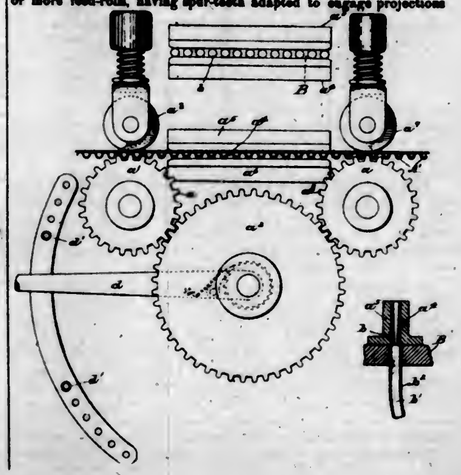
2. In a machine for loading nail-strips, the combination of a block

388,910.

having a recess or pocket into which nails are fed in succession, a reciprocating plunger to traverse said pocket or holder and remove nails therefrom, and a feeding mechanism for feeding the nail-carrier, having a series of pockets comprising the movable spur-teeth d^3, and the plate d^4, the teeth engaging the projections upon the carrier-strip and moving the pockets successively in line with the recess or holder, and holding each pocket of the strip while it is receiving a nail, as and for the purposes described.

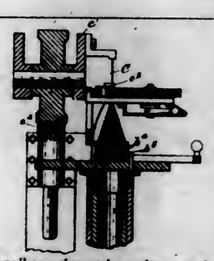
3. The combination of the punch or cutter B, the holder or presser C, the die-block *b*, the recess or holder c^2, the roll d^4, having the teeth d^5, adapted to have intermittent periods of rotation imparted to it, and the plate d^6, as and for the purposes described.

4. The combination, in a machine for feeding nails into pockets of a nail-carrying strip in successive order, of a reel, d^{17}, upon which the complete filled strip is wound, the feed-roll d^4, having the teeth d^5, having intermittent periods of rotation, the plate d^6, a pocket or recess, c^2, in which nails are automatically fed, and a plunger, E, for feeding the nails from the recess or holder to the pockets of the nail-carrying strip in successive order, substantially as described.



5. The combination of the shaft A, the head *c'*, carrying the cutter or punch B, and a cam or eccentric upon the shaft A, for moving the head downward, the presser or holder C, the die block or bed having a recess or holder, c^2, the plunger E, and a cam-pin or eccentric upon the shaft A, for moving the same, the feed-roll d^4, its shaft d^3, the ratchet d^{10}, the feed-pawl d^{11}, and a cam or eccentric for moving the same, and a plate, d^6, substantially as described.

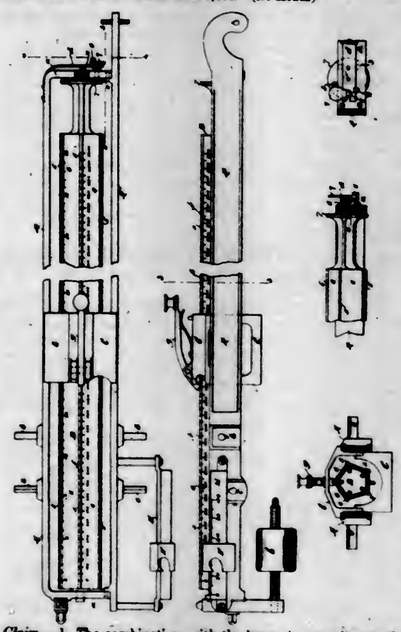
6. The combination of a block having a pocket or recess, c^2, the plunger E, the feeding device having teeth d^5, and a plate, d^6, the bracket for supporting the feeding device cut away in line with the holder or recess c^2, to form a nail-escape passage, F, as and for the purposes described.



383,911. NAIL FEEDING AND DISTRIBUTING MACHINE. FREDERICK P. RAYMOND, 24, Newton, Mass. Filed Oct. 27, 1887. Serial No. 253,498. (No model.)

Claim.—1. In a nail feeding and distributing machine, the combination of a delivery-reel for holding a nail-carrying strip, a nail-strip-feeding device comprising a feed roll or rolls having teeth to mesh with projections upon the strip, and a feedway provided with holes through its bottom through which nails are forced from the strip, and a gang or group of reciprocating ejectors to simultaneously enter the pockets or holders of said strips and force nails therefrom through said holes, as and for the purposes specified.

2. The combination of a nail-strip-feeding device comprising one or more feed-rolls, having spur-teeth adapted to engage projections



388,911.

upon the side of a nail-carrying strip, and means for rotating it or them, a plate or roll for holding a nail-strip in the feedway and in contact with the teeth of the feed roll or rolls, a block or plate, B, having holes *b* of the same arrangement as the pockets or holders of the nail-carrying strip, and a reciprocating gang or group of ejectors, substantially as described.

3. The combination of the reciprocating gang of ejectors C, the delivery-reel A, the feed-rolls *a a'*, having spur-teeth a^2, the feedway a^4, the pressure-roll a^7, the block B, having the holes *b*, the tubes *b'*, having the distributing-passages b^2, the gear a^3, and the ratchet-wheel carried thereby, and lever *d*, having a pawl to engage the ratchet, as and for the purposes described.

388,912. SCALE-BEAM. WILLIAM W. REYNOLDS, Rutland, Vt. Filed July 27, 1887. Serial No. 245,401. (No model.)

Claim.—1. The combination, with the beam A, extending to the rear of the fulcrum-pivots, and the sliding poise C, supported upon said beam and arranged to move to the rear of said pivots, of the revolving bar B, arranged adjacent to the beam, and having a plurality of graduations and extending from the front end of the beam to the rear of the fulcrum-pivots, substantially as described.

2. The combination, with the beam A, carrying the sliding poise, of the revolving bar B, composed of a plurality of notched blades, 5, and a plurality of plates, 6, each having a graduation, and the sliding poise C, resting and sliding upon the beam A, and having a catch to engage with the notches upon the blades 5, substantially as described.

3. The combination, with the beam A, composed of the two parallel bars rigidly connected together and provided upon their outsides with the fulcrum and load pivots, of the revolving bar B, journaled between said parallel bars and extending from the front end of the beam between and to the rear of the fulcrum-pivots, and having a plurality of graduations, *f*, and the sliding poise supported upon said parallel bars and arranged to be moved to the rear of the fulcrum-pivots, substantially as described.

4. The combination, with the beam A, composed of the two parallel bars rigidly connected together and provided upon their outsides with the fulcrum-pivots *b* and load-pivots *c*, of the revolving bar having a plurality of blades, 5, of hard metal, and plates 6, of soft metal, and extending between and past the fulcrum-pivots to the rear thereof, and the poise C, arranged to slide upon the parallel bars of the beam A, and having an opening for the passage of the revolving bar B, substantially as described.

388,913. RHEOSTAT. E. WILBUR RICE, Jr., LYNN, Mass. Filed Feb. 4, 1888. Serial No. 262,962. (No model.)

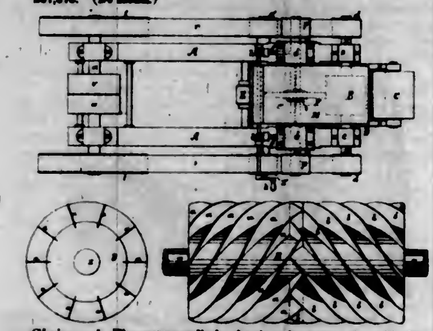
Claim.—1. In an electric resistance-frame, the combination of a series of conducting pins or studs projecting inward from a suitable support and cast in one piece with contact-plates C, arranged upon the outer face of the support, a second set arranged parallel with the first, and electric resistance strips or pieces supported by said studs and bridging the space between the sets.

2. In an electric resistance-frame, the combination of a series of conducting pins or studs projecting inwardly from a suitably-supported plate, a second set of pins arranged parallel with the first, but insulated therefrom, a continuous resistance strip or wire strung upon the two sets of studs and bridging the space between the two sets, and a series of switch-contacts cast in one piece with the conducting-pins and arranged upon the outer face of the support, as and for the purpose described.

3. In a rheostat, the combination, with two sets of pins or studs arranged in circles one within the other, of a set of contacts connected with the pins of one set, a contact-arm or circuit-closer adapted to move over the same, and an electric resistance wound upon the two sets of pins and in electric connection with the pins connected with the contacts, as and for the purpose described.

4. In an electric resistance-frame, the combination of two sets of pins or studs projecting from the same side of a suitable support and arranged in circles, one set of pins being of conducting material and electrically disconnected from the other set excepting by the conductor forming the electric resistance, and a set of contacts connected with the conducting pins or studs.

5. The combination, with a base-plate, of a disk-plate or annulus supported thereon and having a series of pins or studs projecting from its under surface toward the base-plate, a second plate of insulating material carrying a series of conducting pins or studs, also projecting toward the base-plate, a series of contacts mounted on the insulating-plate and electrically connected with the conducting pins or studs, and an electric resistance supported between the pins of the two series, as and for the purpose described.



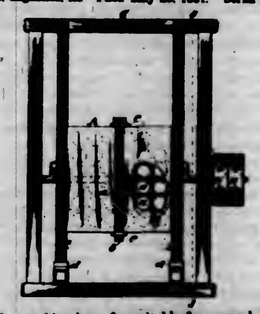
6. An electric resistance-frame consisting, essentially, of a base-plate, a superposed supporting table or plate separated from the first by a free air-space, two sets of pins projecting into said space at right angles to the base, one set being of conducting material, a series of contacts mounted on the face of the table or outer plate and severally connected with the pins of conducting material, and an electric resistance supported by the two sets of pins and bridging the space between the two sets.

7. In an electric resistance-frame, a series of contact-blocks, C, mounted on an insulating board or plate, B, and having pins or studs L formed integral with them and projecting through said board into the space between the latter and the base-plate, as and for the purpose described.

8. In an electric resistance-frame, the combination of a base-plate, a superposed disk or plate, I, having a series of pins projecting inward from it and cast integral with it, a board or plate of insulating material, B, carrying contact blocks and studs L of conducting material projecting inward toward the base-board, and a continuous electric conductor wound to and fro upon the two sets of pins and across the space between the sets, as and for the purpose described.

9. The combination, with a suitable base-board, of a disk or annulus, I, of iron, having a series of pins, P, projecting downward from the same, a plate of insulating material supported over an opening in the center of the plate I and carrying a series of conducting pins or studs projecting inward from it and electrically connected with blocks or studs mounted on the base of the plate, and an electric conductor strung across the space between the two sets of pins, as and for the purpose described.

388,914. MACHINE FOR SHAVING HIDES OR SKINS. JOHN ROSS and IRA VANDAM, Salem, Mass. Filed Mar. 19, 1888. Serial No. 267,673. (No model.)



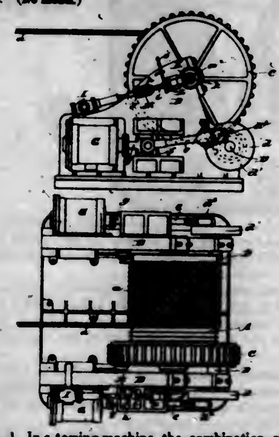
Claim.—1. The cutter-cylinder having the two series of knives arranged as described, in combination with the pressure-roller and the sharpening-wheel, arranged substantially as set forth.

2. The cutter-cylinder having the two series of knives, as described, arranged in a spiral direction on the external surface of said cylinder, the direction of each series being opposite to that of the other series and extending a short distance beyond the middle of the cylinder, longitudinally thereof, in combination with the pressure-roller and sharpening-wheel, arranged and provided with mechanism, substantially as explained, for operating such cylinder, roller, and wheel, as set forth.

3. The cutter-cylinder having the two series of knives, as described, arranged in a spiral direction on the external surface of said cylinder, the direction of each series being opposite to or the reverse of that of the other series, and the knives of each series extending from one end of the cylinder to and beyond the middle of such cylinder longitudinally thereof until they abut each against the other, substantially as shown and described.

388,915. MACHINE FOR LIQUIDISING CONDENSED MILK. GEORGE ROTH, Highland, Ill. Filed May 23, 1887. Serial No. 239,132. (No model.)

Claim.—The combination of a suitable frame-work, G, springs which are suspended therefrom and which have rigid pieces secured to their lower ends, the partitioned box A, which is secured to the springs, suitable stops upon the frame-work, the pitmen, and the operating crank-shaft, substantially as specified.



388,916. COFFEE-FILTER. CHARLES A. SHAW, Boston, Mass., and LEVI W. BENTON, Hudson, N. H.; said Shaw assignor to said Benton and ISAIAH ROBBINS, Jr., Hudson, N. H. Filed Nov. 10, 1887. Serial No. 254,777. (No model.)

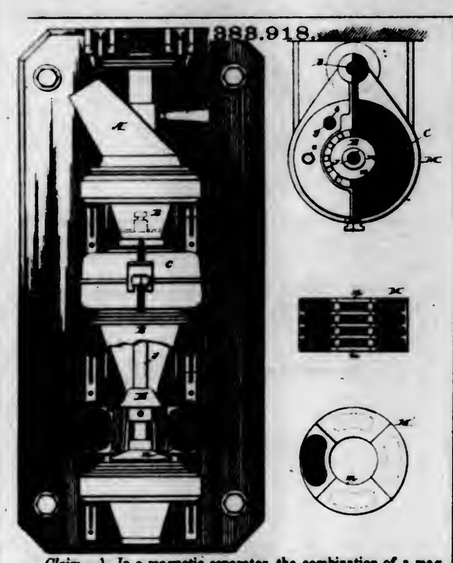
Claim.—The combination of a body provided with bail-tubes on its opposite sides, a bail extending through said tubes in frictional contact therewith, and provided with stops at its lower end for engaging

when in raised position, the lower ends of said tubes, said bail being bent inward above said tubes, forming shoulders which abut over the edges of the cover for holding it in closed position, substantially as described.

388,917. TOWING-MACHINE. T. JACKSON SHAW, Wilmington, Del., and JOHN M. STEDDLE, Philadelphia, Pa., assignors to the Boston Tow Boat Company, Boston, Mass. Filed Feb. 21, 1888. Serial No. 264,893. (No model.)

Claim.—1. In a towing-machine, the combination, with a cable-drum, of an engine the shaft of which is geared to said drum to balance the load on the cable, and a pressure-regulating valve located in the steam-passage to the engine cylinder or cylinders and operatively connected with the shaft of said drum, whereby the pressure of the engine cylinder or cylinders is increased as increased strain on the cable causes the latter to be paid out and is diminished as the strain on the cable is lessened and the latter is hauled in, substantially as set forth.

2. In a towing-machine, the combination, with a cable-drum, of an engine the shaft of which is geared to said drum, a pressure-regulating valve located in the steam-passage to the engine, a screw spindle or shaft geared to the shaft of said drum and serving to operate said valve, and stops for arresting the movements of said spindle and thereby regulating the pressure governed by the said valve within certain fixed limits, substantially as set forth.



3. In a towing-machine, the combination, with a cable-drum, an engine, and a pressure-regulating valve, of a screw shaft or spindle for the said valve, geared to the drum-shaft and formed in two parts, and a friction-clutch for connecting the said parts, substantially as set forth.

4. In a towing-machine, the combination, with a cable-drum, an engine, and a pressure-regulating valve, of a screw shaft or spindle for the said valve, and which is geared to the drum-shaft and formed in two parts, a friction-clutch for connecting the parts of the said shaft, and stops for limiting the rotary movements of one part of the said shaft while the other part thereof having the positive member of the said clutch may still turn, substantially as set forth.

5. In a towing-machine, the combination, with a cable-drum and an engine the shaft of which is geared to the said drum, of the pressure-regulating valve I, connected with the engine cylinder or cylinders, the screw shaft or spindle J, formed in two parts and having the gear K, a clutch for connecting the parts of the said spindle, the gear *k* on the drum shaft, the collar A, fixed to the said spindle and having the pin or projection *k'*, and the bracket M, having the screws *m*, substantially as set forth.

388,918. MAGNETIC SEPARATOR. MICHAEL H. SMITH, Halifax, County of York, England. Filed Oct. 20, 1887. Serial No. 252,703. (No model.) Patented in England Aug. 9, 1887, No. 10,869.

888,918.

Claim.—1. In a magnetic separator, the combination of a magnetic ring, and a rotating cone whereby the material to be separated is distributed by centrifugal force against the surface of the ring, substantially as described.

2. In a magnetic separator, the combination of a magnetic ring having internal projections of opposite polarity, and a rotating cone arranged to distribute the material to be separated by centrifugal force against the magnetic projections of the ring, substantially as described.

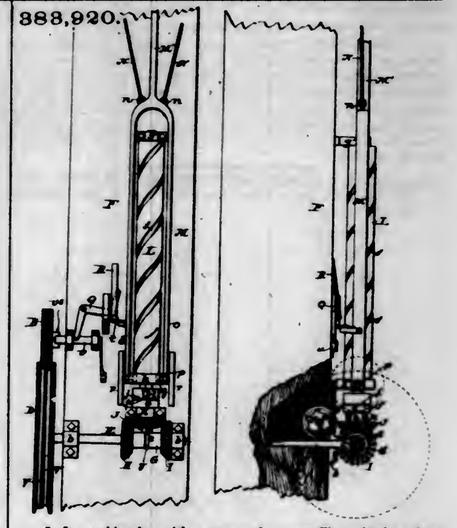
3. In a magnetic separator, the combination of a stationary magnetic ring, and an inclosing-case for said ring, said case being formed in two parts, whereby the case may be easily opened, as and for the purpose set forth.

4. In a magnetic separator, the combination of a stationary magnetic ring, a case inclosing the same, a conical hopper leading to the case, a shaft, and a rotating cone adjustably mounted on said shaft, substantially as described.

5. In a magnetic separator, the combination of a magnetic ring made in two parts, each part secured in one portion of a separable case, whereby the case may be opened to expose the internal projections on the ring, substantially as described.

6. In a magnetic separator, the combination of a case made in two parts, each part inclosing one portion of a magnetic ring, electrical connections for said ring, consisting in part of a spring adapted to bear upon a bracket, the arrangement being such that when the case is open the electric circuit is broken, and when the case is closed the circuit is established by the spring, substantially as described.

888,919. **INSULATED WIRE.** HENRY SPLITDORF, New York, N. Y., assignor to the Splitdorf Wire Company, same place. Filed Nov. 12, 1887. Serial No. 255,013. (No model.)



Claim.—A wire for electrical and other purposes covered with asbestus fibers applied in the form of an untwisted spread and flattened thread, substantially as herein shown and described.

388,920. **GATE.** PATTERSON STEELE, Fayette County, Ky. Filed Nov. 26, 1887. Serial No. 256,127. (No model.)

Claim.—1. In combination, with a longitudinally-movable gate and a wheel or drum for propelling the gate, a helically-grooved drum or cylinder geared to the propelling wheel or drum, and a yoke movable lengthwise of the grooved drum or cylinder and provided with lugs or projections to enter the grooves thereof, whereby a longitudinal movement of the yoke is caused to impart rotary motion to the grooved cylinder and to the propelling-wheel.

388,920.

2. In combination with a gate and a propelling wheel or drum therefor, a post, a helically-grooved cylinder geared to the propelling-wheel extending parallel with the face of said post and journaled in bearings, and a yoke provided with rollers to bear and travel upon the face of the post, and with projections to enter the grooves of the cylinder, whereby the yoke is prevented from turning or twisting laterally, but is caused to impart rotation to the cylinder when moved relatively thereto.

3. The combination, substantially as set forth, of a longitudinally-movable gate, a propelling wheel or drum therefor, a sleeve encircling said shaft free to move longitudinally thereon, but incapable of rotating independently of the shaft, two gears carried by said sleeve, a second shaft or cylinder at right angles to the first and provided with helical grooves, a gear-wheel carried by said second shaft or cylinder, a yoke provided with lugs or projections to enter the grooves of the shaft and impart rotation to the latter, and a shifting-lever connected with the sleeve and actuated through the movements of the yoke to move the sleeve and bring one or another of its gears into mesh with that of the grooved shaft or cylinder.

4. In combination with a longitudinally-movable gate, a propelling wheel or drum therefor, a shaft carrying said drum, a sleeve encircling said shaft and movable endwise thereon, two gears carried by said sleeve, a helically-grooved cylinder at right angles to the propelling-wheel shaft, a gear carried thereby, a yoke movable lengthwise of the grooved cylinder and having projections extending into the grooves thereof, a shifting-lever in engagement with the sliding sleeve, a cam-wheel serving to move the shifting-lever alternately in reverse directions and provided with ratchet-teeth, and a dog or pawl carried by the yoke and serving to engage said teeth and to turn the cam-wheel when the yoke is moved.

5. The combination, substantially as set forth, of a longitudinally-movable gate, a propelling-wheel and shaft therefor, a sleeve encircling said shaft and provided with two gears, a helically-grooved cylinder, a gear to mesh alternately with those of the sleeve connected with the cylinder, substantially as shown and described, whereby it is caused to turn with the cylinder in one direction only, a shifting-lever in engagement with the sleeve, a cam-wheel serving to actuate the shifting-lever and provided with ratchet-teeth, a yoke movable lengthwise of the grooved cylinder and provided with lugs or projections to enter the grooves thereof, and a dog or pawl carried by said yoke and adapted to engage with the ratchet-teeth of the cam-wheel and to rotate said wheel.

6. In combination with a gate, a propelling-wheel and its shaft, a sleeve carried by said shaft and movable longitudinally thereon, gear-wheels carried by said sleeve, a helically-grooved cylinder, a gear-wheel loosely mounted upon said cylinder and provided with a toothed hub, a toothed collar loosely encircling the cylinder directly above said toothed hub and adapted to move a limited distance independently of the cylinder, a shifting-lever connected with the sliding sleeve, a cam-wheel serving to move the shifting-lever and provided with ratchet-teeth, a yoke movable lengthwise of the cylinder and having projections to enter the grooves thereof, and a dog carried by said yoke and

adapted to engage with the teeth of the cam-wheel, all substantially as set forth, whereby each movement of the yoke is caused to shift the sleeve and its gear-wheels and to rotate the shaft, the rotation being alternately in opposite directions.

7. In combination with a sliding gate, a propelling shaft and wheel, a helically-grooved cylinder, a yoke for rotating said cylinder, and gearing connecting the cylinder and the propelling-shaft, a latch adapted to engage with the gate, and a trip or arm projecting from the yoke and serving to engage with and withdraw the latch as the yoke is lifted.

8. In combination with a sliding gate, a vertically-movable yoke or bar, and intermediate gearing, substantially such as shown and described, for transmitting motion from the yoke or bar to the gate, a latch adapted to engage with the gate when the latter is closed, a trip carried by the yoke or bar and adapted to engage with the latch and to withdraw the same as the yoke or bar is lifted, and a guard extending over the latch, and serving to deflect the trip and to prevent its engagement with the latch as the yoke descends.

9. The combination, substantially as set forth, of sliding gate A, propelling-wheel D, shaft E, carried in bearings secured to a post, F, sliding sleeve G, provided with gears H I, shifting-lever U, toothed cam-wheel S S', helically-grooved cylinder L, gear J, loosely encircling said cylinder and provided with teeth *j'*, clutch-hub *i*, provided with teeth *j* and opening *l*, pin *k*, projecting from the grooved cylinder into said opening, a yoke, M, having projections extending into the grooves of the cylinder, and a dog, *y*, carried by said yoke and serving to rotate the cam-wheel.

10. In combination with a sliding gate, A, and propelling-shaft therefor, E, a cylinder or shaft, L, a yoke or bar, and hand-levers for imparting rotary motion to the cylinder L, and reversible gearing interposed between the propelling-shaft E and the cylinder L, whereby the latter may be rotated in either direction by the former without changing the direction of rotation of the cylinder L.

11. In combination with a gate, a propelling-shaft, E, suitably connected therewith, a grooved cylinder, L, a yoke, M, having projections to enter the grooves of said cylinder, a toothed collar, *i*, loosely encircling said cylinder and provided with a hole or recess, a pin extending from the cylinder into said hole or recess, pinion J, loosely encircling cylinder L and provided with teeth to engage with those of collar *i*, and reversing-gear connecting shaft E and pinion J.

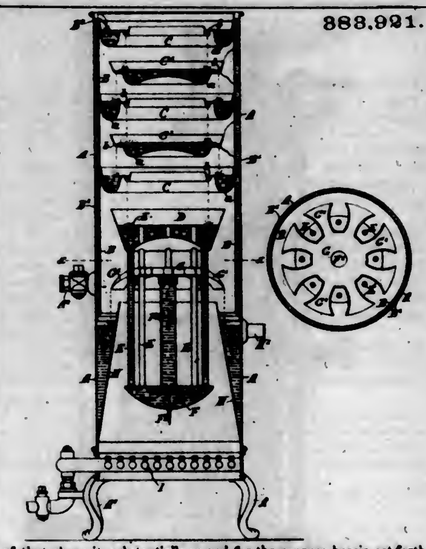
12. In combination with the propelling-shaft of a sliding gate such as described, a shaft or cylinder at right angles thereto, means, substantially such as described and shown, for rotating said cylinder, and reversing-gear forming a connection between the shaft and cylinder, whereby the shaft may be rotated alternately in opposite directions by a continuous rotation of the cylinder in one direction.

13. In combination with shaft E, sleeve G, encircling shaft E, gears H I, carried by said shaft, cylinder L, pinion J, and clutch-collar *i*, carried by said cylinder, shifting-lever U, cam and ratchet wheel S S', yoke M, and dog *y*, carried by said yoke and serving to rotate wheel S S'.

14. In combination with gate A and latch *v*, yoke or bar M, provided with yielding trip *t*, lever Q, extending from latch *v* into the path of *trip t*, and yielding guard R, extending over the rear end of lever Q, all substantially as shown and described.

15. In combination with a sliding gate, a propelling-shaft therefor, a helically-grooved cylinder connected by gearing with said shaft, a yoke having projections to enter the grooves of the cylinder, and a tail or extension, and rollers on opposite sides of said tail or extension to guide the same, substantially as set forth.

16. The combination, substantially as set forth, of a gate, A, a propelling-wheel and shaft therefor, a helically-grooved cylinder, gearing connecting the shaft and the cylinder, a yoke having projections to enter the grooves of the cylinder, rollers carried by said yoke and arranged to travel upon a fixed bearing-surface, and levers connected with and serving to move the yoke.



17. In combination with gate A, pivoted latch-bar or dog v^2, and an operating-lever connected therewith, a locking-bolt connected with the actuating mechanism of the gate and adapted to pass into the path of the bar or dog *v*.

388,921. **APPARATUS FOR HEATING WATER AND OTHER LIQUIDS.** WILLIAM T. SUGG, Westminster, England. Filed Feb. 21, 1887. Serial No. 228,273. (No model.)

Claim.—1. In an apparatus for heating water or other liquid, a tray containing both a reservoir and a perforated overflow-trough approximately concentric with each other, substantially as herein described.

2. In an apparatus for heating water or other liquid, the combination, with a cylinder or casing and a burner or heating device at the base thereof, of a series of trays arranged one above another and each containing a reservoir and a perforated overflow-trough, the said reservoirs and overflow-troughs being relatively arranged with the reservoirs of one tray directly under the perforated overflow-trough

388,921.

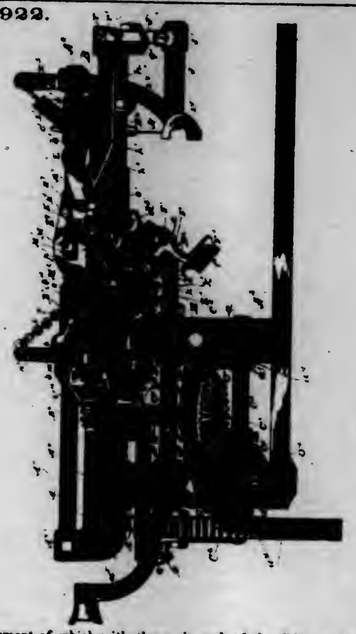
of that above it, substantially as and for the purpose herein set forth.

3. In an apparatus for heating water, the combination, with a cylinder or casing and a burner or heating device at the base thereof, of a series of alternating larger and smaller trays, C and C', the larger tray, C, fitting the cylinder or casing and having a central opening, and the smaller tray, C', having no opening, and each containing a reservoir, *a*, and a perforated overflow-trough, *b*, the trough *b* of each being directly over the reservoir *a* of the one below, substantially as herein described.

4. The combination, with a casing, A, and lining H, forming an open annular water-chamber and a burner or heating device at the bottom thereof, of a boiler, F, arranged above said burner, a tube, F', ascending from said boiler, and a tray or ledge, G, arranged on the top of said pipe and having overflow-spouts situated above said open annular water-chamber, substantially as herein described.

5. The combination, with the open annular water-chamber A H and a burner at or near the bottom thereof, of the boiler F, arranged above the burner, a water pan or vessel, D, above the boiler, communicating overflow-pipes E between the said vessel D and the boiler, an ascending pipe, F, connected with the boiler, and a tray or ledge, G, arranged at the top of said ascending pipe and provided with overflow-troughs over the said water-chamber, substantially as herein set forth.

6. The combination of a casing, A, having within its upper part a reservoir, B', with an overflow, B^3, and having in its lower part a water-chamber, A H, and a burner or heating device at the base of said casing, of the series of trays C C', comprising reservoirs *a a*, and perforated overflow-troughs *b b*, constructed and arranged as described, a pan, D, for receiving water from said trays, a boiler, F, and pipes E, connecting it with said pan, an ascending pipe, F, having its lower end in communication with the boiler, and having at its upper end a tray or ledge, G, with spouts G' arranged over the water-chamber A H, all substantially as herein set forth.



388,922. **APPLE PARING, CORING, AND SLICING MACHINE.** BYRON D. TABER, Wilson, N. Y. Filed Aug. 27, 1887. Serial No. 248,090. (Model.)

Claim.—1. In an apple-paring machine, the combination, with a frame, and a sliding table having a rack mounted thereon, of a main gear-shaft, a swinging bracket mounted thereon, a gear-shaft adapted to rotate in this bracket, and thereby reciprocate the sliding table and paring devices, substantially as set forth.

2. In an apple-paring machine, the combination, with a main frame, and a sliding table having a rack mounted thereon, of a main gear-shaft, a swinging bracket mounted thereon, a gear-shaft adapted to rotate in this bracket to move the sliding table in one direction, a spring or similar means for returning the sliding table to its normal position, and paring devices, substantially as set forth.

3. In an apple-paring machine, the combination, with a main frame and a sliding table mounted thereon, said table having rack-teeth thereon, of a main gear-shaft, a swinging bracket mounted thereon, a shaft journaled in this bracket and provided with a pinion

883,922.

the engagement of which with the rack-teeth of the sliding table is adapted to operate the latter in one direction, a spring for holding the pinion normally in engagement with these rack-teeth, devices for removing the pinion from these teeth, and paring mechanism, substantially as set forth.

4. In a paring-machine, the combination, with a main frame and a sliding table having rack-teeth mounted thereon, of a main driving-shaft, a swinging bracket mounted thereon, said bracket having a shaft journaled therein, gear-wheels for communicating motion from one shaft to the other, a pinion on one shaft adapted to mesh with the rack-teeth, a spring for normally holding said pinion in engagement with said teeth, a cam for removing the pinion from the rack-teeth during the backward movement of the sliding table, and paring mechanism, substantially as set forth.

5. In an apple-paring machine, the combination, with a main frame and a main driving-shaft journaled therein, of a swinging bracket mounted on this main shaft, said bracket having an upwardly-projecting arm and a shaft journaled in the swinging bracket, of a sliding table mounted on the frame, said table having rack-teeth thereon adapted to mesh with a pinion on the shaft in the swinging bracket, a switch-bar removably secured to the carriage, said bar having a bearing-pad adapted to engage the end of the upwardly-projecting arm of the swinging bracket, and paring devices, substantially as set forth.

6. In an apple-paring machine, the combination, with a main frame, a forked spindle journaled therein, and gearing for communicating motion to said spindle, of a sliding table mounted on the frame, a coring-tube carried by the table, an apple-remover depending from the frame in position to abut against the apple when the machine assumes its normal position, a device for adjusting said apple-remover, and a spring or equivalent means for returning the table to its normal position, substantially as set forth.

7. In an apple-paring machine, the combination, with a main frame and a sliding table mounted thereon, said table carrying a coring-tube, of an apple-remover depending from the frame and in a position relative to the coring-tube to remove an apple from the latter when the machine assumes its normal position, a device for adjusting said apple-remover, and a spring or similar means for returning this table to its normal position, substantially as set forth.

8. In an apple-parer, the combination, with a frame, of a depending apple-remover and a device for adjusting said apple-remover, substantially as set forth.

9. In an apple-parer, the combination, with a frame and a sliding table mounted thereon, of a coring-tube, said tube being removably secured to the table, and adjusting-screws, whereby the tube may be moved laterally, substantially as set forth.

10. In an apple-coring machine, the combination, with a frame and a sliding table, of an arm pivoted to one end of the table, said arm being forked at one end and provided with screws adapted to impinge against the end of the table to thereby laterally adjust the arm, and a coring-tube removably secured in the arm, substantially as set forth.

11. A coring device consisting, essentially, of a tube and an arm in which this tube is removably secured, said arm having adjusting-screws, whereby it is laterally shifted, substantially as set forth.

12. In an apple-paring machine, the combination, with a frame and a sliding table mounted thereon, of a coring-tube extending from the latter, an apple-remover depending from one end of the frame and provided at its lower end with a loop in position to allow the coring-tube to pass through it, and a device for adjusting said apple-remover, substantially as set forth.

13. In an apple-parer, the combination, with a main frame and a guide-rod extending the length of the latter, of a sliding table mounted on this guide-rod, said table having rack-teeth thereon, paring mechanism connected with the main frame and operated by the sliding table, a swinging bracket, a shaft journaled in this bracket and provided with a pinion adapted to mesh with the rack-teeth on the sliding table, and a spring and cams for varying the lateral position of the swinging bracket, substantially as set forth.

14. In an apple-parer, the combination, with a main frame, a guide-rod secured thereto, a sliding table mounted on said rod, this table having rack-teeth, a cam-plate thereon, a coring-tube at one end, and a main driving-shaft journaled in the frame, of a swinging bracket mounted on the driving-shaft, a shaft journaled therein, said shaft having a pinion on one end adapted to mesh with the teeth on the sliding table, a spring for normally holding the pinion in meshed contact with the rack-teeth, a switch-bar loosely secured to the sliding table, this switch-bar having cams thereon, a paring-knife, and mechanism for operating said knife by the passage of the switch-bar in contact therewith, substantially as set forth.

15. In an apple-parer, the combination, with a main frame, a guide-rod secured thereto, and a sliding table mounted on this rod, said table having an upwardly-projecting arm rigidly secured thereto, of an apple-remover adjustably secured on the guide-rod and having an arm projecting therefrom, and a spring yieldingly connecting said arm with the arm projecting from the sliding table, substantially as set forth.

16. In an apple-parer, the combination, with a sliding table, of an apple-slicing knife pivoted to the table, and lugs by which the knife is automatically locked in position, substantially as set forth.

17. In an apple-parer, the combination, with the main frame, a sliding table, and paring mechanism, of a removable switch-bar composed of an elongated bar of metal having arm M, finger M', arm K, ear n, lug n^2, depending arm n', and bearing-pad 8, substantially as set forth.

18. In an apple-parer, the combination, with the main frame, a sliding table, and paring mechanism, of a removable switch-bar composed of an elongated bar of metal having arm M, finger M', arm K, ear n, lug n^2, depending arm n', and bearing-pad 8, cams L (7' 6, and shoulder 7, substantially as set forth.

19. In an apple-parer, the combination, with a sliding table having arm n^2, offset x, and notch o, and a paring mechanism, a removable switch-bar having a depending arm, K, laterally-extended lug n^2, and depending arm n', for the purpose substantially as set forth.

20. In an apple-parer, the combination, with a sliding table having rack-teeth, cam A A^2, arm n^2, offset x, and notch o, and a paring mechanism, of a removable switch-bar having a depending arm, K, laterally-extended lug n^2, and depending arm n', for the purpose substantially as set forth.

21. In an apple-parer, the combination, with a frame and a shaft-box supported thereon, of a rocking-table frame supported in said box, a turn-table pivoted in the rocking-table frame, connected gearing for turning said table, and paring mechanism yieldingly supported in the turn-table, substantially as set forth.

22. In an apple-parer, the combination, with a main frame and a shaft-box supported thereon, of a rocking-table frame supported in said box, a turn-table pivoted in the rocking-table frame, connected gearing for turning said table, paring mechanism yieldingly supported on the turn-table, and an arm adjustably secured to said rocking-table frame, whereby the inclination of the latter is regulated, substantially as set forth.

23. In an apple-parer, the combination, with a main frame, a rocking-table frame supported thereby, and a toothed segment pivoted to the table-frame, of a turn-table pivoted also to the rocking-table frame in position to be turned by the toothed segment, substantially as set forth.

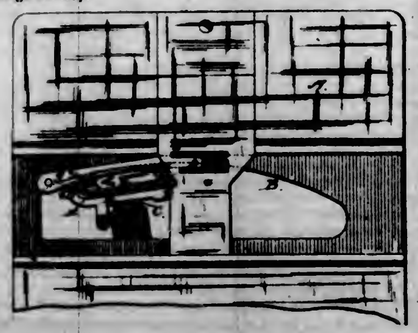
24. In an apple-parer, the combination, with a main frame, a rocking-table frame supported thereby, and a toothed segment, of a turn-table, also pivoted to the rocking table and provided with a toothed arc adapted to mesh with the teeth of the segment, whereby the turn-table may be turned, and a knife-stock pivoted to this turn-table, substantially as set forth.

25. In an apple-parer, the combination, with a main frame, a rocking-table frame supported thereby, and a toothed segment pivoted in said frame, of a turn-table having a toothed arc thereon which meshes with the teeth of the segment, a paring-knife stock pivotally and yieldingly supported on the turn-table, and cam mechanism for operating the paring mechanism, substantially as set forth.

26. In an apple-parer, the combination, with a main frame and a sliding table, the latter having an elongated cam-flange thereon, of a rocking-table frame supported by the main frame, a toothed segment pivoted on said frame, a turn-table having a toothed arc thereon which meshes with the teeth of the segment, a paring-knife stock pivotally and yieldingly supported on the turn-table, and an arm, F', secured to the rocking-table frame and in position to be moved by the cam-flange on the sliding table, substantially as set forth.

27. In an apple-parer, the combination, with a main frame, a sliding table mounted thereon, the latter having an elongated cam-flange on its side, and a movable switch-bar having arms and cams thereon, of a rocking-table frame supported by the main frame, a toothed segment pivoted on said frame, this segment having a toe adapted to be engaged by an arm on the switch-bar for turning the segment, a turn-table having a toothed arc thereon which meshes with the teeth of the segment, a paring-knife stock pivotally and yieldingly supported on the turn-table, an arm, F', adjustably secured to the rocking-table frame and provided with a notch which receives the cam-flange on the sliding table, and a cam on the switch-bar, whereby the rocking-table frame is rocked, substantially as set forth.

28. In an apple-parer, the combination, with a main frame, a rocking-table frame supported by the main frame, said frame having the incline K^4, a toothed segment pivoted on this rocking frame, and a turn-table carrying a yieldingly-pivoted knife-stock, said turn-table being operated by the segment, of a spring-actuated latch-bar pivoted to the rocking table and provided with a hook adapted to travel up the incline K^4 and be engaged by the shoulder formed at the upper end of this incline, substantially as set forth.



29. In an apple-parer, the combination, with a main frame, a sliding table mounted thereon, this table having an elongated cam-flange, and a removable switch-bar having projecting arms and cams thereon, of a rocking-table frame pivotally supported on the main frame, a toothed segment pivoted on this rocking frame, a spring-actuated latch pivoted to the segment and provided with a hook adapted to ride over an incline on the rocking-table frame and be engaged there, a turn-table pivoted in the rocking frame, and an arm adjustably secured to the rocking table, all these parts being operated, engaged, and disengaged periodically by the contact of arms and cams on the sliding table and switch-bar, with projections on the segment, the spring-actuated latch, and the rocking table, substantially as set forth.

30. In an apple-parer, the combination, with a main frame, a sliding table, said table having a laterally-projecting arm, a hollow forked spindle journaled in the main frame, and a core-ejector therein, of a pusher-bar having a hook adapted to be caught by the laterally-projecting arm of the sliding table when the latter is assuming its normal position, thereby driving the core-ejector forward through the forked hollow spindle, and a lug for automatically disconnecting the hook of the pusher-bar from the arm on the sliding table, substantially as set forth.

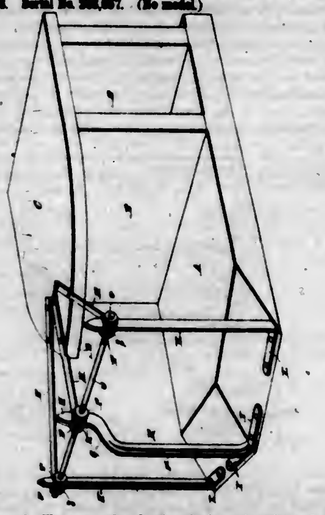
883,923. WITHDRAWN.

883,924. SEWING-MACHINE. CHARLES R. TYRRELL, Chicago, Ill. Filed Aug. 30, 1886. Renewed Dec. 28, 1887. Serial No. 259,276. (No model.)

Brief.—The guard g, which slightly overlaps the shuttle-race and is provided with an eye and groove in which the thread lies, prevents the raising of the shuttle by the thread while the nose is passing through the loop.

883,924.

Claim.—1. In a sewing-machine having slide-plates, the combination, with a bed-plate, a shuttle, and a shuttle-race, of a curved guard between said shuttle and one of the slide-plates, said guard having an eye, A, for the passage of the needle, substantially as described.



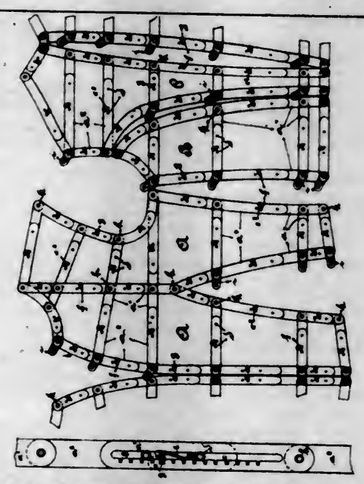
2. In a sewing-machine, the combination, with a shuttle and shuttle-race, of a shuttle-guard, g, located in close proximity to the top of said shuttle, having an eye, A, for the needle, and a groove, l, within which the thread loosely lies during the passage of the loop, substantially as and for the purpose described.

3. The combination, with an eye-pointed needle and means for reciprocating the same, of a shuttle having upon the flattened surface upon its outside, near the nose thereof, a depression or groove inclining upward and backward from a point near its lower front portion, and means for reciprocating said shuttle, whereby the eye of said needle during its upward movement follows the line of the groove, substantially as described.

4. In a sewing-machine, the shuttle having notches in its heel and a slot connecting one of said notches with the thread-guide, in combination with a bobbin having a disk or plate provided with lugs fitting the said notches, substantially as herein described.

5. In a sewing-machine, a shuttle having a notched heel, in combination with a bobbin having a disk or plate loosely mounted on its spindle permanently attached thereto and provided with lugs fitting the notches in the heel of the shuttle, substantially as herein described.

883,925. SNOW-PLOW. JOHN VERNER, Houlton, Me. Filed Feb. 4, 1888. Serial No. 263,057. (No model.)

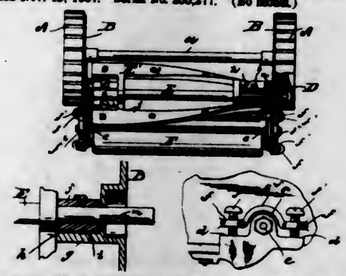


Claim.—1. The snow-plow having the base A and top C, in combination with the vertical cutters secured to the sides and center of the base at the front end thereof, the bolt-rod extending through and connecting the upper ends of said cutters, and the brace-rods secured to the top and to the upper end of the cutters to prevent the same from moving laterally, substantially as described.

2. The combination, in a snow-plow, of the base A, the top C, the vertical cutters secured to the sides and center of the base at the front end thereof, the brace-rod B, projecting forward from the center of the top, and having the ears N, bearing on opposite sides of the upper end of the central cutter, the diagonal brace-rods R, secured to the top C and having ears at their front ends bearing against the outer sides of the upper ends of the side cutters, and the bolt-rod arranged transversely and extending through aligned openings in the upper ends of the cutters and in the ears of the brace-rods, said bolt-rods having the clamping-nuts, for the purpose set forth, substantially as described.

883,926. ADJUSTABLE DEVICE FOR OUTLINING PATTERNS FOR GARMENTS. ARTUR WAGNER, Berlin, Germany. Filed Nov. 7, 1887. Serial No. 254,512. (No model.)

Claim.—1. In an apparatus for pattern-making, consisting of a number of jointed bars to fit the human figure, the combination of a series of flat bars, c' and c^2, sliding over each other and having longi-



388,926.

tudinal slots *b* and communicating transverse slots *c* formed therein, with springs *e*, attached to the bars a^2 and provided with hooks e^2, which enter said cross-slots to hold said bars a' a^2 in any position to which they may be adjusted, substantially as set forth.

2. In combination with a series of flat bars, a', and another series of flat bars, a^2, movable over each other and provided with longitudinal and transverse slots, as described, a series of springs attached to the bars of one series and provided with hooks for engaging with the transverse slots of the other series, and eccentrics *g*, arranged on bands a^2 near the respective springs for operating them, substantially as set forth.

388,927. LAWN-MOWER. FRANK M. WATERS, Springfield, Ohio. Filed Nov. 15, 1887. Serial No. 255,277. (No model.)

Claim.—1. The combination, with the end pieces, of the stationary cutter having upwardly-extending ears, with bearing-faces on either side thereof, projecting lugs on said end pieces provided with adjusting-screws adapted to bear against said faces, a connecting-bolt passing through said end pieces and ears, and a shield or cap connecting said lugs and forming a hood or covering for ears, substantially as set forth.

2. In a lawn-mower, the end pieces, each having an inwardly-projecting bearing-support with a V-shaped depression therein, the cutting-reel and its shaft, a loose bearing-block seated in said bearing-support, the inside of which is adapted to conform to said shaft and the outside to the V-shaped depression, said bearing-block being tapered from the middle toward both ends, as set forth, and provided with a cap secured to said bearing-support, substantially as set forth.

3. The combination, with the end pieces, each having an inwardly-projecting bearing-support with the V-shaped depression therein, the tapered bearing-block adapted to rest in said V-shaped depression, and a cap over said bearing-block, of a cutting-reel, the shaft of which is journaled in said bearing-block, the stationary cutter under said reel secured at each end to said end piece, and a connecting-rod connecting said end pieces, substantially as specified.

4. The combination, with the reel-shaft, of a driving-pinion having a clutching-ring secured to and adapted to turn therewith, said ring being adapted to encircle the shaft, and having a projection on the inner face thereof adapted to engage the said shaft when turned in one direction and to turn freely thereon when turned in the opposite direction, and formed with a preponderance of weight on the side opposite to the said projection, substantially as specified.

5. In a driving-clutch, the shaft-encircling clutching-ring constructed with a driving-offset on its inner face and an engaging projection on its outer periphery, substantially as and for the purpose set forth.

6. In a driving-clutch, a shaft-encircling clutching-ring with a driving-offset on its inner face and an engaging projection on its outer periphery, and having a preponderance of weight upon the side opposite to the inside offset, substantially as set forth.

7. In a clutch, the combination, with a shaft, of an inclosing-rim provided with a slot or opening therein, and a clutching-ring having an outer projection adapted to engage in said slot and an inner projection to engage said shaft, said clutching-ring being formed with a preponderance of weight on the side opposite the inner projection, substantially as set forth.

388,928. ICE-SHAVER. FRANK K. WAY, Springfield, Ohio, assignor to John Foos, same place. Filed Apr. 13, 1888. Serial No. 270,761. (No model.)

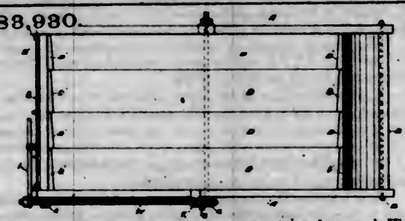
Claim.—1. The combination, with the main casing having the cutting-cylinder therein, the reservoir at right angles to the axis of said cylinder, and a follower having projecting ends adapted to extend through the sides of said casing, of the revolving shaft journaled in bearings on said casing and chains connected to said follower on either side, said chains being connected to said shaft, so that a revolution of said shaft will move said follower, substantially as and for the purpose set forth.

2. The combination, with the main casing provided with an opening in the lower side thereof and an open-ended cutting-cylinder in said casing opposite to said opening, of a projecting stud at right angles to said casing, an adjustable plate on said stud, and means for securing said plate on said stud at a greater or less distance from said casing, substantially as specified.

3. The combination, with the cutting mechanism and the reservoir in a plane at right angles to the plane of said cutting mechanism, said reservoir being provided with longitudinal openings in the sides thereof, of the traveling follower provided with projections extending through said openings, and endless chains connected to said projections and passing over supporting-wheels, and engaging with sprocket-wheels on a revolving shaft, substantially as and for the purpose set forth.

4. The combination, with the main casing provided with an opening in the bottom and an open-ended cutting-cylinder in said casing, of a projecting stud at right angles to said casing and an adjustable plate on said stud, means for securing said plate in different positions on said stud, and a discharging mechanism in said cylinder, substantially as set forth.

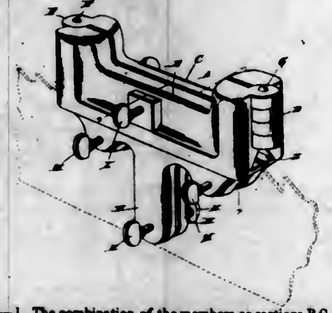
388,929. COMBINED NECKTIE AND COLLAR-BUTTON. ALFRED C. WHITTINGHAM, Toledo, Ohio. Filed Nov. 11, 1887. Serial No. 254,999. (No model.)



Claim.—As an improved article of manufacture, the combined necktie and collar-button herein described, consisting of a scarf or tie having a collar-button secured within the body of the same by means of stitches, its shank and head projecting and adapted to pass through the button-holes of a collar and neckband, all substantially as set forth.

388,930. DUMPING-WAGON. DAVID A. WILLIAMS, Denver, Colo. Filed Sept. 26, 1887. Serial No. 250,602. (No model.)

Claim.—1. In a dumping-wagon, the supporting-bar F, provided with loop F' and pin F^2, supporting-straps E, provided with roller E', clevis G, attached to said bar F at one extremity and to crank H' of rod H at the other extremity, and rod H, to which is attached hand-lever I, provided with spring J, as shown and described, and for the purpose set forth.



388,930.

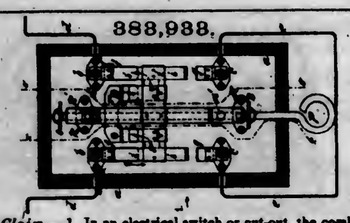
2. In a dumping-wagon, the combination, with bottom boards, D, provided with cast-iron end pieces, D', said end pieces being provided with journals D^2, of the supporting-bar F, provided with loop F' and pin F^2, the same being supported at one extremity by straps E, provided with roller E', and attached at the other extremity to hand-lever I by means of clevis G, and rod H, provided with crank H', said rod H being held in place by means of straps E, said supporting-bar F also being attached to one of the boards D by means of attaching-piece D^4 and spring J, for retaining lever I, as described, and for the purpose set forth.

3. In a dumping-wagon, the bottom boards, D, provided with the cast-iron pieces D' and plate D^3, in combination with supporting-bar F, provided with loop F' and pin F^2, and supported at one end by the straps E, provided with roller E', and supporting-bar F being provided with attachment D^4, and raised and allowed to drop by any suitable means desired, for the purpose set forth and described.

388,931. DEVICE FOR SIDE-DRESSING THE TEETH OF SAWS. HAMILTON W. WILLIAMS, Nashville, Tenn. Filed Feb. 11, 1888. Serial No. 263,682. (No model.)

Claim.—1. The combination of the members or sections B C, having the matched ears D E at opposite ends and having the grooves I in their opposing sides, the files secured in said grooves, the gage-plate O, secured to the inner side of one of the members and vertically adjustable, the bolt F, connecting the ears E and forming the hinge for the members, and the removable pin G, adapted to be inserted in aligned openings in the ears D, substantially as described.

2. The combination of the members or sections B C, having the matched ears D E at opposite ends and having the grooves I in their opposing sides, the files secured in said grooves, the bolt F, connecting the ears E and forming the hinge for the members, and the removable pin G, adapted to be inserted in aligned openings in the ears D, substantially as described.



3. The combination of the members or sections B C, hinged together at one end and having the fastening device at the opposite ends to secure the same together on opposite sides of a saw, said members having the grooves I and the set-screws M N, the files secured in the grooves I, and the gage-plate O, secured to one of the members or sections and vertically adjustable thereon.

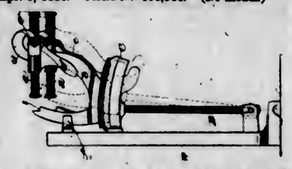
388,932. COMPOSITION FOR MAKING CEMENT. JOSIAH WOLFF, Union, N. J., assignor of three-fourths to Sarah B. Pulhara, Brooklyn, N. Y. Filed Mar. 7, 1887. Serial No. 230,004. (No specimens.)

Claim.—A building material consisting of a mixture of dry powdered slag, dry powered slaked lime, and coal-ashes, substantially as set forth.

388,933. SWITCH OR CUT-OUT FOR ELECTRIC CIRCUITS. JAS. J. WOOD, Brooklyn, N. Y. Filed May 28, 1887. Serial No. 239,041. (Model.)

388,933.

Claim.—1. In an electrical switch or cut-out, the combination, with the movable contact-maker, of a latch to lock the same in either position, a movable manipulating device, a spring interposed between the said device and the contact-maker, and an engaging-trip between the manipulating device and the latch, whereby the first movement of the manipulating device compresses or strains the spring against the contact-maker, while the terminal motion releases the latch, substantially as and for the purpose set forth.



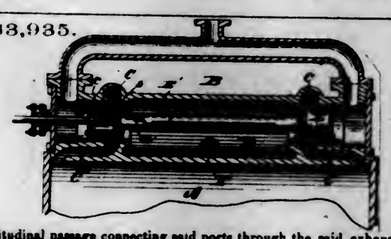
2. In an electric switch or cut-out, the combination, with the movable contact-maker, of a movable bolt or rod for shifting said contact-maker, a spring interposed between the shifting-rod and contact-maker, and a latch or catch arranged to hold the contact-maker in either of its positions, with a trip or trips connected with and operated by the rod and arranged to release said catch or latch when the rod is at the end of its stroke and the spring strained, whereby the contact-maker is suddenly released and shifted instantaneously and again held by the latch, substantially as herein set forth.

3. In an electrical switch or cut-out, the combination of the movable contact-maker carrying the movable contacts, a clasp, *j*, attached to said contact-maker, and a rod, *p*, passing through said clasp, with the flanged sleeves *v v*, fitting on said rod and abutting against said clasp, a spring, *l*, encircling said rod and abutting at each end against said sleeves, fixed stops or collars *s* on said rod, and a spring catch or latch, *n*, with engaging-points *k'*, arranged and operating substantially as shown and described.

4. In an electrical switch or cut-out, the combination of the terminals *b b* and *c c*, with contact-tongues *f g*, and the fixed conducting-bridge *r*, with the movable non-conducting cross-bar *h*, and Y-shaped contact-springs *i*, fixed thereon, arranged and operating substantially as shown and described.

5. In an electrical switch or cut-out, the combination, with the fixed contacts, of the movable contact-maker, such as *h*, carrying the movable contacts, such as *i*, a manipulable rod, *p*, a spring, *l*, interposed between the rod and the contact-maker, bearings *k k*, in which the rod slides, a spring-latch, *n*, attached to said contact-maker, having recesses *n* and engaging projections *k'*, with trip-stops *s* on said rod, substantially as shown and described.

388,934. HEEL-BURNISHING MACHINE. CHARLES J. ADDY, Malden, Mass., assignor to the Tapley Machine Company, Portland, Me. Filed Apr. 9, 1888. Serial No. 270,316. (No model.)



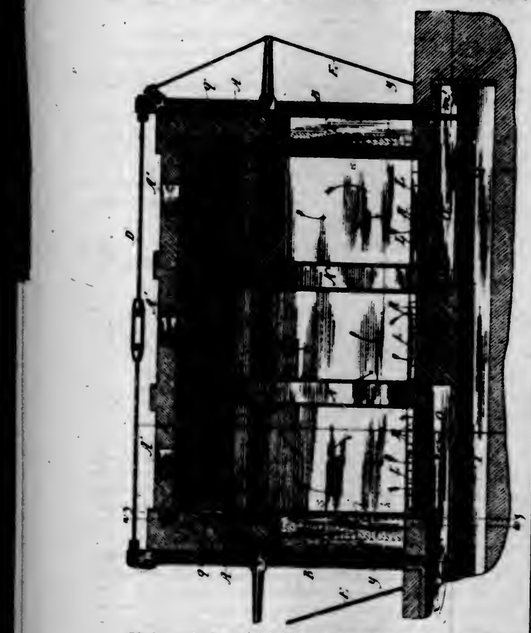
Claim.—1. In a heel-burnishing machine, the combination, with the post or rod B, of a pivoted frame containing two or more upwardly-extended branches, each of which constitutes a shoe-holder, the movement of the said frame upon its pivot enabling a shoe held by the said branches or shoe-holders to be placed in operative position with relation to the burnishing-tool, substantially as described.

2. In a heel-burnishing machine, the post or rod B, the yoke, and a frame pivoted thereon to vibrate about a horizontal pivot, and having two or more branches to constitute two or more shoe-holders, combined with a guide to receive and guide the arms of one of the branches or shoe-holders as the jack is being moved horizontally, or to and fro, under the burnishing-tool, substantially as described.

388,935. VALVE FOR STEAM-ENGINES. WALTER J. ALLEN, Springfield, Ohio, assignor of two-thirds to Philip J. Cole and Lawrence J. Hickey, both of same place. Filed Sept. 6, 1887. Serial No. 249,091. (No model.)

Claim.—1. A cylindrical valve to each end of which the steam is admitted at an equal pressure, and having a reduced middle portion about which is formed an exhaust-chamber, said valve being provided at either end with small circular ports in the periphery thereof and a

383,935.

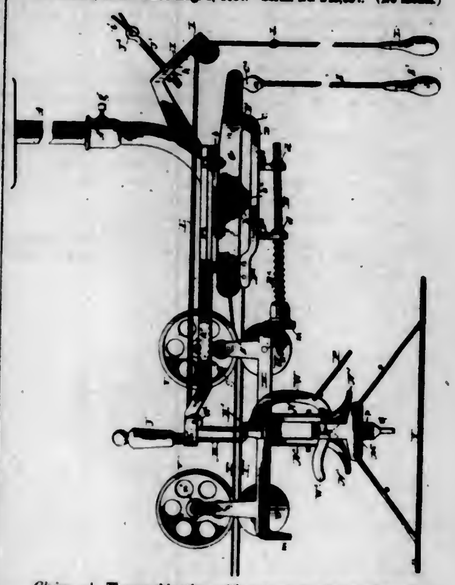


longitudinal passage connecting said ports through the said exhaust, said ports being located on the exhaust end of said valve, said valve formed without lap between said ports and the exhaust-chamber, substantially as specified.

2. A balanced valve, substantially as set forth, having a longitudinal passage provided at either end with small openings or ports adapted to register with the main cylinder-ports, said valve being formed without exhaust lap between the small openings or ports and the exhaust-chamber in said valve, whereby the terminal pressure of each piston-stroke is transferred from the front to the back of the piston to produce an automatic cushion, substantially as set forth.

3. A cylindrical balanced valve provided with piston-shaped ends adapted to open and close the main ports, as described, the reduced central portion adapted to form the exhaust-chamber with which the cylinder-ports are adapted to register as the valve moves in either direction, premature exhaust-ports in said piston ends connected together through said reduced central portion, said premature exhaust-ports being adapted to register with the main cylinder-ports without lap between the premature exhaust-ports and the main exhaust-ports, substantially as specified.

383,936. BRICK-KILN. WILLIAM ALSIP and SAMUEL H. ALSIP, Momence, Ill. Filed May 26, 1887. Serial No. 239,500. (No model.)



Claim.—1. In a brick-kiln, the combination of a chamber to receive the bricks to be burned, a series of furnaces, each of which is provided with two flues, a' and a^2, located directly at the rear of the fuel-chamber and having dampers $b\,b'$, the walls H and K, the vertical passages I and I', leading from said flues in opposite directions on the outside of the wall H, the cold-air passages d, located between said walls H K and communicating with both the passages I I', the partitions g in the passages d, and the air-passages $e\,f$, leading from the outside of the kiln to the passages d, substantially as described.

2. In a brick-kiln, the combination of a burning-chamber, a series of furnaces or fire-boxes, passages leading from the furnace both to the top and to the bottom of the kiln, dampers for such passages, flues N N', O O', and Q, dampers to control the outlets from the passages O O', flues R R' S S' T T', and dampers to control the flues S S', substantially as and for the purposes specified.

3. In combination with the burning-chamber of a brick-kiln, the passages $j\,j$ at the ends of the kiln, communicating at their upper ends with the burning-chamber and at their lower ends with passages R R', which communicate with passages S S', whereby heat, through $j\,j$, can pass either up or down according to the direction of the draft, substantially as and for the purposes specified.

4. In a brick-kiln, a burning-chamber, in combination with passages $k\,k$ at the ends of the kiln, which passages communicate at their upper ends with the burning-chamber and at their lower ends with passages or flues $l\,l$, which are controlled by dampers $n\,n'$, and which lead to a flue, P, which goes to the smoke-stack, substantially as and for the purposes specified.

383,937. CASH AND PACKAGE CARRIER. SAMUEL W. BARR, Mansfield, Ohio. Filed Aug. 2, 1887. Serial No. 245,267. (No model.)

Claim.—1. The combination, with a car-frame having depending limbs and spring-pressed latch-hooks, of a receptacle, a latch-block attached thereto, and a trip-block adapted to be moved into contact with the hooks and actuate the same to release the catch-block, substantially as set forth.

2. The combination of a car-frame having spring-actuated latch-hooks with a latch-block affixed to the cash or package receptacle and having an angular-shaped apex, and a sliding trip-block attached to the latch-block, substantially as set forth.

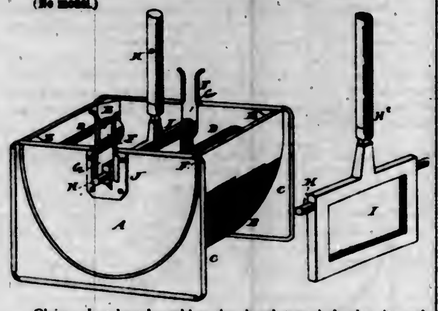
3. The combination, with a track, a car, a latch-hook, and hooks for elevating the receptacle, of a latch-block provided with laterally-projected curved arms and a body, the top portion of which is made with an apex and sloping sides that terminate in edges that are adapted to receive the elevating-hooks, substantially as set forth.

4. In a cash and package carrier, the combination, with a latch-block having curved laterally-extended arms and its body adapted to engage latch-hooks on its lower edge, of a sliding trip-block connected to the latch-block and adapted to actuate the latch-hooks, substantially as set forth.

5. The combination, with a car having a latch-hook, of the bail of a cash or package receptacle carrying a latch-block that has two curved lateral arms, a body that slopes to produce an apex and equally-inclined sides, and a sliding trip-block connected to the latch-block, substantially as set forth.

6. The combination, with a hanger, a boat-bracket affixed adjustably thereto and provided with two parallel flanges, and lugs on the flanges to support a rocking bar, of a swinging arm pivoted to the rocking bar, two track-wires, and a means for vibrating the rocking bar, substantially as set forth.

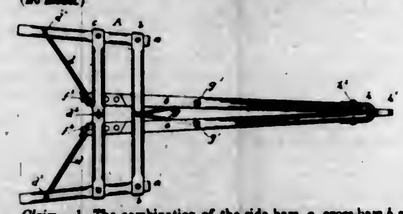
7. The combination, with a supported rocking bar and a swinging arm pivoted at one end to the rear portion of the rocking bar, of a spring-actuated bumper-rod supported to slide longitudinally below the swinging arm, substantially as set forth.



8. The combination, with a hanger, a bracket affixed thereto and provided with two horizontal and parallel flanges, and a rocking bar pivoted below these flanges and adapted to swing upwardly between them, of a swinging arm pivoted upon the rear end of the rocking bar on its lower edge, a bumper-rod, two line-wires, and a cam adapted to move when the rocking bar is vibrated, substantially as set forth.

9. An apparatus comprising a hanger, a bracket having two parallel flanges and two limbs attached to the bracket and projecting forwardly therefrom, two cords, and two hooks, of a rocking bar, a swinging arm pivoted on the rocking bar, a spring-actuated bumper-rod, two line-wires, and a cam adapted to move when the rocking bar is rocked, substantially as set forth.

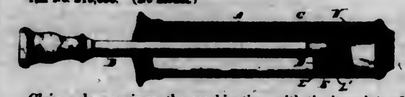
10. An apparatus comprising a hanger, a bracket, two parallel horizontal flanges of the bracket, a rocking bar, a swinging arm, and a spring-actuated bumper supported by this arm, two limbs attached to the bracket-flanges, two loose grooved pulleys that rotate on the forward ends of the limbs, two cords, and two hooks adapted to release a basket from a car by the elevation of the hooks that engage arms of the latch-block of this basket, substantially as set forth.



11. The combination, with a bracket, rocking bar, swinging arm, and track-wires, of a catch secured to the bar and a bumper carried by the arm, substantially as set forth.

383,938. BREAD-MACHINE. BERNARD BETTERMAN and LOUIS H. BRINKMEIER, North Topeka, Kans. Filed Dec. 12, 1887. Serial No. 257,656. (No model.)

Claim.—In a bread-machine, the dough-trough having its ends C C formed with vertical slots, and the strengthening-wires F, extended around said ends C and having their ends extended upward upon opposite sides of said slots, and the metallic plates J, secured to said ends C around the slots therein, substantially as and for the purpose described.



383,939. POLE AND SHAFTS FOR VEHICLES. ALBERT L. BRATHEN, Danville, Minn. Filed Mar. 27, 1888. Serial No. 268,627. (No model.)

Claim.—1. The combination of the side bars, a, cross-bars b and c, bolted to said side bars, elbowed rods d, secured to said side beams and rear cross-beam, e, shafts e, their rear ends secured in the sleeves f, sleeves f, adapted to slide back and forth on the rods d, set-screws f^3, adapted to hold said sleeves in position, rods g, their rear ends bolted between the upper and lower cross-beams b, their front ends bolted to the under side of said shafts by the bolts and nuts g', and tongue-irons h, holding the front end of said shafts together, being secured in place by the bolt and nut h^2, substantially as shown and described.

2. The combination of the side bars, a, cross-bars b and c, bolted to said side bars, elbowed rod d, secured to said side beams and rear cross-beam, e, shafts e, their rear ends secured in the sleeves f, sleeves f, adapted to slide back and forth on the rods d, set-screws f^3, adapted to hold said sleeves in position, and rods g, their rear ends bolted between the upper and lower end beams, b, their front ends bolted to the under side of said shafts by the bolts and nuts, substantially as shown and described.

383,940. SYRINGE. ALEXANDER W. BRINKERHOFF, Upper Sandusky, Ohio; Millard H. Brinkerhoff and Willis C. Brinkerhoff executors of said Alexander W. Brinkerhoff, deceased. Filed Nov. 16, 1886. Serial No. 219,055. (No model.)

Claim.—In a syringe, the combination, with the barrel A, of the piston-rod having the shouldered and threaded inner end, the collar C, having an encircling groove, the open yielding metal ring E within the encircling groove, the leathers L and L', and the circular locking-nut on the threaded inner end of the piston-rod, substantially as specified.

383,941. ELECTRIC SIGNALING-BOX. WALTER D. BROWER, Seneca Falls, assignor to Fred C. Timpson, Auburn, N. Y. Filed Sept. 17, 1887. Serial No. 249,909. (No model.)

Claim.—1. In an electric signaling-box, the combination of the hollow reversible carrier provided with a fixed diaphragm constituting a partial division-wall across said carrier, two movable heads connected at a fixed distance, and a weight, p, composed of finely-divided material and contained within said carrier between said heads.

2. In an electric signaling-box, the combination of the hollow reversible carrier provided with a diaphragm constituting a partial division-wall across said carrier, a weight of finely-divided material, two connected movable heads inclosing said weight, and a circuit making and breaking device actuated by said weight and moving with said heads.

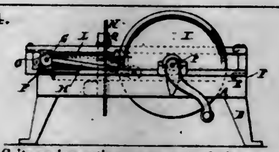
3. In an electric signaling-box, the reversible carrier B, in combination with the locking-bar N, and a releasing-bar, E, impelled by gravity.

4. The combination of the hollow reversible carrier B, provided with a fixed diaphragm constituting a partial division-wall across said carrier, a weight of divided material, the sliding heads V V, bar E, and the segmental support i for the end of said bar.

383,942. COMPOSITION OF MATTER FOR PAVING-BLOCKS, &c. CHARLES E. COFFIN, Denver, Colo., assignor of one-half to Robert H. Jones, same place. Filed Apr. 13, 1888. Serial No. 270,544. (No specimens.)

Claim.—The composition of matter hereinbefore described, consisting of silica, oxide of iron, lime, alumina, barium, zinc, manganese, and lead, combined in the proportions substantially as set forth.

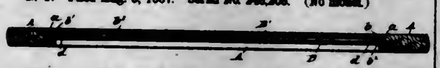
383,943. CULINARY VESSEL. ALONZO B. COMBS, Albany, N. Y. Filed Nov. 25, 1887. Serial No. 256,061. (No model.)



Claim.—1. A culinary vessel provided with a movable bail and a stationary bail, as herein described, said stationary bail being fitted to bear snugly around one side of said vessel and having its ends bent inwardly to form retainers for holding the cover on said vessel, as and for the purpose herein specified.

2. The combination of a culinary vessel provided with supporting-stops 5 and check-stops 6, a stationary bail retained in position by said stops and having its ends turned inwardly over the upper edge of said vessel to form retainers for holding the cover in place, and a movable bail fitted to swing on the trunnions of said vessel, as and for the purpose specified.

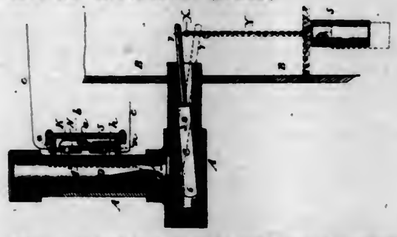
383,944. BAND-SAW-FILING MACHINE. ANDREW S. DUNN, New Brighton, Pa. Filed Feb. 23, 1887. Serial No. 229,233. (No model.)



Claim.—In a machine for filing band-saws, the combination, with main frame A, and cam-wheel I, running between guide-rollers K,

383,944.

giving file-slide C its reciprocating movement, of pitman-rod H, attached to cam-wheel I and file cross-head D, giving the backward and forward motion to file cross-head D, which carries file L and the saw-feeding mechanism O, substantially as described.



383,945. SCHOOL-SLATE AND RULER THEREFOR. MAYBURY W. FLEMING, New Brighton, and CHARLES R. LE SAUVAGE, Brooklyn, N. Y. Filed Aug. 5, 1887. Serial No. 246,203. (No model.)

Claim.—1. The combination, with a slate, and a frame attached thereto provided with grooves in the inner edges above the surface of the slate, of a ruler having rabbeted ends adapted to slide in said grooves, and a centrally-recessed under surface whereby a bearing-surface is provided at the ends only, substantially as set forth.

2. A ruler for slates, provided with rabbeted ends, a centrally-recessed under surface, and bearing-surfaces upon the under side at the ends only for use, as set forth.

383,946. BOILER-ALARM. JOHN J. GEOGAN, Newark, N. J. Filed Mar. 5, 1888. Serial No. 266,277. (No model.)

Claim.—1. In water-level alarms, the combination of a vibratory bar provided with a gravitating body and a counter-balance carrying magnetic material, with a liquid-reservoir, electric-alarm circuit, and magnetic-circuit controller, substantially as described.

2. In water-level alarms, a fluid-reservoir containing a gravitating body, in combination with a counter-balance and magnetic-circuit controller, substantially as described.

3. In a boiler-alarm, the combination of a fluid-reservoir, a movable balance located within a casing having a non-magnetic portion, a magnetic-circuit controller, a gravitating body connected with said balance, and an alarm-circuit, substantially as described.

4. The combination, in a boiler-alarm, of an electric circuit and a magnetic-circuit controller, with a movable balance located within the casing, one arm of said balance being of magnetic material and the other provided with a gravitating body, that portion of the casing intervening between said arm and the magnetic pole being of non-magnetic material, substantially as described.

383,947. MECHANISM FOR OPERATING DERAILING-SWITCHES AND SEMAPHORES. WILLIAM GRAVIT, Elkhart, Ind. Filed Feb. 24, 1888. Serial No. 265,129. (No model.)

Claim.—1. The combination, with the derailing-switches of crossing railroad-lines, of a cam-wheel mechanically connected to said switches, and separately closing those of either line, substantially as set forth.

2. The combination, with the derailing-switches of crossing railroad lines, of a cam-wheel mechanically connected to said switches and acting to close the switches of either line by a single movement and to open them by its return movement, substantially as set forth.

3. The combination, with the derailing-switches of crossing railroad-lines, of a single cam-wheel having the hooks F, the switches being mechanically connected to the wheel by the rods and arms, substantially as specified.

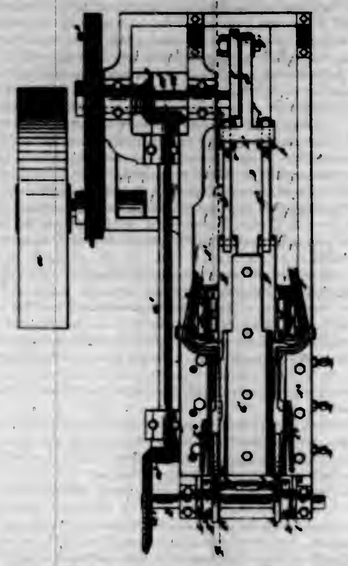
4. The combination, with the derailing-switches and semaphores of crossing railroad-lines, of a single shaft, a cam-wheel for operating the switches, and pulleys for operating the semaphores, said wheel and pulleys being all mounted upon said shaft, substantially as set forth.

5. In apparatus for operating derailing-switches, the shaft A and the cam-wheel having a concentric portion and the hooks F, in combination with the arms J and K, in contact with said wheel, and the rods G and H, extending to the switches, substantially as specified.

6. In apparatus for operating derailing-switches and semaphores, the cam-wheel, the pulleys P and Q, having studs *p* and *q*, and the arm R, all combined and operating substantially as specified.

7. In apparatus for operating derailing-switches and semaphores, the shaft A and the operator's lever, the latter having the three positions described, in combination with the cam and pulleys on said shaft and the mechanical connections to the switches and semaphores, substantially as set forth.

383,948. CHILD'S VEHICLE. FAYETTE GROFF, Saratoga Springs, N. Y. Filed Feb. 21, 1888. Serial No. 264,781. (No model.)



Claim.—1. A sleigh provided at its forward end with a wheel journaled in fixed axles and normally free from contact with the ground, as set forth.

2. A sleigh combined with a wheel journaled in axles fixedly secured to the forward ends of the runners with its periphery normally above the acting face of the runner, substantially as and for the purpose specified.

3. The combination, with the runner, of the clamp E, having jaws *c*, to embrace the runner, and a stub-axle, *a*, to receive the wheel, and the thumb-screw *d*, tapped through one of said jaws and engaging the runner, substantially as and for the purpose specified.

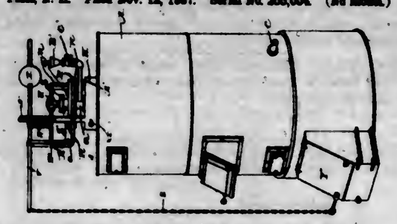
383,949. SCREW-SWAGING MACHINE. HAYWARD A. HARVEY, Orange, N. J. Filed Jan. 13, 1888. Serial No. 260,626. (No model.)

Claim.—1. In an organized machine for rolling the threads of screws, two screw-blank feeding ways and deliverers, and two pairs of appropriately-ribbed dies, each pair consisting of an actively-reciprocating die and a supporting-die, in combination with a common actuating mechanism, such as a crank and pitman, for imparting motion to the said actively-reciprocating dies.

2. In a screw-thread-rolling machine of the type in which an actively-reciprocating die is employed to roll the screw-blank over the face of a supporting-die, and in which the said supporting-die has prescribed endwise movements for effecting the feeding of the blanks to the dies and the discharge of the finished screws therefrom, and during the operation of rolling the thread upon each blank also has a lateral movement toward the plane of movement of the actively-reciprocating die, the combination, as herein set forth, of a cam for instituting said endwise movements of said supporting-die, and an independent cam for instituting said lateral movement of said supporting-die.

3. The combination, in a double screw-thread-rolling machine, of two actively-reciprocating dies which are independently adjustable with relation to the mechanism which actuates them, two supporting-dies supported in the frame of the machine, and two cams for imparting prescribed endwise motions to said supporting-dies, as and for the purpose set forth.

4. In a screw-thread-rolling machine of the type herein shown, in which an actively-reciprocating die and a supporting-die are employed, a cam for imparting a prescribed range of endwise movement to said supporting-die, a wedge interposed between the carriage, upon which said supporting-die is mounted, a laterally-adjustable gib affording the bearing for the diagonal side of said wedge, and a cam for imparting a prescribed endwise movement to said wedge.

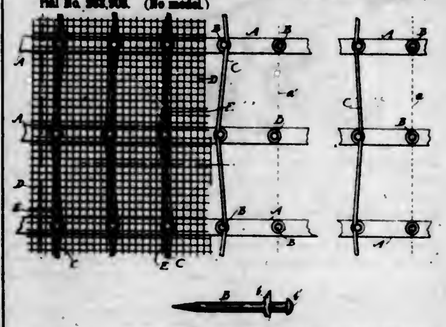


5. In a screw-thread-rolling machine of the type in which an actively-reciprocating die and a supporting-die are employed, a supporting-die, such as the die H', mounted upon a carriage, such as the carriage H, having affixed to its rear end a yoke, such as the yoke H^3, provided with a rib, such as the rib h^2, in combination with a cam, such as the cam H^2, for imparting a prescribed range of endwise movement to the carriage H, and a notched hub, such as the hub K', provided with the notch K^5, for steadying the carriage H at the end of the said movement, as set forth.

6. In a screw-thread-rolling machine of the type in which an actively-reciprocating die and a supporting-die are employed, the stop R, affixed to and projecting from the face of the actively-reciprocating die-carriage at an appropriate distance from the die mounted thereon, as and for the purpose described.

7. The supporting die-carriages H and I, in combination with the expanding-springs J J and J' J', for holding the die-carriages against the side bearings upon which they slide.

8. The cam-shaft B, the cams H^2 and *k*, mounted thereon, and the supporting die-carriages H and I, in combination with the ways O and P, and the spring-check slides Q Q, operated by the die-carriages H and I, respectively.



383,950. DAMPER-REGULATOR. IRVIN W. HAYNES, Franklin Falls, N. H. Filed Nov. 12, 1887. Serial No. 255,004. (No model.)

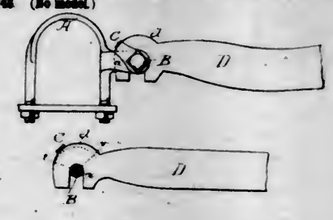
Claim.—1. The combination of the outer tank, B, the case or frame H, secured thereon, having the bridge K, the diaphragm P, and the follower on the said diaphragm, the inner tank, F, arranged in the tank B and having the pipe G, secured to the bridge K under the diaphragm, the levers connected to the said follower, the adjusting-weight on one of the said levers, the damper or door, Y, and the connection between the same and the weighted lever, substantially as described.

2. The combination of the furnace having the door or damper Y and the tank B, the case or frame H on the upper side of said tank and adapted to turn thereon, said case or frame having the bridge K, the diaphragm resting on said bridge, the follower on said diaphragm, the levers supported on the case or frame, connections between the same and the follower and door or damper, the inner tank, F, arranged in the tank B, and the pipe G, extending upward from said inner tank and secured to the bridge K and communicating with the lower part of the diaphragm, substantially as described.

383,951. DEVICE FOR SECURING WIRE LATHING TO WOODEN JOISTS AND STUDS OF BUILDINGS. MARSELLUS HERRON, Chicago, Ill., assignor to Frederick Voss, same place. Filed Feb. 13, 1888. Serial No. 263,903. (No model.)

Claim.—1. In combination with the wooden joist or studs A A and the wire lathing D D, the iron spikes B B, having their heads *b b* of less diameter than the mesh of the wire lathing and provided with the shoulders or supports *b b*, having a greater diameter than the mesh of said lathing, the wires C C, resting on the supports *b' b'* underneath the wire lathing and running transversely across the joist A A, and the wires E E, also running transversely across said joist above said wire lathing D D and passing between the lathing and the heads of the spikes, in manner substantially as shown, and for the uses and purposes specified.

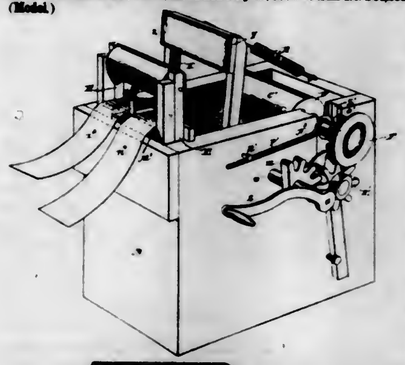
2. In combination with the wooden joist or studs A A and the wire lathing D D, the iron spikes B B, having the shoulders or supports *b b*, on which the wire lathing is made to rest, and the wires E E, extending transversely across the joist or studs A A above the lathing and looped around the spikes B B between the wire lathing and the heads *b' b'*, for the purposes and in the manner substantially as described.



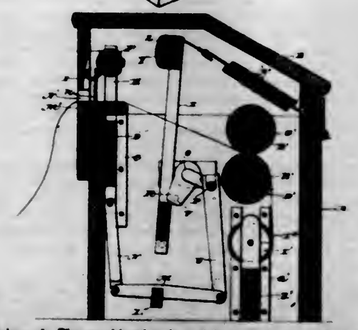
383,952. DEVICE FOR SECURING WIRE LATHING TO THE WOODEN JOISTS AND STUDS OF BUILDINGS. MARSELLUS HERRON, Chicago, Ill., assignor to Frederick Voss, same place. Filed Feb. 13, 1888. Serial No. 263,905. (No model.)

383,952.

Claim.—In combination with the wooden joist or studs A A and the wire lathing B B, the metallic tubes C C, the wires E E, the staples D D, and the wire lacings *e e*, in manner substantially as and for the uses and purposes specified.



383,953. THILL-COUPLING. GEORGE R. HOWLAND, Chicago, Ill., and FRANK W. ALLEN, Osawatomie, Kans. Filed Apr. 22, 1887. Serial No. 236,748. (No model.)



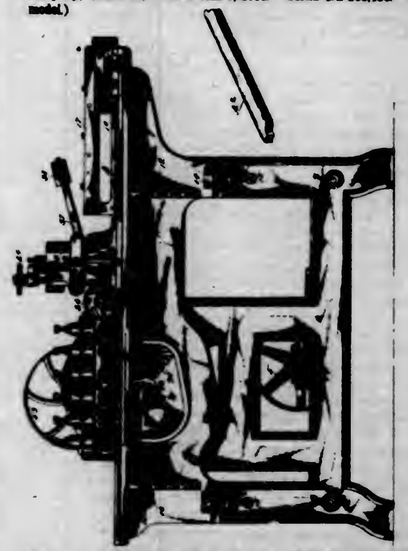
Claim.—1. In a thill-coupling, the combination, with clip A, having lugs *a* projecting therefrom, thill-bolt B, and ⌐-shaped spring C, of shaft D, and coupling-hook *d*, having its articulating surface correspond in width to the diameter of the bolt B, and having its back eccentric to the terminus of said articulating opening, as hereinbefore described.

2. In a thill-coupling, the combination, with clip A, having lugs *a* projecting therefrom, thill-bolt B, spring C, and cushion *e*, of shaft D and coupling-hook *d*, substantially as set forth.

383,954. TICKET-PRINTING MACHINE. CHARLEY F. HUFF, Golden, and WILLIAM R. HUFF, Bunn, Ill. Filed July 13, 1887. Serial No. 244,322. (Model.)

Claim.—1. The combination, in a ticket-printing machine, of the vertically-movable frame D, the printing-cylinder journaled therein and having the arm connected to a fixed part of the machine to oscillate said cylinder in the same, the vertical rocking frame X, carrying the inking-pad, the horizontal lever centrally pivoted below said frames and engaging the same to swing the inking-pad against the printing-cylinder and vertically move the frame to oscillate said cylinder, substantially as described.

2. The combination, in a ticket-printing machine, of the vertically-movable frame, the printing-cylinder journaled therein and having the arm 1, the fixed link K, slotted to receive said arm, the vertical rocking frame X, carrying the inking-pad, the horizontal lever centrally pivoted below said frames and engaging the same to swing the pad against the cylinder and vertically move the cylinder-frame to cause said cylinder to oscillate therein, substantially as described.



3. The combination, in a ticket-printing machine, of the vertically-movable frame D, the printing-cylinder journaled therein and adapted to be turned first in one direction and then in the contrary direction by the movement of the frame, the rocking frame X, having the inking-pad, the shaft O, having the crank and the tappet-arms R, the latter being adapted to engage the rocking frame to actuate the same and the lever M, the link N, connecting the said lever to the frame D, and the pitman U, connecting the lever to the crank P, substantially as described.

4. The combination, in a ticket-printing machine, of the vertically-movable frame D, the printing-cylinder journaled therein and having its arm connected to a fixed part of the machine to oscillate said cylinder in its frame, the vertical rocking frame X, carrying the inking-pad, the horizontal lever centrally pivoted to vibrate said cylinder and pad-frames, the feed-rollers B' C', having the spur-wheels geared together, the actuating-shaft O, operating the horizontal lever and having the segment-wheel engaging one of the spur-wheels, substantially as described.

5. The ticket-printing machine having a case provided interiorly with the vertical guide-ribs, the removable frame H, playing vertically in said guide-ribs, and the drums journaled in said frames and carrying the rolls of paper, substantially as described.

6. The combination, in a ticket-printing machine, of the feed-rollers B' and C', journaled in the case or frame, the roller C' being vertically adjustable in said case and removable therefrom, and the locking-arm pivoted to the case or frame and having the offset adapted to engage the spindle of the removable roller, substantially as described.

383,955. MACHINE FOR MAKING SCHOOL-SLATE FRAMES. GEORGE L. KRAMM, Allentown, Pa., assignor to the Hyatt School Slate Company, (Limited.) Filed Jan. 9, 1888. Serial No. 260,156. (No model.)

Claim.—1. In a machine of the class described, the combination of a vertically and laterally adjustable cutter-head consisting of alternately-arranged saws and groovers, and a series of feeding-disks mounted upon independently-adjustable shafts in rear of said cutter-head, and independent mechanism for rotating said shafts and head at different relative speeds, substantially as specified.

2. In a machine of the class described, feeding-disks the shafts of which are mounted in vertically-adjustable spring-boxes at one side and swinging boxes at the opposite side, substantially as specified.

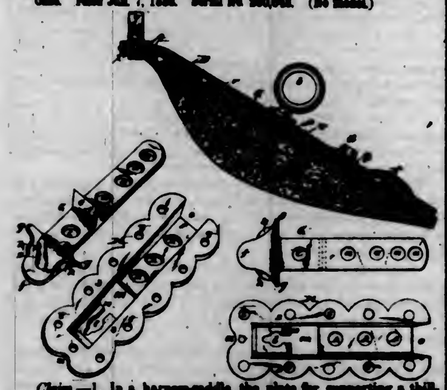
3. In a machine of the class described, the combination, with a cutter-head comprising an alternate arrangement of saws and groovers, a series of feeding-disks mounted in rear of the same, and a second cutter-head mounted in rear of first, said cutter-head consisting of a series of saws registering with the grooves in the first-mentioned head, substantially as specified.

4. In a machine of the class described, the combination of a cutter-head consisting of an alternate arrangement of saws and grooves with a second cutter-head consisting of a like arrangement and registering with the first cutter-head and mounted below the same, and with a third cutter-head comprising a series of saws registering with the grooves of each cutter-head, substantially as specified.

5. In a machine of the class described, the combination, with a cutter-head adapted to form kerfs and grooves, of a similar cutter-head mounted below the same, a series of feeding-disks mounted upon shafts, and a third cutter-head comprising a series of saws registering with the grooves, and mechanism for operating the heads and shafts, substantially as specified.

6. In a machine of the class described, the combination, with the side frame 2, having the oppositely-located lugs 16, provided with screws 15, of the feed-table 11, mounted at one side of the frame upon said screws and having vertical slots 12, and bolts 13, passing through the slots and frame, substantially as specified.

7. The combination of the side frames, 1 and 2, carrying the feed-table 11, with the pivoted lever 9, having the feed-block 10, and guard 17, in which said lever is mounted for movement, substantially as specified.



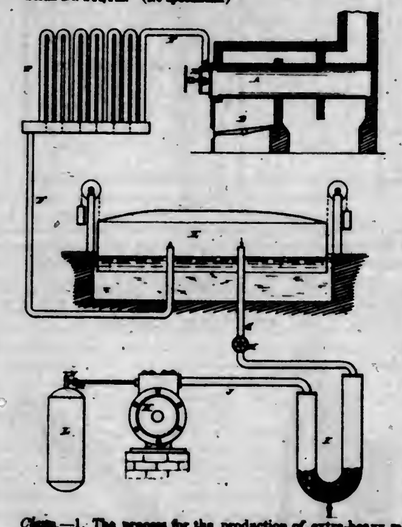
8. The combination, with the bridge 22, having the hand-wheel and shaft 24 and vertical grooves 28, of the longitudinally-grooved and vertically-ribbed plate 27, having the hand-wheel and shaft 29, mounted at one side thereof, the longitudinally-ribbed block 25, mounted at one side of the plate 27 and connected with the shaft of the hand-wheel, and the grooved plate 26, mounted at the side of the block 25, and having bearings 31, in which is mounted the shaft 32, substantially as specified.

9. The shafts 44, carrying disks 45, with the bridge 43, having spring-boxes 55 for said shafts, and the bridge 42, having adjustable boxes 56, consisting of the pivoted hangers 57, and the bearings 59, having trunnions 58, journaled in said hangers and forming a bearing for the opposite ends of the shaft 44, substantially as specified.

10. The combination of the frames 1 and 2, constructed as shown and provided with the shaft 4, carrying pulleys 5 and 6, with the shafts 44, carrying gears 47, the standard 49, carrying shafts 48 and gears 47 and 50, the shaft 52, carrying gear 51, and the pulley 53, all operating as set forth.

11. The combination of the frames 1 and 2 with the stationary plate 60, slotted, as at 61, and grooved, as at 66, and having the bolts 62 and the hand-wheel 64, with the movable plate 63, having ribs 65, provided with boxes, and having journaled therein the cutter-head 71, substantially as specified.

383,956. HARNESS-SADDLE. WILLIAM R. KNOWLES, Columbiana, Ohio. Filed Jan. 7, 1888. Serial No. 260,042. (No model.)



Claim.—1. In a harness-saddle, the plate for supporting a thill-bearer, provided with a head having transverse arms, flanges depending from each side of the head for limiting the movement of the thill-bearer, and a pin projecting from the under side of said head for engagement with a hole in the thill-bearer, in combination with a plate separate from the tree, having a groove to receive the nuts of the tarret and pad-screw, substantially as described.

2. In a harness-saddle, the plate for supporting a thill-bearer, provided with a head having flanges depending from each side of the head for limiting the movement of the thill-bearer, and a pin projecting from the under side of said head for engagement with a hole in the thill-bearer, in combination with a plate separate from the tree, having a seat to receive said pin and secure it against lateral displacement, and a groove for the reception of the nuts of the tarret and pad-screws, substantially as described.

3. In a harness-saddle, the plate for supporting a thill-bearer, provided with a head having flanges depending from each side of the head for limiting the movement of the thill-bearer, a pin projecting from the under side of said head for engagement with a hole in the thill-bearer, and a lug on the under side of the plate, in combination with a plate separate from the tree, having a slot to receive the lug on the upper plate and a groove to receive the nuts of the tarret and the pad screw, and a thill-bearer having a hole in it to engage with said pin, substantially as described.

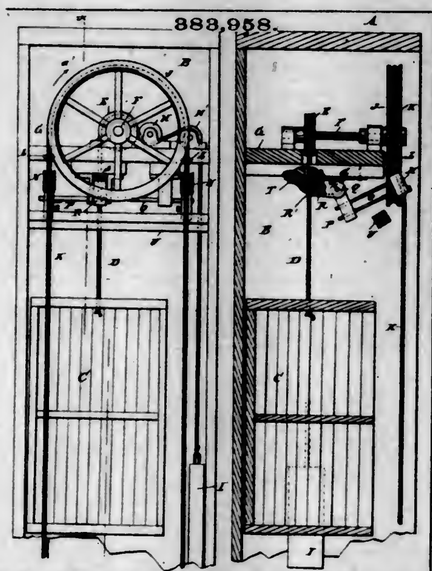
383,957. MANUFACTURE OF CARBONIC ACID AND HEAVY MAGNESIA. HENRY LEMFRAME, Philadelphia, Pa. Filed July 16, 1887. Serial No. 244,442. (No specimens.)

Claim.—1. The process for the production of extra-heavy magnesia, consisting in subjecting native magnesite to the action of heat.

2. The herein-described process for the simultaneous production of carbonic acid and extra-heavy magnesia, consisting in subjecting native magnesite in a closed retort to the action of heat, which decomposes the native magnesite into carbonic acid and extra-heavy magnesia, thus drawing off the carbonic-acid gas from the retort, and finally removing the extra-heavy magnesia.

3. The herein-described commercial extra-heavy magnesia, formed from native magnesite, as an improved article of manufacture.

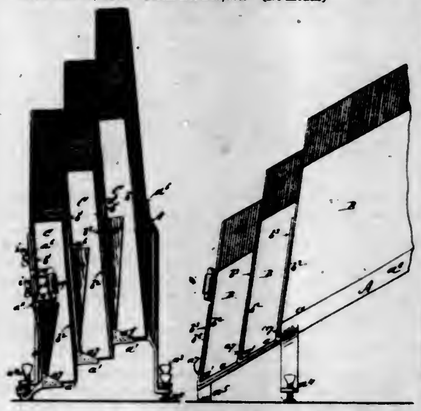
383,958. DUMB-WAITER. CHARLES L. LESSLIE, Brooklyn, N. Y., assignor of one-half to Andrew P. Van Tuyl, Jr., same place. Filed Feb. 28, 1888. Serial No. 265,261. (No model.)



Claim.—1. In a dumb-waiter, the combination, with a carriage-supporting rope, of a hoisting-rope adapted to operate said carriage-supporting rope, and a clamp engaging said carriage-supporting rope and controlled by the said hoisting-rope, substantially as shown and described.

2. In a dumb-waiter, the combination, with a rope supporting the elevator-carriage, of a clamp adapted to engage the said rope, a hoisting-rope operating the said carriage-supporting rope, and shoes over which passes said hoisting-rope, said shoes being connected with the said clamp, substantially as shown and described.

3. In a dumb-waiter, the combination, with a carriage-supporting rope, of a spring-arm adapted to engage said rope, a fixed arm, against which the said rope is pressed by the said arm, a shaft carrying the said spring-arm, and shoes secured to arms on said shaft and operated by the said hoisting-rope, substantially as shown and described.



4. In a dumb-waiter, the combination, with a carriage-supporting rope, of a spring-arm adapted to engage the said rope, a fixed arm, against which the said rope is pressed by the said arm, a shaft carry-

383,958.

ing the said spring-arm, and shoes secured to arms of the said shaft, and a hoisting-rope operating the said carriage-supporting rope and passing over the said shoes, substantially as shown and described.

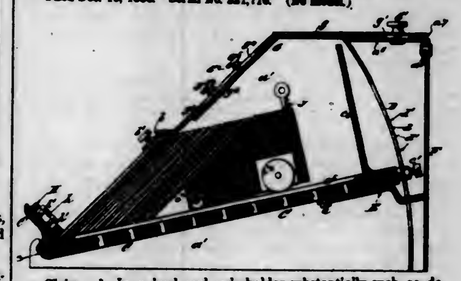
383,959. LEAD AND RULE HOLDER. A. AUGUSTUS LOW, Brooklyn, assignor to the Alden Type Machine Company, New York, N. Y. Filed Nov. 26, 1886. Serial No. 219,965. (No model.)

Claim.—1. A series of lead or rule holders formed with transverse openings for the removal of the leads or rules, arranged side by side, with their delivery ends successively one in advance of the other, the smaller compartments being advanced beyond the larger ones next adjoining, substantially in the manner and for the purpose described.

2. In combination with a series of lead and rule holding compartments of different sizes, formed with transverse openings for the removal of the leads or rules, substantially as described, a common holder or frame formed with seats or supporting-rests for the chanels, the front lower ends of which seats or rests project successively one in advance of the other from left to right, substantially in the manner and for the purpose described.

3. In a lead and rule holder substantially such as described, a lower front line-holder, a^1, having its upper edge inclined obliquely, substantially in the manner and for the purpose described.

4. In combination with one or more lead or rule holders substantially such as described, the supporting-frame A, formed with the three adjustable rests, a^2, a^3, and a^4, and the stationary rest a^5, for the purpose and substantially in the manner described.



5. A lead or rule holder substantially such as described, formed at its lower front end with a lateral line-retaining guard, the right edge of which is inclined obliquely, substantially in the manner and for the purpose described.

6. A lead or rule holder substantially such as described, formed at its lower front end with a lateral opening, and with a floor of reduced width coinciding with said lateral opening, for the purpose of facilitating the removal of the rules or leads, substantially in the manner and for the purpose described.

7. In combination with a lead and rule holder substantially such as described, provided with lateral openings for the removal of the leads or rules, an end line-support consisting of an anti-friction roller supported substantially in the manner and for the purpose described.

8. In combination with a lead and rule holder substantially such as described, provided with lateral openings for the removal of the leads or rules, an end line-support which is adjustable in position with relation to the length of the leads or rules, substantially in the manner and for the purpose described.

383,960. LEAD AND RULE HOLDER. A. AUGUSTUS LOW, Brooklyn, assignor to the Alden Type Machine Company, New York, N. Y. Filed Dec. 16, 1886. Serial No. 221,716. (No model.)

Claim.—1. In a lead and rule holder substantially such as described, a floor-piece which is adjustable longitudinally, substantially in the manner and for the purpose described.

2. In a lead and rule holder substantially such as described, the combination and arrangement, with the floor-piece C, pivotally suspended at its front end and provided at its rear end with the swinging catch or lever E, of the concentric segment D, formed with the longitudinal slot d, having lateral notches d', for the reception and support of the said lever E, substantially in the manner and for the purpose described.

3. In a lead and rule holder substantially such as described, the combination, with a floor-piece pivotally suspended at its front end, of the concentric segment D, formed with the slot d and provided with the adjusting-screw d', arranged and operating substantially in the manner and for the purpose described.

4. In a lead and rule holder substantially such as described, the floor-piece C, formed with the central groove, c^3, and series of perforations c^4, for the purpose and substantially in the manner described.

5. In a lead and rule holder substantially such as described, the combination, with a floor-piece formed with a series of perforations, substantially as described, of a line-follower provided with an adjustable stop adapted to engage the said perforations, for the purpose and substantially in the manner set forth.

6. In a lead and rule holder substantially such as described, a floor-piece formed with a forward extension substantially at right angles to the position of the leads or rules upon the said floor, substantially in the manner and for the purpose described.

7. In a lead and rule holder substantially such as described, the combination, with the floor-piece formed with the forward extension, substantially as described, of the adjustable lower front line end rest or support arranged and operating substantially in the manner and for the purpose described.

8. In a lead and rule holder substantially such as described, the combination, with the adjustable floor-piece pivotally suspended at its front end, of the concentrically-adjustable upper front line end support, b, arranged and operating substantially in the manner and for the purpose described.

9. A lead and rule holder substantially such as described, formed with a back plate or cover, F, at its rear end, the upper extremity of which is pivotally connected to the holder in such manner as to permit of the lower end being swung outward laterally, for the purpose and substantially in the manner described.

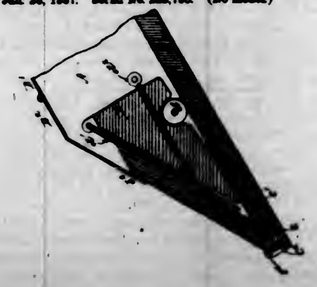
10. In a lead and rule holder substantially such as described, the sliding cover G, formed with the horizontal plate g, and forward extension, G^2, the latter projecting downward at an angle substantially the same as that of the inclination of the leads and rules in the compartment and inclosing the space above the transverse front guard, b, in combination with the latter and with the inclined parallel side walls of the holder, for the purpose and substantially in the manner described.

11. In combination with a lead and rule holder substantially such as described, the sliding cover G, formed of the horizontal plate g and extension g^2, and provided with the adjustable plate g^3, substantially in the manner and for the purpose described.

12. In a lead and rule holder substantially such as described, the sliding cover G, consisting of the inclined front portion, g^2, projecting downward from the main portion g, which runs between parallel guides a^7 a^7, and is formed with a longitudinal slot, g', and is provided with a set-screw, G', engaging the frame of the holder for the purpose of securing the cover rigidly in a prescribed position, substantially in the manner and for the purpose described.

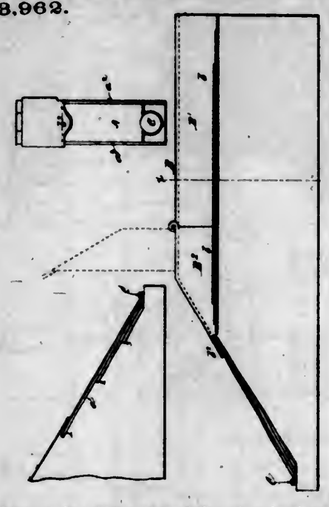
13. In a lead and rule holder substantially such as described, the side bearing, L, formed with the gage L' and receding backward and downward from that point, substantially in the manner and for the purpose described.

883,961. LEAD AND RULE HOLDER. A. AUGUSTUS LOW, Brooklyn, assignor to the Alden Type Machine Company, New York, N. Y. Filed Dec. 22, 1886. Serial No. 222,262. (No model.)



Claim.—1. The combination, in a lead and rule channel or compartment substantially such as described, of the side walls formed with inclined front edges, and a parallel front plate for supporting the upper end of the last lead or rule in the line, the said front plate being supported from above, so as to leave a free space upon both sides, for the purpose and substantially in the manner described.

2. In a lead and rule holder substantially such as described, formed with the open front end and with side walls the front edges of which are inclined and parallel, an inclined front plate parallel to the said front edges of the side walls, supported by means substantially such as described, by which it may be adjusted toward or from the said front edges of the side walls, substantially in the manner and for the purpose described.



3. In a lead and rule holder substantially such as described, formed with the open front end and with side walls the front edges of which are inclined and parallel, an inclined front plate supported above and parallel to the said front edges of the side walls by means substantially such as described, which admit of its being adjusted in position vertically to increase or diminish the open space between its lower end and the floor of the holder, substantially in the manner and for the purpose described.

4. In a lead and rule holding and presenting channel substantially such as described, the bottom spine or stiffener, G, situated underneath the floor of the channel and having the lower end line-support attached to its front end and being secured between the walls of the channel by means which permit of its being adjusted longitudinally, substantially in the manner and for the purpose described.

383,962. LEAD AND RULE HOLDER. A. AUGUSTUS LOW, Brooklyn, assignor to the Alden Type Machine Company, New York, N. Y. Filed Jan. 26, 1887. Serial No. 225,780. (No model.)

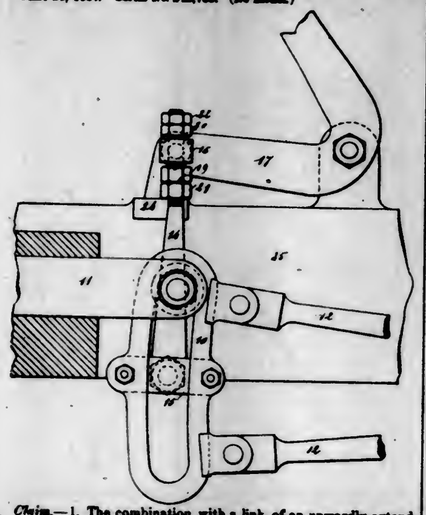
383,962.

Claim.—1. In a device substantially such as herein set forth for holding and presenting leads and rules, the combination, with a rear end line-support and a lower front end line-support for imparting a prescribed inclination to the leads or rules, substantially as described, of the right-hand-side wall having its front edge formed at a steeper degree of inclination than that at which the leads or rules are controlled, for the purpose and substantially in the manner described.

2. In a device substantially such as herein set forth for holding and presenting leads and rules, the combination, with the movable rear end line support or follower and the front end line-support for imparting a prescribed inclination to the leads or rules, and with the right-hand-side wall having its front edge formed at a steeper inclination than that at which the leads or rules are controlled, of the left-hand-side wall formed with the series of offsets, substantially in the manner and for the purpose described.

3. In a device substantially such as herein set forth for holding and presenting leads and rules, the combination, with a movable rear end line support or follower, of the lower front end line-support, consisting of the screw G, a portion of the head of which projects above the floor-surface to form the lower front end line support or rest, substantially in the manner and for the purpose described.

4. In a device substantially such as described for holding and presenting leads and rules, the combination, with a front and line-support, of a movable rear end line support or follower provided with a line-end bearing-surface plate which is hinged to the top of the follower and is adjustable thereon in inclination by means of a set-screw impinging against the under side of the said bearing-plate, for the purpose and substantially in the manner described.



5. In a device substantially such as described for holding and presenting leads and rules, the cover or top B, provided with the overlapping flaps b b and formed in two sections, B' B^2, the front section, B^2, being formed with the upper end line-bearing surface, b^2, and being hinged to the rear section, B', substantially in the manner and for the purpose described.

6. In a device substantially such as herein designated for holding and presenting leads and rules, the combination, with a front end line-support and with a movable rear end line-support, of the front edges, a^2 a^2, of the side walls having their inner edges beveled, for the purpose and substantially in the manner described.

7. In a device substantially such as herein designated for holding and presenting leads and rules, the combination, with a movable rear end line-support provided with an anti-friction roller, of the hinged rear end floor-extension, E, formed with the groove e, for the reception and retention of the lower perimeter of the said anti-friction roller against lateral displacement, substantially in the manner and for the purpose described.

8. In a device substantially such as herein set forth for holding and presenting leads and rules, the combination, with a movable rear end line-support provided with an anti-friction roller, of the hinged rear floor-extension, E, formed with the recess or depression e', for the reception and retention of the lower perimeter of the said anti-friction roller against longitudinal movement, substantially in the manner and for the purpose described.

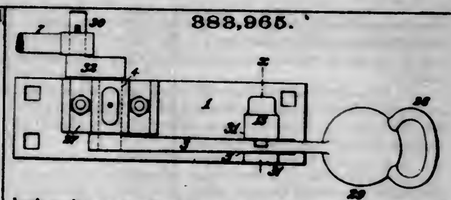
383,963. VALVE-GEAR. ROBERT MACKAY, Warren, Pa. Filed June 28, 1887. Serial No. 242,723. (No model.)

Claim.—1. The combination, with a link, of an upwardly-extending rod connected thereto, an operating-lever, a swivel-eye, and stops carried by the upwardly-extending rod upon either side of the swivel-eye, substantially as described.

2. The combination, with a link, 10, arranged for connection with a valve-stem and eccentric-rods, of a rod, 14, a lever, 17, a swivel-eye, 16, carried by the lever 17, nuts 19 and 20, arranged upon either side of the swivel-eye and engaging the rod 14, and jam-nuts 21 and 22, substantially as described.

3. The combination, with a link arranged for connection with a valve-stem and eccentric-rods, of a rod, 14, connected to the link-block, a lever, 17, formed with a foot, 23, a table upon which said foot rests, a swivel-eye, 16, carried by the lever 17, the rod 14, passing through said eye, and lock-nuts carried by the rod upon either side of the swivel-eye, substantially as described.

383,964. BOTTLE-WASHER. JOHN C. HACKSTORM, Erie, Pa., assignor of one-half to A. Fred. Tillotson, same place. Filed Oct. 3, 1887. Serial No. 251,243. (No model.)



Claim.—1. The combination, in a portable bottle-washer, of a screw-threaded collar, having a diaphragm and a central jet-tube secured in said diaphragm, with a hood secured to said collar and surrounding said jet-tube, substantially as and for the purpose set forth.

2. The combination, in a portable bottle-washer, of a collar, C, having a tapering jet-tube, F, adapted to enter a bottle-neck, secured to one end thereof, with a conical hood, A, secured at its apex to the collar C, and adapted to cover and surround a bottle-neck when the jet-tube F is inserted therein, substantially as and for the purpose set forth.

383,965. RAILROAD-SWITCH LOCK. WILLIAM T. MANNING, Pittsburg, Pa., assignor of one-half to I. H. Kellough, same place. Filed Mar. 14, 1883. Serial No. 267,169. (No model.)

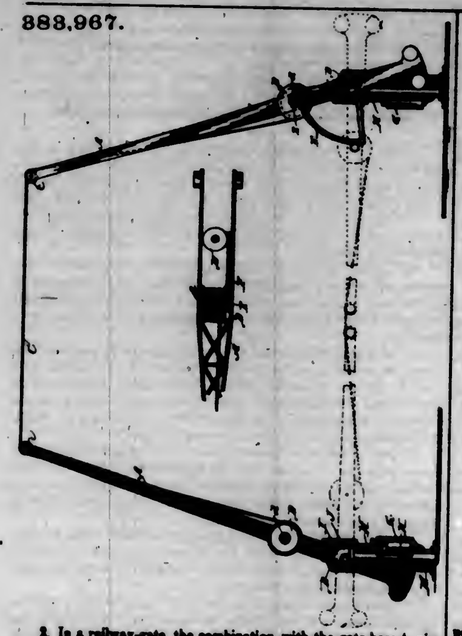
Claim.—The combination of a switch-stand having a horizontal base-plate and a bearing for the shaft of a switch-lever, a switch-lever

having a lateral recess and journaled in said bearing, a weight fixed to said lever and acting to retain the same in position to effect either desired adjustment of the switch-rails, a lock-case fixed relatively to the base-plate of the switch-stand, and a spring locking-bolt fitted to slide in said case transversely to the plane of movement of the switch-lever and adapted to engage the recess thereof when the lever is thrown into main-track position and held by the gravity of the weight, substantially as set forth.

383,966. WHEEL. HENRY G. MANNING, Albuquerque, N. Mex., assignor to himself, August Traviesa, and Michael Blandel, all of same place. Filed Dec. 20, 1887. Serial No. 258,467. (No model.)

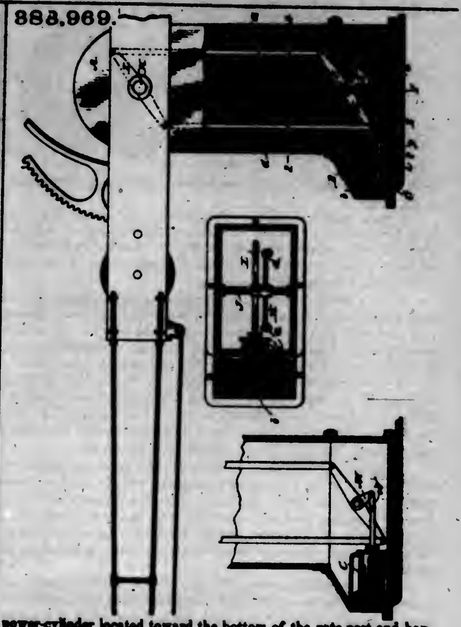
Claim.—1. The combination, with a hub having opposing and spaced peripheral recesses, of spokes provided with bifurcated inner ends filling said recesses, a felly engaging the outer ends of the spokes, cap-plates clamping the bifurcated extremities of the spokes, and means, substantially as described, for drawing the cap-plates toward the center of the hub, whereby the spokes are clamped to the hub and felly, as set forth.

2. The combination, with a hub having opposing and spaced peripheral recesses, of spokes provided with bifurcated inner ends filling said recesses and angular outer ends, a felly having a polygonal inner face, the angles whereof correspond to the number of spokes and their angular outer ends, cap-plates engaging the bifurcated extremities of the spokes, and means, substantially as shown and described, for drawing the cap-plates toward the center of the hub and compressing the bifurcated ends of the spokes, as set forth.



3. The combination, with a hub provided with a series of opposing and spaced peripheral recesses, and an interior chamber having polygonal walls, and head-blocks inserted in said chamber, of a contour corresponding to the walls thereof and apertured to receive the axle-box, of spokes provided with bifurcated inner ends fitting said recesses and having angular outer ends, a felly having a polygonal inner face, the angles whereof correspond to the number of spokes, and cap-plates secured to said head-blocks and engaging the bifurcated extremities of the spokes, substantially as shown and described.

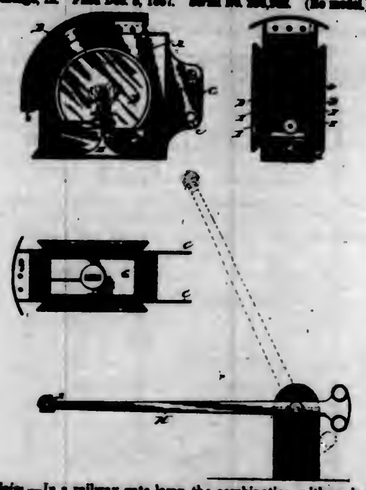
4. The combination, with a hub provided with a series of opposing and spaced peripheral recesses, and an interior chamber having polygonal walls, and head-blocks inserted in said chamber, of a contour corresponding to the walls thereof and apertured to receive an axle-box, of spokes provided with bifurcated inner ends fitting said recesses and having angular outer ends, a felly having a polygonal inner face, the angles whereof correspond to the number of spokes, cap-plates to said head-blocks, engaging the bifurcated extremities of the spoke, and bolts passing through the cap-plate, head-blocks, and hub, provided with a suitable head and nuts, all adapted to operate substantially as and for the purposes herein set forth.



383,967. TIE FOR RAILWAY-GATES. ALEXANDER J. McDONALD, Chicago, Ill. Filed Nov. 5, 1887. Serial No. 254,446. (No model.)

Claim.—1. The combination, in a railway-gate, of gate-bars pivoted upon supports and adapted to be turned upon their pivots to open and close the crossing, drums mounted upon said bars toward their pivotal points, pinions secured to turn with said drums, and toothed segments, with which said pinions mesh, secured to a fixed part of the gate, and a cable secured to the drums and passing over sheaves secured to the gate-bars toward their outer ends, whereby the swinging of the gate-bars operates to take up and pay out the cable, substantially as described.

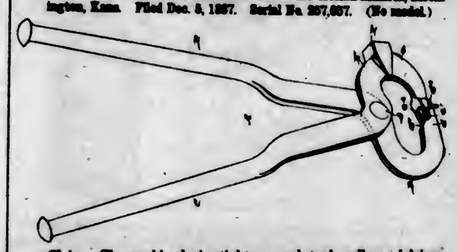
383,967.



383,969.

2. In a railway-gate, the combination, with the gate-bars A, pivoted to posts B, of a cable, C, sheaves c at the ends of the gate-bars, drums D, mounted on said bars and carrying pinions E, which pinions mesh with segments F, secured to a fixed part of the gate, whereby the swinging of the gate-bars operates to rotate the drums and to pay out and take up the cable, substantially as set forth.

383,968. RAILWAY-GATE LAMP. ALEXANDER J. McDONALD, Chicago, Ill. Filed Dec. 6, 1887. Serial No. 256,982. (No model.)



Claim.—In a railway-gate lamp, the combination, with an inclosing-case, A, provided with an attaching bracket or brackets, C, and having transparent side portions, D, and a ventilator, E, of a lamp suspended within said case by means of the standards E E, carrying the studs *e e* and the swinging arms F F, substantially as described.

383,969. RAILWAY-GATE. ALEXANDER J. McDONALD, Chicago, Ill. Filed Dec. 6, 1887. Serial No. 257,004. (No model.)

Claim.—1. The combination, in a railway-gate, of a pivoted gate-bar, a cross-beam secured to and turning with the gate-bar, a power-cylinder located toward the bottom of the gate-post and having a horizontally-reciprocating piston-rod, a rock-shaft having secured thereto a second cross-beam, suitable connecting devices between the piston-rod and said rock-shaft, whereby the latter is rocked, and links connecting said cross-beams on both sides of their centers of oscillation, substantially as described.

2. The combination, in a railway-gate, of a gate-bar pivoted upon a rock-shaft, a cross-beam secured to said rock-shaft, a power-cylinder having a horizontally-reciprocating piston-rod provided with a rack, a segment secured upon a second rock-shaft and adapted to be operated by the piston, a cross-beam secured to said last-named rock-shaft, and links connecting said cross-beams on both sides of their centers of oscillation, substantially as described.

383,970. COMBINED WIRE-TIGHTENER AND STAPLE DRIVER AND EXTRACTOR. FRANKLIN G. MCELHENY and HOMER MARVIN, Huntington, Kans. Filed Dec. 5, 1887. Serial No. 257,057. (No model.)

Claim.—The combined wire-tightener and staple puller and driver, having the jaws D E, the end of the jaw D forming a point, *d*, having a concave inner edge, *d'*, and an inwardly-turned point, d^2, and the end of the jaw E being pointed and widened laterally, made slightly concave on its lower edge, and provided with a longitudinal notch or recess, d^3, the floor d^4 of said recess being convex and corresponding to the concave edge of the point *d*, substantially as specified.

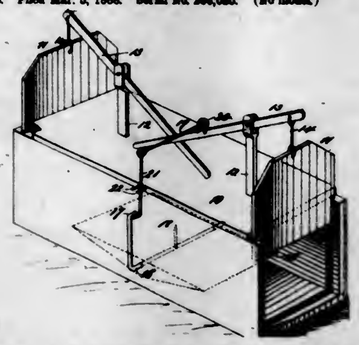
383,971. BLOW-PIPE FURNACE. FRANCIS J. MCLAREN, New York, N. Y. Filed July 26, 1887. Serial No. 245,313. (No model.)

Claim.—1. In a muffle-furnace, in combination, a refractory jacket or body-piece having a chamber with a front opening and a longitudinal opening extending through the upper side and the rear end, a muffle supported within the chamber, and a cover for closing the upper part of the longitudinal opening, whereby the muffle is preliminarily heated through the upper part of the longitudinal opening, which is then closed by the cover, and the operation completed by the

383,971.

heating-flame being directed through the rear opening, substantially as set forth.

2. In a muffle-furnace, in combination, a refractory jacket or body-piece having a chamber extending entirely through it, a muffle provided with a stopper supported within the chamber, and a deflecting-block placed in front of the chamber, partly closing the exit end of the same, substantially as set forth.



3. In a muffle-furnace, in combination, a refractory jacket or body-piece having a chamber extending entirely through and provided with a central stud, a muffle supported within the chamber, and a slab provided with a hole into which the stud of the jacket extends, whereby the jacket is held free to rotate on the slab, substantially as set forth.

4. In a muffle-furnace, in combination, the refractory jacket or body-piece *a*, provided with the chamber *b*, extending entirely through it, the muffle *j*, supported within the chamber on the frames *d* and *e*, and the flange *k*, extending from and around the front end of the muffle, so as to nearly close the chamber, substantially as set forth.

5. In a muffle-furnace, in combination, the refractory jacket or body-piece *a*, having a chamber, *b*, extending entirely through it, the muffle *j*, supported within the chamber on the frames *d* and *e*, the flange *k*, extending from and around the front end of the muffle, so as to nearly close the chamber, and the deflector *o*, placed in front of the chamber and extending partly within the same, substantially as set forth.

6. In a muffle-furnace, in combination, a refractory jacket or body-piece having a chamber with a front opening and a longitudinal opening extending through the upper side and the rear end, a muffle supported within the chamber and provided with a flange extending from and around its front end, a cover for closing the upper part of the longitudinal opening in the jacket, a deflector placed in front of the chamber, and a slab upon which the jacket is held free to rotate, substantially as set forth.

383,972. ANIMAL-TRAP. CHARLES H. MITTLER, Marthasville, Mo. Filed Mar. 3, 1888. Serial No. 266,095. (No model.)

Claim.—1. In an animal-trap, the combination, with the rectangular box 10, having vertical grooves at its open ends, and doors 11, sliding in said grooves, of the pivotally-supported levers 13, and the links 14, connecting said levers loosely with the sliding doors, the cross-bar 19, the hook 21, the tilting platform 15, and an upwardly-extending hook, 17, rigidly connected to said platform and adapted to engage the hook 21, substantially as shown and described.

2. In an animal-trap, the combination, with the rectangular box 10, having vertical grooves at its open ends, and the doors 11, sliding in said grooves, of the levers 13, the standards 12, supporting said levers, the link 14, which loosely connects the lever with the sliding door, the cross-bar 19, the hook 21, the tilting platform carrying the bait-pin 18, and the upwardly-extending hook 17, rigidly connected to said platform and adapted to engage with the hook 21, substantially as shown and described.

383,973. ADDING-MACHINE. CHARLES C. MOORE, New York, N. Y., assignor to Jacob B. Moore, same place. Filed Aug. 18, 1887. Serial No. 247,273. (No model.)

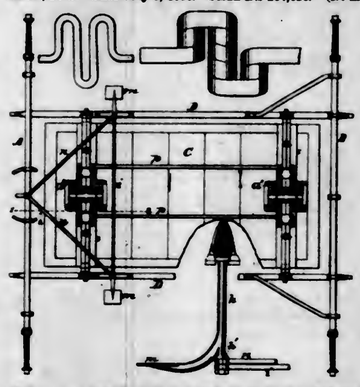
383,973.

Claim.—1. In an adding device, the combination, with a numbering-disk and rack for turning the same, of sliding plates operated by the said numbering-disk, and a second numbering-disk also operated by the sliding plates for carrying the tens, substantially as described.

2. The side plates, F F', plate G, apron H, plate G', and pawl J, in combination with the numbering-disk B and the operating-bar D, substantially as described.

3. The side plates, F F', numbering-disk B, bar D, plates G G', constructed to be moved longitudinally by the disk B and the pawl J, in combination with another frame carrying similar parts, the pawl J engaging with the next adjoining numbering-disk, substantially as described.

4. In a numbering device, the numbering-disk B, provided with a side pin, A, and means for revolving the disk, in combination with the side plates, F F', and the plates G G', the latter provided with a pawl, J, said plates, G G' being formed, respectively, with shoulders h' h^2 to receive the impact of the said pin h for reciprocating the plates G G', substantially as and for the purposes set forth.



5. The side plate, F, provided with a locking-pawl, K, in combination with the numbering-disk, the operating-bar D, for revolving the same and notched for receiving the locking-pawl, and the united plates G G', the plate G being provided with a pin, *n'*, for operating the pawl K, substantially as described.

6. The sliding bars D, notched at *m*, in combination with the numbering-disks, the plates G G', the pivoted locking-pawls K, and pins *n'*, attached to the plates G and entering a diagonal slot in the said locking-pawls, substantially as described.

7. In a numbering-machine, the combination, with the numbering-disks, the bars D, for turning the same, the ratchet-wheel and ratchet and pawl for locking the disks from backward movement, the sliding plates G G', and the disk B, provided with the pins A, for reciprocating the plates G G', of the pawls J and the apron H, substantially as described.

8. In a numbering-machine, the combination, with the numbering-disks, the bars D, for turning the same, the ratchet-wheel and ratchet and pawl for locking the disks from backward movement, the sliding plates G G', and pins A, for reciprocating the plates G G', of the pawls J, for communicating motion to the neighboring numbering-disks, and the locking-pawls K, for locking the bars D, substantially as described.

383,974. VEHICLE SPRING AND GEAR. EVERETT P. MOSES, Ithaca, N. Y. Filed July 3, 1886. Serial No. 207,089. (No model.)

Claim.—1. A vehicle-spring consisting of two oppositely-extending supporting-arms supported at their remote ends and pivotally connected to the body on opposite sides of its central line at their adjacent ends, and an elastic rod or bar which is either a continuation of or has its ends rigidly attached to and extends continuously and freely between the butt-ends of said arms, said rods being formed into two or more nearly or quite parallel horizontal torsional branches arranged between the axes of said central pivotal connections and extending transversely to said arms, substantially as described.

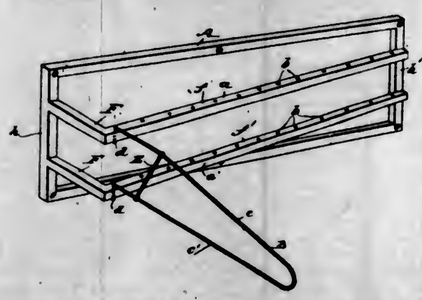
2. A vehicle-spring consisting of two oppositely-extending arms

supported at their remote ends and pivotally connected to the body on opposite sides of its central line at their adjacent ends, and an elastic rod or bar which is either a continuation of or has its ends rigidly attached to and extends continuously and freely between the butt-ends of said arms, said rods being formed into two or more nearly or quite parallel horizontal coils arranged between the axes of said central pivotal connections and extending transversely to said arms, substantially as described.

3. A vehicle-spring consisting of two elastic rods or bars having their ends pivotally connected to the side bars of a side-bar wagon, their central portions formed into oppositely-extending torsional branches, and the portions extending outward from said branches similarly formed, clamped together, and pivotally connected to the body on opposite sides of said branches, substantially as described.

4. A vehicle-spring consisting of two elastic rods or bars having their ends pivotally connected to the side bars of a side-bar wagon and their central portions formed into similar coils *d' d'*, and the portions extending outward from these coils similarly formed and closely clamped together by clamps *d' d'*, adapted to pivotally connect said rods to the body at two points on opposite sides of the longitudinal central line of the body, said coils lying between the axes of the central bearings and being free to yield to the movements of both arms, substantially as and for the purpose described.

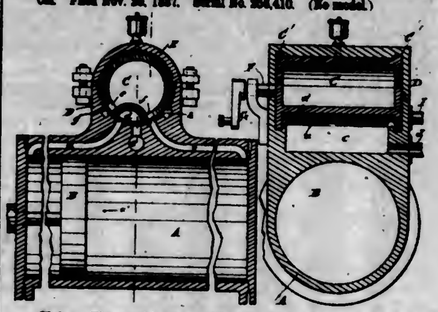
5. The combination, with a vehicle-spring bearing or joint, of a series of small cylindrical rollers inserted between the bearing-surfaces of said joint and parallel to its axis, whereby as one of said surfaces moves relatively to the other said small cylinders are adapted to roll between them, substantially as described.



6. The combination, with the axles and side bars of a side-bar wagon, of dependent arms having their upper ends rigidly attached to said side bars, stops *m*, securely affixed to the lower ends thereof, and rods or bars securely attached to and extending between the lower ends of said arms and the lower end of the axis about which the front axle turns, substantially as described.

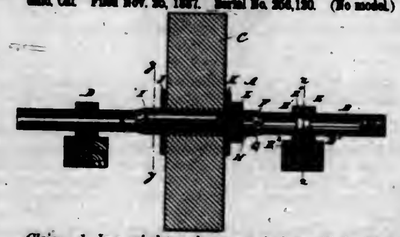
7. The combination, with the side bars and axles of a side-bar wagon, of dependent arms extending from and having their upper ends securely attached to said side bars, and a horizontal truss consisting of members diverging from its opposite ends, which are connected with and supported by the lower ends of said arms, the central part of said truss being connected to and staying the lower end of the axis about which the front axle turns, substantially as described.

8. The combination, with the side bars and axles of a side-bar wagon, of dependent arms having their upper ends securely attached to said side bars, rods diverging in two branches from and securely attached to the lower ends of said arms, the one branch extending to and pivotally connected with the lower end of the axis about which the front axle turns, the other extending between and connecting said arms, substantially as described.



9. The combination, with the axles and side bars of a side-bar wagon, of arms A, having their upper ends securely attached to said side bars, and stops *m*, affixed to their lower ends, rods *n n*, securely attached to and extending between the lower ends of said arms and the lower end of the axis about which the front axle turns, and rod *i*, securely attached to and extending directly between the lower ends of said arms, substantially as described.

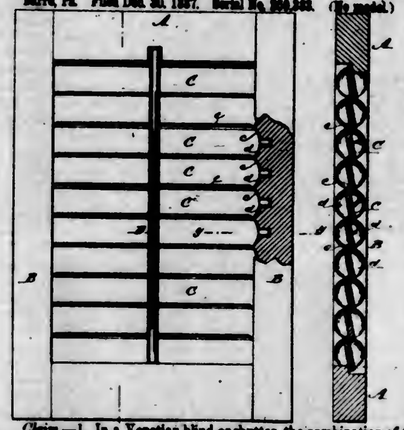
383,975. RACK FOR EXHIBITING GOODS. ADOLPH HERVILLE, St. Louis, Mo., and ALBERT BAER, New York, N. Y.; said Baer assignor to Tillie Baer, New York, N. Y. Filed Jan. 10, 1888. Serial No. 260,302. (No model.)



Claim.—The vertical frame A, having horizontal arms F F at right angles to the said frame, and the pierced horizontal diagonal supports or bars *f f'*, in combination with the arms B B, bent to form the members *c d* and hooks *d*, substantially as described.

383,976. ROTARY VALVE. JAMES O'DONNELL, San Francisco, Cal. Filed Nov. 20, 1887. Serial No. 256,410. (No model.)

Claim.—The combination, with the valve casing or chest E, having ports *g h a c b* in its bottom, and the cylinder A, to which the ports *a b* lead, of the tubular valve C, having a transverse cavity, *d*, in its under side connecting the port *c* with port *a* or *b* and ports *e f* at opposite sides of the cavity *d*, below the median line of the valve, and connecting ports *b g* or *a h*, substantially as set forth.

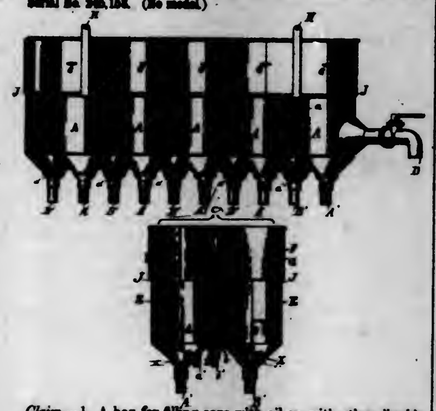


383,977. GRINDSTONE-HANGER. DENNIS O'LEARY, San Bernardino, Cal. Filed Nov. 25, 1887. Serial No. 256,120. (No model.)

Claim.—1. In a grindstone-hanger, a shaft provided with a split portion having an oblong cross-section and supporting the stone, substantially as shown and described.

2. In a grindstone-hanger, the combination, with a shaft having a split portion formed by a diametrical slot, of a key held in said slot, washers held on said oblong portion, and between which is held the grindstone, and a nut screwing on the threaded portion of said slotted oblong part of the shaft, substantially as shown and described.

383,978. VENETIAN BLIND. SAMUEL S. PATTERSON, Wilkesbarre, Pa. Filed Dec. 30, 1887. Serial No. 259,283. (No model.)



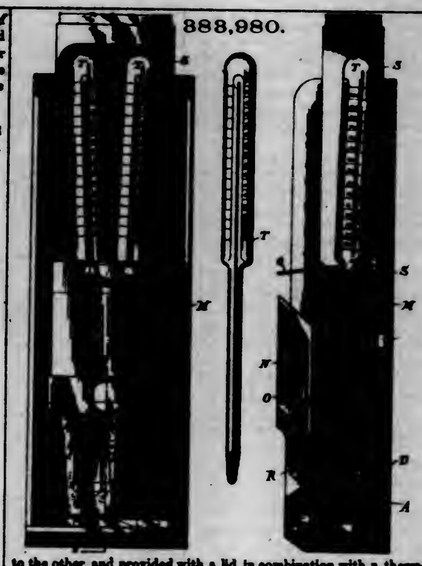
Claim.—1. In a Venetian blind or shutter, the combination of the side bars of the frame having a series of adjoining concave cavities, and the pivoted slats having their ends curved from edge to edge in the direction of their width, and fitting in and filling said cavities from edge to edge, substantially as described.

2. An improved Venetian blind or shutter, the combination of the

frame A B, the side pieces, B, of which are provided with the series of concave adjoining cavities, *d*, and the slats C, having their ends curved from edge to edge in the direction of their width, and their upper overlapping margins, *c*, straight and provided with the pivots *b*, the said curved ends fitting in the cavities and filling the same from edge to edge, substantially as herein shown and described.

383,979. BOX FOR FILLING CANS WITH OIL OR OTHER LIQUIDS. GEORGE H. PERKINS, Philadelphia, Pa. Filed July 26, 1887. Serial No. 245,158. (No model.)

Claim.—1. A box for filling cans with oil or with other liquids, provided with one or more series of adjacent compartments of a given size and with a like number of series of a like number of smaller adjacent compartments of a given size, each of said compartments of each of said series having at its lower end an outlet for permitting the escape of the oil from said compartment to a can, said compartments at their upper ends being provided with a compartment common to the compartments of all of said series, as and for the purpose specified.

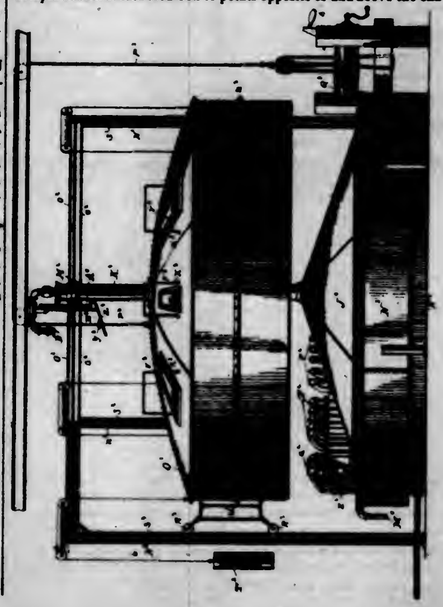


2. A box for filling cans with oil or with other liquids, provided with one or more series of adjoining compartments of a given size and with a like number of series of a like number of smaller adjoining compartments of a given size, each of said compartments of each of said series having at its lower end an outlet for permitting the escape of the oil from each of said compartments to a can, said compartments at their upper ends being provided with a compartment common to all the compartments of all of said series, in combination with vertically-adjustable displacing-blocks, as specified.

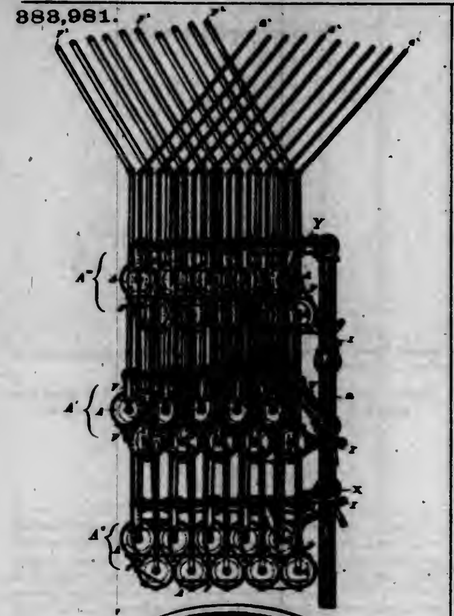
383,980. DEVICE FOR TESTING THE PHYSICAL CONDITION OF LIQUIDS AT GIVEN TEMPERATURES. GEORGE H. PERKINS, Philadelphia, Pa. Filed July 26, 1887. Serial No. 245,159. (No model.)

Claim.—1. A device in which to determine the physical condition of oil and other liquids at given temperatures, which consists in a transparent glass block provided with two or more bores in proximity to each other, having a partition of glass between them, and provided with a lid, one of the faces of which is plain and the other of which is provided with a transverse slot or channel adapted to form a passage between said bores, as and for the purpose specified.

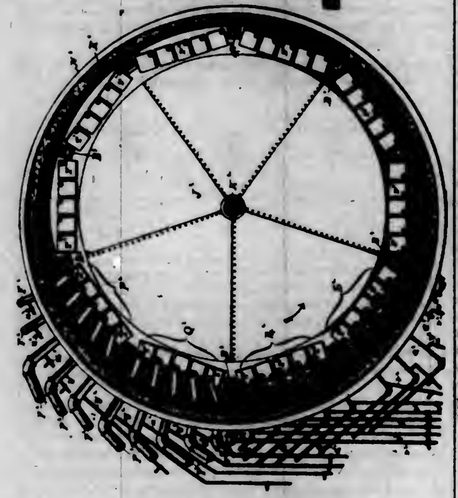
2. A device in which to determine the physical condition of liquids or liquefied solids at given temperatures, which consists in a transparent glass block provided with two or more bores parallel and in proximity to each other, having a partition of glass between them, and provided with a duct or channel leading from one of said bores



383,980.



to the other, and provided with a lid, in combination with a thermometer located within each of said bores, as and for the purpose specified.



383,981. MACHINE FOR FILLING CANS. GEORGE H. PERKINS, Philadelphia, Pa. Filed July 26, 1887. Serial No. 245,160. (No model.)

Claim.—1. In an apparatus for filling cans with liquids, in combination, a filling-box provided with a series of compartments of equal size and with a series of a like number of smaller compartments of equal size, the compartments of both of said series at their lower ends being provided with exit-orifices and valves, a turn-table provided with two or more series of cans supported upon its periphery, and feed-pipes leading from one series of said compartments of said filling-box to points opposite to and above the can-orifices of one series of cans on the turn-table, and feed-pipes leading from a second series of smaller compartments of said feed-box to points opposite to and above the can-

383,981.

orifices of an equal number of cans of a second and adjacent series of cans on the turn-table, as and for the purpose specified.

2. In an apparatus for filling cans with liquids, a filling-box provided with one or more series of compartments and with a like number of series of a like number of smaller compartments, all of said compartments being provided with outlet-orifices and with valves, each of the valves of each of said series of compartments being connected with one end of a wire or rope adapted to operate the same, the other end of said wire or rope being provided with a handle and with a guard so attached thereto as to be capable of adjustment to, at will, permit of or prevent said handle being grasped, said guard being provided with a wire or cord attached thereto for adjusting said guard into or out of contact with said handle, as specified.

3. In an apparatus for filling cans, in combination, a turn-table provided upon its periphery with one or more series of can-rests, each series having a like number of said rests, a series of feed-pipes, the exit ends of which open over and into the orifices of the cans of one or more of said series, a second series of an equal number of smaller feed-pipes, the exit ends of which open over and into the orifices of the next adjoining series of cans, as and for the purpose specified.

4. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and of which each has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the number of said compartments, and being, as to one half of their number, of greater diameter than the other half, said large and small conduits being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles which overhang the periphery of said turn-table, a metal hood or dome supported over the turn-table, and means for raising and lowering said dome, substantially as set forth.

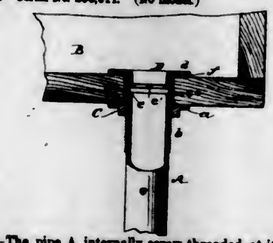
5. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and of which each has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the said given number of compartments, and being, as to one half their number, of greater diameter than the other half, said large and small conduits being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles overhanging the periphery of said turn-table, a metal hood or dome supported above the turn-table, provided with upwardly-opening doors in its top, means for raising and lowering said dome, and vertical guide-posts to guide it in its vertical movement, substantially as set forth.

6. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and of which each has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the said given number of compartments, and being, as to one half of their number, of greater diameter than the other half, said large and small conduits being at one end in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles and overhanging the periphery of said turn-table, a wall surrounding said turn-table and provided with a trough or water seal, a metal hood or dome supported above the turn-table, and means for vertically moving said dome into or out of said water seal, substantially as set forth.

7. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and of which each has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the said given number of compartments, and being, as to one half their number, of greater diameter than the other half, said large and small conduits being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles and overhanging the periphery of said turn-table, a water seal surrounding said turn-table, a metal hood or dome supported above said turn-table, means for lowering said dome into said water seal, so as to completely inclose said turn-table, and a hollow metal post upon which said turn-table is mounted, in communication, by means of a pipe, with a steam-supply, and provided, intermediate of its length, with steam-escape openings, substantially as described.

8. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and of which each has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the said given number of compartments, and being, as to one half their number, of greater diameter than the other half, said large and small compartments being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles, each size being grouped by itself and overhanging the periphery of said turn-table, a wall surrounding said turn-table, a metal hood or dome supported above said turn-table, means for lowering said dome upon said wall, so as to completely inclose said turn-table, a hollow metal post upon which said turn-table is mounted, in communication, by means of a pipe, with a steam-supply, and provided, intermediate of its length, with steam-escape openings, a valve seated in said steam-pipe and provided with a valve-lever, and a trip device connected to the dome, which, when the dome is lowered, acts upon the valve-lever and opens the valve, substantially as set forth.

9. In an apparatus for filling cans, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and of which each



has a valve-provided bottom opening, a turn-table adapted to support and hold in place a series of cans to be filled, provided with a handle whereby it may be rotated and with a device for locking it in given positions, a series of conduits equal in number to the said given number of compartments, and being, as to one half their number, of greater diameter than the other half, said large and small conduits being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles, each nine being grouped by itself and overhanging the periphery of said turn-table, substantially as set forth.

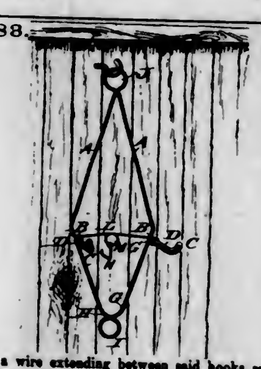
10. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and each of which has a valve-provided bottom opening, a series of conduits equal in number to the said given number of conduits, and being, as to one half of their number, of greater diameter than the other half, said large and small conduits being, at one end, in position to receive the discharge from the valve-openings of the large and small compartments, respectively, and at their other ends terminating in nozzles and overhanging the periphery of said turn-table, a metal hood or dome supported over said turn-table, means for raising and lowering said dome, and counter-balances connected with said dome, substantially as set forth.

11. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and each of which has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the said given number of compartments, and being, as to one half their number, of greater diameter than the other half, said large and small compartments being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles which overhang the periphery of the turn-table, and a valve located in each of said conduits to prevent the backflow of its contents, substantially as set forth.

12. In an apparatus for filling cans, in combination, a series of filling-boxes, each of which is divided into a given number of compartments, of which one half are of greater capacity than the other half, and each of which has a valve-provided bottom opening, a turn-table adapted to support a series of cans to be filled, a series of conduits equal in number to the said given number of compartments, and being, as to one half their number, of greater diameter than the other half, said large and small conduits being, at one end, in position to receive the discharge from the valved openings of the large and small compartments, respectively, and at their other ends terminating in nozzles overhanging the periphery of said turn-table, an adjustable drip-cup supported under each of said nozzles, and means for shifting them into and out of such position, substantially as set forth.

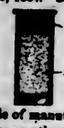
383,982. COMBINED PLUG AND FERRULE FOR WASH-TRAY CONNECTIONS. CORNELIUS J. PHILLIPS, New York, N. Y. Filed May 18, 1887. Serial No. 238,611. (No model.)

Claim.—The pipe A, internally screw-threaded at its upper end, enlarged in diameter at c^1, and externally screw-threaded at b, in combination with the ferrule D, formed with flange d, and externally screw-threaded to enter the top of the pipe, and the jam-nut C, placed upon the threads b, substantially as shown and described.



383,983. HARNESS-RACK. HENRY PHILLIPS and ALBERT H. EDWARDS, Wichita, Kans. Filed Nov. 15, 1887. Serial No. 255,242. (No model.)

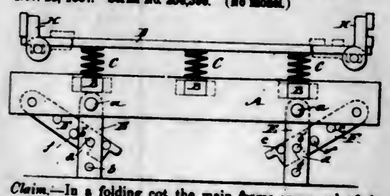
Claim.—1. The harness-rack herein described, provided with loops at its upper and lower ends and intermediate side and center hooks, substantially as described.



2. The harness-rack herein described, constructed of a single piece of wire having upper and lower loops formed therein and intermediate hooks formed on the sides of said rack, substantially as shown and described.

3. The harness-rack herein described, having upper and lower loops formed therein, intermediate side hooks, and a central hook suspended from a wire extending between said hooks, substantially as shown and described.

383,983.

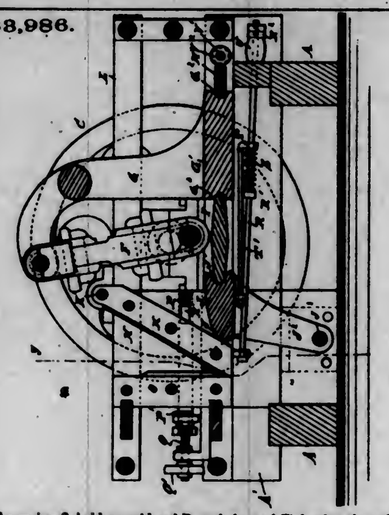


383,984. PHOTOGENIC CARTRIDGE. HENRY G. PIFFARD, New York, N. Y. Filed Oct. 19, 1887. Serial No. 252,784. (No model.)

Claim.—As a new article of manufacture, a photogenic cartridge containing a charge consisting partly of an easily ignited or explosive material of a nature and in a sufficient quantity to discharge the load of the cartridge and in part of powdered magnesium, which will be ignited by the combustion of the easily ignitible or explosive material and burned entirely at or near the mouth of the weapon, so as to produce at the place of discharge a magnesium light of great intensity, but momentary duration.

383,985. FOLDING COT. JOHN C. FOSTER, New York, N. Y. Filed Nov. 29, 1887. Serial No. 256,399. (No model.)

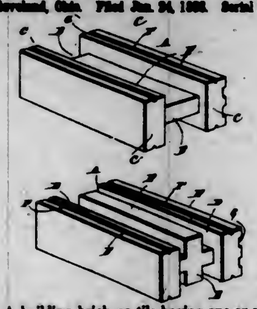
Claim.—In a folding cot, the main frame composed of the side beams, A A, cross-bars B B, supporting the springs and the slats held upon the same, and the folding legs E, pivoted to the side bars, A, and provided with the rounds b', in combination with the holding-arms F, each pivoted to the main side bars, A, on a line with the pivots of the legs E, and notched at d, and provided with the stop-pins f between the notch d and the pivot of the holding-arms, substantially as described.



383,986. BREAKER AND CRUSHER. FREDERICK L. PERRYMAN, Darien, Wis. Filed Apr. 27, 1887. Serial No. 236,320. (No model.)

Claim.—1. In a breaking and crushing machine, a fixed corrugated jaw, fixed side plates between which said jaw is held, and an inclined vibrating jaw pivoted at its upper end, in combination with a pivoted pushing-plate operating against the lower end of said vibrating jaw, a bent lever, the main shaft, the pitman connecting said bent lever and main shaft, and an intermediate link-plate connecting said pushing-plate with the lower plate of the bent lever, substantially as shown and described.

2. In a breaking and crushing machine, the combination, with the vibrating jaw K and the side plates, N, between which said jaw K operates, and having slots N', of the cross-bar P, held to slide in said slots N', the U-shaped arm P', connected at its outer ends with said cross-bar P, and the screw Q, having the hand-wheel Q', adapted to move said U-shaped arm forward and backward, so as to adjust the cross-bar P in relation to the jaw K, substantially as shown and described.

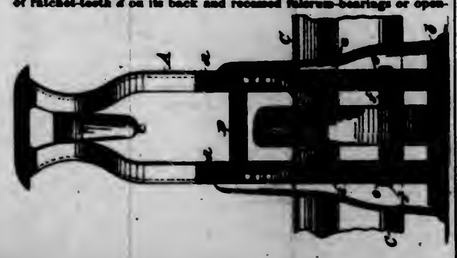


3. In a breaking and crushing machine, the vibrating jaw K, the adjustable cross-bar P, adapted to limit the return motion of said vibrating jaw K, and the swinging plate J, operating against the free end of said vibrating jaw K, mechanism for vibrating said plate J, in combination with the rod R, the spring U, held on said rod R and adapted to be pressed by the forward motion of said crushing-lever

383,986.

K, the spring S, held on said rod R, and the rod T, having the collar T, pressing the spring S by the forward motion of said swinging plate J, substantially as shown and described.

383,987. BRICK OR TILE FOR BUILDING PURPOSES. WILLIAM J. PETTEE, Cleveland, Ohio. Filed Jan. 24, 1888. Serial No. 261,712. (No model.)



Claim.—1. A building brick or tile having one or more longitudinal grooves and one or more ribs on its upper and lower sides, the said ribs having one or more shallow longitudinal grooves, as set forth.

2. A building brick or tile having one or more longitudinal grooves on its upper and lower sides, said grooves being separated by intervening ribs, one or more recesses at the ends, and one or more shallow grooves in the said ribs, as set forth.

3. A building brick or tile having a smooth outer face and provided on its inner face with one or more longitudinal grooves, one or more longitudinal grooves on the upper and lower sides of the brick or tile, said grooves forming intervening ribs, shallow grooves in said ribs, and one or more recesses at the ends of the brick or tile, as set forth.

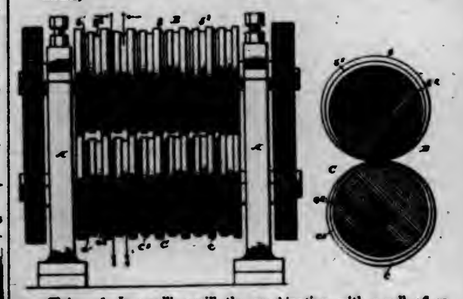
383,988. TRACK-LIFTER. GAVIN RAINNIE, Portland, New Brunswick, Canada. Filed Dec. 29, 1887. Serial No. 259,593. (No model.)

Claim.—1. In a track-lifter, the frame A, having opposite rows of ratchet-teeth d on its back and recessed fulcrum-bearings or open-

383,988.

ended slots e, arranged below said teeth, substantially as and for the purpose specified.

2. The combination of the frame A, having opposite rows of ratchet-teeth d on its back, and a series of recessed fulcrum-bearings or open-ended slots, e, arranged one below the other beneath the ratchet-teeth d, the claw bar or lever B, and its attached pawl D, essentially as shown and described.



383,989. CAR-WHEEL. WILLIAM G. RICHARDS, Brooklyn, assignor to the Peckham Car Wheel Company, New York, N. Y. Filed Dec. 20, 1887. Serial No. 259,326. (No model.)

Claim.—1. A car-wheel composed of a single piece of cast metal formed with annular internal cavities respectively around the hub and near the periphery, and sectoral cavities uniting the annular cavities, substantially as set forth.

2. The improved cast-metal wheel-body composed of the hub A, web-plates P P', peripheral ring a, and the ribs b b, extending part way across the interior of the wheel-body, all cast in one piece with the internal annular cavities, c c', and sectoral cavities d d, uniting the annular cavities, substantially as described and shown.

383,990. ROLLING-MILL. JOHN T. RICHARDSON, Harrisburg, Pa., and AARON RAPP, Holland, N. J., assignors of one-third to Alexander H. Ege, Mechanicsburg, Pa. Filed Dec. 16, 1887. Serial No. 258,069. (No model.)

Claim.—1. In a rolling-mill, the combination, with a roll, of an opposing reducing-roll, B, provided with a reducing-face having eccentrically-arranged grooves and eccentrically-arranged ribs, substantially as described.

2. In a rolling-mill, the combination, with a roll, of an opposing reducing-roll, B, provided with a reducing-face having eccentrically-arranged grooves and eccentrically-arranged ribs, the degree of eccentricity of the grooves and of the ribs varying, substantially as described.

3. In a rolling-mill, the combination, with a roll, C, of an opposing reducing-roll, B, provided with a reducing-face having grooves and

ribs both eccentrically arranged relatively to the axis of the roll, the least eccentricity and the greatest eccentricity of all of such grooves and ribs coinciding on the same lines parallel with the axis of the roll, substantially as described.

4. In a rolling-mill, the combination of the roll B, provided with a rolling-face having one or more grooves and ribs eccentrically arranged relatively to the axis of the roll, the lines of least and greatest eccentricity coinciding, and the roll C, having a rolling-face opposed to the rolling-face on roll B, and provided with grooves and ribs opposed to the grooves and ribs on rolls B, and arranged eccentrically to the axis of their roll, the lines of least and greatest eccentricity coinciding, the two rolls being geared together to bring the lines of least and greatest eccentricity of the ribs and grooves on their respective rolls opposite each other as the rolls are revolved, substantially as set forth.

5. In a rolling-mill, the combination, with a roll, C, of an opposing roll, B, provided with a rolling-face having one or more eccentrically-arranged grooves and eccentrically-arranged ribs, the least and the greatest eccentricity of such grooves and ribs coinciding on different lines parallel with the axis of the roll, while the degree of eccentricity varies, substantially as and for the purpose set forth.

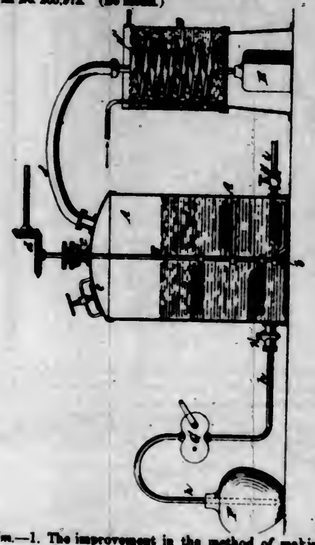
6. In a rolling-mill, the combination of the roll B, provided with a rolling-face having one or more eccentrically-arranged grooves and ribs, and a roll, C, having one or more eccentrically-arranged grooves and ribs opposed to the eccentrically-arranged grooves and ribs on the roll B, and having a groove concentric with the axis of said roll, substantially as set forth.

7. In a rolling-mill adapted to form tapering rails for railway-switches, the combination of the roll B, provided with a rolling-face having the eccentrically-arranged grooves $b' b^2$, and rib b^3 between said grooves, the greatest eccentricity of said grooves and ribs coinciding on a line parallel with the axis of the roll, and the roll C, having a rolling-face opposed to the rolling-face of roll B, and provided with the eccentrically-arranged groove c^2 and rib b^3, and the concentrically-arranged groove c', substantially as described.

8. In a rolling-mill adapted to form tapering rails for railway-switches, the combination of the roll B, provided with a series of rolling-faces having eccentric grooves $b' b^2$ and ribs b^3, the diameter and degree of eccentricity of said grooves and ribs varying progressively with each of the series of rolling-faces in the direction of the length of the roll, and the roll C, having a series of reducing-faces opposed to those on the roll B, and having the eccentric grooves c^2 and ribs c^3 and the concentric grooves c', the diameter and degree of eccentricity of ribs and grooves $c^3 c^2$ varying progressively in the direction of the length of the rolls, while the diameter or depth of groove c' remains uniform, substantially as set forth.

383,991. CAR-COUPLING. George M. Rogers, Worcester, Mass., assignor of two-thirds to Henry F. Arms and Charles G. Rusher, same place. Filed Apr. 14, 1888. Serial No. 270,694. (No model.)

Claim.—1. The within-described car-coupling, consisting of the draw-head A, provided with the lip *a*, the jaws B, formed with the lip *b* and upward extension B', and having the opening *f*, with flat top surface, *l'*, the pivot-pin E, and the locking-bar F, having the weighted offset-arm, and the flattened side I, as and for the purpose set forth.



2. The combination, as described, of the draw-head A, having the lip *a*, the jaw B, having lip *b* and upright back B', the locking-bar F, having the counterweighted head F' and flattened side I, the pivot E, and the chain J, and rocker-shaft G, with arm H, as and for the purpose set forth.

3. The combination, with the draw-head A and pivoted jaw B, having lips *a* and *b*, formed with backwardly-inclined inner surfaces, and the locking-bar F, arranged for working said jaw, as set forth, of the link-plate D, having upon one side thereof the shoulders *d*, formed with outwardly-inclined surfaces, as shown and described.

4. The plate D^2, having the backwardly-inclined shoulder d^3, and the eye e^2, pivoted at *l* in the side of the draw-head, in combination with the draw-head A, vertically-swinging jaw B, respectively provided with the lips *a* and *b*, and the counterweighted locking-bar F, as shown and described.

5. The combination, with the horizontally-pivoted jaw B, having the opening *f*, with flattened surface I', and the draw-head A, having cylindrical openings in its sides, of the locking-bar F, having the flattened surface I, cylindrical bearings *n n*, and counterweighted offset end, and the stop *m m'*, and chain J, for limiting the rotative movement of said bar, substantially as set forth.

383,992. MANUFACTURE OF CHLOROFORM FROM ACETONE. Gustav Ruhff, Frankfort-on-the-Main, Germany, assignor to Frank Rossiter and Jacob Hasslacher, New York, N. Y. Filed June 28, 1886. Serial No. 206,972. (No model.)

Claim.—1. The improvement in the method of making chloroform, consisting in adding acetone to chloride-of-lime solution in such quantities that the chloride of lime employed shall be more than five times the weight of the acetone employed, substantially as herein described.

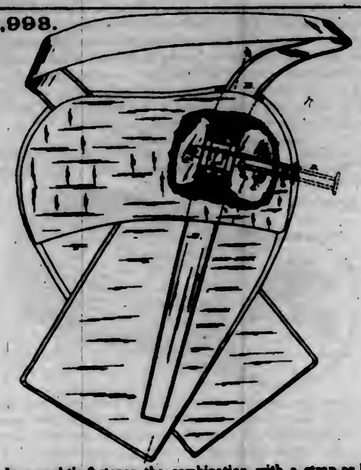
2. The improvement in the method of making chloroform, consisting in introducing acetone into a chloride-of-lime solution and in maintaining as nearly as possible a uniform temperature until the chloroform has been produced by the reaction, substantially as herein described.

3. The improvement in the method of making chloroform, consisting in introducing acetone into a chloride-of-lime solution, and in meanwhile stirring or agitating the solution to promote the thorough combination of the acetone with the chlorine of the solution, substantially as herein described.

4. The improvement in the method of making chloroform, consisting in introducing acetone in a dilute state into the chloride-of-lime solution, substantially as herein described.

5. The improvement in the method of making chloroform, consisting in introducing acetone into a vessel or still containing chloride-of-lime solution at a point below the surface of the chloride-of-lime solution, substantially as herein described.

6. The improvement in the method of making chloroform, consisting in introducing the acetone in a dilute state into a still containing chloride-of-lime solution and at a point below the surface of the chloride-of-lime solution, substantially as herein described.

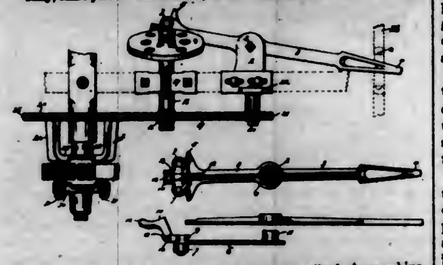


7. The improvement in the method of making chloroform, consisting in introducing the acetone periodically or at intervals of time during the operation into the still containing the chloride-of-lime solution and at a point below the surface of such solution, substantially as herein described.

8. The improvement in the method of making chloroform, consisting in introducing the acetone in a dilute state periodically or at intervals of time during the operation into a still containing chloride-of-lime solution and at a point below the surface of the chloride-of-lime solution, substantially as herein described.

383,993. BUCKLE-FASTENER. William R. Gardner, San Francisco, Cal. Filed Mar. 29, 1888. Serial No. 268,868. (No model.)

Claim.—1. The buckle-fastener herein described, which consists in a band or strap guiding tube, and a pin holding and guiding plate or arm connected to the said tube, and a retaining-pin adapted to operate and extend into the tube and pass through the strap or band to hold it in position, substantially in the manner specified.



383,998.

2. In a necktie-fastener, the combination, with a strap or band guiding tube, of an intersecting pin containing and guiding arm or plate, with means for securing the same to the necktie, which consists of thin metal arms bent upward and adapted to pass through the necktie-shield and be bent downward upon the face thereof, and a fastening-pin held in the guiding-arm, all operated substantially in the manner described.

3. In a necktie-fastener, the combination, with a guiding-tube and an intersecting guiding plate or arm having a pin or stop, of a pin composed of two arms or members, with one of the arms or members terminating in a bent end or hook to engage with a pin or stop in the guiding plate or arm in which the pin operates, as in the manner described.

383,994. DRILL ATTACHMENT FOR PLANTERS. Levi Scofield, Grand Haven, Mich., assignor to the Challenge Corn Planter Company, same place. Filed Mar. 6, 1888. Serial No. 266,178. (No model.)

Claim.—1. In a drill attachment such as described, the combination, with the feed-bar provided with stops or shoulders, of a lever for actuating said feed-bar, provided with tapering sides at the point of contact with said stops, substantially as described.

2. In a drill attachment such as described, in which the feeding devices are mounted upon a frame flexibly connected to another or main frame, the combination, with the feed-bar provided with stops, of the actuating-lever supported upon the main frame, and provided with the inclined or tapering engaging portion interposed between and acting against the stops on the feed-bar, substantially as described.

3. In a drill attachment such as described, and in combination with the feed-bar, a lever and a link or plate supported upon coincident axes, driving mechanism for reciprocating the link, and a catch or dog connecting said lever and link, substantially as described.

4. In a drill attachment such as described, the combination, with the seeding devices, of the lever provided with the notched segmental end, the pivoted link, guides or ways connecting said link and lever to permit the one to vibrate independently of the other, and a dog or latch for connecting said link and lever to cause them to vibrate in unison, substantially as described.

5. In a drill attachment such as described, and in combination with the feeding mechanism, a lever for actuating the latter pivotally supported upon a link concentric with the pivot of the latter, a clutch or catch for connecting said link and lever, and devices acting upon the link to reciprocate the latter, substantially as described.

6. In a drill attachment such as described, the combination, with the feeding devices mounted on the runner-frame, of a lever mounted upon the main frame and provided at one end with the tapering sides engaging the feed-bar and at the opposite end with a notched segmental plate, the link pivotally supported on an axis concentric with that of the lever, guides, and a catch or dog connecting the lever and link, and a cam engaging the link to reciprocate the latter, substantially as and for the purpose set forth.

7. In a drill attachment such as described, the combination, with the actuating-lever for operating the feeding devices, of an independently-reciprocating link connected to the lever by a detachable dog or catch, and a cam-disk operating between pins or rollers on said link, substantially as described.

8. In a drill attachment such as described, the combination, with the actuating-lever provided with the notched arc-shaped plate, of the reciprocating link guided on said arc-shaped plate, and the pawl or dog pivoted upon said plate and provided with shoulders, said dog being held by gravity in engagement with the notch in the lever and when withdrawn and turned back sustained in like manner upon the shoulders, substantially as and for the purpose set forth.

9. In a drill attachment such as described, and as a means for detachably connecting and centering the driving-gear upon the hub of the wheel, the combination, with said driving-gear provided with the annular grooved plate for application to the inner end of the hub, of the outer plate correspondingly grooved and fitted to receive the outer end of the hub, and the clamping-bolts inserted between the spokes to clamp and hold the plates upon the hub, substantially as described.

10. In a drill attachment such as described, and in combination with the feeding devices and supporting-wheel, a driving-gear detachably applied to the hub, the cam-shaft, and sprocket-wheel, the tightening-wheel, and the chain encircling the driving and tightening wheels and passing over the intermediate sprocket-wheel, substantially as described.

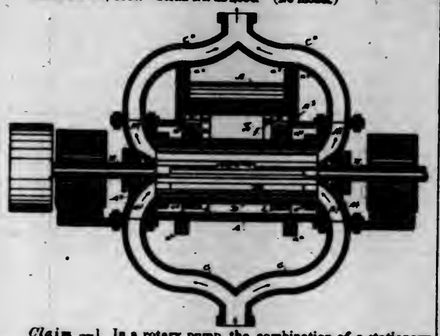
11. In a drill attachment such as described, and in combination with the feeding devices on the runner-frame, the actuating-lever and its driver, the link supported upon a single bracket and connected by a movable dog or catch, the cam supported upon a shaft carrying a sprocket-wheel, and the chain engaging and driving said sprocket-wheel, substantially as described.

12. In combination with the frame of a planter, the improved drill attachment constructed substantially as described, and comprising the following parts detachably secured to the frame, viz: the bracket forming a support for the lever and link, the bearings for the tightener-pulley, and shaft-carrying cam and sprocket-wheel, and the driving-gear applied to the wheel-hub, said parts being constructed and combined for co-operation with the chain and feeding mechanism, substantially as described.

13. In a drill attachment such as described, the combination, with the frame and the cam-shaft and its detachable sprocket-wheel, of the chain engaging said sprocket-wheel and a driving-wheel, and the tightener-wheel mounted on an axis adjustable with relation to the sprocket-wheel to accommodate interchangeable sprocket-wheels differing in diameter, substantially as described.

14. In a drill attachment such as described, the combination, with the frame, of the bracket supporting the cam-shaft, a sprocket-wheel detachably secured to said shaft, a driving-gear on the wheel, a chain passing around said last-named gear and engaging the sprocket-wheel, and the pulley 21, supported upon a bolt, the latter adjustably secured in a slot in a bracket attached to the frame, substantially as described.

383,995. FAUCET. Elijah U. Scoville, Manlius, N. Y. Filed Oct. 3, 1887. Serial No. 251,788. (No model.)



Claim.—1. The combination of the barrel B, provided with the channels *a a*, having their adjacent ends *a' a'* deflected laterally to the exterior of the barrel, the convex seat *b* across the ends of said channels, the concave valve *c*, provided with the port *c'*, and the lever *l*, pivoted to the barrel between the channels and carrying the valve, substantially as described and shown.

2. The combination of the barrel B, provided with the channels *a a*, having their adjacent ends *a' a'* deflected laterally to the exterior of the barrel, the convex seat *b* across the ends of said channels, the

concave valve *c*, provided with the port *c'*, the lever *l*, pivoted to the barrel between the channels and carrying the valve, and the spring *s*, arranged to push the lever into a position to normally hold the valve in its closed position, substantially as described and shown.

383,996. ROTARY PUMP. OSWALD SIEFERT, San Francisco, Cal. Filed Jan. 20, 1887. Serial No. 224,998. (No model.)

Claim.—1. In a rotary pump, the combination of a stationary case, the cylindrical chamber, piston and piston-shaft placed eccentrically in the chamber, suction and pressure openings and passages A^6 A^7 above and below the line of the piston-shaft, and the loose cylinder D, concentric with the main case and eccentric to and inclosing the piston and free to revolve with it, substantially as described.

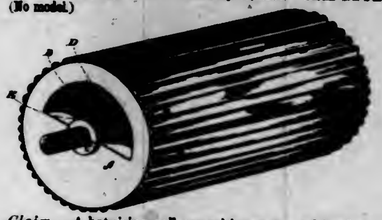
2. In a rotary pump, the combination, with a rotating piston having folding wings or partitions and set eccentrically in a cylindrical chamber, as described, of a loose revolving ring or cylinder concentric with the main case or piston-chamber and eccentric to and inclosing the piston, and guide wheels or rollers that control the cylinder and keep it in position during its revolutions, substantially as described.

3. In a rotary pump, a piston having hinged wings that open out from the piston-block and shut against it, and a loose ring or cylinder surrounding the piston, in combination with a cylindrical piston-chamber, within which the piston is set to rotate eccentrically, and the ring or cylinder concentrically, the said chamber having ports or passages of inlet and discharge leading in and out from the ends of the cylinder, substantially as described.

4. In a rotary pump, a stationary piston-chamber having bearings a^5 for a longitudinal eccentrically-set shaft, H, in the ends, and suction and discharge ports and passages above and below, or on opposite sides of said shaft-bearings, in combination with the piston, and a revolving ring or cylinder which is interposed between the walls of the chamber and the piston and is eccentric to, incloses, and turns with the piston, but concentric with the axis of the chamber.

5. In a rotary pump, a stationary piston-chamber having a loose internal cylinder inclosing the piston and set concentric with the piston-chamber and eccentric to the piston, in combination with said piston, and with roller-chambers E E, and guide wheels or rollers F F, held in chambers E E over the loose cylinder, as set forth.

6. The pump-case having cylindrical piston-chamber and roller chambers or spaces over it on opposite sides of the center thereof, in which are roller-bearings *g* f^3 and spaces for the rollers, as described.



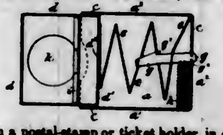
7. The herein-described pump, consisting of the stationary case having piston-chamber, roller spaces or chambers E E above and on opposite sides of the center of the chamber, the inlet and discharge ports and passages leading into and from the ends of the piston-chamber, the eccentrically-set piston, concentric cylinder D, and guide wheels or rollers F F, combined for operation as set forth.

383,997. SIDE-HILL PLOW. ALBERT K. SNODGRASS, Ellensburg, Oreg. Filed Aug. 23, 1887. Serial No. 247,805. (No model.)

Claim.—The combination, in a side-hill plow, of the beam, the vertical bolt F, extending through the same and adapted to rotate therein, the diverging standard-arms E, depending from the lower end of said bolt and having their upper ends united, the plows having their landside-plates attached to the said standard-arms and extending in opposite directions, said plows having their soles or lower edges arranged at an obtuse angle, the link-plate I, connecting the opposing ends of the said landside-plates, the outer upper corners of the mold-boards in contact and bolted together, and means to lock the revolving standard to the beam, substantially as specified.

383,998. HAT-SIZING ROLL. CHARLES R. SPRAGUE and WILLIAM J. WILEY, Danbury, Conn. Filed July 28, 1887. Serial No. 245,471. (No model.)

Claim.—A hat-sizing roll comprising cast-metal heads secured within the ends of a corrugated cylinder and having openings, as shown, and bearings which lead into said openings, and the shaft extending through the cylinder within said bearings, the caps superimposed upon the shaft at these bearing-points, and the headed bolts depending from and running within the upper walls of said openings, substantially as and for the purpose hereinbefore set forth.



383,999. RASP. PHILIP S. STOKES, Tennent, N. J. Filed Feb. 23, 1888. Serial No. 265,262. (No model.)

Claim.—1. As an improved article of manufacture, a rasp formed with teeth B and recesses C, curved at the bottom, substantially as described.

2. As an improved article of manufacture, a rasp having its tooth B punched up from curved recesses C, whereby each tooth is re-enforced by extra metal and the recess made shallow, substantially as described.

384,000. POCKET POSTAL-STAMP AND TICKET HOLDER. FERDINAND STRAUSS, New York, N. Y. Filed Jan. 7, 1888. Serial No. 260,053. (No model.)

Claim.—1. In a postal-stamp or ticket holder, in combination, an inclosing-case open at one end, a drawer fitted to slide therein, a spring in the case for forcing the drawer out, and a spring-latch located in the case for holding the drawer in closed position.

2. In a postal-stamp or ticket holder, in combination, an inclosing-case open at one end, a drawer fitted to slide therein, a cover hinged to the drawer, a spring in the case for forcing the drawer out, and a spring-latch located in the case for holding the drawer in closed position.

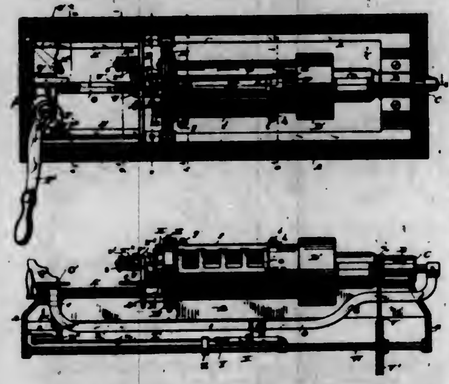
3. In a postal-stamp or ticket holder, in combination, an inclosing-case open at one end, a spring-acting drawer fitted to slide therein and provided with an opening through its bottom, for the purpose set forth, and a spring-latch located in the case for holding the drawer in closed position.

4. In a postal-stamp or ticket holder, in combination, an inclosing-case open at one end, a drawer fitted to slide therein and having an opening through its bottom, for the purpose set forth, a spring in the case for forcing the drawer out, a spring-acting cover hinged to the drawer, and a spring-latch located in the case for holding the drawer in closed position.

5. The combination, with an inclosing-case composed of a bottom plate, three sides integral therewith and provided with retaining-lugs, and a top plate secured to the sides by means of the lugs, of a spring-acting drawer fitted to slide in the case and a spring-acting latch pivoted to the top plate and arranged to hold the drawer in closed position.

384,001. COAT AND HAT HOOK. FREDERICK TAYLOR, Lowell, Mass. Filed Feb. 1, 1886. Serial No. 190,442. (No model.)

Claim.—1. A hook formed of wire and having a hat-hook and a coat-book, a brace connecting said hat-hook and said coat-book, a horizontal arm, and a vertical back, said horizontal arm being connected to said hat-book at its front end, and at its rear end being provided with an eye which surrounds said back, the upper end of said back being bent backward above said arm to form an attaching-point for said book, as and for the purpose specified.



384,001.

2. A hook formed of wire bent to form a coat-book and a hat-hook, and a brace connecting said hat-book and said coat-book, and a horizontal arm provided at its rear end with an eye, the front end of said horizontal arm being connected to said hat-book, and a vertical back passing upward through said eye and bent backward above said arm to form an attaching-point, said back being bent forward where it is surrounded by said eye to prevent the rear end of said horizontal arm from moving on said back and to allow said back to rest closely against the vertical surface of the object to which it is attached, as and for the purpose specified.

3. A hook formed of wire and having a hat-hook and a coat-hook connected by a brace, and having a horizontal arm and a vertical back, said horizontal arm connected to said hat-book and provided with an eye which surrounds said back, the upper end of said back being bent backward above said arm to form an attaching-point for said hook, the head of said attaching-point being bent forward of said back to enable said point to be driven by a hammer, as and for the purpose specified.

384,002. MACHINE FOR TURNING IRREGULAR FORMS. HILBERT B. TAYLOR, Bennington, assignor, by direct and mesne assignments, of one-half to Miles D. Taylor, Janesville, Wis. Filed Sept. 3, 1887. Serial No. 248,698. (No model.)

Claim.—1. In a machine for turning irregular forms, the combination of a main frame, a revolving cylinder, a sliding feed-carriage, a pattern mounted on the cylinder, suitable means for imparting an independent rotation to the pattern, a knife carried by the cylinder, and means, substantially as described, for actuating the knife by the rotation of the pattern, as set forth.

2. In a machine for turning irregular forms, the combination of a main frame, a tube stationary on the frame, a revolving cylinder arranged on the tube, a sliding feed-carriage, a pattern mounted on the cylinder, suitable means for imparting an independent rotation to the pattern, a spring-apron forming part of said cylinder, a knife-arm secured to the axis of the apron, and a collar that travels on said tube and has transverse play, whereby it is caused to simultaneously bear against said pattern and apron, substantially as set forth.

3. In a machine for turning irregular forms, the combination of a main frame, a tube stationary on the frame, a revolving cylinder arranged on the tube, a sliding feed-carriage, a pinion journaled to the cylinder and provided with a cent, a pattern clamped between the cent and opposite head of said cylinder, a gear-wheel fast on the tube and arranged to mesh with the pinion, a spring-apron forming part of the cylinder, a knife-arm secured to the axis of the apron, and a collar that travels on said tube and has transverse play, whereby it is caused to simultaneously bear against said pattern and apron, substantially as set forth.

4. In a machine for turning irregular forms, the combination of a main frame, a tube stationary on the frame, a revolving cylinder arranged on the tube, a sliding feed-carriage, a pattern mounted on the cylinder, suitable means for imparting an independent rotation to the pattern, a spring-apron forming part of said cylinder, a knife-arm secured to the axis of the apron, a collar arranged to travel and have transverse play on said tube, so as to simultaneously bear against the pattern and apron, and an anti-friction roller journaled in the collar to come in contact with said pattern, substantially as set forth.

5. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a sliding feed-carriage, and an automatic stop for the carriage, substantially as set forth.

6. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a sliding feed-carriage, a screw-threaded shaft, an open nut connected to the carriage and arranged to engage the shaft, a block loose on said shaft, a headed rod knuckle-jointed to the nut and passed through the block, and a crank-rod connected to said block, substantially as set forth.

7. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a sliding feed-carriage, a screw-threaded shaft, an open nut composed of two arms pivoted to the feed-carriage and having turned-down ends that engage said shaft, a block loose on said shaft, a headed rod passed through the block and knuckle-jointed to the nut-arms, a crank-rod connected to said block, and a spring arranged to return the crank-rod to its normal position after setting the nut, substantially as set forth.

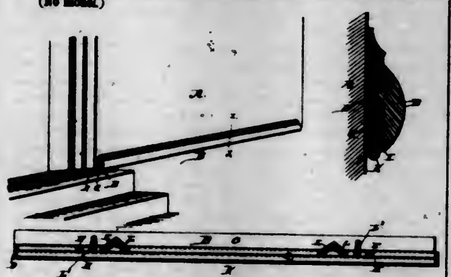
8. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a longitudinal sliding feed-carriage, a transverse plate loosely mounted on the carriage and provided with a jaw, a pivoted block in opposition to the jaw and provided with a cam-shaped recess that engages a lug on the transverse plate, and a lever for actuating the block, substantially as set forth.

9. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a longitudinal sliding feed-carriage, a transverse plate loosely mounted on the carriage and provided with a jaw, a pivoted block in opposition to the jaw and provided with a cam-shaped recess that engages a lug on the transverse plate, a lever adjustably secured to the block, and a set-screw for holding the lever in its adjusted position, substantially as set forth.

10. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a sliding feed-carriage, a revolving bracket arranged in advance of the vibratory knife and terminated in a ring, and a knife secured to said bracket to have its cutting-edge inside the ring, substantially as set forth.

11. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a sliding feed-carriage, and a grooving-knife arranged to operate upon the form during the return movement of the feed-carriage, substantially as set forth.

12. In a machine for turning irregular forms, the combination of a main frame, a pattern having a planetary movement and a revolution on its axis, a vibratory knife that is rotated about the work, a bearing that rests against and travels along the pattern to control the vibratory movement of the knife, a sliding feed-carriage, a loose sleeve provided with a lateral extension, an arm adjustably held in this extension, a grooving-knife secured to the arm to operate upon a form during the return movement of the feed-carriage, and a spring arranged upon the sleeve and connected to said extension thereof, substantially as set forth.



13. In a machine for turning irregular forms, the combination of a main frame, a revolving cylinder, a sliding feed-carriage, a pattern mounted on the cylinder, suitable means for imparting an independent rotation to the pattern, a spring-apron forming part of the cylinder and having a scalloped bearing-edge, a bearing that rests against and

travels along the pattern and scalloped edge of the apron, and a knife-arm secured to the axis of said apron, substantially as set forth.

14. In a machine for turning irregular forms, the combination of a main frame, a tube stationary on the frame, a revolving cylinder arranged on the tube, a pattern mounted on the cylinder, suitable means for imparting an independent rotation to the pattern, a sliding cross-head carrying a clamping mechanism, a plunger operative in the tube and provided with a chuck, an arm connecting the cross-head and plunger, a screw-feed detachably united to the plunger, an apron forming part of said cylinder, a knife-arm secured to the axis of the apron, and a collar arranged on said tube to be actuated by the plunger and travel along the pattern and bearing-edge of said apron, substantially as set forth.

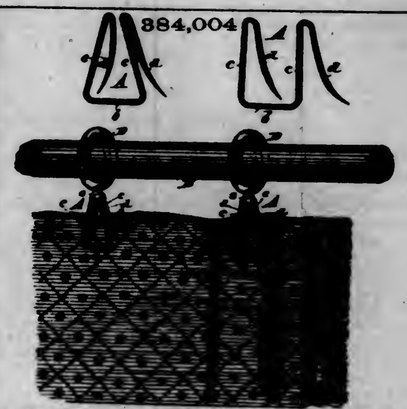
15. In a machine for turning irregular forms, the combination of a main frame, a screw-threaded shaft journaled in the frame, a pulley fast on the shaft, a feed-carriage, an open nut connected to the carriage and arranged to engage said shaft, suitable means for closing and opening the nut, a revolving cylinder mounted on said frame, a belt connecting the cylinder and feed-shaft pulley, a pattern mounted on said cylinder, suitable means for imparting an independent rotation to the pattern, an apron forming part of the cylinder, a knife-arm secured to the axis of the apron, and a bearing that rests against and travels along said pattern and bearing-edge of the apron, substantially as set forth.

884,008. WEATHER-STRIP. JOSEPH THOMPSON and JOHN O. STEPHENS, St. Joseph, Mo. Filed Sept. 27, 1887. Serial No. 250,947. (No model.)

Claim.—1. In a weather-strip, the combination of the molding C, adapted to be secured to the lower edge of the door and having the rabbet D in the lower edge thereof, the beveled blocks E E in the upper side of the said rabbet, the adjustable strip G, adapted to operate in the said rabbet and having the notches in the upper edge to fit the said beveled blocks, the end of the said strip being adapted to project slightly beyond the end of the molding on the hinge side of the door, for the purpose described, and the springs to hold the strip normally in the rabbet, substantially as specified.

2. In a weather-strip, the combination of the molding C, having the rabbet D in the lower edge, the triangular blocks E E in the upper side of the said rabbet, the adjustable strip G, operating in the rabbet and having notches in the upper edge to receive the said blocks E E, and the springs L L, arranged in pairs and secured at the upper ends to the molding and at the lower ends to the strip G, the said springs diverging toward the lower ends, as and for the purpose substantially as specified.

3. In a weather-strip, the combination, with the molding C, having the rabbet or groove in the lower edge, provided with the stationary beveled blocks E E, of the movable strip G, operating in the said groove or rabbet and having notches in the upper edge to receive the said blocks and the parallel slits I I in the lower edge, the strip K, of rubber or other similar material, secured at the edges in the said slits and forming a flexible loop, and the springs to hold the strip normally in the groove or rabbet, substantially as specified.



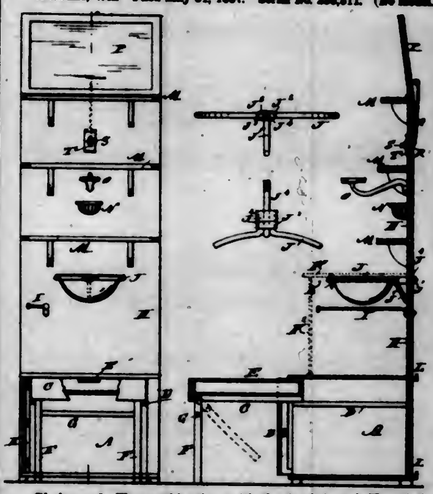
884,004. DRAPERY-HOOK. RALPH TELFER, New York, N. Y., and MARTIN COWEN, Chicago, Ill. Filed Feb. 9, 1888. Serial No. 263,513. (No model.)

Claim.—1. The elastic staple-like hook herein described for suspending drapery, composed of a bar-like head or back and sides bent to terminate in prongs inclining downward and away from said head or back, essentially as specified.

2. A hook for suspending drapery, constructed of a piece of spring metal bent to form a bar-like head or back, *b*, converging sides *c c*, and laterally-flaring elastic prongs *d d*, inclining downward toward the head or back and of a distance apart at their points corresponding, or thereabout, to the length of the head or back, substantially as specified.

3. The combination, with a sliding curtain or drapery ring, C, having an eye, *e*, of the within-described spring-metal staple-like hook

384,004



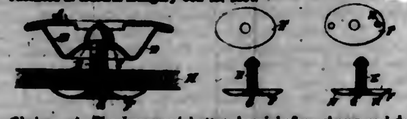
A, adapted to suspend a curtain or piece of drapery and to automatically lock with the eye in the ring, essentially as set forth.

884,005. VARNISH. RICHARD H. TODD, Newark, N. J. Filed Jan. 28, 1887. Serial No. 225,173. (No specimens.)

Claim.—The herein-described composition of matter to be used in a lacquer or varnish, consisting of pyroxyline or nitro-cellulose and balsam of tolu, in the proportions specified, substantially as and for the purposes set forth.

884,006. COMMODE. GAYNER D. TOLMAN and LORENZO D. BOWDEN, Shawano, Wis. Filed May 31, 1887. Serial No. 239,811. (No model.)

Claim.—1. The combination, with the back board, H, and the ring J, projecting in the horizontal plane from the face thereof, of the table K, its folding brace K^3, rear dowel-pins, K', and downwardly-projecting pin K^2, adapted to pass inside the ring J, substantially as shown and described.

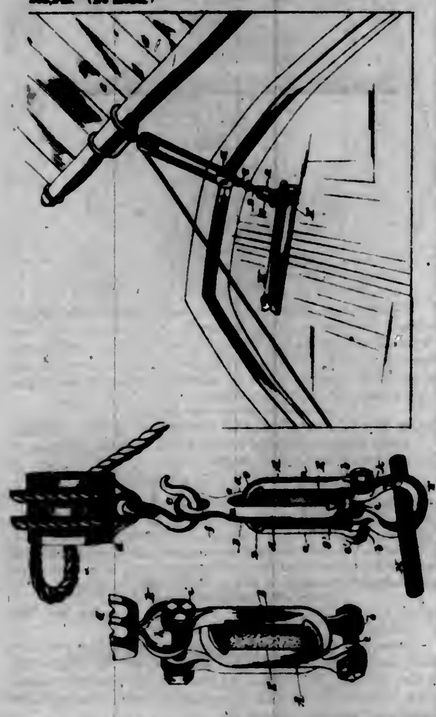


2. The combination, with the back board, H, of the ring J, having an arm, J^4, passed through the back board, a nut, J', screwed on the end of said arm, and an inclined brace, J^5, projecting downward from the ring and having an end spur to enter the back board, substantially as shown and described.

3. The supporting-ring made of a piece of wire, J, bent to form and having its ends bent outward parallel with each other, a short tube, J^6, through which the said parallel ends are passed, and an angle-wire having one arm, J^4, passed, also, through the tube J^6, and its other arm, J^5, projecting outward from the inner end of said tube, substantially as shown and described.

4. The combination, with the board H and the tilting mirror P, hinged at its lower edge to the upper or top edge of the said board, of a rod, Q, connected with the back of the mirror, its end bent forward and projecting through a slot in the board H, a knob on said

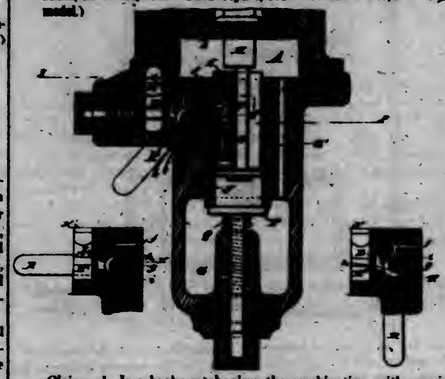
bent end, and a spring-escutcheon interposed between the knob and board H, substantially as shown and described.



884,007. BUTTON. HENRY VALLERY, Manchester, County of Lancaster, England. Filed Mar. 10, 1888. Serial No. 266,889. (No model.) Patented in Austria-Hungary Oct. 15, 1887.

Claim.—1. The improved button hereinbefore shown and described, consisting of the cover-plate A, having a central aperture, in combination with the flanged, dished, recessed, and radially-slit inner plate, B, having a central hole, the outer plate, D, flanged, dished, and recessed, and having a central hole, the stud E, having a head larger than the hole in plate B, but smaller than the hole in plate D, and the disk F, surrounding the end of the stud, which is expanded against the outer side of the disk, substantially as shown and described.

2. In a stud for securing button-heads to garments, an elliptical disk or flange, F, having two small holes or perforations therein, substantially as and for the purpose set forth, and as illustrated by the drawings.



884,008. SHOCK-ARRESTER FOR THE RIGGING OF VESSELS. FRANK WHEELER, Meriden, Conn. Filed Feb. 28, 1888. Serial No. 265,962. (No model.)

Claim.—1. In a shock-arrester for vessels, the combination, with two interlocking links, each having approximately parallel integral sides and curved at one end, and the grooved cast-blocks resting on the curved ends of the links, of a spring interposed between the blocks, and a shackle-ring mounted on a bolt removably secured to the open end of one of said links, substantially as set forth.

2. In a shock-arrester for vessels, the combination, with the links, each made in a single piece and curved at one end, one of said links being open at one end and closed at the other, and the other link closed at both ends and provided at its outer end with an eye, and cast-blocks secured to the links, of a spring interposed between the blocks, and a shackle-ring mounted on a bolt removably secured to the open link, substantially as set forth.

884,009. TRIPLE VALVE FOR AIR-BRAKES. GEORGE B. WILLIAMS, La Crosse, Wis. Filed Sept. 8, 1887. Serial No. 249,169. (No model.)

Claim.—1. In a brake mechanism, the combination, with a main air-pipe, auxiliary reservoir, triple valve, and an auxiliary valve for admitting air in the application of the brake directly from the main air-pipe to the brake-cylinder at the same time that air is admitted thereto from the auxiliary reservoir, of a cock controlling the admission of the air from the main air-pipe into brake-cylinder through the said auxiliary valve-passage and independently of the ordinary cock of the main valve, substantially as set forth.

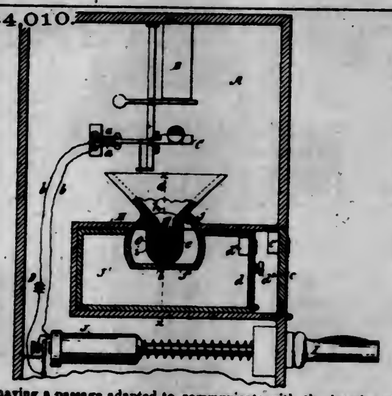
2. In a triple valve, the combination, with a piston carrying the usual slide-valve on its upper end, and carrying on its lower end an auxiliary slide-valve with its graduating-valve, of a cock connected with and controlling the auxiliary ports leading from main air-pipe through said auxiliary slide-valve and a check-valve to brake-cylinder, substantially as shown and described.

3. In a triple valve, a piston, a slide-valve operating with and above said piston, an additional slide-valve operating with and below said piston, and a cylinder in which latter slide-valve operates over the ports *f* and *g*, in combination with a three-way cock adapted to be connected with the ports *f* and *g*, and a check-valve adapted to open and close the connection between said slide-valve and brake-cylinder through three-way cock, substantially as shown and described.

4. In a triple valve, a piston, a slide-valve adapted to operate with and above said piston, an additional slide-valve operating with and below said piston, a cylinder having ports over which latter slide-valve operates, and a graduating-valve for said auxiliary slide-valve, in combination with a cock adapted to connect with said ports in said cylinder, and a check-valve adapted to allow air to pass from main air-pipe through said slide-valve and cock to brake-cylinder, but to prevent its return, substantially as shown and described.

5. In a triple valve, a piston, a slide-valve operated by and above said piston, an additional slide-valve operating with and below said piston, and a graduating-valve held in the latter slide-valve, in combination with a cylinder having ports over which said slide-valve operates, a cock or valve adapted to be connected with said ports, a check-valve adapted to open and close the passage leading from main air-pipe through said slide-valve, said cock, and said check-valve to brake-cylinder, substantially as shown and described.

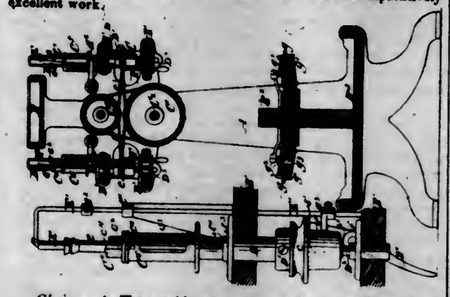
884,010. CASH-DRAWER. FRED G. WILLIAMS and ALFRED W. BOWERS, Brooklyn, N. Y.; said Bowers assignor to said Williams. Filed Dec. 14, 1887. Serial No. 257,578. (No model.)



Claim.—1. The combination, with a cash-drawer, of a rotary receiver for coin, provided with a passage adapted to communicate with the interior of the cash-drawer, and a lock for securing said receiver in one position, substantially as specified.

2. The combination, with a cash-drawer, of a rotary receiver for coin, having a passage adapted to communicate with the interior of the cash-drawer, a lock for securing said receiver in one position, and a spring for rotating the receiver, substantially as specified.

3. The combination, with a cash-drawer, of a rotary receiver for



384,010.

coin, having a passage adapted to communicate with the interior of the cash-drawer, a projection against which the receiver will come in contact upon the removal of the drawer and be rotated into one position, and a lock for securing it in such position, substantially as specified.

384,011. MACHINE FOR WINDING QUILLS AND BOBBINS. JOHN R. ATWOOD, Stonington, Conn. Filed Aug. 3, 1887. Serial No. 246,302. (No model.)

Brief.—The object of the invention is to produce a quilling-machine of simple construction and low cost which will do comparatively excellent work.

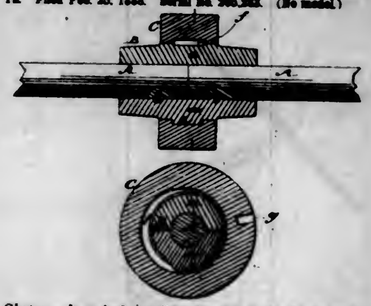
Claim.—1. The combination, with a hollow spindle having a slotted tubular flier at one end and open entirely through its opposite end, and a quill-support entering said tubular flier and on which the quill is held independently of the spindle, of a traverse-guide on the flier, and mechanism, substantially as described, for rotating the spindle and flier and for traversing said guide, substantially as herein set forth.

2. The combination, with the spindle having at one end the tubular flier slotted lengthwise to its extremity, and having its end oblique to form a shoulder at one side of the slot, the spindle being open entirely to its opposite end, of a quill-support entering the flier and on which the quill is held independently of the spindle, a traverse-guide on the flier, and mechanism, substantially as described, for operating the spindle and traverse-guide, substantially as herein described.

3. The combination, with the spindle having at one end a tubular slotted flier and a traverse-guide locked to turn with but sliding on the flier, the spindle being open entirely to its opposite end, of a quill-support entering the open end of the flier, on which the quill is held independently of the spindle, and mechanism, substantially as described, for operating the spindle and traverse-guide, substantially as herein set forth.

4. The combination, with a spindle, a flier, a traverse-guide, and a movable quill-support, of a whirl on the spindle for receiving a continuously-running band, a brake for checking the whirl and spindle, a stop-lever for applying the brake, and a stop-rod operated by the movable quill-support to trip the stop-lever, substantially as herein described.

5. The combination, with the spindle C and its tubular and slotted flier C^9, of the traverse-guide on the flier, the whirl having a lump or projection, and the stop-lever F, for engaging the lump or projection to stop the whirl and spindle, the whirl when on the spindle having its lump or projection about diametrically opposite the slot in the flier, so as to stop the spindle with the slot at the front of the flier and clearly exposed, substantially as herein described.



6. The combination, with the spindle C, the tubular slotted flier, and the traverse-guide C^9, of the bearing-bushing D, having the brake-collar D', the whirl fast on the spindle and adjacent to the brake-collar, the stop-lever F, and mechanism, substantially as described, for operating the spindle and traverse-guide, substantially as herein set forth.

7. The combination, with a hollow spindle having a tubular slotted flier, of a traverse-guide on the flier, a whirl on the spindle, a stop-lever engaging the whirl to stop the whirl and spindle on a quill being full, and a quill-support entering the tubular flier and having a stop-rod provided with an adjustable collar for acting on the stop-lever as the quill and support are moved by the quill-bearing on the flier, substantially as herein described.

8. The combination, with the hollow spindle and tubular slotted flier, of the traverse-guide C^9, the oil-guard or thread-centering device D^9 at the lower end of the spindle, a quill-support entering the flier, and mechanism, substantially as described, for operating the spindle and traverse-guide, substantially as herein set forth.

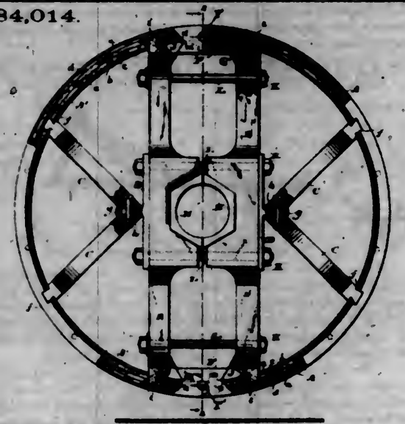
9. The combination, with the end frames and double girts rigidly secured together by struts *b*, of the hollow spindles terminating in tubular fliers, the traverse-guider C^9 on the fliers, the quill-supports entering the fliers, bearing-bushings D, fixed in the upper rail of the girts, the thread-centering devices and oil-guards fixed in the lower rail of the girts, and mechanism, substantially as described, for operating the spindles and traverse-guides, substantially as herein set forth.

384,012. SHAFT-COUPLING. SIMON H. RAHSER, Lansdowne, Pa. Filed Feb. 25, 1888. Serial No. 265,262. (No model.)

Claim.—In a shaft-coupling, the longitudinally-divided gripper having a projection upon the exterior of one of its sections, in combination with a rotatable band fitted to turn upon said sections and provided internally with an eccentric groove adapted to receive and to bear by its outer wall upon the exterior projection of the divided gripper, essentially as shown and described.

384,013. THIMBLE FOR CASINGS OF SCREW-STOPPERS. HENRY BARRETT and JOHN J. VARLEY, London, England. Filed Dec. 17, 1886. Serial No. 221,860. (Model.)

Claim.—An elastic thimble plain or unthreaded and closed at one end and composed of partly-cured material, such as is used in the manufacture of vulcanite, as and for the purpose set forth.



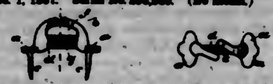
384,014. SPLIT PULLEY. JULIUS BAUER, Milwaukee, Wis. Filed Feb. 24, 1888. Serial No. 265,150. (No model.)

Claim.—1. The combination, in a split pulley, of cross-bars interposed between the ends of each half of the rim, the two being beveled at their meeting-points, with a key-block having transverse recesses which inclose the parts, and clamping-bolts for locking the two halves together, substantially as described.

2. The combination, in a split pulley, of the cross-bars and rim, and adjustable arms interposed between the bars and rim-sections, substantially as described.

384,014.

384,015. LAST. CHARLES H. DURHAM, Philadelphia, Pa. Filed Sept. 6, 1887. Serial No. 248,788. (No model.)

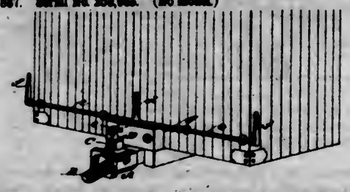


Claim.—The last herein described, composed of two parts united at a diagonal line running from the instep to the sole and capable of expansion and contraction by means of a screw moving in a nut parallel with the line of division, as described.

384,016. WIRE FENCE. JESSE J. DONAHAN, Bridgeport, Ill. Filed Sept. 9, 1887. Serial No. 249,263. (No model.)

Claim.—As an improvement in wire fences, the combination, with a hollow metallic post, 1, having perforations 10, of horizontal fence-wires 8 and wire supports and fasteners 9, passing through the perforations in the post, then bent around the wires 8 and back of the post, and having their ends twisted together, as at 11, substantially as described.

384,017. CHEEKPIECE-LOOP. EDWIN H. CARPENTER, Newark, N. J. Filed Dec. 1, 1887. Serial No. 256,602. (No model.)

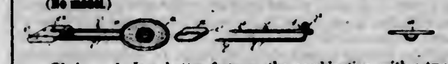


Claim.—1. The improved loop for bridles, combining in one integral piece therein arms *b b*, which stand oppositely to and extend inwardly and toward one another and are laterally curved, as described, and a connecting-bar, *d*, substantially as set forth.

2. The improved loop consisting of the lugs *c*, lips *a*, oppositely placed, and upwardly and laterally extending arms *b b*, substantially as and for the purpose set forth.

3. In a loop for bridles, the combination, with the oppositely-placed arms having the connecting-bar *d*, of the blade-like lugs *c*, extending from beneath the base of such arms, and the laterally-projecting lips *a*, all substantially as and for the purpose set forth.

384,018. CAR-COUPLING. WILLIAM B. GRAMBY, Chicago, Ill., assignor to W. A. Ogden Hoguenin, New York, N. Y. Filed Dec. 22, 1887. Serial No. 258,603. (No model.)



Claim.—1. In a car-coupling, the combination, with the link spur-pin, of the returning-spring A, adapted to lift and maintain said pin at its normal position, as described.

2. In a car-coupling, the buffer-pin F, located transversely to the link-pin, engaging thereon by a shoulder, as *k*, and adapted to a longitudinal release action by abutment of its extending portion upon an opposite car-buffer, as and for the purposes described.

3. In a car-coupling, the combination, with the buffer-pin F, having the link-pin shoulder *k*, of its actuating-spring, as *l*, and the handle G, operating in the L-shaped slot, adapted to retain said pin F in its withdrawn position as against said spring.

384,019. BUTTON-FASTENER. HENRY F. CLARK and NATHAN D. INGRAHAM, Holyoke, Mass. Filed Mar. 12, 1888. Serial No. 267,774. (No model.)

Claim.—1. In a button-fastener, the combination, with a two-pronged pin having at its rear end a loop to receive the shank of a button, and having near each of its pointed ends a transverse groove or notch, of a clasp having an opening to receive the pointed ends of said pin and having an engaging device to engage the grooves or notches in the pin, whereby the clasp is detachably retained upon the pin, substantially as set forth.

2. The combination, with a shank-button, of a two-pronged pin having at its rear end a loop which passes loosely through the shank of said button, whereby said button is free to rock upon said loop, and a detachable clasp adapted to be received upon the pointed ends of said pin, substantially as described.

3. The combination, with a shank-button, of a pin comprising two sharp-pointed prongs and a loop secured to or formed integrally with said prongs at their rear end and projecting therefrom at substantially a right angle, said loop being inserted through the shank of the button, a clasp consisting of a hollow receptacle adapted to receive the pointed ends of the prongs of said pin, and stops located upon said clasp and prongs, respectively, whereby the former is retained upon the latter, substantially as and for the purpose described.

4. The combination, with a shank-button, of pin *b*, having loop b^9 to receive the shank of the button, and prongs *b'*, having grooves or notches b^3 therein, and a clasp consisting of a hollow receptacle having a central opening and a longitudinal slot communicating with said opening, whereby it is adapted to receive the ends of prongs *b'*, said clasp being provided with stops to engage the grooves or notches in said prongs, arranged and operating substantially as and for the purpose set forth.

5. The combination, with pin *b*, having a button secured thereto, said pin having prongs *b'*, provided with transverse grooves or notches b^3 near their pointed ends, of clasp *c*, consisting of a flattened hollow receptacle having therein the transverse slot c^9, of greater width than the diameter of prongs *b'*, and having the longitudinal slot *c'*, communicating with said slot c^9, said slot *c'* corresponding substantially in width

with the diameter of prongs *b'* at the bottom of the grooves or notches b^3, substantially as and for the purpose described.

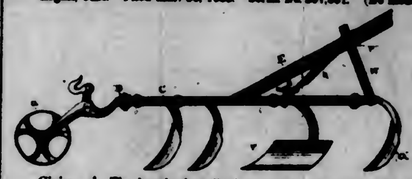
6. The button-fastener herein described, consisting of a pin, *b*, composed of a single piece of wire bent to form prongs *b'*, and loop b^2, projecting at substantially a right angle to said prongs, said prongs having their ends pointed, and having grooves or notches b^3 near said ends, and a clasp consisting of a hollow receptacle having an opening to receive the ends of said prongs, and having stops to engage the grooves or notches b^3 in the latter, substantially as set forth.

384,020. KNIFE-SHARPENING ATTACHMENT FOR SKIVING-MACHINES. PHILO B. CLARK and GERHART J. KLEINLEIN, Brooklyn, N. Y. Filed Dec. 1, 1887. Serial No. 256,616. (No model.)

Claim.—1. In a leather-skiving machine, a knife-sharpening attachment comprising a base-plate, a lever pivoted thereon, a casing or bearing, a universal joint connecting the sleeve and lever, a spindle mounted in said casing or bearing and provided with the grinding disk or wheel at one end, and a means of rotation, substantially as set forth.

2. In a leather-skiving machine, the combination, with the frame, the knife, and the operating mechanism, of the lever pivotally connected to the frame between its ends, the casing connected to the forward end of said lever by a universal joint, a spindle journaled in said casing, and provided with a grinding disk or wheel and an operating-pulley receiving motion from the main drive-shaft, and the elbow-lever engaging the inner end of said first-named lever, substantially as set forth.

3. The combination, with the knives of a leather-skiving machine, of a plate, 5, attached to said machine, an L-shaped lever, 8, pivoted to said plate, having a slot, 11, in its horizontal member, a rocking lever, 12, also pivoted to the plate 5, a pin, 14^a, attached to said rocking lever entering the said slot 11, a spindle, 15^a, united to said rocking lever by a ball-and-socket joint, a grinding-disk, 21, secured to the lower end of the spindle, a pulley, 17, attached to the upper end of the same, and a belt-connection between said pulley 17 and the driving-pulley of the machine, substantially as herein shown and described.



4. The combination, with the knives of a leather-skiving machine, of a plate, 5, attached to the machine, an L-shaped lever, 8, pivoted to said plate, having a slot, 11, in its horizontal member, a rocking lever, 12, also pivoted to the plate 5, a pin, 14^a, attached to said rocking lever, entering the said slot 11, a spindle, 15^a, united to said rocking lever by a ball-and-socket joint, a grinding-disk, 21, secured to the lower end of the spindle, a pulley, 17, attached to the upper end of the same, a belt-connection between said pulley 17 and the driving-shaft of the machine, and a shifting mechanism, substantially as shown and described, interposing the said pulley 17 and the driving-pulley, as set forth.

5. In a leather-skiving machine, the combination, with the main shaft and the grinding-disk and its shaft, of a rocking lever having a vertical shaft at its outer end provided with two idle-pulleys, and a belt passing around pulleys on the main shaft and the disk-shaft and around said idlers, whereby by throwing said shaft outward the belt may be tightened, substantially as set forth.

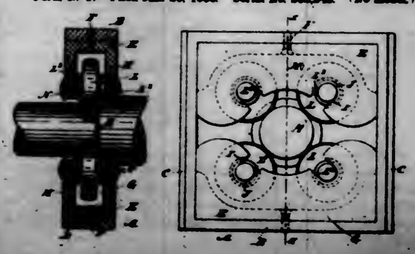
6. The combination, with the main shaft and the grinding-disk shaft, of the rocking lever 24, having a vertical shaft at its outer end provided with pulleys, an upward-projecting hand-lever pivoted to the rocking lever, a spring, 29, the idlers 26, and the belt passing around pulleys on the main and grinder shafts, respectively, and around the pulleys on said vertical shaft, substantially as set forth.

7. The combination, with the skiving-knife and its operating-shaft, of the rocking lever, a casing connected with it by a universal joint, a spindle mounted in said casing and having a pulley at its upper end and a grinding-disk at its lower end, a second rocking lever at right angles to the first-named rocking lever, a shaft projecting upward from the outer end thereof and carrying horizontal idle-pulleys, and a belt passing from the main shaft-pulley around the idlers and grinding-spindle pulley, whereby the idlers may be thrown inward and outward, according to the several adjustments of the grinding-spindle and its casing, substantially as set forth.

384,021. CULTIVATOR. ELI B. CORLEY and DAVID HOTHERSWELL, Logan, Ohio. Filed Mar. 30, 1888. Serial No. 267,891. (No model.)

Claim.—1. The herein-described connection for securing cultivator blades and shovels to their standards, consisting of the two parts G and G', having the horizontal extensions *b* and *b'*, respectively, which extensions overlap and are adjustably secured together by the vertical bolt *d*, the one extension being adjustable on the other about the said bolt as an axis, substantially as and for the purpose described.

2. The combination of the standard, the connection composed of two parts, one part being adjustable laterally on the other, means for vertically adjustably securing the connection on the standard, the blade, and means for adjustably fastening the blade to the said connection, whereby the inclination of the blade to a vertical line may be had, substantially as described.



3. The herein-specified connection, composed of the part G, having an oblong opening and a horizontal extension, *b*, and the part G', having its front end expanded and provided with an opening at its upper and lower end, one of the openings being extended transversely and having a horizontal extension, *b'*, the opposing faces of the extensions *b* and *b'* corrugated, and the vertical bolt *d*, for securing the parts G and G' together, substantially as set forth.

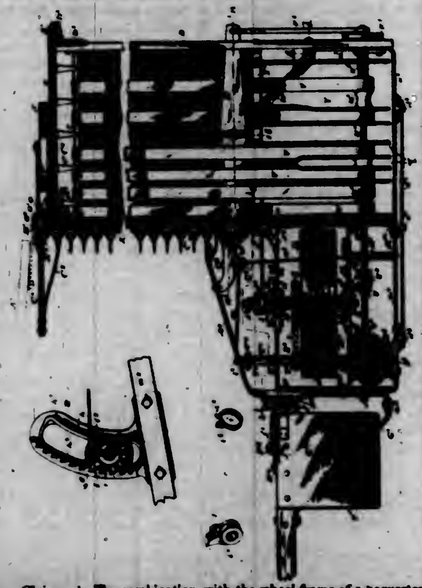
384,022. BOTTLE-FILLER. WILLIAM H. COMPTON, Oskaloosa, Iowa. Filed May 20, 1887. Serial No. 238,209. (No model.)

Claim.—The combination, with the frame, the filling cylinder or tank, and the valve, of the bottle-rest L, pivoted at N and having an extension, L', below its pivotal point, the adjustable spring R, connected with the frame and the said extension, the lever P, pivoted to the frame between its ends and having a weight on its long arm, and the link O, connecting the short arm of said lever with the bottle-rest above its pivotal point, substantially as set forth.

384,023. ANTI-FRICTION BEARING. FRANK CORBETT, New York, N. Y. Filed Jan. 28, 1888. Serial No. 262,242. (No model.)

Claim.—1. An improved anti-friction bearing consisting of a band-like frame, centrally-recessed blocks fitted to opposite sides of the interior of the band-like frame, and having their walls provided with radial slots forming semicircular bearings, and friction-rollers provided with gudgeons mounted on the said bearings, substantially as herein shown and described.

2. In an anti-friction bearing, the combination, with the band-like frame B, of the blocks E, detachably secured within the frame and provided with the recesses G, the radial slots I, forming semicircular bearings J and inwardly-projecting flanges N, and the friction-rollers L, provided with the gudgeons L^2 and the projecting hubs L^3, substantially as herein shown and described.



384,024. DISK WATER-METER. JAMES DAVIES, Wednesbury, County of Stafford, England. Filed Aug. 3, 1887. Serial No. 245,698. (No model.) Patented in England Oct. 22, 1886, No. 13,571.

Claim.—1. An oscillating disk, E, provided with a central ball having a recess in its under side, in combination with a bearing-pin, F, which enters said recess and has its point rounded, a lower cone provided with a recess which fits said ball, an upper cone, and a cylinder, B, the ball rocking partly on the bearing-pin F and partly on the concave bearing-face n^3, substantially as shown.

2. The combination of the upper cone and disk having a central ball, either the ball or cone having a hole, *z*, therein, with the lower cone, the cylinder having parts b^2 b^3, and the partition K, substantially as set forth.

384,025. HARVESTER. JOHN S. DAVIS, Toledo, assignor to Adlon B. Sumner, Cleveland, Ohio. Original application filed Mar. 7, 1888, Serial No. 266,857. Divided and this application filed Dec. 22, 1888. Serial No. 294,597. (No model.)

Claim.—1. The combination, with the wheel-frame of a harvester rectangular in shape and braced by a longitudinal bar which divides the frame into two compartments, of the driving-wheel and its axle which carries the frame, located in the inner compartment, and the gearing and shafts for transmitting power to the harvesting mechanism, located in the outer one, substantially as hereinbefore described.

2. The wheel-frame of a harvester surrounding the driving-wheel and supported by its axle, located in front of the outer end of the platform and rigidly connected thereto, the frame being composed of a continuous piece which forms its four sides, and extends across the end of the platform to the rear sill thereof, to which it is secured, substantially as hereinbefore described.

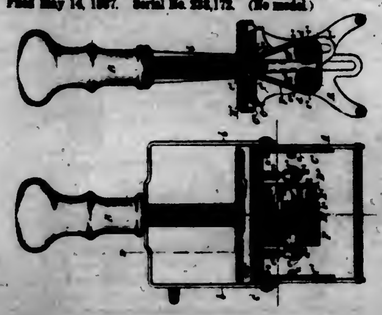
3. The combination, in the wheel-frame of a harvester, located in front of the outer end of the platform and rigidly connected thereto, of the outer side bar of the frame extending across the end of the platform to the rear sill to which it is secured, with a truss-brace on the extension-bar, substantially as and for the purpose hereinbefore set forth.

4. The combination of the wheel-frame of a harvester and a finger-beam attached to the frame, with a brace-bar extending diagonally from the front of the frame to the finger-beam to which it is attached, and twisted at its lower end to form a guard or shoe which shields the outer or first guard-finger on the beam, substantially as hereinbefore set forth.

5. The combination of the wheel-frame of a harvester having its outer side bar extending across the end of the platform and secured to the rear sill thereof, and a finger-beam rigidly attached to the rear bar of the wheel-frame, with a brace-bar attached to the finger-beam and extending diagonally across the platform to a point near its outer rear corner, where it is attached to the rear sill near the end of the extension-bar, substantially as hereinbefore set forth.

6. The combination of the wheel-frame of a harvester, located at the outer front corner of the platform and rigidly connected thereto, with a truss-brace on the outer side bar of the frame and platform and a diagonal brace across the bottom of the platform to stiffen the structure both vertically and laterally, respectively, substantially as hereinbefore set forth.

7. The combination of the wheel-frame, a tongue pivoted to the frame at its inner front corner, a diagonal brace-bar attached to the tongue and pivoted to the outer front corner of the frame in line with the tongue-pivot, and a foot-board attached to the tongue and extending across the front of the wheel-frame, and also attached to the brace-bar to strengthen the structure, substantially as hereinbefore set forth.



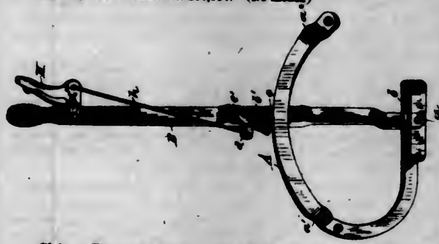
8. A bracket or standard attached to the end of the finger-beam, having a rear flange at its inner end, to which the end board of the platform is attached, and a front flange at its outer edge to which the divider is attached, and constituting an offset or breast between the end board and the divider, substantially as hereinbefore set forth.

9. The combination of a finger-beam, the guard-fingers offset therefrom by an interposed bar, and a rod or flexible connection through which the adjustment of the grain-wheel is effected, lying on the interposed bar in front of the finger-beam, substantially as hereinbefore set forth.

10. The combination of a wheel-frame divided longitudinally by a brace-bar, a bracket or casting located in the outer division of the frame and bolted to the adjacent bars, a counter-shaft mounted in sleeve-bearings in the bracket and provided at its inner projecting end with a spur-pinion, a driving-wheel upon the axle of which the frame is supported, located in the inner division of the frame, a spur-gear carried by the driving-wheel engaging the pinion, and a bevel gear-wheel on the counter-shaft working in a recessed gear-box in the bracket, and engaging a bevel-pinion on the end of a line driving-shaft, also journaled in a sleeve-bearing on the bracket, substantially as hereinbefore set forth.

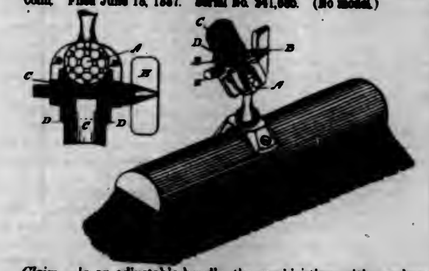
11. The combination of a harvester-platform, a sway-bar extending across the platform, a pivot-stand for the sway-bar bolted to the bottom of the platform, and a diagonal brace-bar between the front and rear sills of the platform, passing beneath the pivot-stand and united to it by bolts, substantially as hereinbefore set forth.

384,026. DATING DEVICE. WILLIAM H. BEEBE, Chicago, Ill. Filed May 14, 1887. Serial No. 238,172. (No model.)



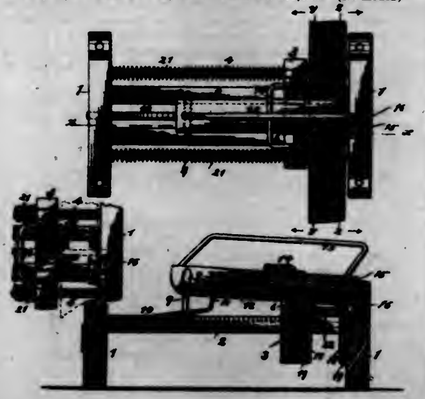
Claim.—1. The combination, with the movable type-supports in a dating or similar device, of a flexible sheet located adjacent to and extending over said type-supports, substantially as and for the purpose set forth.

2. The combination, with the frame of a dating or similar device and the movable type-supports thereof, of a flexible sheet supported upon the frame and extending over the said type-supports, substantially as described.



3. The combination, with a frame of a dating or similar device and movable type-supports sustained thereon, of a covering of elastic material placed around the said frame and extending over the said type-supports, substantially as described.

384,027. BRAKE-LEVER. THEODORE DELOSS, Liberal, Ind. Filed Mar. 31, 1888. Serial No. 267,987. (No model.)



Claim.—The combination, with the slotted tension or brake having one end wall, *c'*, rounded, and a segmental bar extending through the slot in the lever, of a pawl provided with a round end and an eccentric face, pivoted in the slot of the lever, and a grip-lever and connecting-rod, substantially as shown and described.

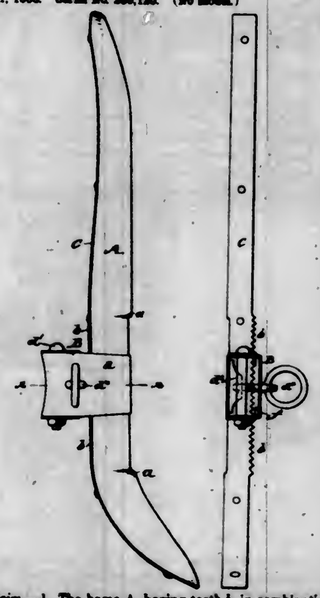
384,028. ADJUSTABLE HANDLE. WILLIAM A. FABER, Danbury, Conn. Filed June 18, 1887. Serial No. 241,663. (No model.)

Claim.—In an adjustable handle, the combination, with a polygonal-faced ball secured to a brush or other utensil, of a split socket adapted to embrace the ball, a ferrule extending within the socket and affording an annular seat for the ball, and a set-screw extending through the ferrule and the socket and adapted to clamp the latter firmly against the ball, substantially as set forth.

384,029. STRAP-EDGING MACHINE. JAMES H. FARLOW, Lander, Wyo. Filed Feb. 11, 1888. Serial No. 263,720. (No model.)

384,029.

Claim.—1. In a strap-edging machine, the combination, with a frame having fixed and relatively-movable cutters and a sliding clamp having fixed and relatively-movable cutters, of a tilting presser bar or lever adapted to bear upon the movable cutters and force them into operative position, substantially as described.

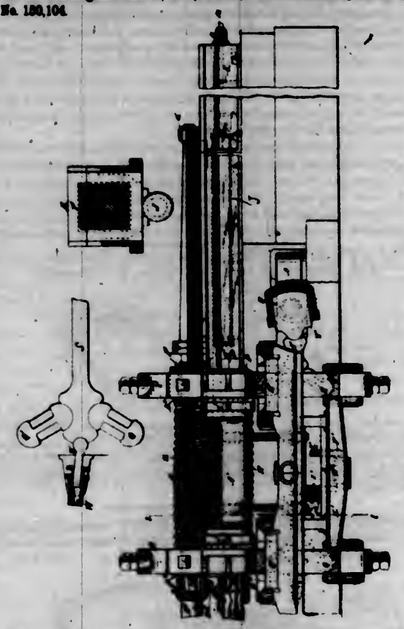


2. The combination, with the frame having a fixed cutter and a vertically-yielding cutter, of a clamp movable toward and from these two cutters and provided on its inner face with a fixed cutter and a vertically-movable cutter, and a presser-bar movable vertically across the strap-receiving space between the said knives and in line with the vertically-yielding knives, to depress them into engagement with the strap-edges, substantially as set forth.

3. A strap-edging machine consisting of a frame having a fixed cross-piece with a fixed cutter and vertically-movable spring-actuated cutter, and a spring-actuated sliding cross-piece with a fixed cutter and a vertically-movable spring-actuated cutter, the sliding cross-piece serving to hold a strap between the edges of the cutters, and a spring-actuated tilting presser lever or bar which is adapted to press down the movable cutters against the strap, substantially as described.

4. In a strap-edging machine, cross-pieces 1, connected by bars 4 and rods 2, the sliding cross-piece 3, mounted on bars 4 and rods 2 and provided with reacting springs 21, the tilting spring-actuated presser-lever 7, with handle 13, and having slots 8, engaging a standard and resting in recess 6 beneath handle 14 of cross-piece 3, and the fixed cutters 17 and movable cutters 17, mounted in casings 18 and resting on springs 19, said cutters being located on the cross-piece 1 and sliding cross-piece 3, substantially as described.

5. In a strap-edging machine, the combination, with clamp 3, mounted on bars 2 and having cutters 17, one of which rests in casing 18 upon spring 19, of cross-piece 1, having fixed cutter 17 and movable cutter 17 in casing 18, resting on spring 19, and the presser-lever 7, with handle 13, and resting in recess 6 of cross-piece 3 beneath handle 14, substantially as described.



384,030. HAME. JAMES H. FARLOW, Lander, Wyo. Filed Mar. 31, 1888. Serial No. 269,126. (No model.)

Claim.—1. The hame A, having teeth *b*, in combination with the clip B, having teeth *f*, a bolt, d^3, and a screw-socket for closing the teeth *f* into the teeth *b*, substantially as and for the purposes set forth.

2. The hame A, having teeth *b*, and the clip B, having the teeth *f*, and screw-socket d^6, placed upon the hame, in combination with the bolt d^3, substantially as described, for the purposes set forth.

384,031. CORRUGATING-MACHINE. SAMUEL FOX, Leeds, County of York, England. Filed Mar. 6, 1888. Serial No. 266,126. (No model.) Patented in England Jan. 16, 1888, No. 810, and in France July 13, 1888, No. 180,104.

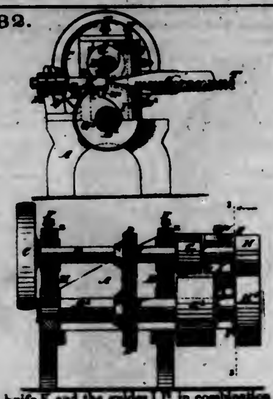
Claim.—1. The combination, in a corrugating-machine, of a corrugating-roll, two fixed bearings for supporting the same, one of said bearings being greater in diameter than the roll, and mechanism for withdrawing the roll longitudinally through said bearings, substantially as described.

2. The combination, in a corrugating-machine, of a corrugating-roll, two fixed bearings for supporting the same, one of said bearings being greater in diameter than the roll, and a hydraulic motor for withdrawing said roll through said bearing, substantially as described.

3. The combination, in a corrugating-machine, of a roll supported in two fixed bearings, one of said bearings being greater in diameter than the roll, so as to allow of the withdrawal of the roll therethrough, with a second roll and mechanism for causing the approach of the second roll to the first roll, substantially as described.

4. In a corrugating-machine, the combination of the adjustable corrugating-roll E, the fixed roll D, the movable bearings O and P, the double-toggle mechanism operated by bar B, and mechanism for moving said bar in both directions, substantially as described.

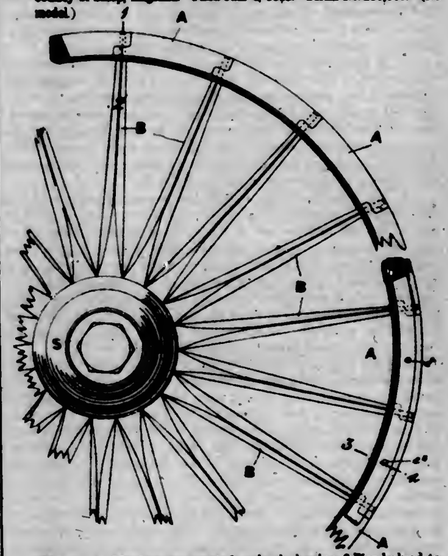
5. In a corrugating-machine, the combination of the guide-rolls Z Z, hydraulic motors E^2, gearing F^2 G^2 H^2 I^2 J^2, eccentrics J', and links K', substantially as described.



6. The combination, in a corrugating-machine, of a roll supported in two fixed bearings, one of said bearings being greater in diameter than the roll, so as to allow of the withdrawal of the roll therethrough, with a second roll and mechanism for causing the approach of the rolls to each other during corrugation, and adjustable guide-rolls for guiding the corrugating-cylinder during the process of corrugation, substantially as described.

384,032. MACHINE FOR STRIPPING LEATHER-BOARD. WALTER R. PRIEST, Lewiston, Me., assignor to the Mountain Manufacturing Company, of Maine. Filed Sept. 28, 1887. Serial No. 250,894. (No model.)

Claim.—1. The combination of the knife K, supported by the guides I^2, with the feed-rolls $G G^2$ $H H^2$, one of which rolls, G^2, extends inwardly beyond the cutting-edge of the knife K, arranged and to operate substantially as and for the purpose set forth.



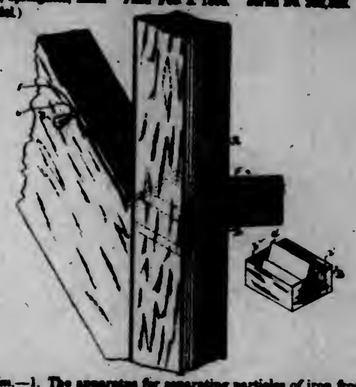
2. The combination of the knife K and the guides I^2 with two sets of rolls, between which the said knife and guides are arranged, one of the rolls on each set—viz., G^2 and H—extending inward beyond the cutting-edge of the knife, substantially as described.

384,082.

3. The knife K and the guides I^2, in combination with the feed-rolls G H and the enlarged rolls G^2 H^2, one of which extends inward beyond the cutting-edge of the knife, substantially as specified.

384,083. WHEEL. THOMAS GREEN, Highfield House, Wellington, County of Salop, England. Filed Jan. 4, 1888. Serial No. 259,800. (No model.)

Claim.—1. The improvements in wheels having follies halved together at their ends, with the hollowed and rounded corners, and resting at each end upon a spoke, whether wood or metal, with a pin, either separate or fast, passing through each half, substantially as and for the purpose herein set forth.



2. In wheels having follies halved together at their ends and secured to the spokes by pins passing through them, the combination therewith of circular side plates riveted through the follies, substantially as herein set forth.

384,084. CARD-HANGER. HENRY S. HACK, Taunton, Mass. Filed Aug. 8, 1887. Serial No. 246,403. (No model.)

Claim.—The device above described, consisting of the two outer legs, *a a*, and the intermediate leg, a^2, the two outer legs being each sharpened at its end and each having its sharpened end bent to form a claw, all substantially as set forth.

384,085. ELECTRO-MAGNETIC SEPARATOR. JOSEPH B. HAMILTON, Springfield, Minn. Filed Feb 2, 1888. Serial No. 262,852. (No model.)

Claim.—1. The apparatus for separating particles of iron from a mass of comminuted or other material, herein described, consisting of a frame open at top and bottom, one or more electro-magnets supported within said frame, each of said magnets being composed of two parallel bars united by an intermediate rib and having wound upon said rib lengthwise of said bars a wire coil, and suitable connections between each of said coils and an electrical generator for inducing an electric current through the former, substantially as described.

2. In apparatus for separating particles of iron from a mass of comminuted or other material, consisting of a series of magnets each comprising two parallel bars, an intermediate connecting-rib, and a wire coil wound upon said rib lengthwise of said bars, suitable connections between the coils of said magnets and an electrical generator for inducing an electric current through the former, and a chute or similar device for conducting the material to be operated upon to and through said series of magnets, substantially as set forth.

3. The apparatus herein described for separating particles of iron from a mass of comminuted or other material, consisting of a frame open at top and bottom, one or more electro-magnets supported at each end by opposite sides of said frame, each of said magnets being composed of two parallel bars, an intermediate connecting-rib, and a wire coil wound upon said rib lengthwise of said bars, said bars having their outer faces inclined outwardly from their upper toward their lower edges, and suitable connections between each of said coils and an electrical generator for inducing an electric current through the former, arranged and operating substantially as set forth.

4. In an apparatus for separating particles of iron from a mass of comminuted or other material, a frame open at top and bottom and having at opposite sides thereof seats for supporting the ends of a series of magnets, a series of magnets, each consisting of two parallel bars, an intermediate connecting-rib, and a wire coil wound upon said rib lengthwise of said bars, and having at each end a contact-strip connected to one of the ends of the wire composing said coil, contact-strips upon said frame located in such manner as to make connection with the strips upon said magnets when the latter are seated in said frame, and suitable connections between the contact-strips on the frame and an electrical generator for inducing an electric current through the former, whereby said current will also be induced through the coils of each of the magnets seated in the frame, substantially as set forth.

5. The combination, with chute A, having in one side thereof an opening and a door for closing the same, of frame B, supported within said chute adjacent to said opening, said frame being open at top and bottom and having horizontally disposed therein a series of electro-magnets, and suitable connections between each of said magnets and an electrical generator for inducing an electric current through the former, substantially as and for the purpose described.

6. The combination, with chute A, of frame B, detachably supported within said chute, said frame being open at top and bottom and having detachably supported therein a series of electro-magnets, C, positive and negative binding-posts upon said frame electrically connected with the positive and negative poles of each of said magnets, contact devices upon said chute to engage said posts on the frame, and suitable connections between said contact devices on the chute and an electrical generator for inducing an electric current through the former, arranged and operating substantially as and for the purpose set forth.

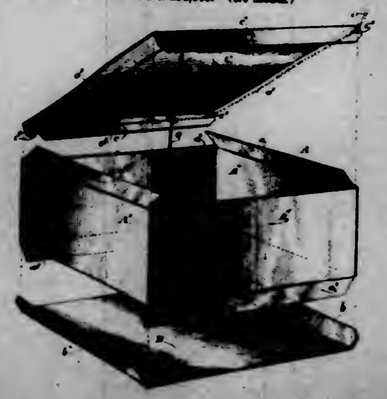
7. The combination, with chute A, frame B, located within said chute, and electro-magnets C, supported within said frame, of suitable connections between said magnets and an electrical generator for creating an electric circuit through said magnets, and lamp D, located in said circuit outside of said chute, whereby said lamp is adapted to serve as an indicator, substantially as and for the purpose described.

8. The electro-magnetic separator herein described, composed of a series of magnets, C, each consisting of parallel bars *c c*, connecting-rib *c'*, having a wire coil wound thereon, disks c^2, and contact-strips c^3 upon said disks, connected to opposite ends of the wire composing said coil, frame B, having seats *b* for said magnets, and contact-strips 1 2 3 4, arranged upon said seats, substantially as described, suitable connections between two or more of said strips on the frame and an electrical generator for inducing an electric current through the former, and a chute or similar device for conducting a mass of comminuted or other material to and through said frame, arranged and operating substantially as and for the purpose set forth.

9. In an electro-magnetic separator of the kind herein described, the combination, with the series of magnets C, each composed of bars *c c*, having their outer sides inclined, as shown, connecting-rib *c'*, and wire coil c^4 upon said rib, of a series of caps, c^5, closely fitting the space between said bars and above said coils, said caps having their upper surface wedge-shaped, substantially as and for the purpose described.

384,086. SECRETE-FASTENER. ADOLPH HELLERMANN, New York, N. Y. Filed Jan. 26, 1888. Serial No. 261,923. (No model.)

Claim.—The body *d*, formed with the fold or member d^2, to hold one side of the scarf, and the hinged member d', free at one edge and constructed to overlap the opposite side of the scarf, in combination with the plate f', hinged arm f, provided with shoulder f^2, and the spring *e*, arranged to press upon the shoulder f^2, substantially as described.



384,087. BELL-COLLAR FOR CATTLE. JOHN B. HILL and BENJAMIN B. HILL, New Albany, Miss. Filed Mar. 10, 1888. Serial No. 266,894. (No model.)

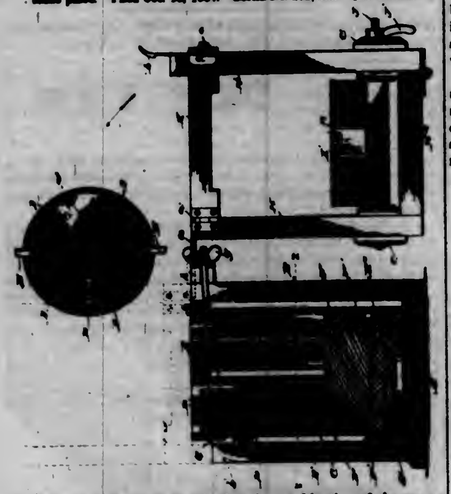
Claim.—1. The combination, in a bell-collar, of the yoke A, provided with staples *a*, the clasp B, having apertures *c*, for receiving the staples *a*, and the leather tongues C, provided with heads *d* and adapted to enter the staples *a*, substantially as described.

2. As an improved article of manufacture, a bell-collar for cattle, formed of a wooden yoke, A, provided with staples *a*, the clasp B, furnished with apertures *c*, for receiving the staples *a*, and provided with curved ends *c'*, the leather lining *c*, secured to the clasp B, and the tongue C, provided with T-heads *d*, substantially as described.

384,088. PAPER BOX. WARREN B. HOWE, Chicago, Ill. Filed Sept. 17, 1887. Serial No. 250,003. (No model.)

Claim.—1. The combination, with a paper or board body consisting of four connected walls and provided with two oppositely-arranged inwardly-bent flaps, of an end wall or cover provided at two opposite margins with inwardly-bent flaps inserted within the shell or body, substantially as described.

2. The combination, with a paper or board body consisting of four connected walls and provided with two oppositely-arranged inwardly-bent flaps, of an end wall or cover provided with inwardly-bent flaps upon two of its opposite edges inserted within the said body, and a paper wrapper or covering applied over the exterior of the said body and end walls or covers, substantially as described.



3. The combination, with a paper or board body consisting of four connected walls provided with oppositely-arranged inwardly-bent flaps, of end walls or covers, also provided with flaps at their opposite side margins, and a paper covering for the same, consisting of a sheet, J, extending around three sides of the box or package, and a second sheet or covering, L, extending around the other three sides of the box or package, substantially as described.

4. The combination, with a paper or board body consisting of four connected walls having two oppositely-arranged inwardly-bent flaps, and a cover or end wall, also provided with flaps at two of its opposite side margins, of an opening-string engaged with one corner of the cover or end wall, and a paper wrapper or exterior covering, substantially as described.

5. The combination, with a paper or board box-body consisting of four connected walls having two oppositely-arranged inwardly-bent flaps, and a cover or end wall, also provided with flaps at two of its opposite side margins, of an opening-string engaged with the flap at one corner of the cover or end wall, the flap at the opposite side of the cover or end wall being notched to receive said string, substantially as described.

6. A blank for box bodies or shells, consisting of a strip having parallel side edges and provided with two flaps upon each side margin, the flaps upon one side margin being located at intermediate points with relation to the flaps upon the other side margin, substantially as described.

384,089. LOADING APPARATUS FOR ORDNANCE-CARTRIDGES. JOHN T. JEFFERSON, Annapolis, Md., assignor of one-half to George Wells, same place. Filed Oct. 13, 1887. Serial No. 252,750. (No model.)

Claim.—1. In a cartridge-loader, the combination of the can or powder-charge holder having slotted sides, a lifting-platen arranged in the can and having handles protruding through the slots, and a removable bag-holder, substantially as and for the purpose described.

2. In a cartridge-loader, the combination of a can or powder-charge holder having slotted sides, a lifting-platen arranged in the can and having handles protruding through the slots, a detachable follower arranged within the can, and a removable bag-holding frame having clamping devices for the follower, substantially as and for the purpose described.

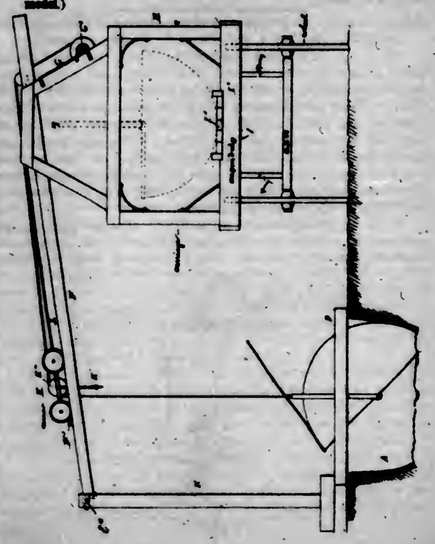
3. The combination of the slotted can, the lift-platen arranged within the same and having protruding handles, a frame-work for the can, and a hinged bag-holding frame arranged to be turned vertically over the can or to be inverted and turned down beside it, substantially as shown and described.

4. The combination of the slotted can or powder-charge holder, the vertical guide-strips D, arranged within the same for holding the vertical rows of powder cubes, the lift-platen arranged within the same and provided with protruding handles, and means for clamping and holding the bag, substantially as and for the purpose described.

5. The combination, with the powder-can and its lift-platen, of a clamping-strap, G, surrounding the top of the can and provided with adjusting devices, the follower F F, and the bag-holding frame removably fitted to the top of the powder-can, substantially as and for the purpose described.

6. The combination, with the can and its lift-platen and follower, of a hinged bag-frame, H H' H², having side clamping-arms, K K, and adjustable cross-head I, with bag-rest I', substantially as and for the purpose described.

384,040. STOP-MOTION. HENRY J. JOHNSON, Providence, R. I., assignor to Pimpl, Bartlett & Barnard, Buffalo, N. Y. Filed Jan. 30, 1888. Serial No. 262,204. (No model.)



Claim.—1. The combination, substantially as set forth, with a revolving shaft, of the spring-stop and the holding-jaw carried by said stop.

2. The combination, substantially as set forth, of the stop-bumper by which the revolution of the driving-shaft is stopped, and the holding-jaw, both mounted on the same spring.

3. The combination, substantially as set forth, of a stop-bumper by which the revolution of the driving-shaft is stopped, with the lever by which said bumper is moved, and a locking device one part of which is connected with the stop device and the other part connected with said lever, by which the stop-bumper is held in its operative position when moved thereto by said lever.

4. The combination, substantially as set forth, of the stop device and the holding-jaw, with a lever by means of which both are moved, and with a locking device one part of which is connected with the stop device and the other connected with said lever, by means of which the stop device and holding-jaw are held in their operative positions when moved thereto by said lever.

384,041. MACHINE FOR EXCAVATING. CHARLES S. JONES, Yates Centre, Kans. Filed July 2, 1887. Serial No. 243,262. (No model.)

Claim.—1. The combination, with a semicircular vault, of a semicircular revolvable pan concentric with the inside curve of the vault, whereby by inserting one edge of the pan into the vault at one end thereof and rotating it therein, as described, the contents of the vault may be transferred to the pan at a single operation, substantially as set forth.

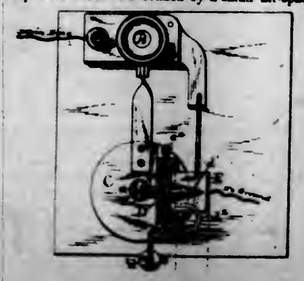
2. The combination, with the semicircular vault and the semicircular pan to fit therein provided with the bail, between the arms of which it may be rotated in the vault, of the holding-frame engaging the vault and the bail to hold the pan at about the center of the vault without interfering with the rotation of the pan, substantially as set forth.

3. The combination, with the semicircular vault and the semicircular pan having the bail pivoted centrally thereto, and between the arms of which the pan may be rotated, of the holding-frame having hooks engaging the vault and the axis of the pan, substantially as set forth.

4. The combination of the semicircular vault and the semicircular pan having the bail pivoted centrally thereto, and between the arms of which the pan may be rotated, and the hooked operating-rod for rotating the pan in the vault, substantially as set forth.

5. The combination, with the wagon-bed having a carriage movable longitudinally thereon, a longitudinal central flooring on the wagon-bed between the opposite sides of the carriage, and a windlass on the carriage, of the carrier traveling at right angles to the wagon-bed and operated from the windlass, and a frame on which the carrier travels, whereby the carriage may travel on the wagon-bed without interfering with the load deposited thereon by said carrier, substantially as set forth.

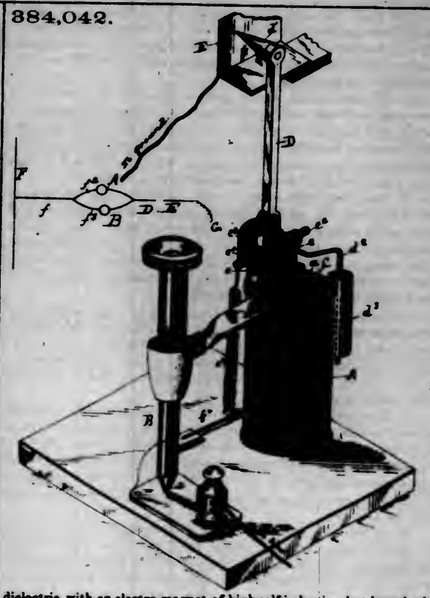
6. The combination of the rectangular wagon-body I, having longitudinal rods or tracks I′ parallel with its side beams, the carriage traveling on said tracks, the floor I^2, secured to the end beams of the wagon-body between the tracks and above the base of the carriage, with the frame F, supported at its inner end on the said carriage at right angles to its direction of movement, and the carrier traveling on the frame F and operated from the carriage, substantially as set forth.



7. The combination, with the wagon-body I, tracks I′, parallel with the side beams, and the floor I^2, of less width than the space between the tracks, of the carriage H, consisting of the bottom frame, H^2, under the floor I^2, and having wheels mounted on the tracks, the side frames, H′, extending up from the bottom frame at opposite sides of the floor, and the windlass mounted on the side frames at right angles to their line of movement, substantially as set forth.

8. The combination, with the carriage H and its windlass, of the frame F, the carrier K, having wheels K^2, central pulley, K^4, hook K^3 on its rear end, and depending hooked rod K′, the rope L, extending from the windlass and detachably connected to the hook K^3, and the pan having a bail detachably suspended from the hooked rod, whereby, when the carrier reaches the desired point, the rope may be disconnected from the hook and passed over the central pulley and the pan removed from the hooked rod and connected with the rope, substantially as set forth.

384,042. LIGHTNING-ARRESTER. PIERRE O. KNELDOLTH, Baltimore, Md. Filed Feb. 8, 1888. Serial No. 263,390. (No model.)



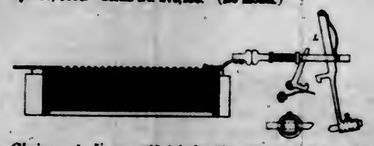
Claim.—1. In a lightning-arrester for electric lines, the combination of a main line with a branch from said line and a ground-connection separated from said branch by a small air-space or other dielectric with an electro-magnet of high self-induction but low ohmic resistance, and a shunt of low self-induction but high ohmic resistance, each included in a divisional branch of the main-line branch, said divisional branches reuniting before reaching the dielectric, and means operated by the electro-magnet for breaking the ground-connection automatically after it has been established by an arc bridging the dielectric, substantially as described.

2. In a lightning-arrester apparatus for electric-light lines, the combination of a main line with a branch from said line and a ground-connection separated from said branch by a small air-space or other

dielectric with an electro-magnet of high self-induction but low ohmic resistance, which is provided with an armature, and a shunt of low self-induction but high ohmic resistance, each included in a divisional branch of the main-line branch.

384,042.

384,043. SCREW-DRIVER ATTACHMENT. LEE KIELHORN, Jackson, La. Filed Feb. 2, 1888. Serial No. 262,737. (No model.)



Claim.—1. The combination, with the screw-driver blade having a lateral projection, of a clasping-slide provided with a point and spring and adapted for engagement with such projection, as and for the purpose specified.

2. The combination, with the screw-driver blade B, provided with the tooth *b*, of the slide C, provided with the point D, and having the opening *d*, for receiving the said tooth *b*, and the spring *e*, for retaining the slide C in position upon the blade B, substantially as described.

3. As an improved article of manufacture, a screw-driver having a blade, B, with parallel edges, provided with the tooth *b*, the slide C, fitted to the blade B, adapted to move longitudinally thereon, and provided with the point D, aperture *d*, and knob *f*, and the spring *e*, attached to the slide C and adapted to bear upon the side of the blade B, substantially as described.

384,044. RHEOSTAT. WALTER H. KNIGHT, New York, N. Y. Filed Apr. 10, 1888. Serial No. 270,126. (No model.)

Claim.—1. In an artificial electric resistance, the combination, with a series of plates in superficial contact, of a contact device and extensions on certain plates of the series with which the contact device is adapted to connect.

2. The combination, in an artificial resistance, of a series of plates in superficial contact, certain plates of the series projecting above the rest, with a contact device adapted to sweep over the edges of the projecting plates.

3. In an artificial resistance, the combination of a series of exposed metallic plates held in permanent superficial contact and stationary relatively to one another, a non-combustible support therefor, and a movable contact device sweeping over the series to bring more or less of them into circuit.

4. The combination, with a variable artificial resistance, of a controlling device therefor, and a supplementary circuit-breaker in series therewith and placed in line of action of said controlling device, so as to be operated thereby.

5. The combination of a variable artificial resistance, a movable contact device therefor, and a supplementary circuit-breaker in series with said resistance and placed at the terminal point of movement of said contact device, so as to be actuated thereby after the resistance has been included in the circuit.

6. The combination, with a variable artificial resistance, of a controlling device therefor, and a "snap" circuit-breaker in series with said resistance and placed in the line of action of said controlling device, so as to be operated thereby.

7. The combination, with a variable artificial resistance, of a movable controlling device therefor, a supplementary terminal contact, and a mechanical power-accumulator between it and the said controlling device, whereby a sudden and wide separation between the contact-points may be effected.

8. The combination of a variable artificial resistance, a controlling device therefor, a supplementary terminal contact, and an accumulating-spring between it and the said controlling device, substantially as described.

9. The combination, with a double series of resistance-plates, C, of a movable contact device for each series in electrical connection with each other, and a line-connection at corresponding ends of the two series, respectively, whereby any desired number of plates may be included in the circuit.

10. An artificial resistance consisting of a series of metallic plates in superficial contact and a box or frame having a non-conducting and non-combustible lining, substantially as described.

384,045. BOW FOR STRINGED INSTRUMENTS. EDWARD LAVENDER, London, England. Filed Jan. 5, 1888. Serial No. 259,903. (No model.)

Claim.—1. A bow-stick for stringed instruments, provided with finger-bearings projecting from the bow in one direction, and with a thumb-bearing projecting from such bow in a reverse direction, substantially as and for the purpose specified.

2. An attachment for bow-sticks for stringed instruments, consisting of a sleeve provided with finger-bearings projecting therefrom in one direction and a thumb-bearing projecting therefrom in a reverse direction, substantially as and for the purpose specified.

3. As an attachment for bows for stringed instruments, a sleeve consisting of two parts hinged together and provided with a plurality of finger-bearings, A, B, C, and D, for the purpose set forth.

4. As an attachment for bows for stringed instruments, a sleeve consisting of two parts hinged together and provided along its meeting edges with a plurality of finger-bearings, for the purpose set forth.

5. As an attachment for bows for stringed instruments, a sleeve consisting of two parts hinged together and provided along its meeting edges with a plurality of finger-bearings, and a spring-clip for fastening the parts together, as shown.

384,046. TOWEL. FRANK LEAKE, Philadelphia, Pa. Filed Feb 21, 1888. Serial No. 264,709. (No model.)

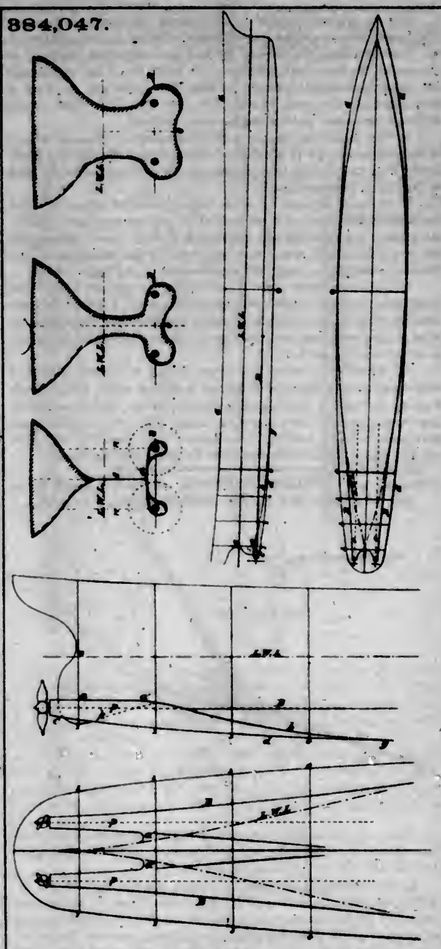
Claim.—As an improved article of manufacture, a towel composed of a closely-woven body having a double surface of terry loops, the loops upon one side being composed entirely of soft material and the loops upon the other side entirely of harsher material, substantially as and for the purpose set forth.

384,047. CONSTRUCTION OF SHIPS, &c. CHARLES C. LESSNER, New York, N. Y. Filed Mar. 22, 1887. Serial No. 231,893. (No model.)

Claim.—1. A twin-screw vessel having its hull tapered rearward to a central stern-post and provided on opposite sides with two laterally-extended trunks or tubes inclosing the screw-shafts.

2. A twin-screw vessel having its hull tapered rearward to a central stern-post and provided at the bottom on opposite sides with trunks or tubes gradually emerging from the sides of the hull at their forward ends and projected independently in tubular form at their rear ends, whereby they are adapted to inclose and sustain the screw-shafts to their rear ends and to permit the free run of the water to the entire face of the screws.

3. A hull for a twin-screw vessel, tapered rearward to a central stern-post and contracted at the stern from the load-line downward to a point above the screw-shafts, and again widened at the bottom in the form of two tubes or trunks to inclose the screw-shafts.



4. A hull for a twin-screw vessel, having a central stern-post, a rudder hung thereon, and two tubes projected rearward on opposite sides of and beyond the rudder, in combination with shafts mounted in said tubes and screws mounted on the rear ends of said shafts.

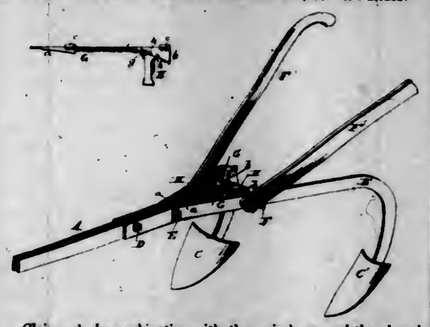
5. A hull having its rear end provided with a central stern-post and its lower portion divided vertically in the middle and terminated in the form of two shaft-receiving tubes or tunnels.

6. In a twin-screw vessel, a hull tapering to a central stern-post in the middle line and having on opposite sides two shaft-receiving tunnels emerging gradually from the sides and bottom of the hull at a point aft of its greatest transverse section, said tunnels contracting gradually rearward and extending in tubular form to the screws.

7. A hull for a twin-screw vessel, tapered rearwardly to a central stern-post, provided with two shaft-inclosing tunnels on opposite sides diminished in width between the said tunnels and the water-line and elevated on the bottom between the tunnels and forward of the stern-post.

384,047.

8. In a twin-screw vessel, a hull tapered rearward to a keel-post and provided on opposite sides with two shaft-receiving tunnels emerging gradually from the sides of the hull and extending rearward to the screws, the stern being contracted in width above the tunnels and the latter contracted vertically between the shafts and the keel as they approach the stern, whereby the free run of the water to the screws is permitted and the displacement reduced.



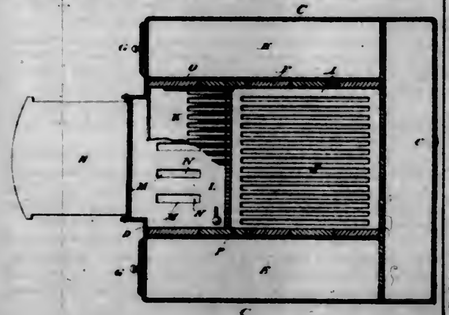
9. The vessel with two or more stern-screws on opposite sides of its longitudinal center in which the bottom of the hull under the shaft-tunnel from the stern for some distance forward forms the deepest part of the hull in transverse section.

10. A vessel with one or more screw-shafts and screws in which the bottom of the hull, at a point aft of its greatest transverse section, merges into and coincides with the bottom of shaft-tunnels surrounding the screw-shafts and rises thence rearward to the screws gradually, thereby permitting an easy and unobstructed run of water astern.

11. In a twin-screw vessel, a hull having on opposite sides of the longitudinal center the rearwardly-projecting tubes or tunnels, in combination with the screw-shafts extended therethrough, the screws applied to their rear ends, and the central rudder hung on the stern-post in advance of the screw.

12. A hull for a twin-screw vessel, having on opposite sides two shaft-receiving tunnels, substantially as described, which issue entirely from the hull only at their junction with the screws, their forward portions forming part of the hull and expanding in height and width from the screws forward, whereby firm support is obtained for the shafts and free access afforded thereto from the interior of the vessel.

384,048. WALKING-CULTIVATOR. EDWARD P. LYDE, Davenport, Iowa. Filed June 12, 1886. Serial No. 204,963. (No model.)



Claim.—1. In combination with the main beam and the shovel-beam applied to its side, the intermediate plate, G, provided at opposite ends with the two distinct wedges.

2. In combination with the main beam and the shovel-beam applied to its side, the intermediate adjustable plate, G, having two wedge-like portions at opposite ends, and the plate H, seated between the rear end of the plate G and the shovel-beam, whereby the shovel-beam is supported at two points and its adjustment at both points simultaneously permitted.

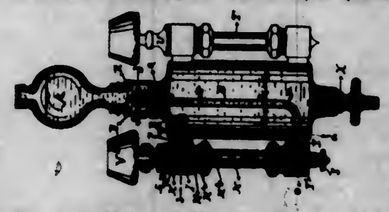
3. The main beam and the shovel-beam at its side, and the intermediate wedge-like block, *b*, having its outer face curved longitudinally and provided with notches A, in combination with the block H, constructed and arranged to interlock therewith, as described.

384,049. BROILING-OVEN FOR RANGES. JAMES G. LYDE, Brooklyn, N. Y. Filed Oct. 6, 1887. Serial No. 251,892. (No model.)

Claim.—1. A range having ovens at the side and a fire-pot provided with an open-front grate set back from the front of the range between the said ovens, so as to form a protected broiling-oven, as and for the purpose set forth.

2. A range or stove having ovens at its sides, a fire-pot set back from the front of the range or stove and between the said ovens and provided with a front grate inclined upward from the front of the fire-pot to the front of the range or stove, and a flooring extending from the front of the fire-pot to the front of the stove or range, substantially as described, whereby a broiling-oven is formed between the fire-pot and the front of the range or stove, as set forth.

384,050. HYDRAULIC PUMP. JOHN H. MARTIN, Oroville, assignee of one-half to Judson Hendy, San Francisco, Cal. Filed Jan. 28, 1888. Serial No. 261,672. (No model.)



Claim.—1. A hydraulic pump consisting of a discharge-pipe having an open lower end and a nozzle for directing a stream of water under pressure into said open end, said nozzle having a fixed and movable portion whereby the inclination of the pipe may be varied, substantially as described.

2. A hydraulic pump consisting of a discharge-pipe having an open lower end, a flexible pipe for conveying water under pressure, and a nozzle connected with the supply-pipe and with the lower open end of the discharge-pipe, said nozzle consisting of a fixed and a movable portion, forming a movable joint, whereby the discharge-pipe and supply-pipe may change their inclination, substantially as herein described.

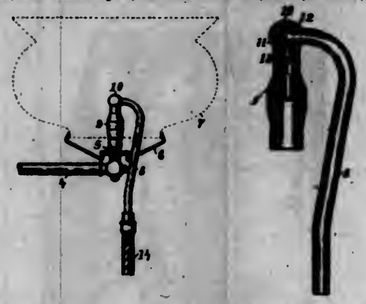
3. A hydraulic pump consisting of a discharge-pipe having an open lower end, a sectional supply-pipe provided with flexible or movable joints for conveying water under pressure, and a nozzle for said supply-pipe connected with the discharge-pipe, said nozzle consisting of a fixed and movable portion, forming a flexible joint, whereby both pipes may automatically change their inclination, substantially as herein described.

4. In a hydraulic pump, the combination of the inclined discharge-pipe, the flexibly-jointed supply-pipe, the flexibly-jointed nozzle, and the bolts connecting the nozzle with the discharge-pipe, substantially as herein described.

384,051. LUBRICATOR. ROBERT MASON and JESSE H. SMITH, Detroit, Mich. Filed Jan. 26, 1888. Serial No. 261,821. (No model.)

Claim.—1. A hydrostatic displacement down-drop lubricator combining in its construction a transparent oil-filled sight-feed glass, a reservoir for lubricating-oil, and an interposed water seal separating and confining the oils in their respective chambers, substantially as set forth.

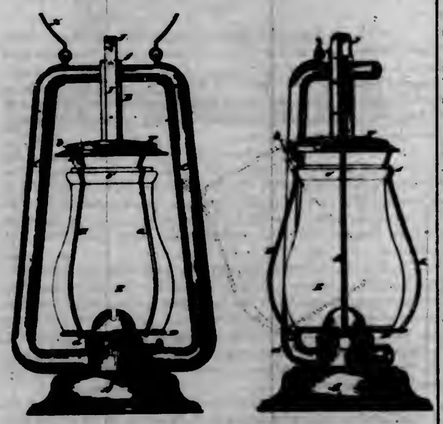
2. In combination with a sight-feed-glass chamber and an oil-reservoir, B, respectively, provided with means for filling them independently, an interposed water seal forming the sole communication between said chambers, a hydrostatic column for supplying water in regulated quantities to the former, and an oil-discharge pipe for delivering oil from the oil-reservoir, substantially as set forth.



3. In combination with the sight-feed glass of a down-water-drop lubricator and the oil-reservoir, respectively, provided with means for independently filling them with oil, a pipe, P, leading up from the bottom of the sight-feed chamber to a level above that of the top of the sight-feed chamber, through which it is filled, substantially as set forth.

4. In combination with the condensation-chamber and oil-reservoir, an intermediate sight-feed having the plug M, constructed with water-ways and externally threaded, substantially as set forth.

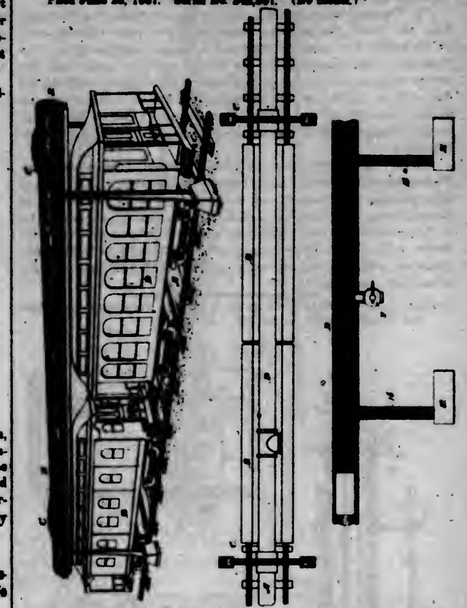
5. In combination with the condensation-chamber and oil-reservoir, an intermediate sight-chamber, and externally screw-threaded plug M, constructed with water-ways, and a detachable valve, V^1, for expelling the air from the passages when the plug is forced into place after the sight-feed chamber has been independently filled with oil, substantially as set forth.



6. In combination with the condensation-chamber, independently oil-filled sight-feed chamber, and oil-reservoir B, a water seal in the passage between the condenser and the sight-feed chamber to prevent the escape of the oil from the latter upwardly, and a second water seal between the sight-feed chamber and the oil-reservoir B, to prevent the passage of oil from either into the other, substantially as set forth.

384,052. DROP-LIGHT ATTACHMENT. WILLIAM B. MASON, Providence, R. I. Filed July 19, 1887. Serial No. 244,703. (No model.)

Claim.—In a detachable stort-cock attachment, the combination, with the internally-screw-threaded gas-socket 9 for receiving the gas-burner, and the externally-screw-threaded bent gas-tube 8, of the elbow-coupling 10, connecting the socket and the tube and provided with the right-angled channel or bore 11, and formed with the internal screw-thread, 12, and the external screw-thread, 13, substantially as and for the purpose herein described.

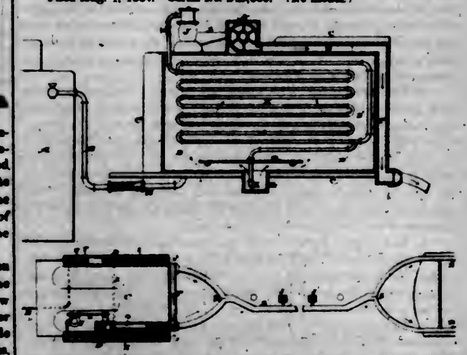


384,053. LANTERN. HENRY A. MATHEWS and DAVID M. IRELAND, Waterbury, Conn. Filed Feb. 16, 1888. Serial No. 264,202. (No model.)

Claim.—1. In a lantern substantially such as described, the combination of the perforated plate D, adapted to rest on the burner below, the cap-plate F above, the globe G, seated upon the plate D and below the plate F, two or more guard-wires extending from the plate below outside the globe to the plate above and rigidly secured to the said plates, and one or more guard-wires hinged at one end to one of said plates and extending outside the globe, detachably secured by the other end to the other plate, substantially as described.

2. In a lantern substantially such as described, the combination of the perforated plate D, adapted to rest on the burner below, the cap-plate F above, the globe G, seated upon the plate D and below the plate F and constructed with an annular bead around its upper end, two or more guard-wires extending from the plate below outside the globe to the plate above and rigidly secured to the said plates, and one or more guard-wires hinged at one end to one of said plates and extending outside the globe, detachably secured by the other end to the other plate, the said wires constructed with bends corresponding to and adapted to embrace said bead on the globe, substantially as described.

384,054. RAILWAY SYSTEM. THOMAS J. MAYALL, Reading, Mass.; Lucy A. Mayall executrix of said Thomas J. Mayall, deceased. Filed June 22, 1887. Serial No. 242,207. (No model.)



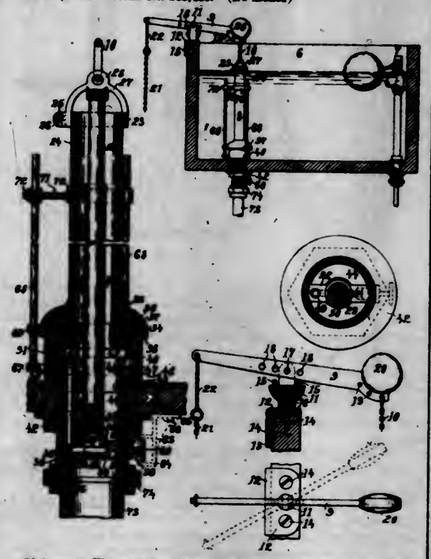
Claim.—1. The combination, with the surface road-bed of ordinary construction and the cars adapted to run thereon, of the arches spanning said road, the pneumatic tube carried by said arches, carriers within said tubes, and connections between said carriers and cars, substantially as described.

2. The combination, with the road-bed and arches spanning the same, of the pneumatic tube carried thereby and having a slot on its under side extending the entire length of said tube, and a flexible packing of anti-friction material for closing said slot, substantially as described.

3. The combination, with the pneumatic tube having a longitudinal slot, of the packing-tubes of anti-friction material, one on each edge of said slot, substantially as described.

4. The combination of the road-bed car, pneumatic tube having a slot, slotted carrier within said tube, and a coupler detachably connecting said car and carrier, substantially as described.

384,055. CAR-HEATER. FRANK C. MCELROY, Columbus, Ohio. Filed Aug. 1, 1887. Serial No. 245,869. (No model.)



Claim.—1. The combination of the boiler, the pipe which conducts the steam therefrom, the inclosing-chambers placed upon opposite sides of the tender and connected together by an air-conducting pipe, the radiators placed in the chambers, an engine placed upon the tender, and a blower which is operated by the engine, with a register or pipe

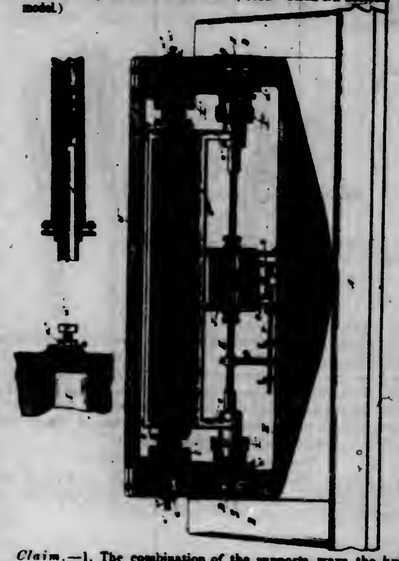
through which cold air is taken into the inclosing-chambers, the pipe through which the heated air is forced by the fan, and the pipe which conducts the heat to the cars, substantially as shown.

2. The combination of the boiler, the pipe for conducting the steam from the boiler, the inclosing-chambers placed upon opposite sides of the tender and connected together by an air-conducting pipe, the registers in the chambers, the fan located upon the tender and connected with one of the inclosing-chambers, the engine for driving the fan, with the register or pipe through which the air is taken into one of the chambers, and the pipes or boxes for conveying the heated air to the outlet-pipe which extends along under the cars, substantially as described.

3. In a car-heater, the combination of the boiler, the pipe for conducting the steam therefrom, the tender, the inclosing-chambers placed upon opposite sides thereof, and which are connected together by an air-conducting pipe, radiators placed in the chambers, deflectors placed in the chambers for evenly diffusing the air, an engine located on the tender, a fan driven by the engine and connected with both of the chambers, and a pipe for conveying away the heated air from the cars, substantially as set forth.

384,056. **VALVE.** PATRICK W. HERMAN, Providence, R. I. Filed Feb. 9, 1888. Serial No. 263,469. (No model.)

Claim.—1. The combination, with the tube 24, provided with the annular valve, of the reservoir formed within the cylinder 40, the tube 30, connected with the reservoir by passage-ways 49 and 53, provided with valves 50, 55, and 58, and the piston 29, connected with the tube 24, constructed to draw water from the reservoir into the tube 30 when the valve is raised to act as a cushion to control the descent of the valve, as described.



2. The combination, with the outlet secured in the bottom of the tank provided with the bridge 52, having water-channel 53, and a reservoir formed within the cylinder 40 by means of the ring 45 and provided with the block 48, connected by tube 49 with the bridge 52, of the tube 30 and piston 29, connected to and moving with the main valve and check-valves 50, 55, and 58, constructed to admit water to the tube 30 when the valve is raised and discharge the water when the valve descends, so as to regulate the descent of the valve and the quantity of the flushing-water, as described.

3. In a tubular flushing-valve, the combination, with the valve, of a reservoir connected with the tube 30 by water-ways 49 and 53, controlled by check-valves 50 and 55, the piston 29, connected to and moving with the valve, and the adjustable discharge-valve 58, as and for the purpose herein described.

4. The combination, with the tank and lever 9, one end of which is connected with the flush-valve, of the tube 24, provided with the valve-disk 36 and packing 38, the cylinder 40, forming the valve-seat, and the sleeve 45, forming a reservoir connected by water-ways with the bridge 52, the tube 30, piston 29, and valves controlling the water supply and discharge, the rods 68, and the stop 70, as and for the purpose set forth.

5. In a flush-valve, the combination, with the tube 24, provided with a valve, the tube 30, and piston 29, of the cylinder 40, forming the valve-seat and discharge-outlet, the ring or sleeve 45, forming an annular reservoir between the cylinder 40 and sleeve 45, and passages connecting the said reservoir with tube 30 of the strainer 46 47, as described.

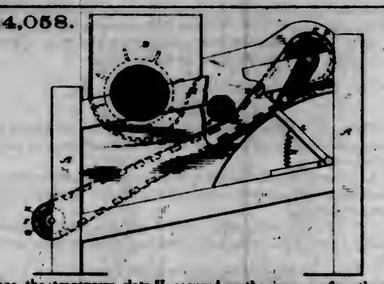
384,057. **MACHINE FOR CUTTING VENEERS.** CHARLES L. MERRILL, Indianapolis, Ind. Filed Mar. 3, 1888. Serial No. 265,998. (No model.)

Claim.—1. The combination of the supports, ways, the knife-table traveling upon the said ways, a reciprocating knife-frame mounted in bearings in the said knife-table, a knife secured upon the knife-frame, a piston-rod connected to the said reciprocating knife-frame, a piston upon the piston-rod, and a cylinder in which the said piston works, this cylinder being mounted upon the traveling knife-table, substantially as herein described.

2. The combination of the traveling knife-table, the reciprocating knife-frame mounted thereon, the knife secured to this frame, the piston-rod rigidly connected at both of its ends to the knife-frame, a piston on the rod, and a cylinder in which the piston works, the said cylinder being mounted on the traveling carriage, whereby the knife is given a smooth and true reciprocating movement as the knife-table advances.

3. The combination of the traveling knife-table, the reciprocating knife-frame mounted thereon, the knife on the knife-frame, the piston-rod rigidly secured to the said reciprocating knife-frame, the piston on this rod, the cylinder in which the piston works, this cylinder being mounted upon the traveling carriage, the steam-chest and slide-valve therein, the latter being provided with a stem, the adjustable stops on this stem, and the adjustable arm on the piston-rod, as and for the purpose specified.

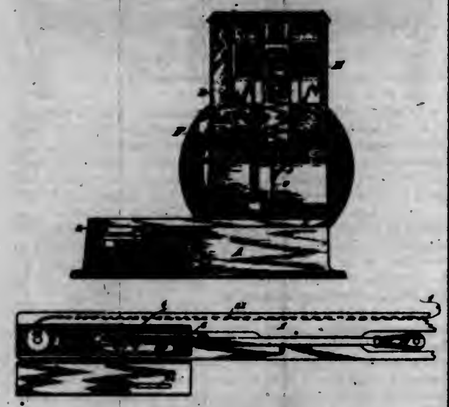
4. The combination, with the knife-table and the air-cylinders secured thereon, of the reciprocating knife-frame provided with plungers or pistons which work in the said air-cylinders, the knife secured to the knife-frame, and means for reciprocating the said knife-frame.



5. The combination, with the knife-table and the air-cylinders thereon, the latter being provided with adjustable openings, of the knife-frame provided with plungers or pistons which work in the said air-cylinders, the knife secured to the knife-frame, and means for reciprocating the knife-frame.

6. In a veneer-cutter, the combination, with the traveling knife-table and the air cylinders or chambers thereon, of the knife-frame provided with pistons or plungers working in the said air-cylinders, a knife on the frame, a piston-rod rigidly connected at both of its ends to the said knife-frame, a piston on this rod, and a cylinder in which this piston works, the said cylinder being mounted upon the traveling knife-table, as and for the purposes set forth.

384,058. **SEPARATING-MACHINE.** ANDREW J. MILLER, Avis, Ohio. Filed July 11, 1887. Serial No. 244,017. (No model.)



Claim.—In a separating-machine, the combination of the pulleys G, the inclined belt F, mounted thereon and having an unbroken outer

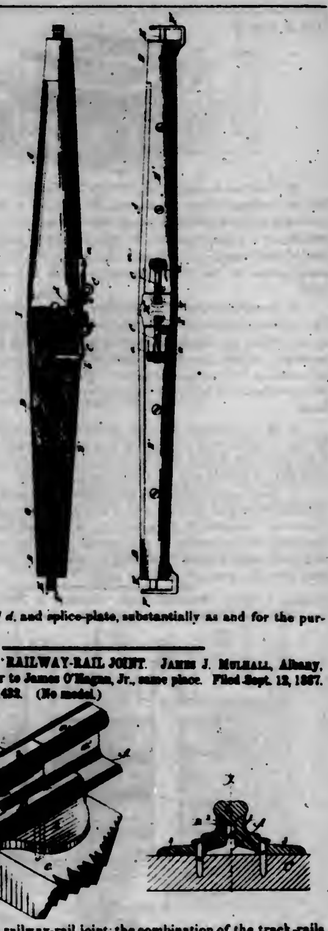
384,058.

surface, the transverse slats H, secured on the inner surface thereof, and the polygonal agitating-wheel I, having a frictional contact with the upper surface of the belt, whereby the jar produced by the frictional wheel is communicated to the whole width of the belt, substantially as shown and described.

384,059. **SEWING-MACHINE.** LOUIS L. MILLER, Newport, assignor of one-half to Frank H. Perkins, Covington, Ky. Filed Feb. 23, 1887. Serial No. 228,195. (Model.)

Claim.—1. The combination, with a hook-needle of a sewing-machine, of the tube-supporting bar 1, having a free end projecting above the machine-table and under the needle, and the reciprocating hook and thread-looper 7, having an eyelet, 8, and provided with a stud moving in a cam-groove, 24, substantially as described.

2. In combination with the supporting-bar 1 of the sewing-machine, the thread-looper mechanism consisting of the vibratory reciprocating bar 6, hook 7, located within said bar, and provided with a slotted guide, 24, and an elongated slot, 23, in the upper side of said bar, whereby the looper is operated in unison with the movement of the hook-needle by the driving mechanism of the machine, substantially as specified.



3. The combination, with the tube-supporting bar 1, provided with a slot, 23, and a lower slot, 24, and having its free end projected under the needle, of the reciprocating bar 6, having hook 7, the latter provided with eyelet 8, the connecting-bar 9, link 10, and lever 11, the hook 7 being guided by a cam-groove, 24, substantially as described.

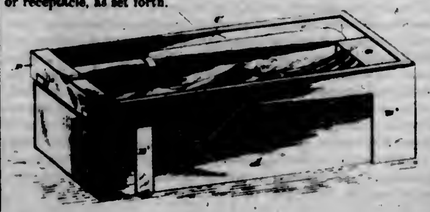
4. In combination with the slotted hollow supporting-bar 1, the thread-looping mechanism located within said bar, consisting of the reciprocating vibratory bar 6, hook 7, eyelet 8, and friction-roller 22, slot 23, and guide 24, for looping the thread over a hooked needle, substantially as specified.

384,060. **HORSE-DETACHER.** WALTER L. MITCHELL, PHILIP M. MITCHELL, and JOHN G. A. HARNIT, Felton, Pa. Filed Dec. 13, 1887. Serial No. 257,293. (No model.)

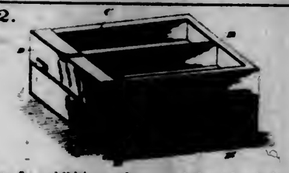
Claim.—The combination of the whiffletree, chambered as described, the ferrules B B, with bracket-arms F F, and the metal strips B' B', screwed to the back of the whiffletree, and provided also with perforated ears *d d*, the spring-bolts E E, pull-rods D D, and elbow-levers C C, having arms *b* extending transversely into the whiffletree, and their outer arms parallel to the whiffletree and provided with loops *c*, the splice-plate H, and bolts I I, passing through and securing the

384,060.

whiffletree, ears *d d*, and splice-plate, substantially as and for the purpose described.



384,061. **RAILWAY-RAIL JOINT.** JAMES J. MULHALL, Albany, N. Y., assignor to James O'Hagan, Jr., same place. Filed Sept. 13, 1887. Serial No. 249,422. (No model.)

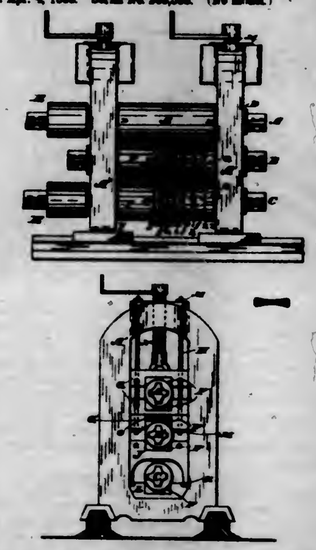


Claim.—In a railway-rail joint, the combination of the track-rails having the heads of their conjoining ends cut away, as herein shown and described, and a joint-piece for fastening the ends of said track-rails, said joint-piece comprising a head which fills the space formed by cutting away the conjoining ends of the track-rails, side flanges pendent from said head and of a uniform length with said head until they bear upon the lower flange of the track-rails, and then expanding both endwise and laterally to form horizontal flanges which bear upon the crosstie, and by which the joint-piece is secured in place, as and for the purpose herein specified.

384,062. **SHOW-CASE FOR CUTLERY.** EUGENE A. NELMS, Atlanta, Ga. Filed Mar. 3, 1888. Serial No. 266,569. (No model.)

Claim.—1. A device for exhibiting cutlery, consisting of a shallow sample box or receptacle having a transparent top and a closed bottom and clasping-bands secured to said bottom adapted to engage and retain an independent packing-box in connection with said sample box or receptacle, as set forth.

384,062.



2. A device for exhibiting cutlery, consisting of a shallow sample box or receptacle having a transparent top and a closed bottom, and provided with longitudinal compartments, and the interior made accessible by a hinged door at one end, and bands attached to the bottom of said sample-box adapted to encircle and hold an independent packing-case in removable connection with the sample-box, as set forth.

3. In combination with a packing-box, A, a display or exhibiting case having bands secured thereto for connecting the cases removably to each other, the display-case being provided with longitudinal compartments, which are suitably lined, and a door, one of said compartments being of less length than the adjacent one to provide a space for the reception of a label, substantially as shown, and for the purpose set forth.

4. In combination with the packing box A, a shallow receptacle having a transparent top, and at one end a socket, the opposite end being provided with a band adapted to encircle the packing-box, substantially as shown, and for the purpose set forth.

5. As an improved article of manufacture, a sample or display receptacle having an open top with a transparent covering and accessible interiorly by means of a hinged door at one end thereof, and attaching-bands on the bottom of said sample or display receptacle adapted to encircle and retain a containing packing-case in removable connection with the sample-box, as set forth.

384,063. ROLLING-MILL. CHARLES A. NORMAN, Canton, Ohio. Filed Apr. 4, 1888. Serial No. 269,993. (No model.)

Claim.—1. A three-high train of rolls placed in vertical order in suitable housing, consisting, essentially, of an upper roll, as A, of plain surface and even diameter throughout its length, between journals, and a middle roll, as B, and a bottom roll, as C, having corresponding plain surfaces, as P and Q, and corresponding convex-bottomed grooves, as a and *f*, forming double concave grooves between the rolls B C, and a groove between the rollers A and B flat on one side and concave on the other, substantially as described, and for the purpose set forth.

2. In combination with housing A', the plain driven roll A, supported in journal-boxes F, suspended in yokes G, supported on rods H, a free middle roller, B, resting in journal-boxes P and F', pillow-block J, a driven bottom roller, C, journal-box F, pillow-block L, and means for adjusting and securing the rolls in adjustment, substantially as described, and for the purpose set forth.

384,064. BUTTON. WILLIAM P. HALE, Jersey City, N. J., assignor to the Vulcanite Manufacturing Company, New York, N. Y. Filed Feb. 27, 1888. Serial No. 265,802. (No model.)

Claim.—1. A button or other article formed of or containing a compound consisting of powdered hoof and a mixture of glycerine and saccharine substance.

2. A button or other article formed of a compound consisting of a fibrous material, powdered hoof, and a mixture of glycerine and saccharine substance.

3. A button or other article formed of a compound consisting of a fibrous material, powdered hoof, and a mixture of glycerine and molasses.

384,065. PISTON METER. JOHN R. HOSFORD, Boston, Mass. Filed Mar. 3, 1888. Serial No. 266,010. (No model.)

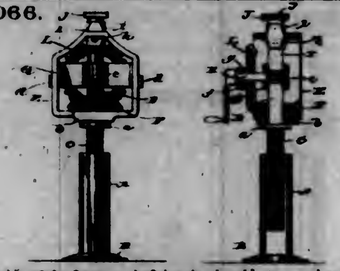
Claim.—1. In a fluid-meter, the combination, with the cylinders A A, reciprocating pistons *a*, and the valve-chamber B, of the main valve L, operated by the direct pressure of the fluid thereon, the supplemental valve S, actuated by the piston, and the latches P P, operated by the said supplemental valve and adapted to control the movement of the main valve, substantially as and for the purpose set forth.

2. In a fluid-meter, the combination, with the main valve L, operated by the direct pressure of the fluid, and the pivoted latches P P, adapted to control the movement of the main valve, substantially as described, of the supplemental valve S, provided with inclines S^2 S^2, for operating the latches when the supplemental valve is moved by the piston, substantially as described.

3. In a fluid-meter, the combination, with the cylinders A A, reciprocating piston *a*, and the valve-chamber B, of the main valve L, having the ports L^2 L^3 extending entirely through it, the valve-plate E, having the ports H H and outlet-port G, the valve-case I, with its ports J K, the cover O, with its ports J^2 K^2 and openings or waterways R R, the supplemental valve S, with its recesses 25 and inclines S^2 S^2, and the pivoted latches P P, having lips or projections Q and spurs or projections Q^2, the latter adapted to pass through the openings R into the ports L^2 of the main valve, whereby the movement of the latter is controlled, all co-operating substantially in the manner and for the purpose set forth.

4. In a fluid-meter, the combination, with the main valve L, its casing I, and the cover O, with their ports and water-ways, substantially as described, of the latches P, pivoted to the cover O and having the lips or projections Q and spurs or projections Q^2, and the supplemental valve S, adapted, when operated by the piston, to alternately raise the latches to release the main valve, whereby the latter is prevented from completing its movement until the piston has been moved to its full extent and the supplemental valve has admitted the water under full pressure to act upon the main valve, substantially as and for the purpose set forth.

5. In a fluid-meter, the combination, with the spindle T and ratchet-wheel U secured thereto, of the reciprocating finger-bar X, provided with a finger, Y, pivoted thereto and adapted to engage with the ratchet-wheel, and the fixed cam W^2 on the bar W, for throwing the finger into engagement with the ratchet-wheel, all constructed to operate substantially in the manner and for the purpose set forth.



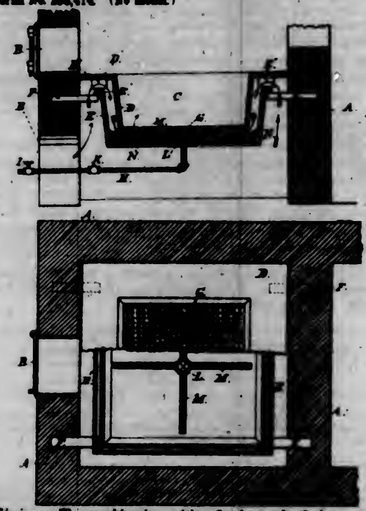
384,066. LIFTING-JACK. JOHN S. OAR, Augusta, Ky. Filed Feb. 16, 1888. Serial No. 264,302. (No model.)

Claim.—1. The combination of the standard, the threaded shaft therein, the open frame having a central swiveled bearing for the upper end of the shaft, and mechanism carried by the frame to rotate the shaft, as set forth.

2. The combination, in a lifting-jack, of a vertical standard, a threaded shaft therein, a frame rotatable on said shaft and provided with a central bearing for the end of said shaft, and a section, I, having its lower end in the said bearing, substantially as specified.

3. In a lifting-jack, a vertical internally-threaded standard, a threaded shaft therein, a frame rotatable upon said shaft, a strap spanning one side of the frame, a shaft bearing in said strap and carrying a bevel-wheel, said shaft being square-ended for the application of a key, and a bevel-wheel, F, on the threaded shaft, substantially as specified.

384,066.

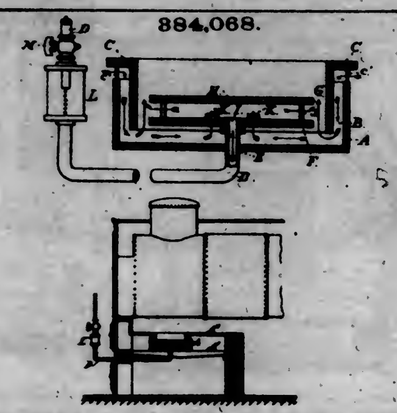


4. In a lifting-jack, the standard, the threaded shaft engaging a threaded portion of the standard and provided with the collar *a*, the upper portion of the shaft above the collar being threadless, the frame E, swiveled on the upper threadless portion of the shaft, the swiveled step carried by the frame, and the gearing carried by the frame to engage with the threaded shaft, as set forth.

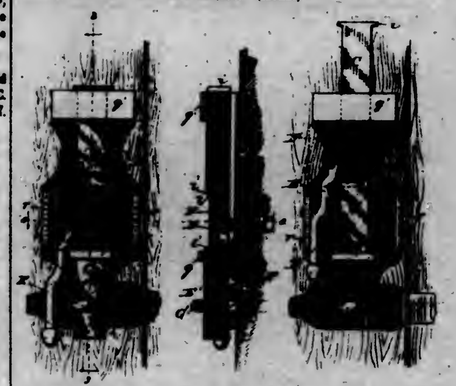
5. In a lifting-jack, the standard, the threaded shaft D, having its upper portion plane and its lower threaded portion working in a threaded part of the standard, the gear F, secured on the plane portion of the shaft, the frame E, swiveled to the plane portion of the said shaft, the gear-wheel L to actuate the gear F, the brace G, the upper independent shaft-section, I, having its lower end seated in the brace, and the swiveled step carried by the shaft-section I, as set forth.

6. In a lifting-jack, the standard, the vertically-movable shaft D, the frame E, swiveled on the shaft D, the gearing carried by the frame E to work the shaft D, the independent shaft I, arranged within the frame E and supporting the same, and step J, as set forth.

384,067. HYDROCARBON-BURNER. JAMES R. PATTERSON and ALONZO HOFFMAN, Toledo, Ohio, assignors of one-third to Walter C. Lloyd and George P. Worts, both of same place. Filed May 16, 1887. Serial No. 238,414. (No model.)



Claim.—The combination, with a fire-box, of a fuel-pan, means for supporting said pan in the fire-box, a perforated oil-supply pipe located in said pan, and an upper pan having a perforated bottom, and flanges for supporting the same within the fuel-pan, whereby an air-supply passage or flue is formed within the fire-box, as described.

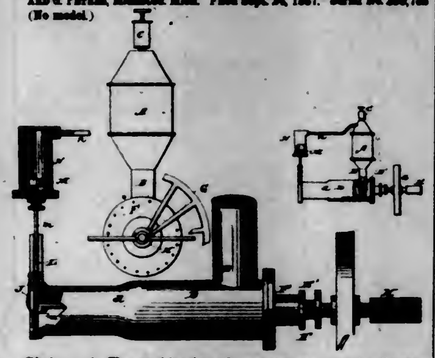


384,068. HYDROCARBON VAPORIZER AND BURNER. JAMES R. PATTERSON and ALONZO HOFFMAN, Toledo, Ohio, assignors of one-third to Walter C. Lloyd and George P. Worts, same place. Filed July 5, 1887. Serial No. 243,262. (No model.)

Claim.—In a hydrocarbon vaporizer and burner, a bottom pan, a cylinder therein having a top flange overlapping the bottom pan, forming air-spaces, as described, in combination with upper and lower burner-plates, the lower plate being provided with an induction-port for fuel centrally thereof, air-induction ports concentric therewith, said burner-plates being of less diameter than the cylinder, whereby an air-space is formed between the cylinder and peripheries of the plates, as and for the purpose set forth.

384,068.

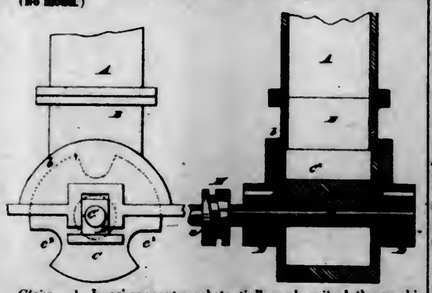
384,069. SEAL-LOCK. ARTHUR E. PRIEST, Chicago, Ill. Filed Feb. 14, 1888. Serial No. 263,896. (Model.)



Claim.—1. In a seal-lock, the combination of a plate, A, provided with lateral flanges *r*, a bolt, C, on the plate, movable longitudinally thereon and immovable axially, and provided with a recess, *l*, and normally locked against longitudinal movement, and a frangible seal, F, confined in the recess *l* and between the flanges *r* and requiring to be fractured to permit access to the locking mechanism of the bolt, substantially as and for the purpose set forth.

2. In a seal-lock, the combination of a plate, A, provided with lateral flanges *r* and a yielding stud, *m*, a bolt, C, on the plate, movable longitudinally thereon, and provided with a recess, *l*, in its front side and with a recess, *k*, in its rear side, a rotary pin, D, extending through the bolt transversely to the stud *m* and carrying a stud, *m'*, adjacent to the recess *k*, a lever, E, extending from the pin D, and a frangible seal, F, confined in the recess *l* and between the flanges *r*, substantially as and for the purpose set forth.

3. A seal-lock comprising, in combination, a plate, A, having extensions at opposite ends, through which to secure the device in place, and provided with guides *q* and *q'*, lateral flanges *r* between the guides, and a yielding stud, *m*, a bolt, C, extending through the guides, movable longitudinally therein, and provided with a recess, *l*, in its front side and with a recess, *k*, in its rear side, a rotary pin, D, extending through the bolt transversely to the stud *m* and carrying a stud, *m'*, adjacent to the recess *k* and normally projecting into the path of the yielding stud, a lever, E, extending from the pin D, and a frangible seal, F, confined in the recess *l* and between the flanges *r*, substantially as and for the purpose set forth.



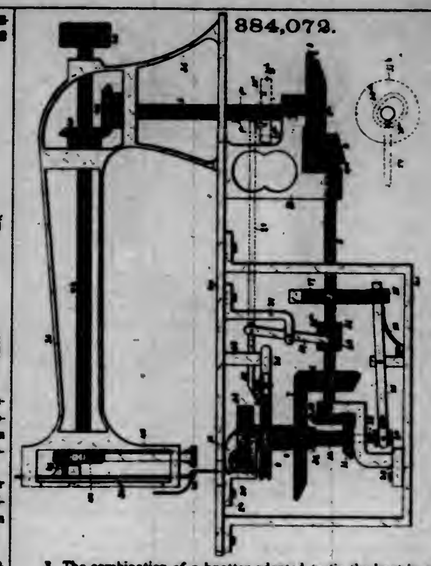
384,070. DISCHARGE MECHANISM FOR VACUUM-PANS. REUBEN G. PEYERS, Manistee, Mich. Filed Sept. 24, 1887. Serial No. 250,782. (No model.)

Claim.—1. The combination of a vacuum-pan, a valve for controlling the discharge of the precipitate, a cylinder, a connection between said cylinder and vacuum-pan forming communication between such parts, and a piston in said cylinder connected with the valve, substantially as and for the purposes specified.

2. The combination of the vacuum-pan, the discharge-chamber thereof having guides L, the valves E, movable in said guides, the cylinder N, connected by pipe *n* with the vacuum-pan, and the piston connected with the valve E, all substantially as set forth.

384,071. DISCHARGE MECHANISM FOR VACUUM-PANS. REUBEN G. PEYERS, Manistee, Mich. Filed July 26, 1887. Serial No. 245,320. (No model.)

Claim.—1. In an apparatus substantially as described, the combination of the leg or pipe having a valve-casing, a pocketed valve rotatably supported in said casing and made of less length than the distance between the side walls of said casing, and mechanism whereby the valve may be reciprocated longitudinally in its casing, substantially as described, and for the purposes specified.



2. In an apparatus for use in the manufacture of salt, the combination of the leg or pipe provided at its lower end with a valve-casing, the rotary pocketed valve supported in said casing and capable of reciprocating in the direction of its axis in said casing, the shaft secured to said valve and supported in suitable bearings and provided with a circumferential spiral groove, and the fixed pin or stud entering said groove, whereby the shaft and its valve may be reciprocated longitudinally as the shaft is revolved, substantially as and for the purposes specified.

384,072. GRAIN-BINDER. WILLIAM H. PLATT, Mac-o-chee, Ohio, assignor of one-third to Benjamin F. Rumble, same place. Filed June 14, 1886. Serial No. 205,152. (No model.)

Claim.—1. The combination of a knotter adapted to tie the knot in one complete rotation, a gripper having two oppositely-disposed radial hooks mounted to rotate on the same center as the knotter, and mechanism for imparting for each single rotation of the knotter a one-half rotation to the gripper in the opposite direction for completing the knot, substantially as described.

2. The combination of a knotter adapted to tie the knot in one complete forward rotation, a gripper having two oppositely-disposed hooks adapted to rotate on the same center as the knotter, a guard over which the knotter operates and beneath which the gripper rotates, and mechanism for imparting for each single rotation of the knotter a one-half rotation to the gripper in the opposite direction for completing the knot, substantially as described.

884,072.

3. The combination of a knotter adapted to tie the knot in one complete forward rotation, a gripper having two oppositely-disposed hooks adapted to rotate on the same center as the knotter, a guard over which the knotter operates and beneath which the gripper rotates, a knife for severing the cord between the gripper and the guard, and mechanism for imparting for each single rotation of the knotter a one-half rotation to the gripper in the opposite direction for completing the knot, substantially as described.

4. The combination of a knotter adapted to tie the knot in one complete forward rotation, comprising the stem 12, an upper jaw, 19, a gear-wheel, 11, a shank, 13, sliding within the stem, and a lower jaw, 20, pivoted to the upper jaw and hinged to the shank, a gripper rotating on the knotter, comprising the sleeve 8, gear-wheel 7, and two oppositely-disposed hooks, 9 9, and mechanism for imparting a single rotation to the knotter-wheel and a one-half rotation to the gripper-wheel in the opposite direction for completing the knot, substantially as described.

5. The combination of the shaft 5, having bevel-pinion 4 and bevel-pinions 6 and 10, shaft 1, the bevel-wheel 2, having rack-segment 2*r*, engaging the pinion, the stem 12, provided with bevel gear-wheel 11, upper jaw, 19, and lower jaw, 20, the shank 13, to which the lower jaw is hinged, having an operating-lever, and the sleeve 8, rotating on the stem, having the large bevel gear-wheel 7 and hooks 9 9, substantially as described.

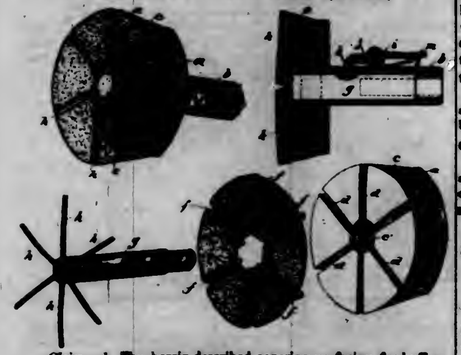
384,073. PIPE-COUPLING. BENJAMIN W. POE, Buffalo, N. Y., assignor to himself and Philip Steingoetter, same place. Filed Feb. 10, 1888. Serial No. 263,681. (No model.)

Claim.—1. In a pipe-coupling, the combination of two hollow flat-faced coupling portions provided with packing-rings, a ring jointed to an arm pivoted to one of the coupling portions, and a pivoted cam-lever for securing them together, substantially as described.

2. A pipe-coupling consisting of two hollow flat-faced coupling portions, a ring pivoted thereto and provided with a cam-lever for securing them together, in combination with pipes rigidly secured to the coupling portions in a line therewith and at right angles thereto by elbows and by stuffing-boxes with the horizontal portions of L-shaped coupling-joints, and pipes connected by stuffing-boxes to the vertical portions and by elbows to horizontal pipes connected by stuffing-boxes to couplings 5, having pipes rigidly secured to them, as and for the purposes described.

884,074. PAVEMENT. JESSE B. FOSTER, Belvidere, Ill., assignor of one-half to Reuben J. Tousley, same place. Filed Dec. 17, 1887. Serial No. 258,264. (No specimens.)

Claim.—The herein-described composition for pavements, composed of coal-tar, sand, hair, lime-plaster, salt, and tallow, substantially as set forth.



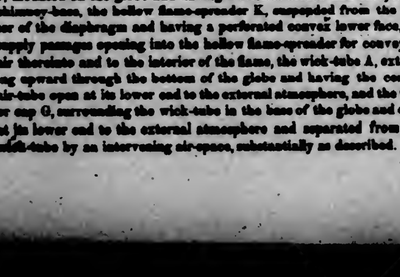
884,075. HAND-CHARGER FOR CONVEYING METALS WITH CHEMICALS, MINERALS, &c. PAUL S. BROWN, Philadelphia, Pa. Filed Sept. 14, 1886. Serial No. 213,472. (No model.)

Claim.—1. A hand-charger for the purpose named, consisting of a body, B, having a chamber, C, open at the bottom and provided with perforations in its sides, a neck, B', rising from said body and formed with a bore, and a handle, E, entering said bore and closing the top of said chamber, substantially as described.

2. A hand-charger for the purpose named, consisting of the body B, having a chamber, C, open at the bottom and provided with perforations in its sides, a hollow neck, B', rising from said body, a handle in said neck, and a cap, F, forming the bottom of said chamber, substantially as described.

884,076. ARMATURE-PAD. JOHN H. RUSSELL, Lynn, assignor, by direct and mesne assignments, to Charles F. Brown, trustee, Reading, Mass. Filed Dec. 9, 1887. Serial No. 257,578. (No model.)

Claim.—1. The herein-described covering or facing for buffing-pads, consisting of a sheet of sand-paper or similar material, having radial corrugations or depressions *f* permanently molded or formed therein, substantially as and for the purpose set forth.



2. The herein-described buffing-pad, consisting of felt or other suitable soft or spongy material, having radial grooves or depressions *d* permanently formed in its face, substantially as and for the purpose set forth.

3. The pad provided with grooves or depressions, the support for the pad, and the sand-paper facing having corrugations or depressions, combined with a rod having radial arms constructed and arranged to extend into the depressions of the pad and facing, and a locking or clamping device for securing said rod to said pad-support, all combined, arranged, and operating substantially as set forth.

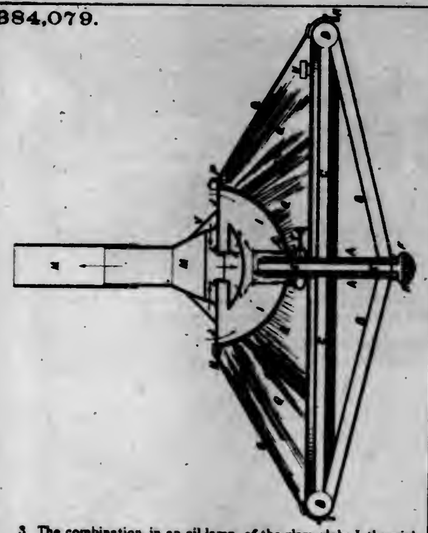
884,077. DYNAMO-ELECTRIC MACHINE OR MOTOR. ANDREW L. RIKER, New York, N. Y. Filed Nov. 23, 1887. Serial No. 256,152. (No model.)

Claim.—In a dynamo or motor, the combination, with the ring-armature, of the four field-magnets, each having its core and pole in one piece of wrought-iron, the outer surface of each pole having the form of an arc of a circle in cross-section, and the uprights to which said pieces are bolted at their ends, said magnets being parallel to the armature-shaft and located at the four corners of a rectangle whose base is horizontal, substantially as described.

884,078. TRUCK. WILLIAM W. ROBIN, Hampton, Va. Filed Feb. 28, 1888. Serial No. 265,915. (No model.)

Claim.—1. The combination of a truck having a longitudinally slotted handle, with an adjustable grip-bar, E, on said handle, having longitudinal slots *e* and *f*, whereby it can be adjusted longitudinally and vertically on the handle, and the securing-bolt passing through the slot in the handle, and through slot *f* in the grip-bar E, for fastening the grip-bar in any position, all constructed and arranged substantially in the manner and for the purpose described.

2. The combination of a truck having studs *b b*, a slotted handle, and braces D D, with an adjustable grip-bar, E, on said handle, having longitudinal slots *e f*, and its securing-bolts and nut, substantially as described.



3. The combination of a truck having studs *b b*, a slotted handle, and pointed arms *d d*, with the adjustable double-slotted grip-bar E on said handle, and the bolt F and nut G, all constructed and arranged substantially in the manner and for the purpose described.

884,079. OIL-LAMP. JAMES ROSS, Walmley Gardens, Sumnerbury, County of Middlesex, England. Filed Jan. 28, 1888. Serial No. 262,263. (No model.) Patented in England Aug. 31, 1886, No. 11,081, and in Belgium Oct. 7, 1887, No. 79,119.

Claim.—1. In an oil-burning lamp, the combination of the globe I, the perforated diaphragm J, having a central orifice and mounted on the top of the bowl and carrying a chimney-base, the hollow flame-spreader K, having a convex perforated lower face and suspended centrally from and supported by the said diaphragm, air-supply passages leading into the hollow flame-spreader to conduct air to the interior of the flame, the wick-tube A, extending into the globe under the flame-spreader and having the central air heating and supply tube, E, open at its lower end to the external atmosphere and at its upper end open to the globe, and the tube or cap G, surrounding the wick-tube in the base of the globe, and supported by the latter and separated from said wick-tube by an intervening air-space, said tube or cap being open at its lower end to the external atmosphere, substantially as described.

2. The combination, in an oil-lamp, of the globe I, the diaphragm J, mounted on the globe and having a central orifice and carrying a chimney-base, the hollow flame-spreader K, suspended from the center of the diaphragm and having a perforated convex lower face, air-supply passages opening into the hollow flame-spreader for conveying air therefrom and to the interior of the flame, the wick-tube A, extending upward through the bottom of the globe and having the central air-tube open at its lower end to the external atmosphere, and the tube or cap G, surrounding the wick-tube in the base of the globe and open at its lower end to the external atmosphere and separated from the wick-tube by an intervening air-space, substantially as described.

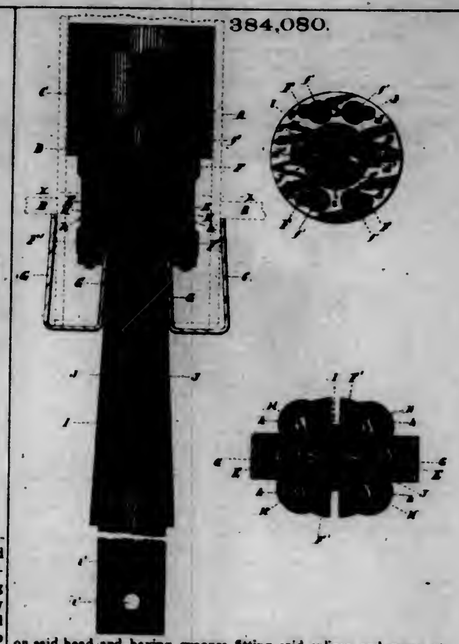
384,079.

3. The combination, in an oil-lamp, of the glass globe I, the wick-tube A, extending into the bottom thereof, the diaphragm J, mounted on the top of the globe and having a central orifice, the hollow flame-spreader K, suspended from the center of the diaphragm and having a convex perforated lower face hung over the wick-tube, air-supply passages leading into the interior of the flame-spreader to supply heated air to the interior of the flame, and passages from the globe to the chimney-base for the products of combustion, substantially as described.

4. An oil-burning lamp comprising a wick-tube having a central air-supply tube, a glass bowl into which the wick-tube projects, a short air-conducting tube or cap around the wick-tube located in and supported by the bottom of the globe, a perforated diaphragm on the top of the globe carrying a chimney-base and having a central orifice, a hollow flame-spreader having a convex perforated lower face hung directly over the wick-tube, air-supply passages leading into the hollow flame-spreader for conducting heated air thereinto and to the interior of the flame, and passages from the globe to the chimney-base for the products of combustion, substantially as described.

5. The combination, in an oil-lamp, of the glass globe I, the wick-tube A, extending into the globe and having its lower portion below the globe, the surrounding oil-reservoir D, the inclined braces Q, extending from the reservoir to the globe for supporting the latter, horizontal tubes C, leading from the reservoir to the upper portion of the wick-tube below the globe, and the inclined tubes B, leading from the reservoir to the lower portion of the wick-tube, substantially as described.

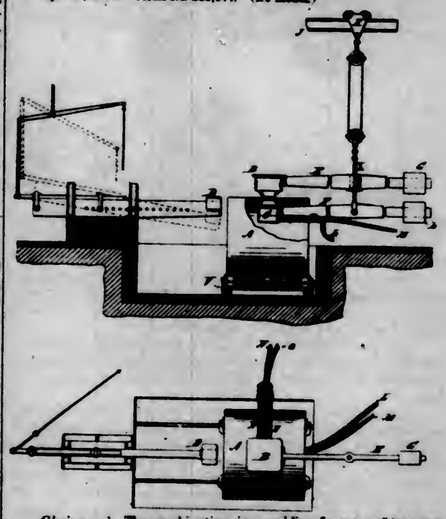
384,080. PIPE EXPANDER AND CUTTER. SAMUEL A. ROSS, Erie, Pa., assignor of one-half to H. R. Barnhurst, same place. Filed Sept. 27, 1887. Serial No. 250,850. (No model.)



Claim.—1. In an apparatus for cutting and expanding steam-boiler flues, the combination, substantially as described, of a head fitting within the tube, sliding frames moving laterally on said head, rollers H, with cutters A, journaled in said frames, a splined tapering mandrel movable longitudinally within said head and between said frames, and grooves on said frames to receive the splines on said mandrel.

2. In an apparatus for cutting and expanding steam-boiler flues, the combination, substantially as described, of a head fitting within the tube and having a tubular extension, C, forming an elongated bearing, sliding frames movable laterally on said head, rollers H, with cutters A, journaled in said head, a splined tapering mandrel movable longitudinally within said head and between said frames, and grooves on said frames to receive the splines on said mandrel.

3. In an apparatus for cutting and expanding steam-boiler flues, the combination, substantially as set forth, of a head fitting in said tube, a tapering mandrel movable longitudinally in said head and having thereon dovetail-formed splines, and frames carrying the expanders and cutters, movable laterally on said head, and having dovetail-formed grooves embracing the splines on said mandrel.



4. In an apparatus for cutting and expanding steam-boiler flues, the combination, substantially as set forth, of a head fitting in said tube, a tapering splined mandrel movable longitudinally in said head, laterally-movable frames carrying the expanders, and cutters adjusted

384,080.

on said head and having grooves fitting said splines, and gages attached to said frames which extend over the end of the tube and bear upon the flue-sheet of the boiler.

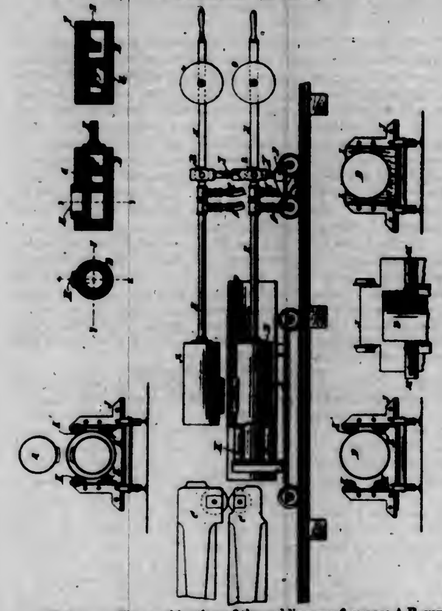
384,081. CYLINDER-WELDING APPARATUS. THOMAS F. ROWLAND, New York, and WARREN B. HILL and ARGUS MCLACHLAN, Brooklyn, N. Y.; said Hill and McLachlan assignors to said Rowland. Filed Apr. 21, 1887. Serial No. 235,677. (No model.)

Claim.—1. The combination, in a welding-furnace, of two gas-burners, B C, pivoted upon the same pivotal support, thereby enabling them to be brought one over the other, substantially as described.

2. The combination, in a welding-furnace, of the gas-burners B C, carried upon the same pivotal support, X, and mechanism for moving them longitudinally, substantially as described.

3. The combination of the pivoted gas-burners B C, the carriage V, and the welding mechanism D, substantially as described.

4. The combination of the gas-burners B C, carried by arms B F, supported by vertical pivot X, carried by carriage K on rail J, substantially as described.



5. The combination, with a welding-furnace, of air-pipe R, gas-pipe P, mingling-chamber S, and oblong burner T, substantially as described.

6. The combination, in a welding-furnace, of an air-chamber connecting with the pipe O and pipes P, the double pipes P and R, the mingling-chamber S, and burner T, substantially as described.

7. The combination, in a welding-furnace, of two gas-burners and mechanism for bringing them together within and without the tube or body to be welded and a carriage for supporting such tube and moving it longitudinally between the gas-burners, substantially as described.

8. The combination of two welding gas-burners and mechanism for moving them longitudinally and a carriage for supporting the tube or body to be welded and capable of longitudinal motion in the same direction as the motion of the gas-burners, substantially as described.

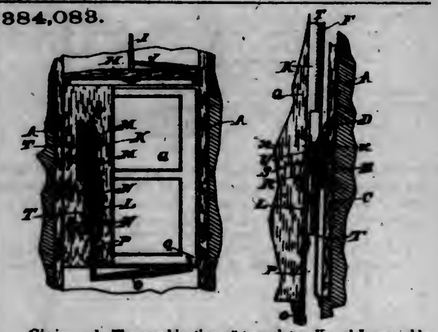
384,082. CYLINDER-WELDING APPARATUS. THOMAS F. ROWLAND, New York, and WARREN B. HILL and ARGUS MCLACHLAN, Brooklyn, N. Y.; said Hill and McLachlan assignors to said Rowland. Filed Apr. 21, 1887. Serial No. 235,678. (No model.)

Claim.—1. The combination of the welding gas-furnaces A B, supported upon the same pivot, and a carriage, J, provided with adjustable mechanism for carrying cylinders of different diameters and bringing such cylinders in the proper relation to the welding gas-furnaces A B, substantially as described.

2. The welding gas-furnaces A B, carried upon the carriage J, capable of longitudinal motion, substantially as described.

3. The welding gas-furnaces A B, combined with the pipes E and longitudinally-movable carriage P, substantially as described.

4. The counterbalanced gas-furnaces A B, pipes E E, air and gas pipes S T, and carriage P, substantially as described.



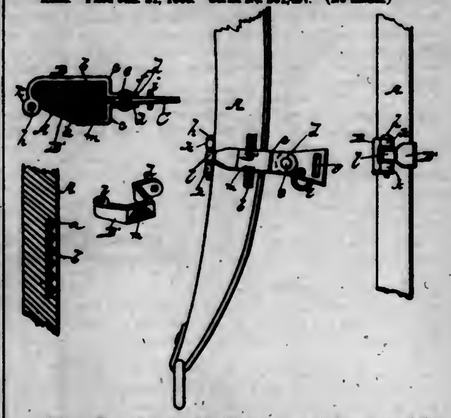
5. The welding gas-furnace B, provided with internal baffle-plates or partitions, and burner H, located beyond said baffle-plates in the flow of gas and air, substantially as described.

6. The combination of the gas-furnaces A B, having their burners H facing each other, the pipes E, and the gas and air pipes S T, substantially as described.

7. The combination of two furnaces having their burning-openings adjacent to each other and each provided with internal baffle-plates between the gas-supply and the burner, and means of introducing gas and air simultaneously to said burners, substantially as described.

384,088. AUTOMATIC DOOR FOR ELEVATOR-WELLS. JOHN P. RIEDEL, Milwaukee, Wis. Filed Sept. 27, 1887. Serial No. 250,702. (No model.)

384,083.



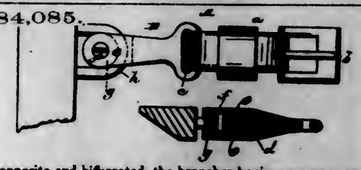
Claim.—1. The combination of two plates, K and L, movably secured to the side of an elevator-car, G, and provided with toothed flanges T, and the lever O, connected at one end to the lower plate, L, and at the other end provided with the pedal Q, with a horizontally-moving elevator-well door, C, a rack, D, secured thereto, a wheel, E, meshing therewith, and a pinion, R, rigid to wheel E and meshing with the teeth on plates K and L, all substantially as described.

2. In a device for automatically operating elevator-well doors, a horizontally-moving door, C, and a thereto-secured rack, D, in combination with a single wheel, E, having integral therewith a single pinion, R, and two plates, K and L, secured to the side of the car and provided with reversed teeth which mesh on opposite sides with the single pinion R, whereby they are adapted to rotate it alternately in the reverse direction, substantially as and for the purpose described.

3. In devices for operating elevator-well doors, the plates K and L, provided, respectively, with the inclined slots M M and N N, and with the toothed flange T, and the therewith-connected operating-lever O, in combination with gear secured to the side of the well, and a rack secured to the door, whereby the door is opened and closed, substantially as described.

4. In devices for operating elevator-well doors, two reversely-toothed plates, K and L, movably secured to the side of the car, one above and moving with the other, but in reverse direction, in combination with an operating-lever, O, substantially as described.

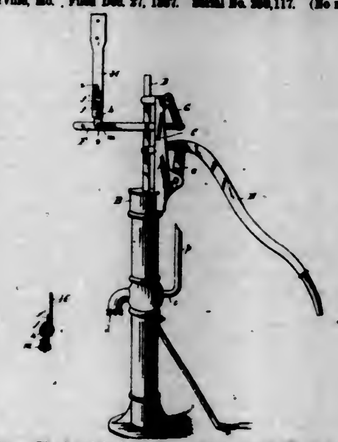
384,084. HAME ATTACHMENT. ROBERT F. REMER, Abilene, Kans. Filed Jan. 21, 1888. Serial No. 261,457. (No model.)



Claim.—The within-described improvement in hames, consisting of the plates B B', one of which having the teeth *m*, and provided with the eyes *k l*, lugs or ears *d*, slotted plate C, having the ring *i*, the pin A, and toothed plate *b* within the recess *a* of the hame, the whole combined, constructed, and arranged as and for the purpose set forth.

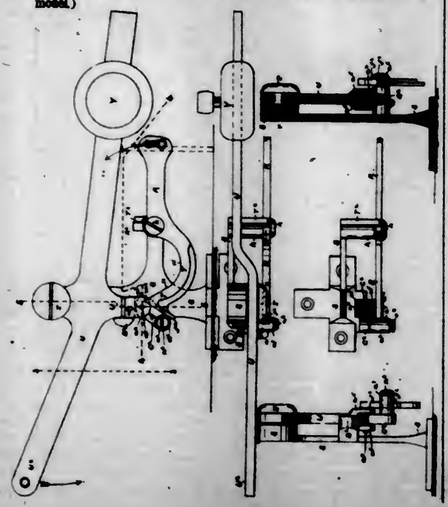
384,085. HAME-TUG. ROBERT F. REMER, Abilene, Kans. Filed Feb. 9, 1888. Serial No. 263,492. (No model.)

Claim.—1. In combination with the hame provided with the staple and the tag-strap, the within-described attachment or plate B, constructed with the loop *e* at one end and the branches *c* at the other end, formed integral, the screw *f* connecting these branches and provided with the roller, as and for the purpose set forth.



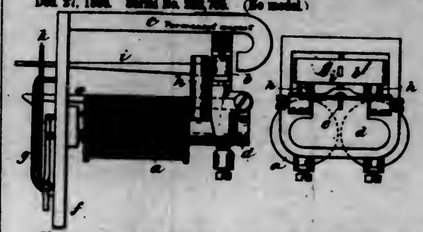
2. The attachment for hames, having a loop, *e*, at one end and

384,085.



the opposite end bifurcated, the branches having a square opening, *k*, and beveled perforation *m*, on the face of one of the branches, the block *o*, having square end *p* and beveled end *n*, and the screw for holding said block in position, as shown and described.

384,086. PUMP AND WINDMILL HEAD. JOHN P. SHUCKMAN, Owensville, Mo. Filed Dec. 27, 1887. Serial No. 258,117. (No model.)

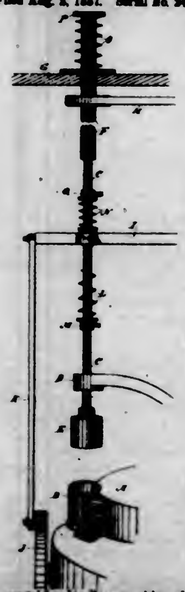


Claim.—The hereinbefore shown and described pump-head for hand and windmill power, composed of the head B, having the standard C projected vertically therefrom, and provided with a bearing at its upper end for the pump-rod to work through, the lever F, pivoted to the pump-rod, and having one end adjustably connected with the windmill-rod, and having its other end connected with the bearing by the swinging link G, and the handle E, connected with the pump-rod and connected with the said standard by the swinging link *e*, substantially as set forth.

384,087. OPERATING-LEVER FOR VALVES, &c. WILLIAM SCOTT, Malden, Mass. Filed Feb 13, 1888. Serial No. 263,898. (No model.)

Claim.—In combination, a reciprocating and operating lever, U, having an abutment-face, e^{10}, and a swinging and dependent toe, C^3, with abutment-faces c^5 c^6 at an angle to each other for said abutment-face e^{10}, and with bearing and working faces c^3 and c^4, a lever, R, having bearing and working faces f^1 a at an angle to each other to be acted upon by the bearing and working faces c^3 c^4 of the operating-lever U, and fixed stops to arrest the movement of said levers, substantially as described, for the purpose specified.

384,088. ELECTRIC ANNUNCIATOR. CHARLES H. SHERBURNE, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Serial No. 222,709. (No model.)

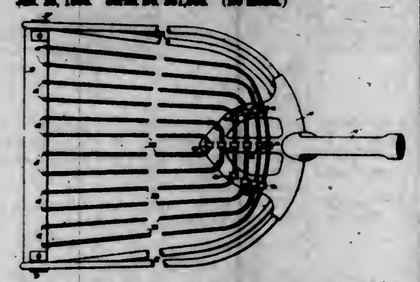


Claim.—1. The combination, in an electric annunciator, of two shutters, an electro-magnet with its poles extended, two armatures, one of said armatures being polarized and centrally pivoted and the other armature being neutral, the said armatures respectively engaging with the said shutters, substantially as and for the purpose specified.

2. The combination, with a pair of electro-magnets, of two armatures, one of said armatures being neutral and the other centrally pivoted and polarized, and two shutters, one of said shutters being operated by the movement of the neutral armature and the other of said shutters being operated by the vibration of the centrally-pivoted armature, whereby different signals may be displayed, according to the character of the current which is sent through the electro-magnet.

3. The combination, with an electro-magnet, of two armatures, one neutral and the other polarized, two shutters, one shutter being retained by a double detent upon the polarized armature, the other shutter being retained by a single detent upon the neutral armature, whereby on energizing the electro-magnet by a single impulse the detent of the neutral armature releases its shutter, while on energizing the electro-magnet by a series of alternate impulses both armatures are operated to release their shutters.

384,089. CARTRIDGE-LOADING MACHINE. PERRYMAN SELBY, Oakland, Cal. Filed Aug. 3, 1887. Serial No. 245,979. (No model.)



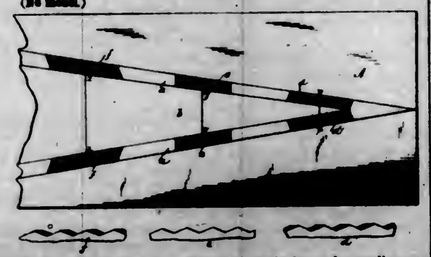
Claim.—1. In a cartridge-loading machine, the vertically-moving crimper-stem and the rotating spindle seated upon its upper end, in combination with the supporting-arm through which the stem passes, a pitman connected with one end of said arm, a crank-wheel to which the opposite end of the pitman is attached, the collars M and Q on the vertical stem, and the springs bearing against the collars, substantially as described.

2. In a cartridge-loading machine, the vertical spindle having the crimper attached to the lower end, the rising and falling supporting-arm, in combination with the spring N and collar Q, by which the weight of the spindle is supported upon the arm from above, and the spring L and collar M upon the spindle beneath the arm, whereby the pressure of the arm is gradually increased by its descent, substantially as herein described.

3. The vertical spindle carrying the cartridge-crimper at its lower end, the rising and falling arm through which the spindle passes, the collars, and springs, as shown, in combination with the vertical rod extending through guides in a line above the spindle, having a tapering socket in the lower end to fit the head of the spindle, and a pulley by which the rod and spindle are caused to rotate, substantially as herein described.

4. The vertical rising and falling spindle carrying a crimping-head at its lower end and having supporting and operating springs and collars, as shown, the vertical rod standing in line above the spindle, having a tapering socket in its lower end fitting a correspondingly-shaped head of the spindle, and a pulley on said rod through which a rotary motion is imparted, in combination with the spring O, surrounding the rod, and the collar or head P, whereby the weight of the rod and spindle is automatically reduced as they move downward, substantially as herein described.

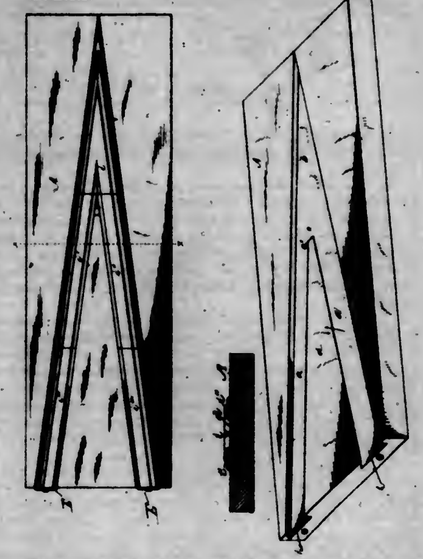
384,090. WIRE SCOOP. LOUIS H. SEGLER, Cleveland, Ohio. Filed Jan. 28, 1888. Serial No. 261,893. (No model.)



Claim.—1. In a wire scoop, the combination, with a skeleton plate having loops therein and outwardly-projecting ribs on its sides and wires passing through these loops in the skeleton plate, of a front plate to which the forward ends of the wires are secured, said plate having loops on its end, and side wires secured in said loops and having their ends secured in the outwardly-projecting ribs of the skeleton plate, substantially as set forth.

2. In a wire scoop, the combination, with wires B, of a front plate having a series of holes for securing the ends of such wires, the latter being offset downward to enter such holes, the plate being offset downward rearward of each hole and offset upward forward of such hole, the parts being arranged substantially as set forth.

3. In a wire scoop, the combination, with plates A and D, the former having ribs arranged in pairs and the latter having loops at the end thereof, substantially as indicated, of wires forming the sides of the scoop, said wires engaging the loops of plate D, these wires being bent back and secured at the ends between ribs of plate A by clinching such ribs over the respective wires, substantially as set forth.



384,091. DIE FOR MAKING ROLLED FORGINGS. GERMAN F. SIMONDS, Fitchburg, Mass. Filed Nov. 2, 1887. Serial No. 254,066. (No model.)

Claim.—1. In the construction of the reducing and spreading surfaces of dies for making rolled forgings, the inclination of the teeth from the lower or base line of such surfaces to the upper line in the direction of the line of travel of the dies when rolling an article.

2. The construction of the teeth or corrugations with their surfaces forming obtuse angles.

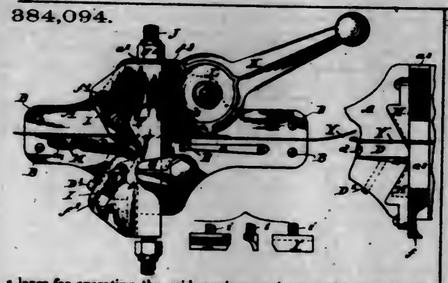
384,092. DIE FOR MAKING ROLLED FORGINGS. GERMAN F. SIMONDS, Fitchburg, Mass. Filed Nov. 2, 1887. Serial No. 254,067. (No model.)

Claim.—A die for producing rolled forgings, formed of a series of hardened-steel sectional parts inserted in their proper relation to each other in converging dovetailed recesses in an iron base.

384,093. WHEELBARROW. WILLIAM SLOCOMB, Jr., Troy, N. Y. Filed Dec. 31, 1887. Serial No. 259,502. (No model.)

Claim.—1. The combination, in a wheelbarrow, of two side stringers, each formed of a single malleable casting having longitudinal ribs and flanges, with laterally-projecting attaching-lugs, a lubricant-chamber at one end of the stringers open on one side to the wheel-axle, and a handle at the other end, supporting-legs bolted upon the stringers, and a traction-wheel, all combined and organized substantially as and for the purposes set forth.

2. The combination, with stringers having the strut E and flanges *b*, of a truss cable, wire, or spring, D, bent down at D' against said strut, resting in a groove formed by said flanges, held by a bolt at its forward end, and bearing with its middle against said strut, as and for the purpose specified.



3. The wheelbarrow axle-boxes, combined with flanged stringers B to form a chamber for lubricants, as shown and described.

384,094. SAW-SETTING MACHINE. WARREN S. SMITH, St. Johnsbury, Vt. Filed Aug. 31, 1887. Serial No. 248,233. (No model.)

Claim.—1. In a saw-set, the combination of a bed-plate having a groove for receiving a saw, a sliding carriage adapted to move across said groove at a right angle, suitable saw-feeding jaws pivotally attached to said carriage and tooth-setting blocks adjustably attached thereto, and means for reciprocating said carriage to and fro upon said bed, substantially for the purpose set forth.

2. In a saw-set, the combination of a bed-plate having a groove for receiving a saw, a sliding carriage adapted to move across said groove at a right angle, suitable saw-feeding jaws pivotally attached to said carriage and tooth-setting blocks adjustably attached thereto,

384,094.

a lever for operating the said carriage, and means for retaining the carriage in its proper position upon said bed-plate, substantially as set forth.

3. In a saw-set, the combination of a bed-plate having a groove for receiving a saw, and a spring-roll for retaining said saw in its proper place, a sliding carriage adapted to move across said groove at a right angle, suitable saw-feeding jaws pivotally attached to said carriage and tooth-setting blocks adjustably attached thereto, a lever for operating said carriage, and means for retaining the same in its proper position upon said bed-plate, substantially for the purpose explained.

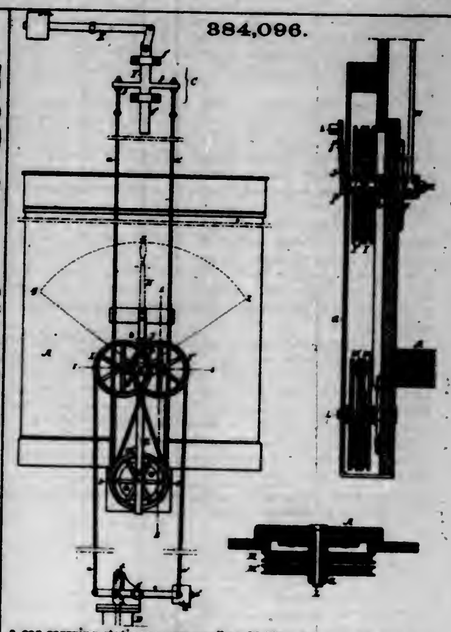
4. In a saw-set, the combination of a bed-plate having a groove for receiving a saw, an adjustable wedge for contracting said groove to various thicknesses of saws near the part being set, and a spring-roll for retaining said saw in its proper place, a sliding carriage adapted to move across said groove at a right angle, suitable saw-feeding jaws pivotally attached to said carriage and tooth-setting blocks adjustably attached thereto, a lever for operating said carriage, and means for retaining the same upon the bed while moving to and fro, substantially for the purpose specified.

5. In a saw-set, the combination of a bed-plate provided with a groove for receiving a saw, an adjustable wedge for contracting said groove to various thicknesses of saws near the teeth being operated upon, and a spring-roll for retaining said saw in its proper place, a sliding carriage adapted to move across said bed at a right angle with said groove, and provided at each end with a set-screw for adjusting its reciprocal movement, as shown, suitable saw-feeding jaws pivotally attached to said carriage and tooth-setting blocks adjustably attached thereto, means for adjusting various widths of saws in the bed, substantially as described, and mechanism comprising a rack, segment of a pinion, and a lever for operating the said carriage, for the purpose set forth.

384,095. STEAM BELL-RINGER. GEORGE B. SNOW, Buffalo, N. Y. Filed Mar. 6, 1883. Serial No. 87,275. (No model.)

Claim.—1. In a steam bell-ringer, the combination of a piston-rod operating through a sleeve on a cylinder-head and formed with a beveled shoulder near its lower end, and a piston formed with a countersink for engagement with the beveled shoulder on the piston-rod, the said piston-rod being wholly disconnected from the piston, substantially as described.

2. The combination, with a single-acting engine having its piston and piston-rod separate and capable of independent motion, of a connecting-rod and a crank attached to the yoke of a swinging bell, the said crank and piston-rod having a greater throw than the said piston, substantially as described.



3. In a steam bell-ringer, the combination of a piston-rod and piston separate and detached from each other and capable of independent motion, said piston-rod having a greater throw than its piston, and seating thereupon to form an equilibrium-valve, substantially as described.

384,096. ELEVATOR. SAMUEL R. STOKER, Philadelphia, Pa. Filed Mar. 20, 1888. Serial No. 268,274. (No model.)

Claim.—1. The combination of ropes attached to a fixture at one end, and a power-controlling device to which the other ends of the ropes are connected, and an elevator-car having pulleys M M', wheels I I', and movable supports for the latter, so that said wheels can be moved toward or from the said pulleys M M', substantially as set forth.

2. The combination of ropes attached to a fixture at one end, and a power-controlling device to which the ropes are also connected, with

384,096.

a car carrying stationary rope-pulleys M M', a two-armed lever carrying pulleys I I', over which the ropes pass, and a lever connected to the two-armed lever for adjusting the rope-pulleys I I' toward and from the rope-pulleys M M', substantially as specified.

384,097. RUBBER SHOE. ELISHA STOUT, Lambertville, N. J. Filed Apr. 5, 1887. Serial No. 233,722. (No model.)

Claim.—1. A boot or shoe composed of a combined fabric of rubber and duck in which the rubber forms an outer covering for the duck and is extended above the same to the top of the shoe, substantially as described.

2. A boot or shoe composed of a combined fabric of rubber and duck in which the rubber forms an outer covering for the duck and is extended above the same to the top of the shoe, that portion of the rubber above the duck being provided with an elastic lining, substantially as described.

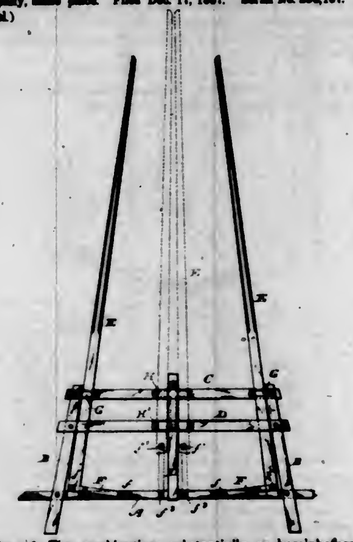
384,098. WATER-HOOK FOR HARNESS. GEORGE M. STRONG, Boston, Mass. Filed June 14, 1886. Serial No. 205,154. (No model.)

Claim.—In a harness water-hook, the combination of the hook or standard B, having an opening, H, and slots L L, with the eyebolt M, having wings N N, and spring K, all adapted to operate together substantially as described, and for the purpose set forth.

384,099. JAR-CLAMP. FRANK G. VALLEAU, Beaver Falls, Pa. Filed Sept. 27, 1887. Serial No. 250,522. (Model.)

Claim.—1. The clamp formed of two loops of substantially like form, each provided with a bar portion adapted to engage the lower face of an annular projection or lug on a jar, with the inner ends connected

384,099.



to form a universal connection between the parts, substantially as described, whereby the clamp shall engage the projection or lugs at points diametrically opposite each other and in line with the universal connection, as set forth.

2. The clamp comprising two loops having their free ends constructed to engage the lower face of an annular projection on the jar, in combination with the ring for connecting the same, the loops being adapted to be turned to draw the parts tightly upon the jar, substantially as set forth.

3. The adjustable wire clamp for fruit-jars, consisting of two loops connected by a ring having unequal dimensions and adapted to be placed with its short or long diameter in the plane of the loops, substantially as set forth.

4. The clamp comprising two loops having their free ends shaped to engage the jar, in combination with a connecting-ring having unequal dimensions and provided with a lever-arm for operating the same, substantially as and for the purpose set forth.

384,100. DRAFT APPARATUS FOR VEHICLES. ALLEN R. THOMAS and SEBASTIAN RITTY, Dayton, Ohio, assignors to the Ohio Rake Company, same place. Filed Dec. 17, 1887. Serial No. 258,167. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the oblique side bars, the transverse bars uniting them, the shafts, the links secured to the rear ends of the shafts and to the rear transverse bar, and a clip bridging each shaft from the adjacent side bar and bolted to one of the forward transverse bars.

2. The combination, substantially as hereinbefore set forth, of the oblique side bars, the transverse bars uniting them, the central longitudinal bar, the shafts, the links secured to the rear ends of the shafts and to the rear transverse bar, and a fastening or fastenings securing said shafts against the edges of said central bar, whereby they form a pole.

3. The combination, substantially as hereinbefore set forth, of the oblique side bars, the transverse bars uniting them, the central longitudinal bar, the shafts, the links bolted to the rear ends of said shafts and to the rear transverse bar, and clips bridging said shafts on each side of the central longitudinal bar, whereby they are brought together and secured in position to form a pole.

4. The combination, substantially as hereinbefore set forth, of the oblique side bars, the transverse bars uniting them, the central longitudinal bar, the shafts, the links secured to the rear ends of said shafts and to the rear transverse bar, a device for uniting said shafts to one of the forward transverse bars adjacent to the corresponding side bar, and a device for uniting said shafts to one or more of the forward transverse bars adjacent to the central longitudinal bar.

5. The combination, substantially as hereinbefore set forth, of the oblique side bars, the transverse bar, the central longitudinal bar, the shafts, the links pivoted to the rear ends of said shafts and to the rear transverse bar and swinging from the oblique bar over toward the central bar on their pivotal connections with said transverse bars, and fastenings for uniting said shafts to one of the forward transverse bars adjacent to the side bars and also adjacent to the central bar.

6. The combination, with the two-part pole, of the neck-yoke hook herein described, formed as a normal goose-neck with a ring or loop journaled in its point and with a shank entering between the ends of the pole and secured by bolts.

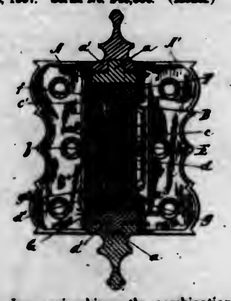
384,101. PEN-HOLDER. CHARLES F. WARNER, Orange, N. J. Filed Sept. 30, 1887. Serial No. 250,963. (No model.)

Claim.—1. The combination, with a staff, of a point at one end of said staff, a spring-clamp adapted to engage said staff, and an arm projecting from said clamp and capable of having one or more marking-instruments secured thereto, substantially as set forth.

2. The combination, with a clamp for engaging a pen-holder, of an arm adjustably secured to said clamp and adapted to have one or more pen-stocks secured thereto, substantially as set forth.

3. The combination, with the slotted arm 4, of a pen-stock provided with a screw-threaded hole and a set-screw therefor, substantially as and for the purposes set forth.

4. The combination, with a staff having a point at one end, of a clamp for engaging said staff and being adjustable thereon, and a screw projecting from said clamp and provided with a cap whereby an arm for carrying one or more marking implements may be adjustably secured thereto.



5. The combination, with the staff 1, having a point at one end, of the clamp 2, for engaging said staff, an arm having a longitudinal slot, a screw projecting through said slot for securing the arm to said clamp, and a pen-stock adapted to be clamped to said arm, substantially as set forth.

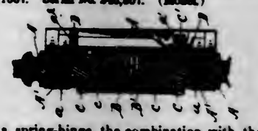
6. The combination of the clamp 2, having screw 3, arm 4, having slot 5 fitting over said screw, tap 7 for said screw, a pen-stock, 8, having screw-threaded hole 10, and a screw, 11, for passing through slot 5 and hole 10, substantially as and for the purposes set forth.

7. The combination, with the clamp 2, for engaging a staff, and the clamp 14, for engaging a marking-instrument, of an arm, 13, projecting from clamp 14 and having a hole therein, and a screw for clamping said arm to the clamp 2, substantially as set forth.

8. As an article of manufacture, the clamp 2, provided with an arm having a slot and a pen-stock provided with a screw-threaded hole, and a screw whereby said stock may be secured to said arm.

384,102. SPRING-HINGE. GEORGE W. WARNER, Prospect, Ill. Filed Aug. 12, 1887. Serial No. 246,803. (Model.)

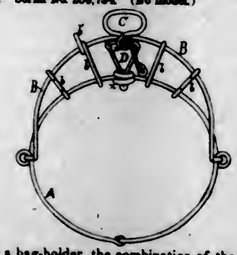
Claim.—1. In a spring-hinge, the combination, with the independent tube or cylinder pivotally connected to one leaf of the hinge and its end trunnions pivotally connected to the other leaf, of the re-



versely-coiled springs arranged within the tube, and having their inner ends connected thereto and their outer ends connected to the respective trunnions, substantially as and for the purposes specified.

2. In a spring-hinge, the combination, with the leaf A, having loop a^2, and the leaf A', having loops a^2, of the tube B, provided with a hook, *b*, to connect it to the loop a^2, the trunnions F and G, mounted in the ends of the tube and provided, respectively, with hooks F' and G', by means of which they are connected to the loops a^2, and the coiled springs C and D, arranged within the tube B and having their inner ends connected to the said tube and their outer ends connected, respectively, to the trunnions F and G, substantially as and for the purposes specified.

3. In a spring-hinge, the combination, with the independent tube pivotally connected to one of the leaves and the reversely-coiled springs arranged within said tube and having their inner ends connected thereto, of the trunnions, each provided with a body portion to fit within the tube, an inward extension to receive the coiled spring which is connected thereto, and an outer cap or head provided with a hook, by means of which it is pivotally connected to the other leaf, substantially as and for the purposes specified.



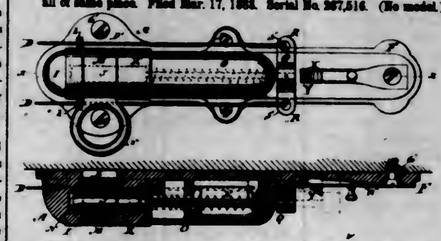
4. In a spring-hinge, the combination, with the tube B, connected to one of the leaves and having internal projection, *b'*, of the trunnions F and G, connected to the other leaf, the coiled springs C and D, arranged within the tube and having their outer ends connected to the trunnions, and the intermediate connecting-piece, E, arranged between the inner ends of the spring and slotted at *c* to receive the projection *b'* and the inner ends of the springs, substantially as and for the purposes specified.

384,103. SPRING-HINGE. GEORGE W. WARNER, Freeport, Ill. Filed Aug. 13, 1887. Serial No. 246,807. (Model.)

Claim.—In a spring-hinge, the combination, with the leaves A and A', having loops *a'* and studs or pins a^2, of the coiled spring B, the independent tube B', loosely surrounding said spring and disconnected from the other parts of the hinge, the trunnions C, having body portions *c* extending into the said coiled spring and connected thereto, the heads *c'*, with hooks C', connected to the loops *a'*, and studs or pins c^2, and the links D, pivoted on the studs or pins a^2 and c^2, substantially as and for the purposes specified.

384,104. BAG-HOLDER. ISAAC H. WEAVER, Toledo, Ohio. Filed Jan. 3, 1888. Serial No. 259,734. (No model.)

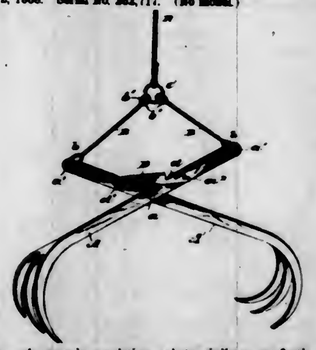
Claim.—In a bag-holder, the combination of the frame with the open swivel and lever, substantially as shown and described, for the purpose specified.



384,105. CLEANER AND GAGE ATTACHMENT FOR GRAIN-DRILLS. JOHN T. WEBB, Bowling Green, Ky. Filed Dec. 31, 1887. Serial No. 259,508. (No model.)

Claim.—1. The combination, with the flukes 1, of the arms C, the axle B, arranged in front of the latter, the wheel A, and teeth *a*, which are slightly curved forward and made of such relative length that when the wheel is in working position the said teeth project a considerable distance below the points of the flukes, and are thus adapted to take a firm hold in the soil and act on clods and trash, in the manner specified.

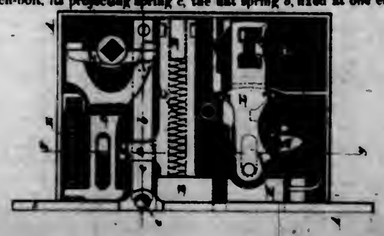
2. In a grain-drilling machine, the combination of the wheel A and axle B, the pendent arms C, having lengthwise slots, the drag-bars 2, and flukes 1, and bolts for securing said arms in any adjustment, as shown and described.



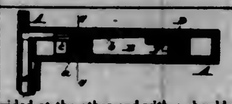
384,106. RELEASING DEVICE. MICHAEL H. WEALEN, Brooklyn, N. Y., assignor to himself, John C. Van Brunt, and Edwin L. Shanbaugh, all of same place. Filed Mar. 17, 1888. Serial No. 267,516. (No model.)

Claim.—1. The combination of the sliding bolt J, cross-head Q, line-wires D D, lugs I K, loop M, and box O, with the spring-catch W, substantially as shown and described.

2. The combination of the series of bed-plates F, each having the lugs I K, the spring-impelled bolts J, each having a cross-head, Q, provided with upper and lower perforations S, and the upper and lower line-wires D D, made in sections, with a pair of said sections arranged between each pair of cross-heads, and having hooks I at their ends engaging the perforations in the cross-heads, substantially as shown and described.



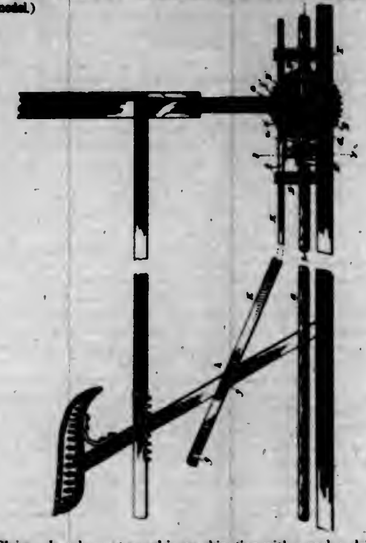
384,107. GRAPPLE. WILLIAM H. WILEY, Stockton, Kans. Filed Feb. 2, 1888. Serial No. 262,717. (No model.)



Claim.—A grapple consisting, substantially as set forth, of a pair of jaws pivoted together at a point between their ends, a rope united by links with the upper ends of the jaws and tending to close the latter, a stud secured to one of the jaws above the pivot *a*, and a pawl pivoted to the other jaw, also above said pivot, and having upwardly and outwardly facing notches in its upper edge to engage the stud.

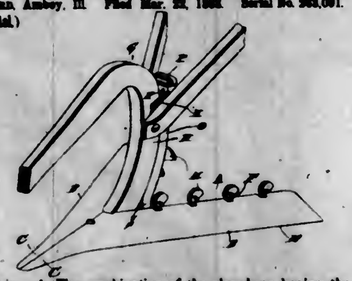
384,108. LOCK. EDWARD S. WITHERSPOON, Boston, Mass. Filed Dec. 4, 1886. Serial No. 220,603. (No model.)

Claim.—1. In combination with the case A, the reciprocating latch-bolt, its projecting spring *c*, the flat spring *b*, fixed at one end to



384,108.

the case and provided at the other end with a shoulder to engage the latch-bolt, and the transverse pin *e*, seated in the face-plate of the lock and provided with a side notch, in which the edge of the lock-case is seated to prevent its escape, as described and shown.



2. The combination of the case, the reciprocating lock-bolt provided with a depending arm, A, in position to encounter the bit of the key, and the elastic arm *m*, fixed at one end rigidly to the lock-case and indented at the opposite end to engage and hold the bit of the key, as described.

384,109. REEL-DRIVING GEAR FOR HARVESTERS. JOSEPH ADAMSON, Sheboygan, assignor to the Empire Harvesting Machine Company, Whitewater, Wis. Filed Dec. 22, 1887. Serial No. 258,716. (No model.)

Claim.—In a harvester and in combination with a reel, a driving mechanism therefor, consisting of the sprocket-wheel and the concentric gears E E', of different diameters, secured thereto, the driving-shaft B, the freely-rotating pinion G thereon, the sliding pinion H and sliding clutch, both splined to the shaft, and a shifting device, substantially as described, acting to throw the clutch I and pinion H into action alternately, substantially as set forth.

384,110. COMBINED PLOW AND PULVERIZER. GEORGE D. BAIRD, Amboy, Ill. Filed Mar. 22, 1888. Serial No. 268,091. (No model.)

Claim.—1. The combination of the plowshare having the rearward-diverging wings or mold-boards with the rock-shafts journaled under the upper inner sides of said mold-boards or wings, the cutters or colters M, attached to said rock-shafts, and devices, substantially as set forth, attached to said rock-shafts to secure the same and the cutters at any desired angle, substantially as described.

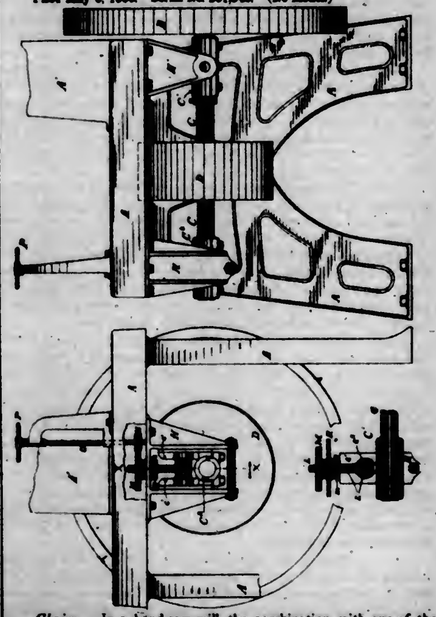
2. The combination of the plowshare having the diverging wings, the rock-shafts journaled under said wings, the cutters attached to said shafts, the standard secured to the share, the keeper N on the rear side of the standard, and the rod O, secured to the rock-shafts and projecting through said keeper and adjustably secured therein, as set forth.

384,111. CAR-UNLOADER. HENRY M. BARNHART, Marion, Ohio. Filed Aug. 15, 1887. Serial No. 246,971. (No model.)

Claim.—1. In a car-unloader, the combination, with a plow and fender, the said parts having a vertical sliding connection with each other, of a lever fulcrumed on the fender and loosely connected to the plow, whereby the relative height of the plow to the fender may be regulated, substantially as set forth.

2. The combination, with a plow, a fender, and arch-bars connected with the fender, of vertically-slotted brackets connected with the rear arch-bar and made to embrace the forward end of the plow, a pin made to pass through the cutter of the plow and into the slots of the bracket, substantially as set forth.

3. The combination, with a plow and a fender, of a lever pivoted to the fender, a link connecting the lever with the plow, whereby the front portion of the plow may be elevated, substantially as set forth.

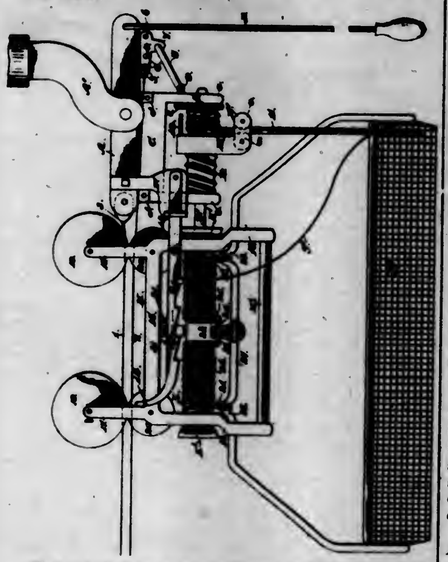


4. The combination, with a connected plow and fender, the former having vertical play, substantially as indicated, of a lever pivoted on the fender and connected by a link with the cutter of the plow, substantially as set forth.

5. The combination, with a plow, a fender, and a lever, of a poise or counter-balance mounted on the lever, substantially as set forth.

6. The combination, with a plow, a fender, and a lever, of a poise mounted on the lever, said poise being adjustable lengthwise of the lever, substantially as set forth.

7. The combination of a plow, a fender, a lever, and a poise, substantially as indicated, said lever having a return-bend, whereby the poise may be moved on either side of the fulcrum of the lever, substantially as set forth.



384,112. BAND-SAW MILL. HENRY R. BARNHURST, Erie, Pa. Filed May 8, 1888. Serial No. 201,848. (No model.)

Claim.—In a band-saw mill, the combination, with one of the band-wheels and the shaft supporting the same, of a pivoted journal-

box, C, for said shaft near the said band-wheel, a vertically-sliding journal-box, C', for said shaft at its end opposite the band-wheel, a link, L, pivoted on said sliding journal-box, a geared nut, M, on said link, and a shaft gearing with said nut, which extends to and may be operated by the sawyer while at his post observing the saw in operation.

384,113. CASH AND PARCEL CARRYING APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed Jan. 21, 1887. Serial No. 224,993. (No model.)

Claim.—1. In a store-service apparatus, the combination of the windlass mechanism, the carriage, revolving hollow cylinder having right and left spiral corrugations on its outer surface, the flexible support, and the receptacle, said cylinder also having inclosed spring-controlled blocks near its ends to cushion said carriage when struck by the said windlass mechanism, substantially as described.

2. In a store-service apparatus, the combination of a carrier, a cylinder mounted and journaled therein and provided with right and left spiral corrugations and with spring-actuated buffers located interiorly and near its ends, a windlass provided with spiral corrugations extending to the left, a stationary frame supporting said windlass, and a rotating bumper-rod connecting said cylinder and windlass, substantially as described.

3. In a store-service apparatus, the combination of a carrier, a way therefor, a cylinder mounted in said carrier and provided with right and left spiral corrugations, a flexible support secured to said cylinder, a receptacle attached to said flexible support, a suspending and detaching hook pivoted in said carrier and having projecting arms, a stirrup or yoke provided with pivoted latch-bars, a windlass provided with spiral corrugations extending to the left, a stationary frame supporting said windlass, and a rotating bumper-rod connecting said cylinder and windlass, substantially as described.

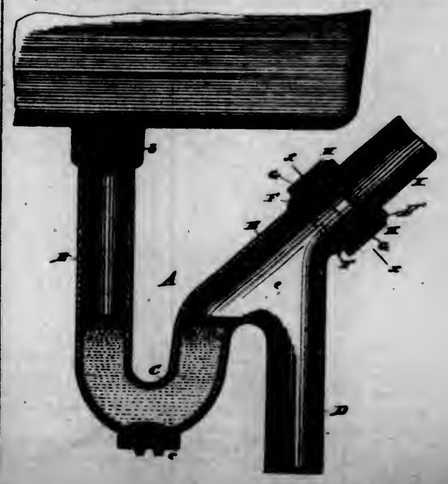
4. In a store-service apparatus, the combination of a way, a movable carrier mounted upon said way and comprising a frame, a revolving cylinder mounted therein, provided with right and left screw-threaded corrugations on its surface, and having inclosed spring-buffers situated near its ends and resting against a spiral internal connection, a flexible support adapted to be coiled on said cylinder, a parcel-receptacle attached to said flexible support, a hook for suspending and releasing said receptacle, latch-bars secured to a tilting lever, a windlass mounted in a stationary frame, a recoiling-spring, and a hanger mounted on the windlass to control the pull-down cord, and a rod rigidly secured in the windlass by a transverse pin provided with a rectangular buffer end, connecting the said carrier and windlass, substantially as described.

5. In a store-service apparatus, a traveling carrier, a revolving cylinder mounted in said carrier and provided with right and left spiral corrugations with interior-cushioned buffers near its ends, and with a cord-retainer at or near its mid-length, in combination with the cord, the receptacle, the windlass and the bumper-rod, and devices for operating the same, substantially as described.

6. In a store-service apparatus, the combination of a lever pivotally mounted in a hanger, and having a pull connected to its rear end and the upper track-wire to its forward end, an adjusting-link secured to the under rear portion of said lever, and having the lower track-wire connected to its forward end, a windlass-frame, a coupling-link connecting said windlass-frame and the adjusting-link, and clips secured to the upper part of the said windlass-frame, through which the lower track-wire passes, substantially as described.

7. In a store-service apparatus, the combination of a windlass-frame secured to a lever pivotally mounted in a hanger, a windlass having an outer screw-threaded corrugated surface, a bumper-rod passing through the legs of the frame and the windlass, a spring mounted on said rod between the rear portion of the windlass and the rear leg of the frame, and having a hook formed on its upper end, and a hanger constructed to move over the outer screw-threaded surface of the windlass, and having an angular projection formed on its lower end, in which friction-rollers are mounted, between which the operating-cord passes, substantially as described.

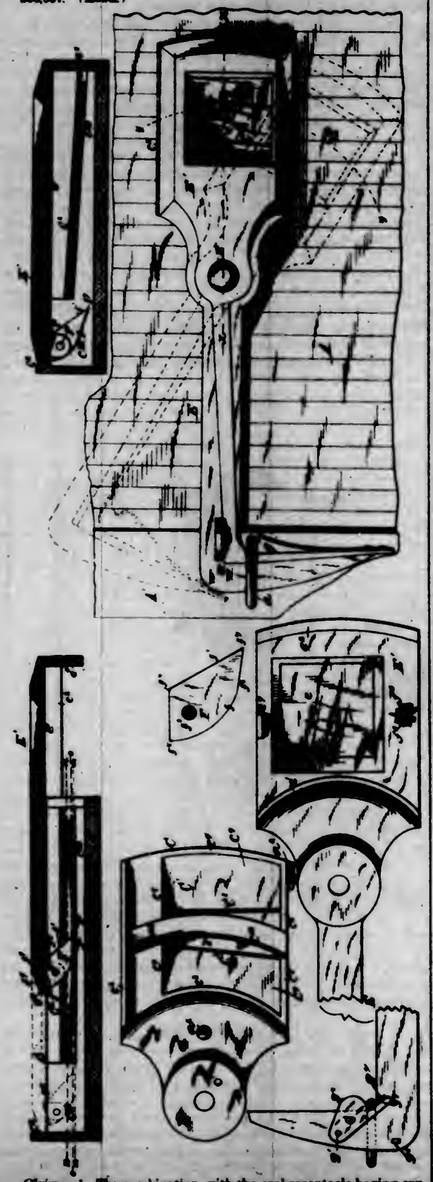
8. In a store-service apparatus, a carriage comprising a supporting-frame having two sets of upper and lower track-wheels on its upper arms, a cylinder mounted in the lower portion of said frame, having its outer surface formed with right and left screw-threaded corrugations and adapted to receive the cord of the basket-bail, and wooden friction-bars mounted in the lower arms of the said frame, substantially as described.



9. In a store-service apparatus, the combination, with a carriage having a supporting-frame, of a cylinder mounted in the lower part of the said frame, having its outer surface provided with right and left screw-threaded corrugations, which are separated by a plane surface, and projections or lugs formed with said plane surface, having a pin passing therethrough, whereby the bail-cord is secured to the said drum, substantially as described.

10. In a store-service apparatus, the combination of a carriage frame-work, a hollow cylindrical drum or barrel mounted therein, hollow heads screw-threaded in the ends of said drum and forming bearings therefor, sliding blocks provided with internal square recesses adapted to be engaged by the square head of the bumper-rod, situated adjacent to and in the rear of said heads and adapted to move in the drum, and a coiled spring situated between said sliding blocks in the cylinder or drum, substantially as described.

11. In a store-service apparatus, the combination, with a lever, A, of a yoke, F, secured thereto, latch-bars G, pivotally mounted on each side of said yoke, having their forward ends, 14, upwardly curved and their lower edges provided with teeth 15, and a bar, *g*, mounted on one of said latch-bars, having a cord, *g'*, secured thereto, substantially as described.



12. In a store-service apparatus, the combination, with the carriage-frame H, having a longitudinal strip, 18, provided with lugs 31, of a bail-attaching device, L, having arms 32 32 in its end, a hook, 35, formed on the lower end of the curved depending portion 34 thereof, and a spring, 33, secured to one of said arms and passing up under and between the lugs 31, substantially as described.

384,114. PLUMBER'S TRAP. NICHOLAS BARRY, Jr., Muscatine, Iowa. Filed Apr. 9, 1887. Renewed Mar. 10, 1888. Serial No. 266,892. (No model.)

Claim.—A sewer-trap formed integral and consisting of a vertical portion, B, adapted to receive a coupling on its upper end, a U formation at its base, having a tap at the lower extremity thereof, an outwardly and upwardly directed branch, E, terminating at its upper end in a double-flanged portion, a downwardly-directed branch, D, and a bread swell, *c*, at the junction of the branches E and D, all constructed and adapted to operate substantially in the manner and for the purposes described.

384,115. SEAL-LOCK. EDWARD C. BASELEY, Omaha, Nebr., assignor to John L. McCague, same place. Filed Jan. 7, 1888. Serial No. 260,067. (Model.)

Claim.—1. The combination, with the seal-receptacle having supports for the seal at its edges, of a stop for the central part of the seal on a plane lower than that of the said supports for the edges, a knife-way extending below the last said stop, and a seal-support across the central part of the seal on the side opposite the said stop, substantially as described.

2. The combination, with the seal-receptable having a support for the edges of the seal and stops below the edge-supports for the center of the seal, and a knifeway between said central stops and extending below them, of a knife all of whose cutting-edge lies in a plane transverse to the seal and which extends below the said central stops, as set forth.

3. The combination, with the seal-receptacle having a support for the edges of the seal and a stop for the central part thereof lower than the edge-supports, of the knife, the seal-cover, and a support or retainer for the outer surface of the seal supplemental to the said cover, substantially as described.

4. The seal-receptacle formed with supports for the edges of the seal, supports for the central part of the seal, and continuous bottom walls formed integral with both of the said supports and gradually depressed from those at the edge to those at the center, and a knifeway between said bottom walls, in combination with a seal-cover provided with a knife in said knifeway, substantially as set forth.

5. In a car-sealing device, the combination of a seal-holder having a knife groove or way, a rigid or unyielding support at the side of said knife groove or way and inclined upward and outward from said way, and a support for the card adapted to bear against the central portion of its outer face, a knife-carrier, and a knife adapted to move in the said knife groove or way to sever the card or seal, substantially as set forth.

6. In a sealing device, the combination of a seal-holder having an unobstructed passage for a seal-cutting knife, and having a rigid inflexible support for the under side of the seal, which is inclined inward or downward relatively to the path of the knife and knife-carrier, and a knife adapted to move along the aforesaid passage and cut the seal, substantially as set forth.

7. In a sealing device, the combination of the seal-holder having an inwardly-sloping bottom wall, c^2, inclined relatively to the path of the knife, a knife way or passage, c^{11}, depressed below the bottom wall, c^2, the seal-support C^3 across the central part of the outer surface of the seal, a knife-carrier lying above the seal-receptacle when the seal is sealed, and a knife secured to the said carrier and adapted to move in the said knifeway and cut the seal, substantially as described.

8. In a sealing device, the combination of the seal-holder and the knife-carrier, of which parts one is fastened by and rocks about a pivot and a staple to which the said pivoted part is fastened, and which is situated on that side of the pivot opposite to the knife and seal, substantially as described.

9. In a sealing device, the combination of a seal-holder and a knife-carrier, which is secured by and rocks about a pivot, a knife thereon which moves in a curvilinear path around said pivot, and a bar or arm, E, on that side of the pivot which is opposite to the knife, adapted to operate as a handle for moving the knife, substantially as set forth.

10. In a sealing device, the combination, with the seal-holder, of the latch-arm secured by a pivot, B, and adapted to engage with a fixed fastener and formed integrally with a cover for the said seal-chamber, which is situated on that side of the pivot opposite to the said fixed fastener, substantially as set forth.

11. The combination, with the seal-receptacle, of the latch-arm fastened by a pivot and adapted to engage with a fixed fastener on one side of the pivot and cast with an apertured heel-extension on the other side of said pivot, adapted to receive a glass to lie over the seal, substantially as described.

12. The combination, with the seal-receptacle having a knifeway extending beyond the seal, of the knife-carrier, the knife hinged thereto and adapted to initially engage with the edge of the seal, and a yielding stop for retarding the movement of the knife around the hinge when it begins to cut the edge of the seal, as set forth.

13. In a sealing device, the combination, with the seal-receptacle and the knife-carrier, (of which two parts one moves relatively to the other,) of a knife having its cutting-edge situated at an inclination to the plane of the seal, substantially as set forth—that is to say, at an obtuse angle on one side of said seal—and a seal-retainer independent of the knife-carrier, adapted to bear against the last said side of the seal to prevent displacement of the card relatively to the knife, substantially as set forth.

14. In a sealing device, the combination, with the seal-receptacle and a knife-carrier, (of which two parts one moves relatively to the other,) of a knife having the cutting-edge inclined to the plane of the seal and a stationary support or retainer for the seal across that face of the seal which is opposite to the point of the knife, substantially as described.

15. In a sealing device, the combination, with a seal-holder adapted to hold the card in a normal position, and also to permit the card to yield inward, of a knife-carrier, a knife hinged to said carrier and adapted to move over the face of the card and to depress it when moving in one direction, and stops, substantially as described, which

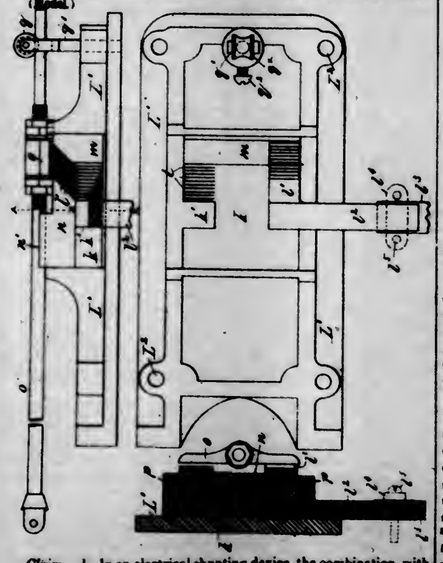
prevent the point of the knife from passing beyond the normal plane of the card, substantially as set forth.

16. In a sealing device, the combination, with the seal-holder adapted to hold a card in a normal position, and also to permit it to yield therefrom, of the knife-carrier and the knife hinged thereto and adapted to move over the face of the card in one direction and in contact therewith to depress it, stops to prevent the point of the knife from moving beyond the normal plane of the card, and stops to limit the movement of the knife in the opposite direction around its hinge, substantially as set forth.

17. In a sealing device, the combination, with the seal-holder, of the knife-carrier and the swinging knife hinged thereto having a curvilinear blunt back and bottom edge and the opposite sharpened cutting-edge, and the knifeway extending beyond the card, whereby the knife and the edge of the card can be brought into the described relation to each other when the cutting begins, substantially as set forth.

18. In a sealing device, the combination, with the seal-holder, of the knife-carrier arranged to form a cover for the seal-holder and having the inward-projecting ears f^3, and the knife F, secured to said ears, substantially as described.

19. The combination, with the knife-carrier having the stops f^5 f^6, of the knife F, hinged thereto and having the opposing stops f^4 f^7, and the seal-holder adapted to hold the card in a plane intersecting the knife prior to the commencement of the cutting action, whereby the aforesaid stops cause the knife to commence the cut at the edge of the card and permit it to swing about the hinge, substantially as set forth.



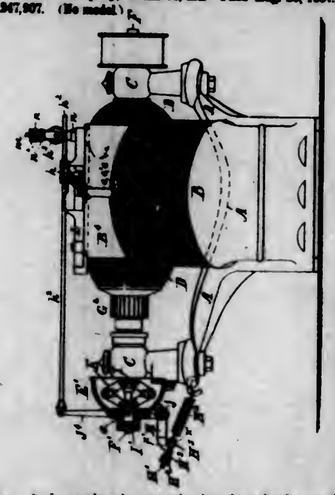
20. The combination, with the seal-holder, the knife, and the knife-carrier, of the latch-arm formed with or secured to the knife-carrier, the fixed fastener *a*, the gravity-lock G, adapted to fall into locking position at the instant the knife reaches the cutting position, and stops which limit the play of the gravity-lock, substantially as set forth.

21. In a sealing device, the combination, with the seal-holder, the knife, and the knife-carrier, of the latch-arm, the locking-plate G, pivoted to the hasp, and the stops g^4 g^5, substantially as set forth.

22. The combination, with the seal-receptacle having the wall c^2 c^4, the side wall, c^5, and the top flange, c^3, projecting to points beyond the wall c^4, of the seal-cover having the glass and the metal frame surrounding the said glass, and having its upper edge adapted to fit under the said flange c^3, substantially as set forth.

23. The combined latching and sealing device having the latch-arm E, pivoted at B, and the heel-extension E' on the side of the pivot opposite to the part E, and the seal-holder secured to the door opposite to the pivot B, whereby the said extension E is caused to move downward when passing out from the locked position, substantially as described.

384,116. ELECTRIC SHUNTING DEVICE. William Baxter, Jr., Baltimore County, assignor to the Baxter Electric Manufacturing and Motor Company, Baltimore, Md. Filed Aug. 20, 1887. Serial No. 247,418. (Model.)



Claim.—1. In an electrical shunting device, the combination, with the different sections of the electric circuit, of a series of yielding springs formed of flat metallic strips, a holder to sustain such springs with their flat sides adjacent, and a movable metallic block arranged and operated to move in succession over the yielding ends of the springs, as and for the purpose set forth.

2. In an electrical shunting device, the combination, with the different sections of the electrical circuit, of a series of yielding springs consisting of flat metallic strips connected with such sections, a spring guide or holder formed with a series of adjacent slits to sustain the yielding springs with their flat sides in proximity, and a movable block arranged and operated to pass in succession upon the yielding ends of said springs, as and for the purpose set forth.

3. In an electrical shunting device, the combination, with the different sections of the electrical circuit, of two series of yielding springs consisting of flat metallic strips connected with such sections, a spring guide or holder formed upon its opposite edges with two series of adjacent slits to sustain the yielding springs with their flat sides in proximity, and a movable block arranged and operated to pass in succession upon the yielding ends of said springs to connect the springs of the opposed series electrically, as and for the purpose set forth.

4. In an electrical shunting device, the combination, with the different sections of the electrical circuit, of two series of yielding springs consisting of flat metallic strips connected with such sections, a spring guide or holder formed upon its opposite edges with two series of adjacent slits to sustain the yielding springs with their flat sides in proximity, and a movable block arranged and operated to pass in succession upon the yielding ends of said springs to connect the springs of the opposed series electrically, and a stop upon the spring guide or holder to arrest the movement of the movable block when retracted from contact with the series of springs, as and for the purpose set forth.

384,117. GOVERNOR FOR ELECTRIC MOTORS. William Baxter, Jr., Baltimore County, assignor to the Baxter Electric Manufacturing and Motor Company, Baltimore, Md. Filed Aug. 20, 1887. Serial No. 247,907. (No model.)

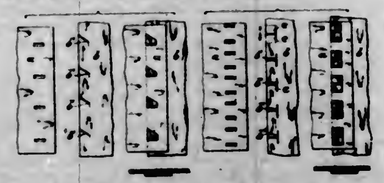
Claim.—1. In an electric motor having the pole-pieces united by a bridge, the combination, with a series of coils wound upon the field-magnet cores, of the shunt-connections c c' c^2, &c., united with the several coils at intervals and extended from the surface of the magnet-coils (at the same point) to the bridge from opposite sides thereof, a shunt-box upon the bridge between the pole-pieces, with contacts united to the said shunt-connections, a shunt-block or connector, and a centrifugal governor actuated by the motor for successively closing the circuit through the shunt-connections, as and for the purpose set forth.

2. In an electric motor, the combination, with the series of coils wound upon the magnet-cores, of a series of shunt-connections connected with the several coils at intervals, means, as a shifting block or piece, for closing successively the electrical circuit through the several shunt-connections, a centrifugal governor mounted upon the armature arbor or shaft, a lever actuated by such governor to operate the shunt-connector, an arm attached to such lever, and a tension-spring resisting the centrifugal force of the governor and arranged at an acute angle with the said arm to operate with a diminishing leverage upon the arm as the speed of the motor increases, as and for the purpose set forth.

3. In an electric motor, the combination, with the main coils upon the magnet-cores, of an auxiliary coil connected with the line or circuit wires and wound upon the cores in the opposite direction from the main coils, a shunt-connection from the ends of such auxiliary coils, shunt-connections attached at intervals to the main coils, contact-pieces attached to such shunt-connections, and a moving contact operating in connection with the same to first close the circuit through the shunt-connections of the main coils, and to subsequently close the shunt-connections from the auxiliary coil to cause a reaction upon the residual magnetism of the field when the motor is very lightly loaded, substantially as herein set forth.

4. In an electric motor, the combination, with the first coil of wire wound upon the magnet-cores, of the line or circuit connection attached to the coil between its ends, an electrical connection from one end of the coil to the other coils, and a shunt-connection from the opposite end of each coil, and means for closing the circuit through such shunt-connection to react on the residual magnetism of the field, as and for the purpose set forth.

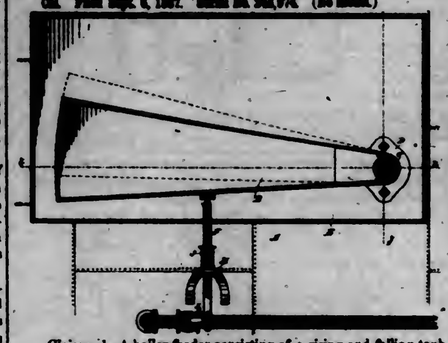
5. In an electric motor, the combination, with magnet-cores having poles at opposite sides of the armature, of the magnet-coils wound upon such cores, a shunt-box mounted upon a bridge between the ends of the poles, shunt-connections attached at intervals to the main coils and terminated in electrical connections adjacent to one another in the shunt-box, a governor mounted upon the armature-shaft, and a connector moved thereby to successively close the several shunt-circuits and thus cut out the successive sections of the main coils from the circuit, as and for the purpose set forth.



6. In an electric motor, the combination, with magnet-cores having poles at opposite sides of the armature, of the main coils wound upon such poles, a shunt-box mounted upon a bridge between the ends of the poles, shunt-connections formed of metallic strips attached at intervals to the main coils, with the latter wrapped over the same, and the said strips terminated in electrical connections adjacent to one another in the shunt-box, a governor actuated by the motor, and a connector moved thereby to successively close the several shunt-circuits and thus cut out the successive sections of the main coils from the circuit, as and for the purpose set forth.

7. In an electric motor provided with a bridge between the pole-pieces and a shunt-box mounted upon said bridge, the combination, with the cores, of flanges upon the same, field-coils wound between said flanges, shunt-connections attached at intervals to the field-coils with the latter wrapped over the same, a notch, c^3, in one of the flanges, and the shunt-connections brought together and extended through such notch in a single band to the shunt-box, as and for the purpose set forth.

8. In an electric motor, the combination, with a bridge between the pole-pieces and a shunt-box mounted upon said bridge, of the magnet-cores, field-coils wound upon said cores, shunt-connections attached at intervals to the field-coils (with the latter wrapped over the same and extended from the coils toward the shunt-box upon the bridge, elbow-pieces s s', having each one arm fitted in the shunt-box to form a contact-surface and the other arms extended upon the pole-pieces between the several shunt-connections, insulating material between the several shunt-connections, and a clamp pressing such connections and elbow-pieces together, as and for the purpose set forth.



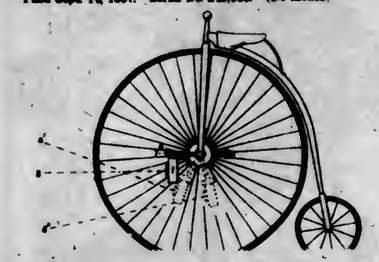
9. In an electric motor, the combination, with a bridge between the pole-pieces and a shunt-box mounted upon said bridge, of the magnet-cores, field-coils wound upon said cores, and shunt-connections formed of flat strips of thin sheet metal attached at intervals to the field-coils and extended beneath the several layers of the field-coils to the same point upon the exterior of the latter and to the shunt-box upon the bridge and connected with contacts therein, as and for the purpose set forth.

384,118. INTERLOCKING THE EDGES OF METAL PLATES. Frank C. Bellingrodt, Pulda, Prussia, Germany. Filed July 19, 1887. Serial No. 244,753. (No model.)

Claim.—The plate *b*, having angular incisions *b'* extending directly from the edge of the plate into the body thereof and then at an angle, whereby said plate is provided with angular laps *c*, in combination with the plate *a*, provided near one edge with slots to receive said laps, substantially as shown and described.

384,119. BOILER-FEEDER. Abraham Blackley, San Francisco, Cal. Filed Sept. 6, 1887. Serial No. 248,974. (No model.)

Claim.—1. A boiler-feeder consisting of a rising and falling tank or reservoir, having a single passage by which it is connected with the boiler, so that water from the boiler may flow out of or into said reservoir and cause it to rise or fall, in combination with a stem or rod connected with the reservoir and with a lever by which the inlet supply-valve for the boiler is actuated, substantially as herein described.



2. A boiler-feeder consisting of a tank or reservoir having one end connected by a rotary joint with the boiler, so that the opposite end may rise and fall about said joint as the water within the reservoir is decreased or increased, and a vertical spring-actuated stem, the upper end of which is connected with the rising and falling end of the reservoir and the lower end with a lever by which the boiler-supply valve is opened or closed, substantially as herein described.

3. A boiler-feeder consisting of a reservoir made wedge-shaped, conical, or enlarged at one end, and having the opposite smaller end connected by a rotary joint with the boiler, so that water will flow to or from the reservoir whenever its bottom line falls below or rises above a horizontal plane, in combination with a supply-valve and an intermediate connection between it and the movable reservoir, substantially as herein described.

4. The reservoir connected at one end with the boiler by a rotary joint and having the other end movable vertically, so that the bottom will rise above or fall below a horizontal plane, in combination with a valve controlling the boiler-feed, a lever, and connecting-rod between the valve and the reservoir, having a lost motion, so that the valve will be opened or closed suddenly by the accelerated motion of the reservoir, substantially as herein described.

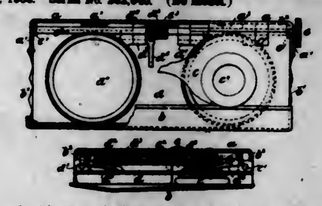
5. In combination with a steam-boiler, the rising and falling reservoir connected at one end with said boiler by a rotary joint, the water-supply valve and intermediate connecting mechanism, and the exterior casing, E, inclosing said reservoir, substantially as described.

384,120. BICYCLE-LIGHTING. Walter T. Bowers, Saco, Me. Filed Sept. 14, 1887. Serial No. 249,680. (No model.)

Claim.—1. The combination, with a bicycle-pedal, of a lantern connected thereto in a semi-rigid manner, substantially as herein set forth, and for the purpose specified.

2. The combination, with a bicycle-pedal, of a lantern and a clip or clips connecting the lantern to the pedal, substantially as set forth, and for the purpose specified.

384,121. AUTOMATIC CYLINDER-PIANO. Alessandro Capra and Giovanni B. Rimmer, Clerkenwell, County of Middlesex, England; said Capra assignor to said Rimmer. Filed Mar. 7, 1888. Serial No. 266,654. (No model.) Patented in England Feb. 4, 1884, No. 2,703.

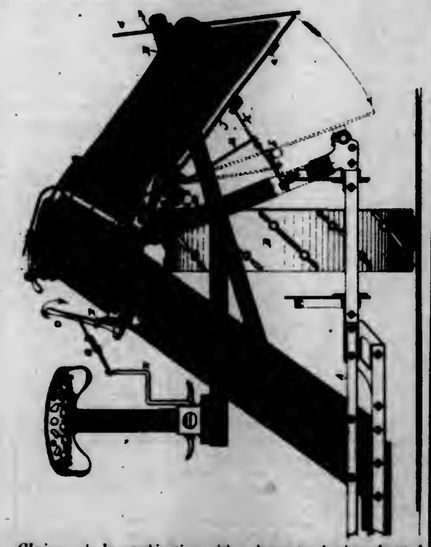


Claim.—In automatic cylinder-pianos, the actuating mechanism consisting of the spring-barrel *c*, with train of wheels and speed-regu-

384,121.

lating device *g g' g³ g⁴ h i' j*, and wheel *z*, combined with and mounted below the pin-barrel *b*, substantially as and for the purposes set forth.

384,122. OPERA, FIELD, OR MARINE GLASS. WILLIAM A. CARDWELL, Meat Croft, Eastbourne, County of Sussex, England. Filed Feb. 1, 1888. Serial No. 262,642. (No model.)



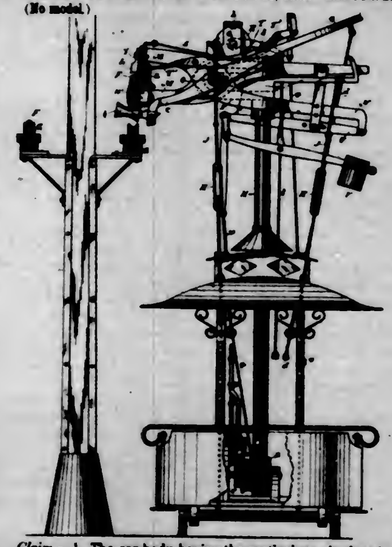
Claim.—1. An opera, field, or marine glass formed with rigid top and bottom and flexible sides, substantially as described.

2. An opera, field, or marine glass formed with rigid top and bottom, flexible sides, and hinged ends, substantially as described.

3. An opera, field, or marine glass formed with rigid top and bottom *a* and *b*, flexible sides *b'*, and hinged ends *c* and *d*, carrying lenses c^2 and d^2, in manner substantially as herein shown and described, and for the purpose stated.

4. An opera, field, or marine glass formed with rigid top and bottom *a* and *b*, flexible sides *b'*, end *c*, carrying lenses c^2 and d^2 hinged to rigid top *a* or bottom *b*, end *d*, carrying lenses d^2 and hinged to a slide, such as d^3, traveling in guides, such as a^3, on top or bottom *a* or *b*, and provided with a rack, d^3, receiving motion from pinion c^3, and spring-levers d^4 d^5, for opening out and retaining the ends *c* and *d* in a vertical position against stops b^3, in manner substantially as herein shown and described, and for the purpose stated.

384,123. DROPPER. HENRY J. CASE, Auburn, assignor of one-half to D. M. Osborne & Company, New York, N. Y. Filed June 11, 1887. Serial No. 241,042. (No model.)



Claim.—1. In combination with a harvester having elevated grain-delivering mechanism, a grain carrying and dropping mechanism consisting of the inclined bottom J, hinged at its upper edge to the harvester, that it may swing inward and downward, the stationary upright wall G, sustained by and at a distance from the harvester to retain the grain on the inclined bottom, and means, substantially as shown, for raising, lowering, and maintaining the lower end of said bottom in contact with said wall at the will of the driver, whereby the grain may be accumulated between said bottom and wall and be delivered at will adjacent to the machine by the swinging of the bottom inward from the wall.

2. In combination with the harvester having the elevator and its sustaining-standards, the outwardly-extending arms E, secured rigidly thereto, the cross-bar F, and upright wall G, connected rigidly to said arms, the inclined bottom J, hinged at its upper edge to the harvester and extending downward and outward to meet the wall G, the links to sustain the inclined bottom in contact with the wall, the said links being jointed and connected one to the harvester and the other to said bottom, and link-controlling means extending to a point adjacent to the driver's seat.

3. In combination with a harvester having an elevated grain-delivery, a grain-receptacle consisting of the inclined bottom J and upright wall G, the bottom being hinged near its upper edge to the harvester, and the cut-off W, hinged to the harvester above and arranged to rest upon the top side of the bottom across its upper end, and means, substantially as described, to operate the hinged bottom, whereby the bottom, in swinging downward and inward, is caused to set at its upper edge beneath the cut-off and lift the same to an active position.

4. In combination with a grain-harvester having the usual elevated grain-delivery, the binder-sustaining brackets H and the binder-shifting shaft N, the grain-receptacle consisting of the stationary outer wall, G, and its sustaining-arms attached to the harvester, the inclined bottom J, having journals mounted in brackets H, and the links connecting the lower edge of the bottom with the harvester-frame and connected with the shaft N.

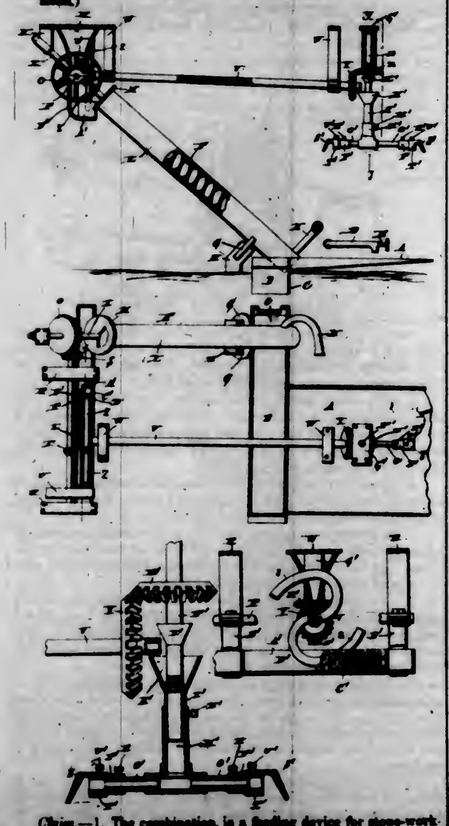
384,124. ELEVATED CABLE AND CAR-PROPELLER. HENRY CASEBOLT, San Francisco, Cal. Filed Feb. 28, 1888. Serial No. 265,690. (No model.)

Claim.—1. The car-body having the vertical standard projecting above its roof, and the horizontal frame secured upon its upper end, upon which the tongs and other mechanism are carried, in combination with the diverging rods extending downward from the frame and connecting with rods passing downward through the floor of the car, and turn-buckles whereby any desired tension may be given to the rods, substantially as herein described.

2. The supporting post or standard extending above the roof of the car, and having a horizontal slotted frame fixed upon its upper end, with tension bracing-rods, as shown, in combination with levers fulcrumed upon a bar or shaft extending through the slot in the fixed frame, said levers having gripping-jaws secured to one end, and having the other end connected with a lever mechanism whereby the jaws may be opened and closed, substantially as herein described.

3. The tongs for grasping the moving cable, having lever-arms fulcrumed upon a shaft which extends through a frame supported above the roof of the car, the compound-lever connection whereby these jaws are operated, and a rod extending downward through the roof of the car, in combination with a drum around which the rope connected with this rod is coiled, and a lever with pawl and holding

rack whereby the drum is rotated so as to close or enclose the jaws, substantially as herein described.



4. The tongs and operating-lever mechanism supported upon a frame-work above the roof of the car, and a rod and flexible rope connecting this lever mechanism with a drum journaled within the car and around which the rope is coiled, in combination with a segmental gear and pinion, a hand-lever for operating the same, and the double segmental rack with which the pawl upon the lever may engage, substantially as herein described.

5. The tongs and the lever mechanism by which they are operated, the fulcrum-shaft of said levers extending through the horizontal slot upon the frame-work supported above the roof of the car, a rotary shaft with winding-drum or pinion, and cords or rack-bars connecting with the tongs and lever mechanism, a lever upon the drum-shaft, and a rod connecting therewith and extending down through the roof of the car, whereby the shaft may be rotated so as to move the grip mechanism to and from the central support, substantially as herein described.

6. The tongs supported above the roof of the car and lever-arms by which said tongs are opened and closed, in combination with the vertically-journaled conical rollers Z, and the levers and operating-rod whereby the rollers are raised to disengage the rope from between the jaws of the tongs, substantially as herein described.

7. The tongs having jaws, the lever mechanism by which they are opened and closed supported above the roof of the car, conical vertically-movable rollers by which the rope is disengaged from the jaws when the latter is opened, and horizontally-journaled rollers *b*, supported on lever-frames which are operated from the interior of the car, said lever and rollers serving to raise the rope and replace it within the jaws, substantially as herein described.

384,125. FEEDER FOR STONE-SAWING MACHINES. PHILIP CHERBA, Detroit, Mich. Filed Nov. 1, 1887. Serial No. 253,266. (No model.)

Claim.—1. The combination, in a feeding device for stone-working machines, of a vertical rotating shaft, F, the radial hollow arms O', communicating with the said shaft, and the hoods at the outer ends of the said hollow arms, for the purpose set forth, substantially as described.

2. The combination, in a feeding device for stone-working machines, of the vertical rotating hollow shaft F, to which water and grits are supplied, the vertical sleeve M', attached to the said shaft and vertically adjustable thereon, the hollow radial arms O', extending from the sleeve M' and communicating therewith, and the deflecting-hoods at the outer ends of the said arms, for the purpose set forth, substantially as described.

3. The combination, in a feeding device for stone-working machines, of the rotating vertical hollow shaft F, the tubular radial arms O', communicating with the said shaft and rotating therewith, the extensible sleeves P' on the said radial arms, and the deflecting-hoods at the outer end of the said sleeves, substantially as described.

4. The combination of the vertical rotating hollow shaft F, the radial hollow arms O', communicating with the said shaft, the extensible sleeves on the outer ends of the said hollow arms, and the deflecting-hoods having the collars attached to the said sleeves and adjustable thereon, substantially as described.

5. The combination, in a feeding device for stone-working machines, of the rotating inclined elevating-screw, the trough to receive the water and sand from the said screw, and the rotating hollow shaft V, having the scoop-arms Z, working in the trough, for the purpose set forth, substantially as described.

6. The combination of the trough A', having the sieve C, and the compartment D', with the rotating hollow shaft V, having the scoop-arm communicating therewith and working in the compartment D', substantially as described.

7. The combination of the trough A', having the sieve C, and the compartment D', with the rotating hollow shaft V, having the scoop-arm Z, working in the compartment D', and the radial arm E', working in the trough on the outer side of the sieve, substantially as described.

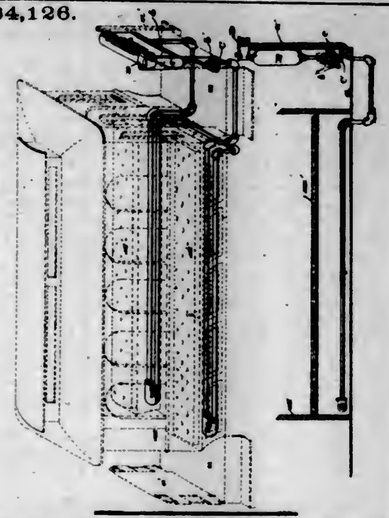
8. The combination of the elevating-screw, the trough to receive water and sand therefrom, the hollow shaft V, geared to the screw and having the scoop-arms Z, working in the trough, and the spraying device geared to the said hollow shaft, and in which the contents of the latter are discharged, substantially as described.

9. The combination of the elevated trough, the rotating hollow shaft V, having the scoop-arms Z, working in the trough, the vertical perforated hollow shaft F, geared to the shaft V, and having the funnel K' below the discharge end of the latter, and the hollow radial arms connected to and communicating with the shaft F', substantially as described.

10. The combination, with the tube V, of the vertical rotating tubular shaft F', having the beveled flange L' above the discharge end of the tube V and the funnel K' below the same, and the radial hollow arms O', communicating with and connected to the lower end of the tubular shaft L', substantially as described.

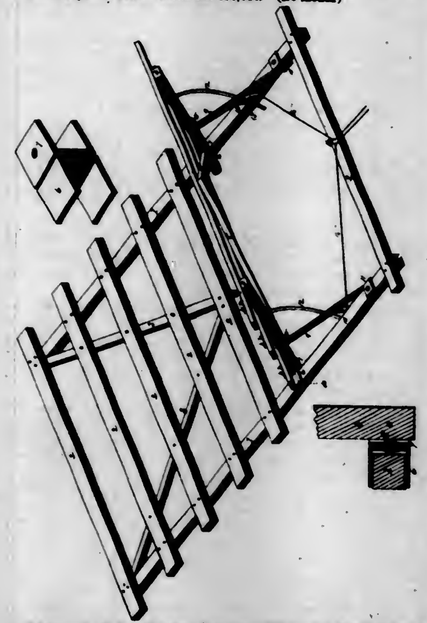
11. In combination with the elevating rotating screw F, the hollow case L, surrounding the same and rotating therewith, the scoop N on the case, the trough A', communicating with the case L, the hollow shaft V, the scoop Z on the said shaft, working in the trough A', and the spraying device communicating with the shaft V and receiving the supply therefrom, as set forth.

12. The combination of the rotating inclined screw having the shaft I projecting from its upper end, the bearing K, in which said shaft is journaled, the trough at the upper end of the screw, the trough at the lower end thereof, and the anti-friction rollers supporting the lower end of the screw, substantially as described.



13. In combination with the hollow shaft I', carrying the spraying devices and having the funnel or supply-nozzle K', the hollow rotary shaft V, discharging into the nozzle-funnel K', the scoop Z on the shaft V, the trough A', in which the scoop Z works, the rotating case L, communicating with the trough A', the screw F, working in the case L, and the scoop N on the case, as set forth.

14. In combination with the hollow shaft I', carrying the spraying devices, the hopper A, arranged under the spraying devices, the trough B, communicating with the hopper, the case L, carrying the scoop N, working in the trough B, the screw F in the case, and the hollow shaft V, receiving its supply from the case L and delivering it to the shaft I', as set forth.

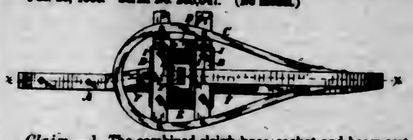


384,126. STREET-CAR-HEATING APPARATUS. MOSES CLEAVE, Cleveland, Ohio. Filed Nov. 4, 1886. Renewed Jan. 12, 1888. Serial No. 260,542. (No model.)

Claim.—The combination of a street-car, a water-tank located by the side of the dash-board of said car, a water-pipe leading from the tank into the car arranged in coils under the seats and returning to the water-tank, the return end of said pipe having a coil, and a vapor-burner for heating the coil at the return end of the pipe and establishing a current of hot water through the car, substantially as set forth.

384,126.

384,127. BED-BOTTOM. ALBERT H. CLEAVELAND, Belvidere, Ill. Filed Sept. 26, 1887. Serial No. 250,707. (No model.)

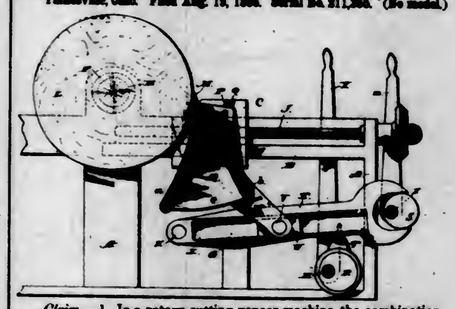


Claim.—1. In combination, a bottom frame, an adjustable head-section, bars loosely connected to the head-section and bottom frame, a segment-brace to support the adjustable head-section at the desired angle, and a vibrating friction-clutch pivotally secured to the said bars, the said friction-clutch consisting, essentially, of an arm provided with an aperture the opposite edges of which bite the opposite edges of the segment-brace when the clutch is allowed to swing freely on its support, substantially as set forth.

2. The combination of a main portion, an adjustable head portion having a sliding connection therewith, a brace connecting the main and head portions, a friction-clutch pivoted to said brace, and a segment-brace connecting the friction-clutch and the adjustable head portion, substantially as and for the purpose set forth.

3. The combination of a main portion, an adjustable head portion having a sliding connection therewith, a brace connecting the main frame and head portion, a friction-clutch pivoted to said brace, a segment-brace connecting the friction-clutch and the head portion, and a cord connected to the friction-clutch for the purpose of releasing it from its engagement with the segment-brace, substantially as and for the purpose set forth.

384,128. SLEIGH-KNEE. JOHN J. OTIS, Grand Rapids, Mich. Filed Feb. 23, 1888. Serial No. 265,047. (No model.)



Claim.—1. The combined sleigh-knee socket and beam-rest E, consisting of a metallic piece which may be made of malleable iron cast in a single piece having ribs $I' I^2 I^4 I^3$, forming grooves H H, for supporting and securing beams B B, and having also sockets G G G, for receiving ends of knees $F' F^2 F^3$, arranged between the beams and runner, substantially as described.

2. In a combined sleigh-knee socket and beam-rest, consisting of metallic piece E, constructed as described, having ribs $I' I^2 I^4 I^3$, forming grooves H H, and having sockets G G G, the combination and arrangement of ribs $I' I^2 I^4 I^3$ and grooves H H with the sockets G G G, arranged substantially as described, and for the purpose herein set forth.

3. A gear for sleigh-bobs, composed of the metallic piece E, having ribs $I' I^2 I^4 I^3$ and grooves H H and sockets G G G, in combination with beams B B, knees $F' F^2 F^3$, and runner A, arranged substantially as described, and for the purpose herein set forth.

384,129. ROTARY-CUTTING VENEER-MACHINE. HENRY H. COE, Painesville, Ohio. Filed Aug. 19, 1886. Serial No. 211,366. (No model.)

Claim.—1. In a rotary-cutting veneer-machine, the combination, with slide-blocks having guides thereon curved in the arc of a circle, of a knife-bar arranged to move on said guides and have its inclination regulated thereby, substantially as set forth.

2. In a rotary-cutting veneer-machine, the combination, with slide-blocks having guides thereon curved in the arc of a circle, of a knife-bar arranged to move on said guides and have its inclination regulated thereby, and a feed-screw for shifting the position of the slide-blocks, substantially as set forth.

3. In a rotary-cutting veneer-machine, the combination, with an adjustable knife-bar, of pivoted guides, the knife-bar having a sliding pivotal connection with said guides, substantially as set forth.

4. In a rotary-cutting veneer-machine, the combination, with an adjustable knife-bar, said bar having arms secured thereto, of pivoted guides, and blocks adapted to slide therein and to which said arms are pivoted, substantially as set forth.

5. In a rotary-cutting veneer-machine, the combination, with an adjustable knife-bar, said bar having arms secured thereto, of pivoted guide-bars or guides, blocks adapted to slide therein and to which said arms are pivoted, and cams for regulating the positions of the guide-bars, substantially as set forth.

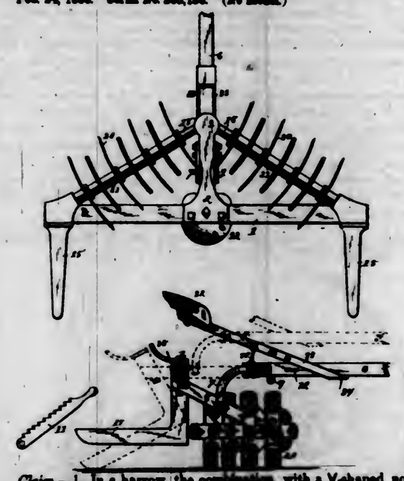
6. In a rotary-cutting veneer-machine, the combination, with an adjustable knife-bar, said bar having an arm secured thereto, and slides, each having a curved groove therein, of a feed-screw to actuate the slides, and a pivoted guide-bar having a slide-block mounted therein, said block being pivoted to the arm of the knife-bar, substantially as set forth.

7. In a rotary-cutting veneer-machine, the combination, with an adjustable knife-bar, and pivoted guide-bars with which the knife-bars have a sliding pivotal engagement, of pivoted levers, and cams for regulating the position of said levers and guide-bars, substantially as set forth.

8. The combination, with the knife-bar, and pivoted guide-bars with which the knife-bar has sliding pivotal engagement, of levers pivoted on the same axis with the pivoted guide-bars, fulcrums for these levers, and cams for changing both the levers and the guide-bars, substantially as set forth.

9. The combination, in a rotary-cutting veneer-machine, of the adjustable knife-bar D, the annular bearings P Q, the arms U, the slide-blocks W, the adjustable guides X, the eccentrics R, the shaft H, and the hand-lever Y, substantially as described.

10. The combination, in a rotary-cutting veneer-machine, of the adjustable knife-bar D, the annular bearings P Q, the arms U, the slide-blocks W, the adjustable guides X, the eccentrics R, the shaft H, the hand-lever Y, the levers T, the fulcrums G, the eccentrics S, the shaft I, and the hand-lever Z, substantially as described, and for the purpose set forth.



384,130. BAG-FASTENER. HENRY W. COMSTOCK, Lafayette, Ind. Filed Mar. 10, 1888. Serial No. 266,793. (Model.)

Claim.—1. The fastener described, composed of a single piece of metal bent upon itself to form a loop, A, and loops *a a* at the end opposite the loop A, and the ends of the piece extended inward parallel with each other and at their extreme ends diverging, substantially as and for the purpose specified.

2. The combination, with a bag-fastener consisting of a wire provided at one end with a loop, A, loops *a a* at the opposite end between the legs of the wire, and the ends of the wire extended inward and alongside each other between said legs and the extreme ends bent outwardly and laterally, of a cord or rope connected to said fastener, substantially as shown and described.

384,131. HARROW. ADAMS CREEK, Jr., Gouverneur, N. Y. Filed Feb. 24, 1888. Serial No. 265,132. (No model.)

Claim.—1. In a harrow, the combination, with a V-shaped non-rotating supporting-rod adapted to receive upon either side a hollow shaft, of two gangs of rotating stirrers mounted loosely thereon, substantially as set forth.

2. In a harrow, the combination, with the thrust-bar recessed at its front end, of the rotating disk-gangs supported at their inner ends by the thrust-bar, and having their inner ends arranged within the recess, whereby the thrust-bar is adapted to serve as stand-beads, substantially as set forth.

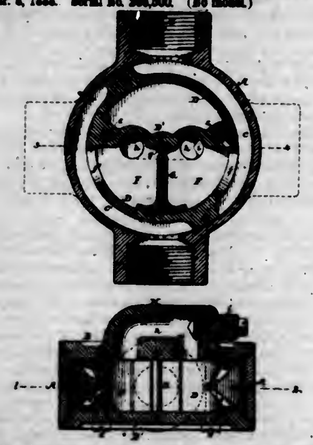
3. In a harrow, the combination, with the recessed thrust-bar, of the supporting-rod and the thimbles 19 for supporting the rod within the recess, substantially as set forth.

4. In a harrow, the combination of the thrust-bar, the cross-bar at the rear end of the thrust-bar, the down-hangers, and the continuous bent supporting-rod mounted at its ends in the down-hangers and connected with the thrust-bar at a point intermediate of its ends, substantially as set forth.

5. In a harrow, the combination of a supporting-frame, a rotating gang mounted at its ends directly upon the supporting-frame, carriers attached to the supporting-frame and projecting rearward therefrom, a tongue hinged to the supporting-frame, and means for suspending the front part of the supporting-frame from the tongue and in a tilted position, whereby both ends of the gang are supported above the soil, substantially as set forth.

6. In a harrow, the combination of a supporting-frame, a rotating gang mounted at its ends in the supporting-frame, carriers attached to and projecting rearward from the supporting-frame and above the surface of the ground when said frame is in its normal position, a tongue hinged to the supporting-frame, and means for suspending the front part of the supporting-frame from the tongue, the said frame and carriers being in a tilted position, substantially as set forth.

7. In a harrow, the combination of a supporting-frame having a cross-bar and downward-projecting hangers at the ends of the cross-bar, a hinged tongue, a rotating gang mounted upon the frame, and carriers projecting rearward from the frame, said carriers being formed integral with the downward-projecting hangers, substantially as set forth.



8. In a harrow, the combination of a hinged tongue, a frame having a cross-bar in rear of the tongue and a thrust-bar projecting forward from the cross-bar, with two gangs of rotating stirrers, each connected at its front end to the thrust-bar and at its rear end to the cross-bar, substantially as set forth.

9. In a harrow, the combination, with the cross-bar, of the rearward-projecting shoes, the thrust-bar, the hinged tongue, and devices for connecting the tongue with the thrust-bar in front of the hinging-point of the tongue, substantially as set forth.

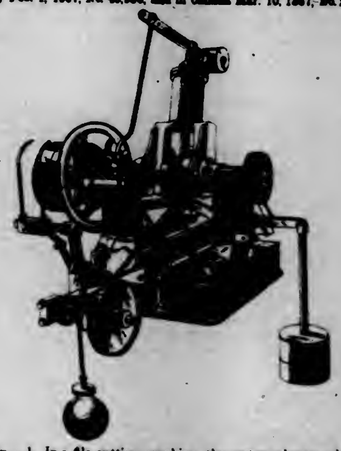
10. In a harrow, the combination of a triangular frame having its apex in front, a tongue hinged to the frame, two gangs of rotating stirrers mounted on the frame, and devices for connecting the triangular frame with the tongue and adjusting the vertical position of the frame relative to the tongue, substantially as set forth.

11. In a harrow, a triangular frame having a cross-bar, a bar projecting at an angle from the central part of the cross-bar, two rods connecting the ends of the thrust-bar with the ends of the cross-bar, and rotating gangs of stirrers mounted on the rods, substantially as set forth.

384,132. GAS-GOVERNOR. B. FRANK DAY, Sellersville, Pa. Filed Mar. 8, 1888. Serial No. 266,900. (No model.)

Claim.—1. The combination, in a gas-governor, of the box provided with inlet and outlet ports, a chamber formed in said box, and a regulating-pendulum therein dividing said chamber into two portions, with a passage providing a communication between the two parts of the chamber, substantially as and for the purpose set forth.

2. The combination of the outer shell, A, having the inlets and outlets, a box adjustably secured within said casing and provided with inlet and outlet ports, said box having a chamber, a regulating-pendulum dividing said chamber, and a communicating passage between the two portions of the chamber, substantially as set forth.



3. The combination of the casing A, side plates, B B', a passage, A,

formed in one of said plates, a ring, D, of smaller diameter than the casing, thus forming a passage, said ring and plates inclosing a chamber, a regulating-pendulum therein, and inlet and outlet ports for said chamber, substantially as set forth.

4. The combination of a ring, D, having a tapered outlet-port, *f'*, said ring forming a chamber, and a pendulum in said chamber, with a side passage communicating with both divisions of the chamber, substantially as set forth.

5. The combination, in a gas-governor, of the ring provided with inlet and outlet ports, a chamber formed in said ring, a pendulum therein dividing said chamber into two portions, and a passage communicating with the two parts of the chamber, with regulating-valve in said passage, substantially as set forth.

384,133. FILE-CUTTING MACHINE. RICHARD DURNELL, Leeds, County of York, England, assignor of one-half to John Blakey, same place. Filed Feb. 19, 1887. Serial No. 228,267. (No model.) Patented in England Jan. 2, 1885, No. 62, and May 1, 1886, No. 5,869; in Belgium Jan. 20, 1887, No. 76,136; in France Jan. 20, 1887, No. 181,316; in Germany Feb. 1, 1887, No. 40,994, and in Canada Mar. 10, 1887, No. 26,194.

Claim.—1. In a file-cutting machine, the rectangular tang-holder partially working in a recess in an oscillating work-supporting anvil, said holder being attached at its top to a releasing-lever fulcrumed at one end to the anvil and curved at its free end, while the bottom of the holder is provided with a pin which, after passing through a hole in said recess, is encircled by a spring working in a second recess in the said anvil, substantially as herein set forth.

2. In a file-cutting machine, the combination, with a tang-holder, as herein described, of a work-supporting anvil capable of oscillating on pins during progress of work in a bed-trough adapted to travel in fixed slides on a supporting bed-plate, and mechanism, as described, for connecting said trough with and propelling it from a single shaft, as set forth.

3. In a file-cutting machine, the combination of a work-supporting anvil, traveling bed-trough, and tang-holder with the device for holding and fixing the oscillating anvil in any required position, consisting of a bar secured to top of anvil with forked projecting end fitting a screwed rod secured to trough, and means for raising and lowering such projecting forked end, substantially as herein set forth.

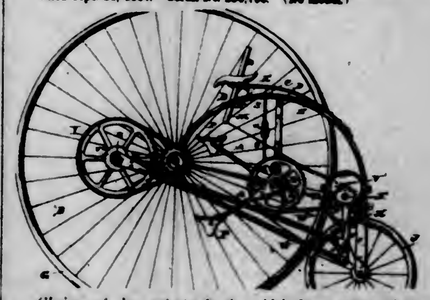
4. The combination, in a file-cutting machine, of the fixed supporting frame or base having a propelling screw-shaft, mechanism for rotating said shaft in a given direction, a bed-trough adapted to travel in slides on said fixed frame, an anvil capable of being oscillated in said trough at any angle during working of machine, a movable half-nut for engaging and disengaging the trough with the screw-shaft, a weight, pulley, shaft, and cord for returning the trough to the rear end of the machine when released from the screw-shaft, the tang-holder, as herein described, and the device for holding the anvil in a given angular position, substantially as described and set forth.

5. In a file-cutting machine, the combination of a work-supporting anvil, a traveling bed-trough, operating mechanism for said trough, and the tang-holding device herein set forth, with a roller attached loosely to a transverse lever weighted at one end and carried at the other end by an adjusting-screw working in bearings on the side of the machine, whereby horizontal and longitudinal adjustment of the point of pressure on the file-blank, as well as vertical movement, is secured, all as herein set forth.

6. In a file-cutting machine, the combination of a roller attached loosely to a weighted lever, *q*, placed across the anvil and pivoted on an adjusting-screw, Q, carried in bearings on the side of the machine and operating to change horizontally position of lever, and mechanism, substantially as herein described, for raising the roller and lever clear of its work, whereby the position of the roller can be adjusted to the varying angles of the cutting-chisel, substantially as herein set forth.

7. In a file-cutting machine, the combination, with a reciprocating carriage for carrying a file or rasp to be cut, of a cutting chisel or tool having a rounded shank with a flat portion, retaining-bar d^{17}, and set-screw d^{16}, for holding it in position in a U-shaped recess formed in a reciprocating holder in any given angle or position across the blank, substantially as set forth.

8. The combination of cutter d^{10}, holder d^3, cam *f*, for reciprocating same, framing D, provided with slides *d'*, for the reception of the tenons d^{13} on holder d^3, trunnions d^{12}, bearings *e* on standards or uprights C, flanges e^3, slot-holes e^4, and bolts e^5, whereby the cutter can be adapted to cut the teeth of the file to any required angle, as set forth.



9. In a file-cutting machine, the combination of a reciprocating tool-holder carried in an adjustable framing with a cylinder fixed to the said framing directly over the cutter-holder containing a spiral spring interposed between two pistons, the said cutter-holder being attached to the rod of the lower piston, substantially as set forth.

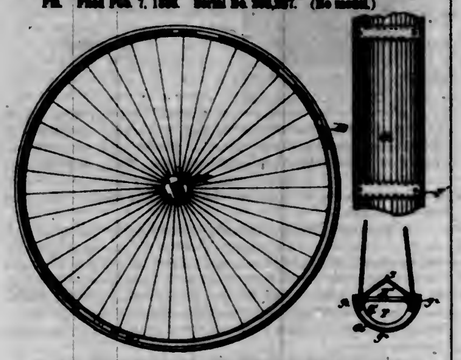
10. In a file-cutting machine, the combination of a reciprocating cutter-holder mounted in slides in adjustable framing provided with trunnions working in bearings formed in the uprights C, the cam on driving-shaft for raising said holder, the cylinder fixed to the adjustable framing over the cutter-slides, the lower piston attached to the said holder by its rod, the upper piston, a spring interposed between the pistons, and the lever mechanism, substantially as described, whereby the upper piston is adapted to compress the said spring onto the lower piston independently of or simultaneously with the upward movement of the tool-holder, whereby the pressure or force of the blow of the cutting-chisel is regulated, as set forth.

11. In a file-cutting machine, the combination of screw-shaft a^3, half-nut b^9, traveling bed B, incline fixed adjustably to such bed, runner r^4 on lever r^3, working against said incline, the levers r^3, r^5, and R, the rods r^7 r^8, the winged nut r^{10}, the cylinder *d*, the adjustable supporting-frame D, upper piston, d^3, spiral spring d^5, and lower piston, d^6, whereby the spring may be compressed independently of or simultaneously with the lower piston, substantially as and for the purposes herein described.

12. In a file-cutting machine, the combination of the fixed bed-plate, screw-shaft, operating mechanism for said shaft, bed-trough adapted to work in slides on said fixed bed A, half-nut whereby it may be engaged with or disengaged from said screw-shaft, a work-supporting anvil adapted to oscillate in said trough, the file-holding devices, substantially as described, the standards or uprights fixed to said fixed bed A, provided with bearings at the upper ends for the reception of the trunnions d^{12} on adjustable framing D, the adjustable framing D, the cylinder *d*, the pressure-regulating mechanism, substantially as described, the tool-holder, cutting-chisel, and cam on driving-shaft, operated as described, whereby the said holder and chisel may be reciprocated and operated for cutting a tooth while the anvil and bed-trough are stationary, substantially as set forth.

384,134. VELOCIPEDE. LLOYD H. DOREMUS, Winter Park, Fla. Filed Sept. 26, 1887. Serial No. 250,703. (No model.)

Claim.—1. In a velocipede, the vehicle-frame composed of the arched tubular sections C, D, E, *c'*, c^2, and *x'*, constructed and arranged substantially as described.



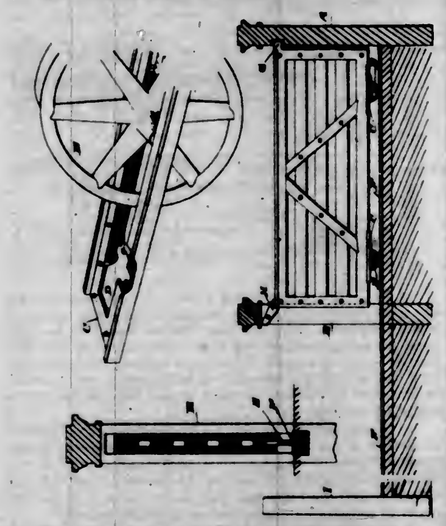
2. The combination, with the tubular frame, constructed substantially as described, of the pedals, the ratchets v' v^2, the eccentrics V V', the sprocket-wheels R Y, and the belts S Z, substantially as specified.

3. In a velocipede, the combination, with the frame thereof, of the alternating device comprising the hanger provided with the adjustable rock-shaft and links for connecting the same with the pedals, substantially as specified.

4. The combination, with the frame of the velocipede, of the curved bars supporting the seat upon the cross-sections of the frame, substantially as specified.

5. In a velocipede, the combination, with the ratchets, of the pawls w, provided on their ends with rubber or leather pieces 3, substantially as specified.

384,135. VEHICLE-WHEEL. LLOYD H. DOREMUS, Winter Park, Fla. Filed Feb. 7, 1888. Serial No. 263,857. (No model.)



Claim.—1. In combination with the tire, the rib F, consisting of the transverse portion and the semicircular portion adapted to engage against the concave side of the tire, and the leg-rivets f^3, for securing said rib in place, substantially as specified.

2. In combination with the tire, the rib F, and the spokes engaging in said rib, the angular piece S, of spring-steel, held in place by the spokes passing through holes corresponding with the spoke-holes in the rib F, substantially as specified.

3. In a vehicle-wheel, the combination, with the spring-steel tire and the crossed spokes, of the hub H, having the caps fitted over its ends, and bolts for securing the caps in place, substantially as specified.

384,136. GATE. JOHN DURNELLY, San Mateo, Cal. Filed Mar. 15, 1883. Serial No. 267,279. (No model.)

Claim.—The combination, with a gate and its posts, one of which is slotted to permit the passage of said gate, of the plate C, secured to the under surface of the gate, said plate having the slot D, elongated channels *a* upon each side of the slot and open at one end, and the rollers in said slot, with the ends of their axles or shafts mounted loosely in said channels, substantially as described.

384,187. APPARATUS FOR OPENING FURNACE-DOORS. FRANK DOYLE, Chicago, assignor of one-half to John Bateman, Lake View, Ill. Filed Aug. 6, 1887. Serial No. 246,270. (No model.)

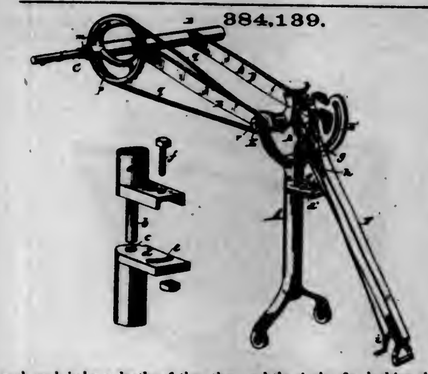
Claim.—1. The combination, with the pedal, of the rod *g*, pivoted thereto and to the cam, said cam bearing upon the friction-wheel upon the crank-handle, and the door rigid with the crank-shaft, whereby the door is opened when pressure is applied to the pedal, substantially as specified.

2. The combination, with the door, of the crank and the crank-shaft with which the door is rigidly connected, the friction-wheel upon the crank-handle, a cam bearing against said wheel, and lever mechanism for forcing the cam against the wheel to turn the crank, substantially as described.

3. The combination, with the door rigidly secured to the crank-shaft, of the pin upon the crank and a pivoted dog provided with teeth, whereby the door may be held at any angle desired.

4. The combination, with the crank mechanism and means for operating the same, of the double door, the front portion thereof being rigidly attached to the crank-shaft and the lining loosely mounted thereon, and stop mechanism for holding the lining at a distance from the front when the door is closed, said front coming against the lining when swung by the crank mechanism, substantially as described.

384,138. METHOD OF MAKING BANDING FOR SPINNING-MACHINES. THOMAS H. DUNHAM, Boston, Mass. Filed Aug. 11, 1887. Serial No. 246,746. (No model.)



Brief.—The object of the invention is to make banding from cotton water-proof, uniform in draft, and not liable to shrink.

Claim.—The method of making banding from cotton, which consists in softly twisting to the left a slubber of cotton, and then softly twisting two or more slubbers together, twisting to the left, then passing such compound slubbers so twisted through a bath of tar, and drying as described, then softly twisting together two or more such compound slubbers thus tarred, twisted, and dried, twisting to the right, all as and for the purpose specified.

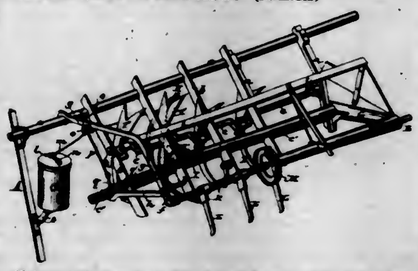
384,139. HARVESTER-REEL. GEORGE EUSTLY, Whitewater, Wis. Filed Mar. 7, 1887. Serial No. 230,019. (No model.)

Claim.—1. In combination with a harvester, a reel-standard jointed thereto to swing forward and backward, said standard consisting of an upper and a lower part connected by a vertical axis, that the upper part may turn horizontally, an arm, B, connected to the upper end of the standard by a horizontal axis, that it may swing upward and downward, a reel having its shaft mounted horizontally in the distal end of said arm, a hand-lever connected rigidly to said arm and extending rearward, for the double purpose of adjusting the reel vertically and turning it horizontally, and a locking device for said lever, also carried by the upper end of the standard, whereby the one lever is enabled to effect the horizontal and the vertical adjustment of the

384,139.

reel, each independently of the other, and the device for locking the lever caused to turn horizontally therewith.

2. A reel-standard divided horizontally into two parts, said parts provided with opposing flanges, in combination with a vertical pivot, and a clamping-bolt distinct from said pivot, as described, whereby the parts may be secured together with more or less firmness, as required, and held in position without the employment of external fastening devices.



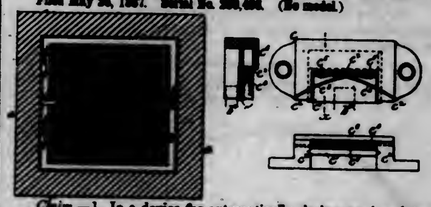
3. In combination with the reel-standard, having its upper end pivoted to turn horizontally and combined with the clamping device, the reel-support sustained thereon by a horizontal axis, and the rearwardly-extending lever attached to said reel-support, whereby the lever is enabled to perform the double duty of adjusting the reel vertically and of turning it horizontally.

4. The reel-support B, mounted on a horizontal axis and provided with the slotted plate B', fixed thereto, in combination with the hand-lever, and the clamping-bolt passing through the slotted plate and seated in the lever, as described.

5. The reel-driving shaft C, provided with a reverse screw-thread, in combination with the reel having the tubular socket or shaft *n*, applied around and screwed upon shaft C, substantially as described.

6. In a harvester, an overhung reel, in combination with a supporting and driving shaft consisting of two members passing one over the other and united by a reverse thread, one of said members mounted permanently in its bearings and the other attached permanently to the reel, substantially as described.

384,140. GRAIN-BINDER. GEORGE BUTLER, Whitewater, Wis. Filed June 3, 1887. Serial No. 240,154. (No model.)



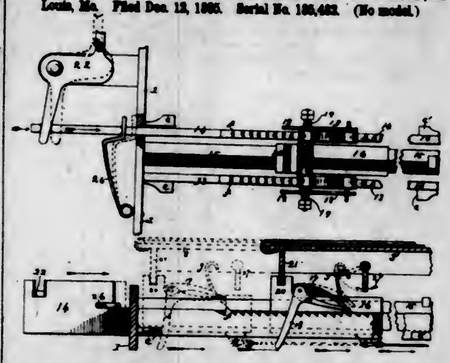
Claim.—1. In a grain-binder, the parallel base-rods *c d*, in combination with the cross-sills connecting them, the rigid binder-standard having the horizontal upper and lower arms, as usual, the shaft *k*, carried by and extended beyond the upper arm, the bearing for said shaft at its overhanging end, and supports for said bearing connected to the base-rods, substantially as shown.

2. In a grain-binder, a base-frame, a gear-standard of the Appleby type secured thereto and overhanging the binding-table, the knotter-driving and ejector-carrying shaft mounted in the top of the standard and prolonged beyond its overhanging end, the bearing for the extended end of the shaft, and supports for said bearing extended downward across the grain-passage to the base.

3. In combination with the circulatory packers rising through and above the grain-space, the overlying breast-plate provided at its sides with the elevated portions above its grain-confining face to cover and protect the points of the packers.

4. In combination with the cord-clamping disk seated therein, the breast-plate provided with the opening and with the downwardly-extending guards or cheeks *y* at the sides of the disk.

384,141. AUTOMATIC SCREEN OR DOOR FOR OBSTRUCTING THE PASSAGE OF FLAME. EDWARD B. FERRET, New York, N. Y. Filed May 26, 1887. Serial No. 239,498. (No model.)



Claim.—1. In a device for automatically closing openings into or through shafts or hoistways of buildings to obstruct the passage of flame, in combination, a door, screen, or shutter, a bolt secured thereto, a fixed nosing which receives the end of the bolt, a movable plate in the nosing, and a fusible retaining device, whereby the movable plate of the nosing is caused to release the bolt upon an abnormal increase of heat.

2. In a device for automatically closing openings into or through shafts or hoistways of buildings to obstruct the passage of flame, in combination, a door, screen, or shutter, a bolt secured thereto, a fixed nosing which receives the end of the bolt, a sliding plate in the nosing, springs which press against the sliding plate, and a solder of fusible metal applied to the plate and springs, whereby the springs are released and move the plate back clear of the bolt upon an abnormal increase of heat.

3. In a device for automatically closing openings to obstruct the passage of flame, in combination, a door, screen, or shutter, a bolt secured thereto, a fixed nosing which receives the end of the bolt, and a movable plate or face in the nosing actuated to release the bolt by an abnormal increase of heat.

4. The device comprising the side posts, c^3 c^3, the sliding plate c', having the flange c^5, springs c^4 c^4, and fusible solder c^6 c^6, the hinged door *b*, and the bolt b^2, secured to the door, substantially as set forth.

384,142. TYPE-WRITING MACHINE. GEORGE L. FERRIS, St. Louis, Mo. Filed Dec. 12, 1885. Serial No. 185,462. (No model.)

Claim.—1. In a type-writing machine, the combination of the type-wheel, the vibrating lever-arm, the pivoted and jointed hand-lever having a segmental end, a spur-gear attached directly to the type-wheel, the notched lettered bars fixed on said lever-arm, the rock-shaft, the reciprocating table, and rod, lever, and bar for connecting the latter two, whereby the depression of the lever-arm and its attachments imparts intermittent movement to said table, substantially as shown and described.

2. In a type-writing machine, the combination, with the table, of the movable ratchet-bar, a feed-pawl engaging therewith and attached to said table, the vibrating type-wheel and rock-shaft, to which it is indirectly attached, and rod and lever for connecting said shaft and ratchet-bar and converting the rotary reciprocation of the one into rectilinear reciprocation of the other, as shown and described.

3. In a type-writing machine, the combination of the pivoted elbow-lever and the vibrating pendent arm connected therein with the movable and fixed ratchet-bars, the table, and a sliding pawl-carrier connected with the latter, the rock-shaft, vibrating lever-arm, type-wheel, and a hand printing-lever, all arranged to operate substantially as shown and described.

4. In a type-writer, the combination of the pivoted pawl-lifters 19 with the sliding table-carrier, the pawls 17, hinged to the latter, the horizontal ratchet-bars, carrier-supporting bar 15, and stops with which said lifters come in contact automatically, as shown and described.

5. In a type-writing machine, the combination of pressure or friction springs with the pivoted pawl-lifters, the carrier, pawls pivoted thereto, and fixed and movable ratchet-bars, substantially as shown and described.

6. In a type-writing machine, the combination, with ratchet-bars, pawl, and table-carrier, and pawls hinged thereto, of the pawl-lifters, which are adapted to maintain their position when raised and thereby hold the pawls elevated, as and for the purpose specified.

7. In a type-writing machine, the combination of the table and its bar 21, the tubular slide 16 and its slotted head 20, the guide-bar 15, the ratchet-bars, and pawls pivoted to said slide, all as shown and described, and operating as specified.

8. In a type-writing machine, the combination of the table, the ratchet-bars, a sliding pawl-carrier and pawls, and a lifter adapted to engage with the latter for raising them out of engagement with the ratchet-bars for the purpose of enabling the table to be moved back to its original position, as shown and described.

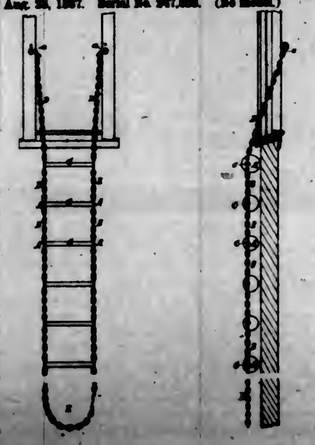
9. In a type-writing machine, the combination, with the table and ratchet-bars, of the pivoted bar, the pawls having hooks that lock with the latter, and the sliding pawl-carrier with which said table is connected, all as shown and described.

10. In a type-writing machine, the combination, with the ratchet-bars having a tooth at their left extremity longer than the others, the sliding table and pawl-carrier, and the pawls pivoted thereto, of pivoted levers for lifting the latter, the same turning on their bearings with sufficient friction to enable them to sustain the weight of the pawls, as shown and described.

11. In a type-writing machine, the combination of friction-springs with the pivoted pawl-lifters, the pawls, ratchet-bars, and the table, as shown and described, for the purpose specified.

12. In a type-writing machine, the combination of stops with the pivoted pawl-lifters, the pawls, ratchet-bars, a sliding pawl-carrier, and the table connected thereto, as shown and described.

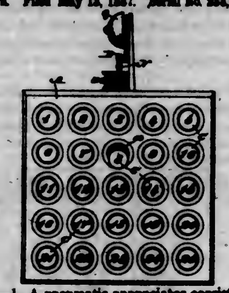
13. In a type-writing machine, the upwardly-projecting notched letter-bars, in combination with the lever-arm, type-wheel, and jointed printing-lever, as shown and described.



14. In a type-writing machine, the type-wheel arm and rock-shaft having sliding connection which permits vertical adjustment of the wheel, substantially as and for the purpose specified.

15. In a type-writing machine, the combination of type-wheel, rock-shaft, and lever-arm, the socket, the sliding tenon, and a screw for holding them in the desired relative adjustment, all as shown and described, for the purpose specified.

16. In a type-writing machine, the combination, with the type-wheel, of the table and the track on which it runs, both curved or made convex, as shown and described, for the purpose specified.



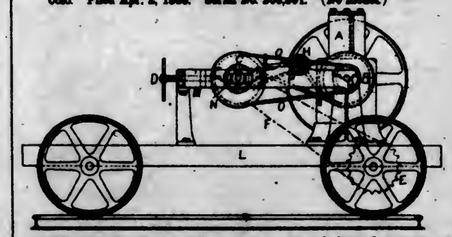
17. In a type-writing machine, the combination, with the rock-shaft and lever-arm carrying the type-wheel, of a clamp attached to said shaft and adapted for adjustment around the same, for the purpose of enabling the lever-arm to be set at the required angle, as shown and described.

384,143. FIRE-ESCAPE. STEPHEN H. GARDINER, Lynn, Mass. Filed Aug. 20, 1887. Serial No. 247,033. (No model.)

Claim.—A fire-escape consisting of the combination of disks A, connected by chains B, rods or rounds C, extending from a disk on one side to a disk on the other and secured eccentrically to said disks, with the two upper chains, D, and the bottom looped chain, E, as set forth.

384,144. PNEUMATIC ANNUNCIATOR. RANDOLF P. GARMAN, Norristown, Pa. Filed May 13, 1887. Serial No. 238,095. (No model.)

Claim.—1. A pneumatic annunciator consisting of a main pipe with branch pipes, air-supply pipes connected with the branch pipes, bellows attached to the branch pipes, a dial-carrying arm operated by said bellows, and check-valves in the branch pipes, the parts being combined substantially as described.



2. In a pneumatic annunciator, the combination of the main pipe H, having an alarm connected therewith, the pipes G, having one end closed and the other leading into the main pipe H, the air-supply tubes J, leading into pipe G, the check-valves K, located at the connection of pipe G and main pipe H, and mechanism, substantially as described, connected to said main pipe and alarm, whereby the inlet of air into said main pipe operates the alarm, substantially as described.

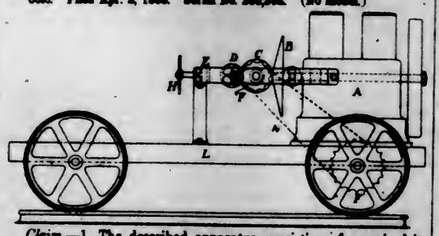
3. A pneumatic annunciator consisting of a board with an inclined opening therein, arm B, passing through said opening and having the dial C on the front end and the ball D on the rear end thereof, the tube J, with air-pump, the branch pipe G, connected with said tube, and the inflated body F, with socket or cup E thereon, said parts being combined substantially as and for the purpose set forth.

4. In a pneumatic annunciator, the main pipe H, with the pipe I, inflated body M, a gong with hammer, and tripping device therefor, in combination with the branch tube G, having check-valve K, the inflated body F, with socket E, a board with an opening, and an arm passing through said opening, and having a dial on its front end and a ball or knob on its rear end, said ball operating in said socket, substantially as described.

5. A pneumatic annunciator consisting of a board with a series of inclined openings therein, arms passing through said openings and having dials at their front ends adapted to close said openings, a main pipe, branch tubes connected with said main pipe, separate tubes leading to each of said branch tubes from air-pumps, a check-valve in each of said branch tubes between said main pipe and air-pump tube, the said arms having pivotal connection with inflated bodies on said branch tubes, and an alarm connected to said main pipe, said parts being combined substantially as and for the purpose set forth.

384,145. MOTOR FOR STREET-CARS. LOUIS B. GIBSON, Pueblo, Colo. Filed Apr. 2, 1888. Serial No. 269,391. (No model.)

Claim.—1. A motor for street-cars, consisting of a source of power, a main driving-shaft, a supplemental shaft, fixed cone-pulleys on the two shafts reversed in position to each other, whereby the motion of the car may be varied, idler-pulleys on the same shafts and a connecting rope or chain between the pulleys on the shafts for communicating the motion of the main shaft to the supplemental shaft, and a driving-connection from the supplemental shaft to the axle of the car, substantially as described.



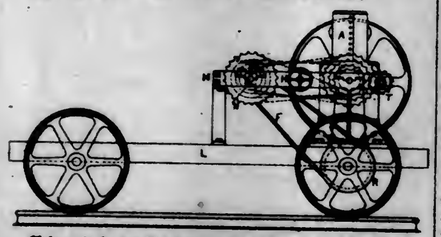
2. A motor for street-cars, consisting of a source of power, a main

driving-shaft, a pulley on said shaft, a supplemental shaft having a pulley fixed thereto, a double set of idler-wheels loosely mounted on said shaft, and connecting ropes or chains extending between the pulleys on the two shafts, one of said driving-ropes being crossed, whereby motion of the car may be reversed.

3. A motor for street-cars, consisting of a source of power, a main driving-shaft, a cone-pulley having a grooved face, a supplemental shaft, a grooved cone-pulley thereon reversed in position to the pulley on the main shaft, idler-pulleys on said shaft, and two connecting ropes or chains for propelling the car in two directions, and a driving-chain between the supplemental shaft and the axle of the car, substantially as described.

4. A motor for street-cars, consisting of a source of power, a main driving-shaft carrying a cone-pulley, and an adjustable supplemental shaft, also carrying a cone-pulley, idler-wheels, connecting-ropes between the pulleys, and a driving-connection between the supplemental shaft and the axle of the car.

884,146. MOTOR FOR STREET-CARS. LOUIS R. GIBSON, Pueblo, Colo. Filed Apr. 2, 1888. Serial No. 269,262. (No model.)



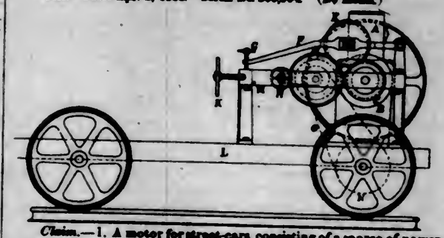
Claim.—1. The described apparatus, consisting of a main driving-shaft, a friction-wheel having its face beveled from the center to the periphery, secured to the end of said shaft at right angles thereto, a supplemental shaft carrying a friction-disk, said shaft being adjustable to make contact between the friction-surfaces, and a driving-connection with the car-axle, substantially as described.

2. The described apparatus, consisting of a main driving-shaft, a friction-wheel secured thereto having its face beveled from the center to the periphery, a supplemental shaft carrying a friction-disk, said disk being adjustable in the shaft to one side or the other of the center, whereby the car is propelled in one direction or the other, means for forcing the disk in contact with the friction-wheel, and driving-connection with the car-axle.

3. The described apparatus, consisting of a driving-shaft, a wheel or disk secured thereto having a beveled front face, a supplemental shaft mounted in an adjustable bracket, a friction-disk feathered on the shaft, means for operating the sliding bracket, means for adjusting the friction-disk, and a driving-connection to the axle, substantially as described.

4. In the described apparatus, the main driving-shaft, the friction-wheel secured thereto having a beveled front face, a shaft in rear of said wheel, carrying idle-pulleys bearing against the rear face of the friction-wheel, an adjustable supplemental shaft, a friction wheel or disk carried thereby adjustable on said shaft, and a driving-connection with the car-axle, substantially as described.

884,147. MOTOR FOR STREET-CARS. LOUIS R. GIBSON, Pueblo, Colo. Filed Apr. 2, 1888. Serial No. 269,263. (No model.)

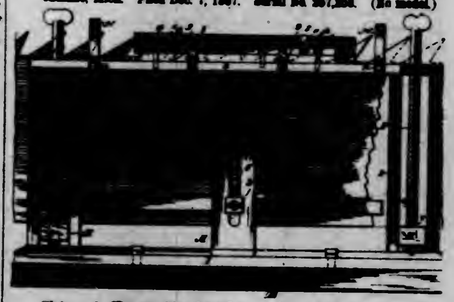


Claim.—1. In combination, a source of power, a main driving-shaft, a supplemental shaft, a driving-connection with the car-axle, and a series of loosely-mounted sprocket-wheels varying in size on the two shafts placed opposite each other, but in reversed position, whereby the speed of the car may be varied, fixed blocks or disks on the shafts for causing the sprocket-wheels to revolve with the shaft, and shifting devices for throwing the wheels into and out of fixed connection therewith.

2. In combination, a source of power, a main driving-shaft, sprocket-wheels mounted loosely thereon, a fixed connection with the shaft adapted to engage the loose wheels, a supplemental shaft having like loose wheels, and means for connecting them with the shaft, sprocket-chains between the wheels, and an idler-sprocket, T, for receiving one of the chains placed in rear of the sprocket-wheel on the main shaft, the chain passing beneath the said sprocket to the idler, whereby when the sprocket is connected with the shaft a reversed motion is given the car, substantially as described.

3. In combination, a source of power, a main driving-shaft, loose wheels thereon, a supplemental shaft pivotally supported at one end and having means of adjustment at the other, loose wheels on said shaft, means for connecting said wheels with the shafts, chains or ropes between the wheels, and a connection with the car-axle, substantially as described.

884,148. MOTOR FOR STREET-CARS. LOUIS R. GIBSON, Pueblo, Colo. Filed Apr. 2, 1888. Serial No. 269,264. (No model.)



Claim.—1. A motor for street-cars, consisting of a source of power, a main shaft, a supplemental frame, friction-wheels on the main shaft varying in diameter, a supplemental shaft adjustable toward or from the main shaft, friction-wheels on the supplemental shaft, adapted to engage with the wheels on the main shaft, connection between said shaft and the car-axle, and means for adjusting the pulleys on the supplemental shaft laterally, substantially as described.

2. A motor for street-cars, consisting of a source of power, a main driving-shaft carrying pulleys varying in diameter, a supplemental shaft carrying splined pulleys varying in diameter, means for adjusting the pulleys laterally, and an intermediate friction-disk between the main and supplemental shafts, adapted to engage the pulleys of both shafts and to transmit the motion of the main shaft to the supplemental shaft and reverse the movement of the car, substantially as described.

3. A motor for street-cars, consisting of a source of power, a main driving-shaft carrying pulleys varying in diameter, a supplemental shaft mounted in a sliding frame, pulleys varying in diameter splined to said shaft, a yoke for said pulleys, means for adjusting said yoke and pulleys laterally, and a driving-connection from the supplemental shaft to the main driving-shaft, substantially as described.

884,149. DEVICE FOR SIDE-DRESSING SAWS. GEORGE CLARK, Cadillac, Mich. Filed Dec. 7, 1887. Serial No. 257,269. (No model.)

Claim.—1. The combination of a saw-dresser, a support on which such dresser is mounted, a guide for such support, a foot-trip or treadle, a strap or connection between the trip and support, and a guide for such connection, substantially as set forth.

2. In a saw-dresser and as a new article of manufacture, a file adapted to act on or file the under face of a swaged saw-tooth, such file being formed with a smooth bearing-surface, 13, whereby to bear against the saw at the base of the teeth, and with a cutting-surface adjoining and arranged at an incline, whereby to engage the under face of the swaged saw-tooth, substantially as set forth.

3. In a saw-dresser, the improved file herein described, having a smooth bearing-face, 13, and having the rounded or beveled end surface, 14, leading to said bearing-face 13, substantially as set forth.

4. The combination of the framing, the file-supports thereon and adjustable toward and away from each other, and the screws for adjusting said file-supports, substantially as set forth.

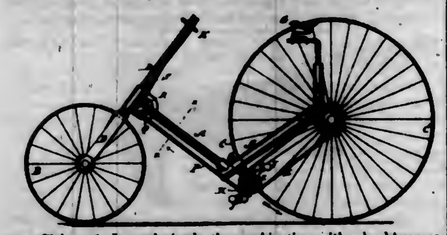
5. The combination of saw-dressing files, a support for the back edge of the saw, such support being arranged below the files, whereby the back edge of the saw may form a straight-edge to guide the saw with relation to the files, and suitable framing, substantially as set forth.

6. In a device, substantially as described, the combination of the main frame having slots S, the guides C, having portions c, operating in slots S, the screws for securing such guides, and the file-supports, substantially as set forth.

7. In a device, substantially as described, the combination of the framing, the file-supports, the saw-supports E, and the screws for adjusting said supports, substantially as set forth.

8. The combination of the framing, the file supports or carriers, the files clamped thereon and having smooth bearing-faces 13, and the rounded or beveled end surface, 14, and the support for the saw, substantially as set forth.

9. In a saw-dresser, the combination of the side frames, the file supports or carriers, the saw support and guides, and the connecting arch or arches, substantially as set forth.



10. In a device for dressing saws, the combination of the framing, the file supports or carriers, the saw-support, and the pulleys O, substantially as set forth.

11. In a saw-dresser, the combination of the framing, the file supports or carriers having main plates provided with seats 10 for the files, clamp-plates 11, and set-screws 12, and screws for adjusting said file-supports, substantially as set forth.

12. The improved saw-dressing device herein described, consisting of the side frames having slots S, the saw-guide having portions c fitting in said slots, the screws for securing said guides in position, the saw-supports E, the threaded screws or shafts for adjusting said saw-supports, the file supports or carriers, and the arch or arches connecting the upper ends of said side frames, substantially as and for the purposes specified.

13. In a saw-dresser, the framing and a support for the saw, combined with the files having smooth bearing-surface 13 and a cutting-surface adjacent the said bearing-surface, and supports or carriers for such files, whereby they may be held with their smooth and cutting surfaces, respectively, against the saw below the swage and in contact with the under face of such swage, substantially as and for the purposes specified.

884,150. VELOCIPEDE. CHARLES H. GOODELL, Poughkeepsie, N. Y. Filed Jan. 20, 1888. Serial No. 261,256. (No model.)

Claim.—1. In a velocipede, the combination, with a backbone or frame, a driving-wheel, and a steering-wheel, of a steering-bar centrally pivoted to the frame of the steering-wheel, a pulley connected to the driving-wheel and having a friction-clutch, and a connection between the pivoted steering-bar and the clutch, substantially as set forth.

2. The combination, with a backbone or frame and a steering and driving wheel, of friction-clutches on the shaft of the driving-pulley, a steering-bar centrally pivoted to the frame, and links connecting said steering-bar to the friction-clutches, substantially as set forth.

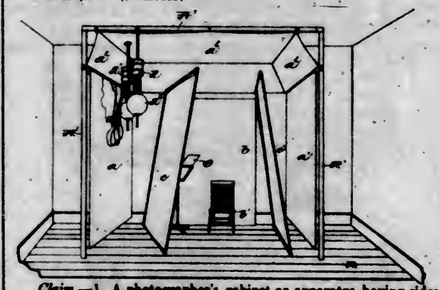
3. The combination, with a backbone or frame and a steering and driving wheel, of a friction-clutch connected to said driving-wheel and an actuating-handle and releasing mechanism connected to said friction-clutch, substantially as set forth.

4. The combination, with a backbone or frame, a steering and driving wheel, and a friction-clutch connected to said driving-wheel, of an actuating-handle and a bell-crank lever connected to said handle and to said friction-clutch, substantially as set forth.

5. The combination, with a backbone or frame, and with a driving and steering wheel, of friction-clutches on the shaft of the driving-pulley, bell-cranks mounted on the frame and connected to said friction-clutches, links connected to the bell-cranks, and a steering-bar centrally mounted to oscillate on the frame and connected to said links, substantially as shown and set forth.

6. In a velocipede, the combination, with a backbone or frame, a driving-wheel, and a steering-wheel, of an actuating-handle and an adjustable connection between said handle and the driving-wheel, substantially as set forth.

7. In a velocipede, the combination, with a backbone or frame, a steering-wheel, and a driving-wheel, of an actuating-handle adjustably mounted on the vehicle and adjustably connected to the driving-wheel, substantially as set forth.



8. The combination, with a backbone or frame, and with a steering and driving wheel, of an actuating-handle, a clutch provided with gripping-rollers L, and made to connect with said actuating-handle and driving-wheel, and releasing-studs N, for holding said rollers L in their releasing position, substantially as set forth.

9. The combination, with the backbone, driving-wheel, and steering-wheel of a velocipede, of a pulley, I, connected with the driving-wheel, a friction-clutch comprising a rotary ring, K, and gripping-rollers L between the ring and a hub on the pulley, a centrally-pivoted steering-bar, E, and connections between said bar and rotary ring, substantially as described.

10. The combination, with the wheel C, treadles J, and the pulley I, connected with said wheel and treadles and having a hub provided with inclined shoulders T, of the rotary ring K, the rollers L, located between said ring and the pulley-hub, the slotted disk U, and the ring M, having pins N extending through the slotted disk, substantially as described.

11. The combination, with a backbone or frame, and with a driving and steering wheel, of clutches on the shaft of the driving-pulley, bell-cranks mounted on the frame and connected to said clutches, links connected to the bell-cranks, and a steering-bar centrally mounted to oscillate on the frame and connected to said links, a lever, O, being applied to said clutches to release said clutches, substantially as set forth.

884,151. APPARATUS FOR PHOTOGRAPHING BY ARTIFICIAL LIGHT. FREDERIC E. GOULD, Hillard, Mass. Filed May 9, 1887. Serial No. 237,577. (No model.)

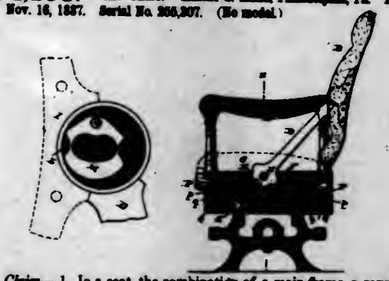
Claim.—1. A photographer's cabinet or apparatus having sides *a a'* and top a^2 of translucent material rendered opaque on its outer side, and an artificial light located in said cabinet, combined with a translucent screen, *c*, between the said light and the subject to be photographed, and with a second screen located on the opposite side of the said subject, substantially as described.

2. A photographer's cabinet or apparatus having sides *a a'* and top a^2 of translucent material rendered opaque on its outside, an artificial light located in said cabinet, a translucent screen between the said light and the subject to be photographed, and a second screen located on the opposite side of the said subject, combined with a screen, *p*, as and for the purpose specified.

884,152. DEMAGNETIZER. JOHN GRAVES, St. Louis, Mo. Filed Aug. 15, 1887. Serial No. 246,998. (No model.)

Claim.—1. In a demagnetizer, in combination with the magnets and wires, the brushes and a series of pins upon which the brushes bear, said pins being connected with opposite terminals of the magnet, and the alternate pins only being connected with the same terminal of the magnet, whereby the current is reversed or alternated through the magnets, substantially as set forth.

2. In a demagnetizer, in combination with the magnets and wires, the brushes and cylinder provided with rings and pins upon which the brushes bear, and connection between the rings and pins, the whole being arranged in such a manner that the current is reversed or alternated in the magnets as the cylinder is turned, substantially as and for the purpose set forth.



3. In a demagnetizer, in combination with the magnets and wires, the brushes and cylinder, the latter being provided with means for turning it, and with rings upon which two of the brushes bear, and also being provided with series of pins 19, 20, 27, and 28, upon which the brushes bear, all substantially as and for the purpose set forth.

4. In a demagnetizer, the combination, with an electro-magnet having two terminals and with the primary conducting-wires, of contact-brushes connected with said wires, a series of contact-points arranged in pairs and adapted to contact with said brushes, each pair of points being connected with both of said terminals, and the alternate points only being connected with the same terminal of the magnet, substantially as set forth.

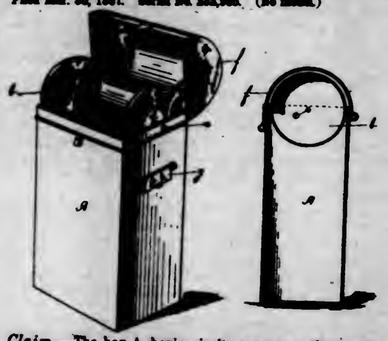
5. The combination, with the primary wires 6 7 and an electro-magnet, of a revoluble cylinder, peripheral conductors on said cylinder insulated from each other, contacts bearing upon said peripheral conductor and connected with said wires 6 7, two pairs of commutator-brushes, each pair being connected with both terminals of the magnet, and the brushes of opposite sign being connected to the same terminal, and a row of contact-points for each brush connected with the peripheral conductors and adapted to meet said brushes in pairs alternately.

6. In a demagnetizer, the combination of the electro-magnets having two terminals, the brushes 24, 25, 31, and 32, arranged in pairs, wires 9 10, connecting one brush of each pair with one terminal of the magnet, and wires 9½ 10½, connected one brush of each pair with the opposite terminal, a revoluble cylinder provided with a crank and composed of non-conducting material, conducting rings 14 15 on said cylinder, battery-wires 6 7, having connection with said rings, and two rows of contact-pins, 19 20 and 27 28, connected with rings 14 15, respectively, and the pins connected with each ring adapted to contact alternately with brushes of like sign.

884,158. CAR-SEAT. HENRY S. HALE, Philadelphia, Pa. Filed Nov. 16, 1887. Serial No. 255,307. (No model.)

Claim.—1. In a seat, the combination of a main frame, a reversible seat-back, connecting-arms hinged at one end to the main frame and at the other to the seat-back by a hinge-joint, a lug on the back and close to the hinge-joint, and a pivoted swinging gravity-pawl with two points, which automatically engage on opposite sides of the lug in its two extreme positions, said pawl being carried on the connecting-arms, the said pawl and lug being adapted to lock the seat-back and connecting-arms in their two extreme positions and unlock them in their highest position.

2. In a seat, the combination of the main frame, the seat-back, connecting-arms hinged at one end to the main frame and at the other to the seat-back by a positive hinged joint, a single independent pivoted pawl, M, having two oppositely-located points to engage on opposite sides of a lug on the seat-back, a weighted portion and an open central portion to allow the passage of the hinge between the connecting-arms and back, and carried by each of said connecting-arms and operating by gravity to automatically lock and unlock the said back and arms in reversing the seat-back, and a lug or projection on each end of the seat-back and close to the hinged joints to work in connection with the gravity-pawl.



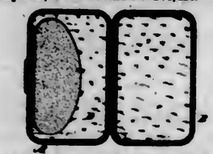
3. In a seat, the combination of the main frame, the back, connecting-arms hinged at one end to the main frame and at the other to the seat-back, and provided with recessed parts, an independent locking device on each arm and arranged in the said recessed part, consisting of a single pawl, M, having notches *m*, pivoted to said connecting-arms at N, and a lug located on each of the seat-back hinges and projecting into said recessed parts of the connecting-arms, to engage with the notches of the pawl and enable it to lock the seat-back on its connecting-arms by the operation of gravity when the back is reversed.

4. In a seat, the combination of the main frame A, seat-back B, connecting-arms D, pawls M, carried by said arms D and having the two recesses or notches *m*, and hinge-plate I of the back, having the lug L on its disk-extension J, adapted to engage in the recesses *m* and lock the arm and seat-back together by the force of gravity when in their lowest positions.

5. In a seat, the combination of main frame A, seat-back B, hinged connecting-arms D between the seat-back and main frame, and each having the disk-extension S, provided with the pin N, the hinge-plates I, each having the disk-extension J, and secured to the seat-back and provided with the lug L, and the gravity-pawl M, pivoted upon the pin N, and having the recesses or notches *m* to receive the lug L, substantially as and for the purpose specified.

6. In a seat, the combination of the main frame A, seat-back B, hinged connecting-arms D between the seat-back and main frame, and each having the disk-extension S, the pawls M, pivoted to and contained within said disk-extensions, and having the notches *m* on opposite sides of their pivotal point, the hinge-plates I, secured to the back, and each having the disk-extension J and lug L to engage with the notches *m* in the pawls, the hinge-pivot K, and the cover or cap-plate T, to hold said disk-extension J to the disk-extension S.

884,154. LETTER-BOX. DENNIS HARRIGAN, Somerville, Mass. Filed Mar. 30, 1887. Serial No. 232,935. (No model.)

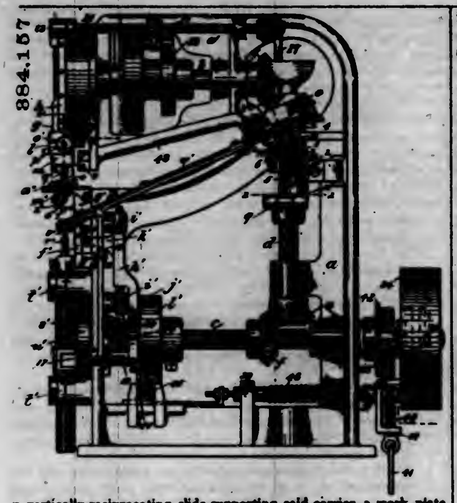


Claim.—The box A, having in its upper part the receptacle *b*, turning on the axis *c*, in combination with the gear *d*, the gear *e*, and the cover *f*, substantially as and for the purpose above described.

884,155. FELT BOOT. HENRY W. HATHORN, Clear Lake, Iowa. Filed Feb. 13, 1888. Serial No. 263,860. (No model.)

Claim.—The combination, with a felt boot having a strap or loop by which it may be removed, of a pocket or receptacle into which the free end of the strap or loop may be inserted, substantially as described.

884,156. BOX OR RECEPTACLE. EDWARD J. HASEK, Brooklyn, N. Y. Filed Apr. 12, 1888. Serial No. 270,416. (Model.)



Claim.—1. A box composed of a body, A, a lid, B, and a casing, D, in said body, having an opening, substantially as described.

2. A box composed of a body, A, a lid, B, a casing, D, in said body, having an opening, and a cover, E, for said opening, substantially as described.

884,157. EYELETING-MACHINE. LORENZO D. HAWKINS, Stoneham, and JOHN C. PAINE, Boston, Mass., assignors to the Combination Power Punch and Eyeleting Machine Company, Portland, Me. Filed Oct. 17, 1887. Serial No. 252,577. (No model.)

Claim.—1. In an eyeleting-machine, the combination of the combined punch and top set, a horizontally-reciprocating carrier therefor,

a vertically-reciprocating slide supporting said carrier, a work plate or table, a die-block and a vertically-reciprocating carrier therefor, a vertically-reciprocating bottom set having an eyelet-engaging finger, and an oscillating or reciprocating roadway, all arranged and operating substantially as set forth.

2. The combination of the combined punch and top set, the carrier therefor, the vertically-reciprocating slide having a guide or way on which said carrier is reciprocated horizontally, the reciprocating bar engaged with the carrier, and means, substantially as described, for varying the reciprocating movement of the carrier, and thereby varying the feed movement of the punch, as set forth.

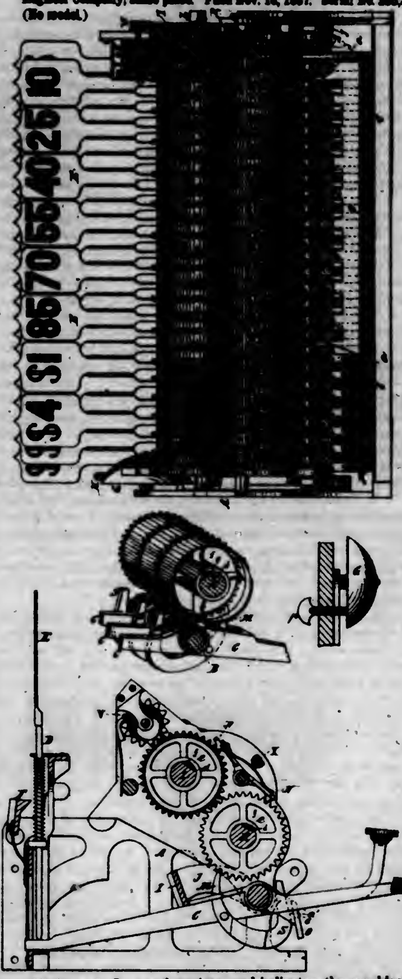
3. The combination of the combined punch and top set, the carrier therefor, the vertically-reciprocating slide having a guide or way on which the carrier is reciprocated horizontally, means, substantially as described, for varying the length of the reciprocating movements of the carrier and punch, a movable stop for said carrier, and means for adjusting said stop and for holding it at any point to which it may be adjusted, as set forth.

4. The combination of the punch and top set, the carrier therefor, the means for reciprocating the carrier vertically, the sliding bar *r*, the slotted lever *t*, and means for oscillating said lever, whereby the carrier is reciprocated horizontally, and the adjustable fulcrum *u* for said lever, whereby the length of the reciprocating movements of the carrier may be adjusted, as set forth.

5. The combination, with the punch and operating mechanism therefor, substantially as described, of the work-table, the die-block having a female die to co-operate with the punch, the carrier *f'*, to which said block is detachably secured, and the devices for vertically reciprocating the die-block carrier, as set forth.

6. The combination, in an eyeleting-machine, of the punch and die-block detachably secured to the machine, the eyelet inserting and upsetting devices, and the eyelet reservoir and roadway secured to the machine by means, substantially as described, whereby said reservoir and roadway can be readily removed and replaced, as set forth.

7. The reservoir having the agitator, combined with the angular sleeve 3, supporting the reservoir, and the shafts 5 6, geared together, as described, one of said shafts being detachably engaged with the hub of the agitator, while the other is provided with operating devices whereby said shafts and agitator are oscillated, as set forth.



8. The combination of the reservoir and roadway, the latter having the lug 14 and the former having the agitator provided with a projecting shank, 12, the oscillating lever 15, having a socket to receive the lug 14, and the fixed sleeve 3, supporting the reservoir and provided with the oscillating socketed shaft 6, in the socket of which the shank of the agitator is removably inserted, as set forth.

9. The combination, with the eyelet inserting and setting devices, of the pivoted roadway, a spring which presents said roadway to the eyelet-inserting finger and permits said roadway to be held back from said finger, and an oscillating lever whereby the roadway is moved back automatically, as set forth.

10. The combination, with the eyelet inserting and setting devices, of the pivoted roadway, a spring which presents said roadway to the eyelet-inserting finger and permits said roadway to be held back from said finger, and an oscillating lever whereby the roadway is moved back automatically, and devices, substantially as described, whereby the operator may hold the roadway back to intermit the insertion of the eyelets, as set forth.

11. In the eyeleting-machine herein described, the combination of the shaft *c*, the clutch 36, attached thereto, having the cam-shaped flange 42, the sliding driving-pulley, the sliding spring-impelled bar 37, engaged with said pulley and provided with the spring-impelled pin adapted to engage the flange 42, and provided with means whereby it may be depressed by the operator, the wedge 44, secured to said bar, and the brake-shoe 45, arranged to be pressed by said wedge against a disk on the shaft *c*, all arranged and operating substantially as set forth.

884,158. CASH REGISTER AND INDICATOR. JOHN F. READY and JOHN H. PATTERSON, Dayton, Ohio, assignors to the National Cash Register Company, same place. Filed Nov. 16, 1887. Serial No. 255,311. (No model.)

Claim.—1. In a cash register and indicator, the combination, with the five-cent-registering wheel and a series of keys indicating odd multiples of five above the first power, of a five-cent bar independent of the five-cent key and actuated by said series of keys, and a dog pivoted to said five-cent bar and engaging with the teeth of the five cent wheel, substantially as and for the purpose described.

2. In a cash register and indicator, the combination, with a five-cent-registering wheel, a series of wheels registering even multiples of five, and a series of keys indicating odd multiples of five above the first power, of a five-cent bar independent of the five-cent key and

actuated by said series of keys, a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, and a dog pivoted to each of said odd-numbered keys and engaging with the teeth on the wheel registering the next lower even multiple of five, substantially as and for the purpose described.

3. In a cash register and indicator, the combination, with a five-cent-registering wheel, a series of wheels registering even multiples of five, and a series of keys indicating even and odd multiples of five above the first power, of a five-cent bar actuated by the odd-numbered keys, a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, a dog pivoted to each odd-numbered key and engaging with the teeth of the wheel registering the next lower even multiple of five, and a dog pivoted to each even-numbered key and engaging with the teeth of the wheel registering the multiple of five indicated by such key, substantially as described.

4. In a cash register and indicator, the combination, with a five-cent-registering wheel, a series of wheels registering even multiples of five, and a series of keys indicating five and the even and odd multiples thereof, of a five-cent bar independent of but arranged to be actuated by each of the odd-numbered keys, a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, a dog pivoted to each odd-numbered key excepting the five-cent key and engaging with the teeth of the wheel registering the next lower even multiple of five, and a dog pivoted to each even-numbered key and engaging with the teeth of the wheel registering the multiple of five indicated by said key, substantially as and for the purpose described.

5. In a cash register and indicator, the combination, with the five-cent-registering wheel, a series of keys indicating odd multiples of five above the first power, and a series of tablet-rods and indicating-tablets, one for each of said odd-numbered keys, of a five-cent bar independent of the five-cent key and actuated by said series of keys, and a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, substantially as and for the purpose described.

6. In a cash register and indicator, the combination, with a five-cent-registering wheel, a series of wheels registering even multiples of five, a series of keys indicating both even and odd multiples of five above the first power, and a series of tablet-rods and indicating-tablets, one for each of said keys, of a five-cent bar actuated by the odd-numbered keys, a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, a dog pivoted to each odd-numbered key and engaging with the teeth of the wheel registering the next lower even multiple of five, and a dog pivoted to each even-numbered key and engaging with the teeth of the wheel registering the multiple of five indicated by said key, substantially as and for the purpose described.

7. In a cash register and indicator, the combination, with a five-cent-registering wheel, a series of keys indicating five and the odd multiples thereof, and a series of tablet-rods and indicating-tablets, one for each key, of a five-cent bar independent of but arranged to be actuated by each of said keys, and a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, substantially as and for the purpose described.

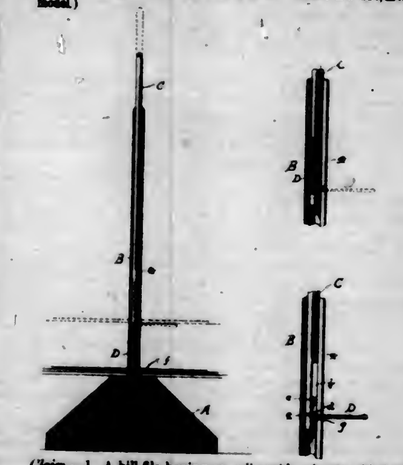
8. In a cash register and indicator, the combination, with a five-cent-registering wheel, a series of wheels registering even multiples of five, a series of keys indicating five and the even and odd multiples thereof, and a series of tablet-rods and indicating-tablets, one for each key, of a five-cent bar independent of but arranged to be actuated by each of the odd-numbered keys, a dog pivoted to said five-cent bar and engaging with the teeth of the five-cent wheel, a dog pivoted to each odd-numbered key excepting the five-cent key and engaging with the teeth of the wheel registering the next lower even multiple of five, and a dog pivoted to each of the even-numbered keys and engaging with the wheel registering the multiple of five indicated by said key, substantially as and for the purpose described.

9. In a cash register and indicator, the combination of a series of operating-keys representing the even multiples of five, another series of keys representing the odd multiples of five, registering mechanism operated by said keys, a bar actuated by the operation of any one of the keys of either series, a sales-registering wheel and connecting mechanism between said vibrating bar and sales-registering wheel, whereby, upon the operation of any key of either series, said sales-registering wheel will be actuated to register the total number of times the machine has been operated, substantially as described.

10. In a cash register and indicator, the combination of a series of operating-keys representing the even multiples of five, another series of keys representing the odd multiples of five, registering mechanism operated by said keys, a vibrating bar actuated by the operation of any one of the keys of either series, a sales-registering wheel, and a dog pivoted to said vibrating bar and engaging with the teeth of said sales-registering wheel, substantially as described, and for the purpose specified.

11. In a cash register and indicator, the combination, with a series of registering-wheels, of a series of holding-dogs engaging therewith, a series of springs bearing with pressure on said dogs and tending to hold them in engagement with the wheels, and a rock-shaft extending transversely across the machine and operating, when turned in one position, to bear upon the springs and increase their pressure upon the dogs, and when turned in another position to leave said springs bearing with normal pressure only on said dogs, substantially as and for the purpose described.

12. In a cash register and indicator, the combination, with a series of registering-wheels, of a series of holding-dogs engaging therewith, a series of springs bearing with pressure on said dogs and tending to hold them in engagement with the wheels, and a rock-shaft eccentrically journaled in and extending transversely across the machine and operating, when turned in one position, to bear upon the springs and increase their pressure upon the dogs, and when turned in another position to leave said springs bearing with normal pressure only on said dogs, substantially as and for the purpose described.



13. In a cash register and indicator, the combination, with a series of registering-wheels, of a series of keys pivoted on an axis parallel to the axis of the registering-wheels, and a series of substantially U-shaped dogs pivoted to the keys in rear of the axis of the latter and embracing said axis, one end of said dogs co-operating with the registering-wheels to propel them and the other end co-operating with said wheels to arrest them after being so propelled, substantially as described.

14. The combination, with the shaft K, provided with a longitudinal groove, *d*, and the registering-wheels strung upon said shaft and the bores of their hubs provided with notches *f*, of the interposed split springs *e*, confined in the groove *d* of the shaft, substantially as and for the purpose described.

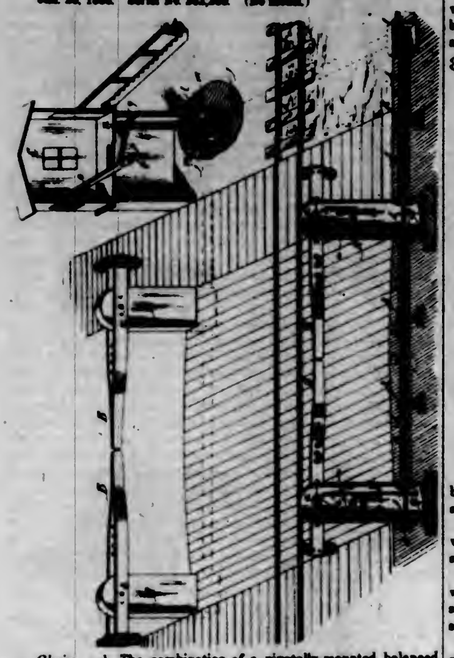
15. In a cash register and indicator, the combination, with the tablet-rods and tablets, tablet-supporting wing, gong, gong-hammer and its extension, a series of keys, and a vibrating frame which is actuated whenever any key is operated, of the bell-crank lever A', pivoted to the frame of the machine and to the vibrating frame, and carrying at its upper end a pivoted tripping-dog, *k*, which engages with a wiper-block upon the wing-extension, substantially in the manner and for the purpose described.

16. In a cash register and indicator, the combination, with the gong G, supported on the interior of the casing, of the thumb-screw *p*, screwed through the casing from the outside and impinging on the gong to form an adjustable damper therefor, substantially as described.

384,159. PAPER-FILE. George P. Henderson, Washington, D. C., assignor, by mesne assignments, to John C. Brown and Edwin H. Bond, both of same place. Filed Dec. 9, 1887. Serial No. 257,427. (No model.)

Claim.—1. A bill-file having an adjustable wire provided with a pivoted arm, substantially as described.

2. The combination, with a stationary slotted tube, of a wire adjustable in said tube and provided with an arm extending through said slot and beyond said tube, substantially as described.



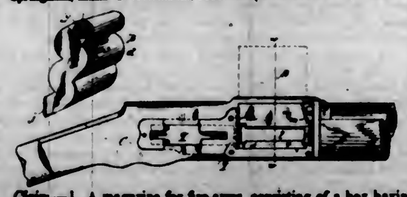
3. The combination, with the slotted tube, of the wire rotatable and vertically adjustable in said tube and a folding arm carried by said wire, substantially as described.

4. The combination, with the slotted tube, of the wire rotatable and vertically adjustable in said tube and formed with a recess, *b*, and an arm pivoted in said recess, substantially as described.

5. The combination, with the slotted tube with a shoulder, *f*, below said slot, of the wire vertically adjustable in said tube and an arm pivoted at its lower end to said wire, substantially as described.

6. The combination, with the slotted tube, of the wire movable therein and formed with recess *b*, the arm D, pivoted at its lower end to said wire within said recess, and a spring, *c*, within the recess acting on the arm, substantially as described.

384,160. GATE FOR RAILWAY-CROSSINGS. Richard W. Hill, Chicago, Ill., assignor to the American Lead and Zinc Works. Filed Jan. 26, 1888. Serial No. 262,209. (No model.)

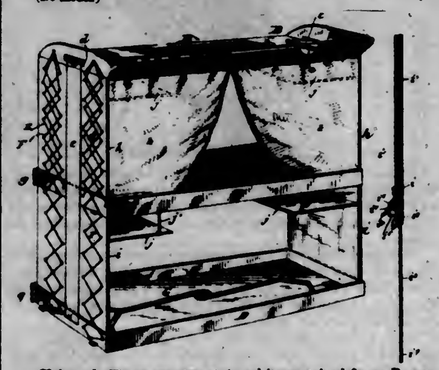


Claim.—1. The combination of a pivotally-mounted balanced gate-bar and a suitably-mounted rock-shaft actuating said bar by crank-and-pitman connection therewith, said rock-shaft being provided with universal joints and actuated by a swinging lever connected with the extremity thereof.

2. In a gate for railway-crossings, the combination of two independent pairs of pivoted arms, two rock-shafts, each actuating a pair of said arms by suitable connections, vertical rock-shafts joined to the first, respectively, by universal couplings, and two adjacent pivoted hand-levers actuating said vertical rock-shafts, whereby a single operator may at will operate either pair of said arms independently or both pairs simultaneously.

3. In a gate for railway-crossings, the combination of a pair of suitably-pivoted bars, a horizontal rock-shaft actuating said bars by suitable connections, a vertical shaft having at its upper extremity a rigid crank-arm, a pivoted lever connected by a link to said crank-arm, and a bar connected with the lower end of said vertical shaft and said horizontal rock-shaft by universal couplings, substantially as set forth.

4. The combination of the guides, pitmen, connecting-rods and crank-arms, the tumbling-rod, and the axle of a balanced gate, substantially as and for the purpose set forth.

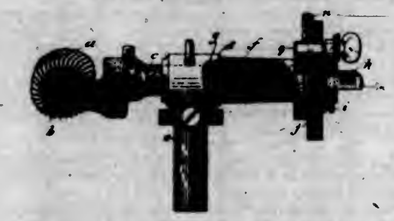


384,161. MAGAZINE FOR FIRE-ARMS. Solomon K. Hindley, Springfield, Mass. Filed Feb. 20, 1888. Serial No. 265,048. (No model.)

Claim.—1. A magazine for fire-arms, consisting of a box having its two opposite side walls internally corrugated, and having in one end wall an opening through which to insert cartridges, and also having in its lifter side wall a discharge-opening, and means whereby the said magazine may be attached to the side of a gun-frame, substantially as and for the purpose described.

2. A magazine for fire-arms, consisting of a box having its two opposite sides internally corrugated and provided near one end wall with the grooves *f f*, and provided with a rear end opening, through which to insert cartridges, and a discharge-opening, and means whereby the said magazine may be attached to a gun-frame, substantially as and for the purpose described.

384,162. BERTH FOR CARS, VESSELS, &c. Alonzo De Witt Hosier, Bergen Point, N. J. Filed Mar. 2, 1883. Serial No. 303,006. (No model.)

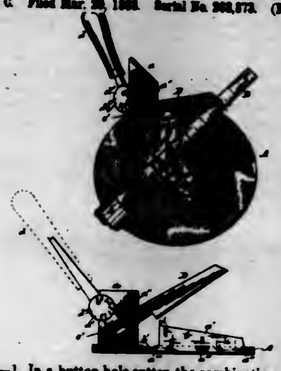


Claim.—1. The compartment A and its contained frame B, combined with berths C D, straps *e*, and lazy-tongs E and F, substantially as described.

2. A vertically-movable berth having end projections, *g*, provided with anti-friction-rollers, combined with guides *f* for said projections, substantially as described.

3. Suspended berths movable bodily in a vertical direction and without disturbing their horizontality, combined with lazy-tongs for staying and assisting them in their movement, substantially as described.

4. A sectional partition the sections of which telescope one within another, combined with spring-bolts on one section to engage openings in another to retain the parts in adjusted position, and a cam-rod for operating said bolts simultaneously, substantially as described.



384,163. DEVICE FOR ADJUSTING THE STITCH-WHEELS OF KNITTING-MACHINES. Frank P. Holt, Laconia, N. H. Filed Feb. 13, 1882. Serial No. 264,513. (No model.)

Claim.—1. The stitch-wheel and its supporting-rod, the latter being screw-threaded at its outer end, combined with the bearing for the rod, a spring for pressing the wheel and its rod forward or in one direction in its bearing, an adjusting-nut on the outer end of the rod for drawing the latter rearwardly or against the strain of the spring, an arm, lever, or projection connected with said nut, and stop-pin connected with a fixed part of the device for limiting the extent of movement of the lever or projection, substantially as set forth.

2. The stitch-wheel and its supporting-rod, the latter being screw-threaded at its outer end, combined with the bearing for the rod, a spring for pressing the wheel and its rod forward or in one direction in its bearing, an adjusting-nut on the outer end of the rod for drawing the latter rearwardly or against the strain of the spring, an arm, lever, or projection provided with a stop-pin connected with said nut, a bracket connected with the sleeve and provided with an adjustable stop-pin, and a fixed stop-pin connected with said bracket or sleeve, substantially as set forth.

884,164. BUTTON-HOLE CUTTER. JAMES R. HOPKINS, Washington, D. C. Filed Mar. 29, 1888. Serial No. 268,873. (No model.)

Claim.—1. In a button-hole cutter, the combination, with the cutting-blades *d'* D, of a transversely-movable gage for spacing the button-holes, said gage being provided with a spring-clamp to receive and hold the edge of the fabric to be cut, substantially as shown and described.

2. In a button-hole cutter, the combination, with the cutting-blades *d'* D, one of which is provided with a holding-point, *i*, of a transversely-movable gage for spacing the button-holes, said gage being provided with a clamp to receive and hold the edge of the fabric to be cut, substantially as shown and described.

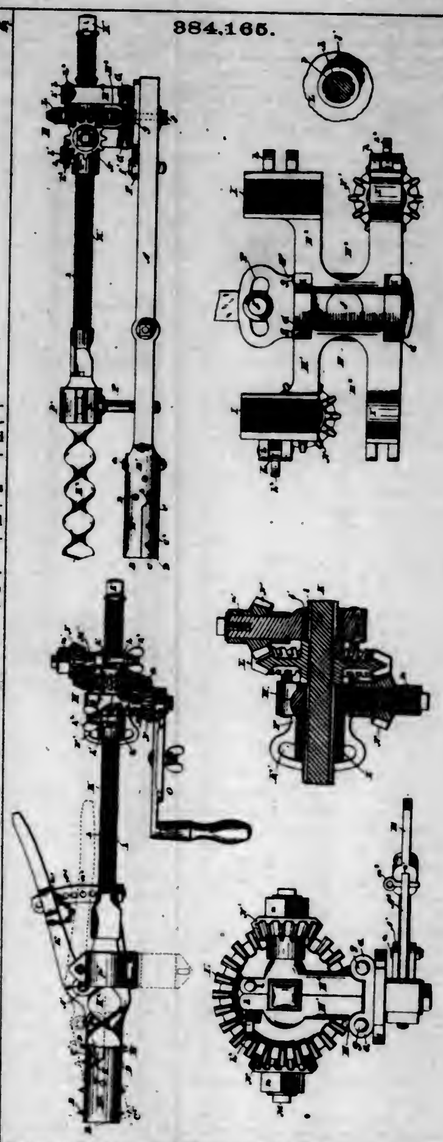
3. In a button-hole cutter, the combination, with the fixed cutting-blade *d'*, provided with a holding-point, *i*, of the gage C *c'*, to gage the distance between the button-holes and the edge of the fabric, substantially as shown and described.

4. In a button-hole cutter, the combination, with the fixed and pivoted cutting-blades *d'* D, the first of which is provided with a holding-point, *i*, of the transversely-movable gage B, for spacing the button-holes, and the gage C *c'*, for gaging the distance between the button-holes and the edge of the fabric, substantially as shown and described.

5. In a button-hole cutter, the combination of the base-plate A, provided with a fixed cutting-blade, *d'*, and a vertical standard in line with said blade, and a vibrating or swinging cutting-blade, D, pivoted to said standard and having a lever-handle by which it may be operated, substantially as shown and described.

6. In a button-hole cutter, the combination, with the base-plate A, provided with a fixed cutting-blade, *d'*, and a vertical standard in line therewith, of a vibrating or swinging cutting-blade, D, pivoted to said standard and having a lever-handle by which it may be operated, and an adjustable stop to limit the movement of the blade D in the cutting direction, substantially as shown and described.

7. In a button-hole cutter, the combination, with the base-plate A, provided with a fixed cutting-blade, *d'*, and a vertical angular standard, *a c*, in line therewith, the angular part *c* of said standard having a vertical slot, *a''*, of a vibrating or swinging cutting-blade, D, pivoted to said standard and working through said slot and having a lever-handle by which it may be operated, and an adjustable stop to limit the movement of the blade D in the cutting direction, substantially as shown and described.



884,165. MINING-DRILL. JOHN E. HOWELLS, Plymouth, assignor of one-half to Richard M. Howells, Wilkes-Barre, Pa. Filed June 8, 1887. Serial No. 240,642. (No model.)

Claim.—1. In a mining-drill, a stock carrying the drilling mechanism and provided on its forward end with a holder or securing device composed of two expansible jaws having gripping-surfaces at their forward and rear ends and pivotally secured to each other at a point between their forward and rear gripping-surfaces, and devices for operating said jaws, whereby the gripping-surfaces of the same may be expanded on each side of the pivotal point, all constructed, arranged, and operating substantially as shown and described, as and for the purpose set forth.

2. In a mining-drill, the stock A, carrying the drilling mechanism and having on its forward end the stationary jaw B, formed in two semi-cylindrical parts, B' B², in combination with the removable jaw C, formed in two semi-cylindrical parts, C' C², centrally pivoted to the jaw B and forming with said jaw a drill-holding head, and provided with the operating-lever E, all arranged and operating substantially as shown and described.

3. In a mining-drill, the combination of the stock A, carrying the drilling mechanism and having on its forward end the stationary jaw

884,165.

B, formed in two semi-cylindrical parts, B' B², the movable jaw C, formed in two semi-cylindrical parts, C' C², centrally pivoted to the jaw B and forming with said jaw a drill-holding head, the operating-lever E, having the slot *e'* and the segmental arm A², secured to the stock and provided with pin-holes *a²*, and the securing-pin *a²*, all arranged and operating substantially as shown and described.

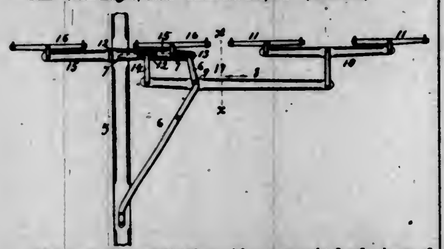
4. In a mining-drill, a suitable stock and a plate or turn-table pivotally secured to the rear end of the stock, in combination with a supporting-frame composed of two separable parts, each hinged to the plate or turn-table and having an internally-screw-threaded sleeve formed in the frame, and a screw-feed shaft mounted in the screw-threaded sleeve and having its rear end shouldered or keyed to receive a handle and provided on its forward end with a suitable bit, all constructed, arranged, and operating substantially as shown and described.

5. In a mining-drill, a suitable stock, a plate or turn-table pivotally secured to said stock, a supporting-frame for the drill and operating mechanism, formed in two separate parts, hinged to the plate or turn-table, and having its central portion cut away, as described, and provided with an internally-threaded sleeve and smooth bearing in a line with each other and on opposite sides of its cut-away portion, in combination with a double bevel-gear located in the cut-away portion of the supporting-frame, and having its hub extended and mounted in the bearing on said frame, and provided on the inside of its hub with lugs or keys, a screw-feed shaft provided with longitudinal grooves or key-seats and mounted in the screw-threaded sleeve and extending through the hub of the bevel-gear, the lugs or keys in said hub engaging with the grooves or key-seats on the shaft, and suitable bevel-pinions mounted on bearings projecting from the opposite sides of the supporting-frames, said pinions engaging with the opposite sides of the bevel-gear and being keyed to receive a crank-handle, all constructed, arranged, and operating substantially as shown and described.

6. In a mining-drill, a stock, A, provided on its forward end with a suitable drill-holding head, a plate or turn-table, F, pivotally secured to the rear end of the stock and provided with the segmental slot F' and clamping-bolt *f'*, a supporting-frame, H, formed in two separable parts, H' H², each hinged to the plate F, and having the internally-screw-threaded sleeve I, in combination with a screw-feed shaft, K, mounted in the screw-threaded sleeve and having its rear end shouldered or keyed to receive a crank-handle, and provided on its forward end with a suitable bit, all constructed and arranged substantially as shown and described.

7. In a mining-drill, a stock, A, a plate or turn-table, F, pivotally secured to said stock, a supporting-frame, H, formed in two separable parts, H' H², hinged to the plate F and having its central portion recessed or cut away at H², and provided with the internally-screw-threaded sleeve I and bearing I' in a line with each other and on opposite sides of the cut-away portion of the frame, in combination with a double bevel-gear, L, located in the cut-away portion of the frame and having its hub *l'* extended and mounted in the bearing I', and provided on the inside of its hub with lugs or keys *l*, a screw-feed shaft, K, provided with longitudinal grooves or key-seats *k* and mounted in the screw-threaded sleeve I and extending through the hub of bevel-gear L, the lugs or keys *l* in said hub engaging with the grooves or key-seats *k* on said shaft, and suitable bevel-pinions, N N', mounted on bearings M M', projecting from opposite sides of the supporting-frame, said pinions engaging with opposite sides of the bevel-gear and being keyed at *n n'* to receive crank-handles, all constructed, arranged, and operating substantially as shown and described.

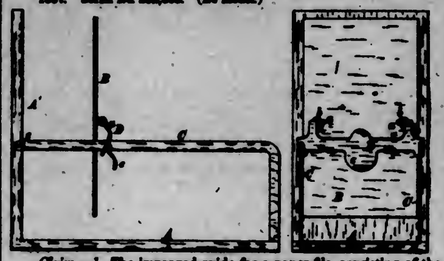
884,166. HAIR-SPRING COLLET AND STUD. HENRY HOWARTH, Waltham, Mass. Filed Feb. 13, 1888. Serial No. 263,955. (No model.)



Claim.—1. A hair-spring stud provided with the vertical and horizontal openings, and the vertical locking-pin, substantially as specified.

2. The combination, with the hair-spring, of the collet having the horizontal and vertical intersecting openings, and the pin inserted in the vertical opening.

3. The combination, with the hair-spring, of the stud having the intersecting openings, the collet having the intersecting openings, and the locking-pins, substantially as specified.

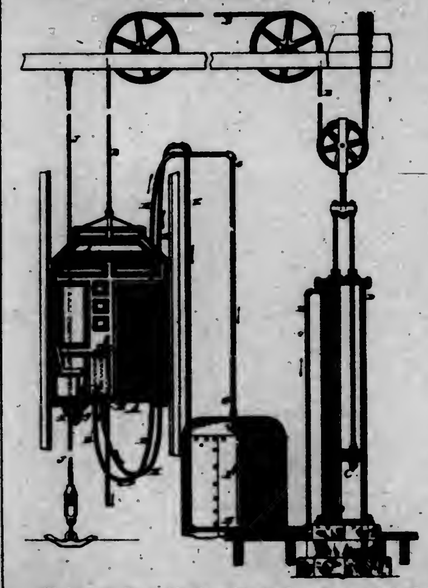


884,167. FOUR-HORSE EVENER. CHARLES C. ISENHOUTH, Huron, Dak. Filed Aug. 6, 1886. Serial No. 210,194. (No model.)

Claim.—1. The combination, with a team-pole, 5, of a brace, 6, secured at one end thereto, a tie, 7, rigidly connecting the other end of the brace with the pole, a lever, 8, eccentrically pivoted to the said brace, the lever 12, pivoted at one end to the same brace, and a tie, 14, connecting the short arms of the said levers, the long arms of the levers extending in opposite directions from the brace 6, and provided at their outer ends with means for attaching horses, substantially as shown and described.

2. The combination of the team-pole 5, the brace 6, rigidly connected at both ends therewith, the lever 8, eccentrically pivoted to the brace, with its long arm extending outward therefrom and provided with means for attaching horses, and with its short arm extending toward the team-pole, the lever 12, pivoted at one end to the said brace at a point forward of the lever 8 and extending across the team-pole, a tie, 14, connecting the short arms of the two levers, a doubletree, 15, centrally pivoted to the outer end of the lever 12 and extending across the team pole, and singletrees 16, attached to the said doubletree, one at each side of the pole, substantially as shown and described.

884,168. PAPER-FILE. H. ROBERTS JOYCE, Rochester, N. Y., assignor to the Schlicht & Field Company, same place. Filed Mar. 26, 1887. Serial No. 232,326. (No model.)



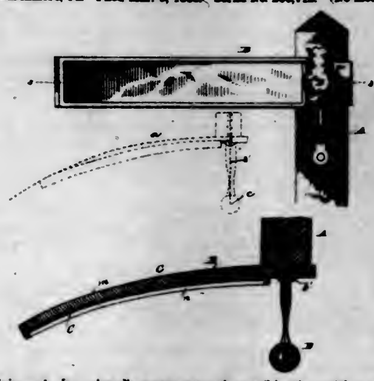
Claim.—1. The improved guide for a paper-file, consisting of the parallel side arms, their downwardly-turned arms, and the connecting member *d*, the whole formed in one piece, as shown.

2. In combination with the base A and end A', and a follower or carrier provided with clamping devices to ride on the guides, the two side guides formed in a single piece of metal, as shown, with the cross-connection at the rear, said guides attached to the front and base, substantially as described.

3. In a bill-file, and in combination with the side guides and the follower, the tilting rocking plate having the upright arms jointed to the follower-board and having the depending arm *c* below the guide, whereby it may be readily unlocked.

884,169. ELEVATOR. WARREN S. JOHNSON, Milwaukee, Wis., assignor of one-half to William Plankinton, same place. Filed Jan. 23, 1887. Serial No. 225,150. (No model.)

Claim.—1. In combination with the elevator-car and the fluid-pressure brake mounted thereon and acting against a stationary surface, such as a rope, a three-way valve mounted on the car, subject to the control of the attendant, a pipe leading from said valve to the brake,

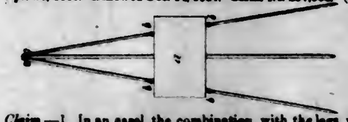


and a flexible pipe leading from the valve to a stationary reservoir or, like source of fluid-pressure supply, whereby the valve is brought in close proximity to the brake and the instantaneous action of the fluid upon the brake permitted.

2. In an elevator, the combination of the movable car, the cylinder and piston, and suitable intermediate connections for raising and lowering the car, the fluid-pressure brake mounted on the car, a stationary reservoir or source of fluid-pressure supply, a flexible pipe communicating with said source of supply and extending to the car, the double valve mounted on the car under control of the attendant and connected with said flexible supply-pipe, a pipe leading from said valve to the brake, and a second and flexible pipe connected with the valve and communicating with the car-operating cylinder.

3. In an elevator, the three-way valve or cock with its actuating-handle, in combination with the independently-operative secondary valve and its actuating devices mounted on said handle, substantially as described, whereby the two valves may be operated independently or simultaneously by one hand.

4. The main valve with its three ports, three-way plug, and operating-handle, in combination with the secondary valve and its actuating spring and rod, all mounted on the handle, and the flexible pipes communicating with the secondary valve, substantially as shown.



384,170. RAILWAY SEMAPHORE-SIGNAL. C. HENDERSON KOTE, Swarthmore, Pa. Filed Mar. 9, 1888. Serial No. 266,712. (No model.)

Claim.—1. In a signaling apparatus, the combination, with a support or standard, of a reflector having the shape or approximately the shape of the section of a paraboloid, as described, and mounted on or pivoted to said support so as to be rotatable about an axis corresponding to or coincident with the axis of the paraboloid, of which said reflector is a section, substantially as and for the purposes hereinbefore set forth.

2. The combination, in a signaling apparatus, of a support or standard, a reflector having the shape or approximately the shape of the section of a paraboloid, as described, and mounted on or pivoted to said support so as to be rotatable about an axis coincident with the axis of the paraboloid, of which the said reflector is a section, and a lamp or other source of light located on said support at the focal point of the said paraboloidal reflecting-section, substantially as and for the purposes hereinbefore set forth.

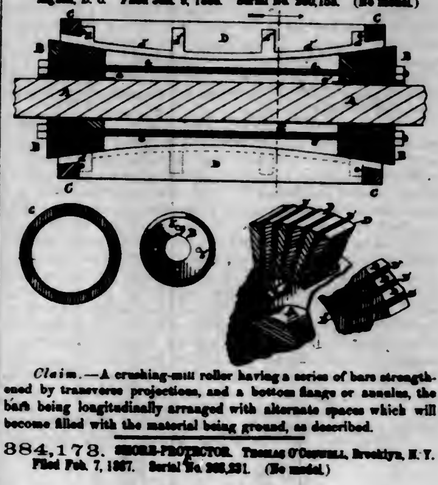
384,171. EASEL. EDWARD R. MORRIS, San Francisco, Cal. Filed Apr. 28, 1886. Renewed Dec. 14, 1887. Serial No. 257,908. (No model.)

Claim.—1. In an easel, the combination, with the legs, which are connected together pivotally and at the head-joint only, of clamps placed on said legs and which support the canvas-frame, panel, or board and connect the same with the legs, substantially as specified.

2. The combination, with the legs of an easel, which are connected together pivotally and at the head-joint only, of adjustable clamps placed on said legs and which support the canvas-frame, panel, or board and connect the same with the legs, substantially as specified.

3. The combination, in an easel, of supporting-legs connected together at the head-joint only, and clamps applied to the front legs of the easel, against which the canvas-frame, panel, or board is placed and fastened to the said legs by means of the said clamps, substantially as specified.

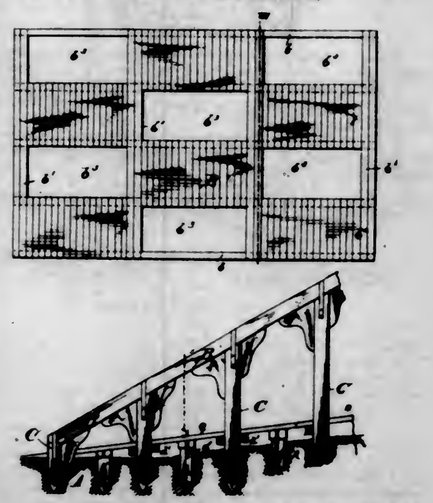
4. In combination with the legs of an easel, an adjustable pivot passed directly through the legs transversely and forming a head-joint which can be tightened or loosened at will, substantially as specified.



5. The combination, in an easel, of legs having the upper ends beveled, the bevel-faces extending below the pivot, as described, and the adjustable screw-pivot forming a head-joint which can be readily tightened, substantially as specified.

6. In an easel, the slides carrying the clamping-screws and provided with suitable devices for being made fast to the legs, substantially as specified.

7. In combination with the legs and canvas-frame, panel, or board, the adjustable slides provided with clamping-screws *d*, substantially as specified.



8. In an easel, the combination of the legs J K L, the adjustable head-joint, the adjustable clamping-slides, and the canvas-frame, panel, or board, substantially as specified.

384,172. CRUSHING-MILL ROLLER. GEORGE R. HOYER, Washington, D. C. Filed Jan. 9, 1888. Serial No. 260,163. (No model.)

Claim.—A crushing-mill roller having a series of bars strengthened by transverse projections, and a bottom flange or annulus, the bars being longitudinally arranged with alternate spaces which will become filled with the material being ground, as described.

384,173. SHORE-PROTECTOR. THOMAS O'CONNELL, Brooklyn, N. Y. Filed Feb. 7, 1887. Serial No. 226,231. (No model.)

Claim.—1. The herein-described shore-protector, consisting in the combination, with a breast-board inclined upwardly and landwardly from the water and provided with openings or pockets extending through the same and arranged as described, of piles formed in close rows substantially parallel with the line of the shore and adapted to support the breast-board in its inclined position, said rows being so arranged as to form parallel compartments beneath each longitudinal series of openings or pockets through the breast-board, as set forth.

2. The herein-described shore-protector, consisting of a breast-board provided with pockets or openings and inclined upwardly and rearwardly from the water, and piles to support said breast-board, said piles being formed in rows and provided with openings normally closed by doors, as described.

3. The combination, in a shore-protector, of a breast-board provided with pockets or openings and inclined upwardly and rearwardly from the water, and a series of piles formed in close rows and supporting said breast-board, and provided with openings and doors hinged to normally close said openings and adapted to swing outwardly, substantially as described.

4. The combination, in a shore-protector, with a breast-board provided with pockets and piles to support the same, of planking or flooring above the ground or shore beneath the breast-board, substantially as described.

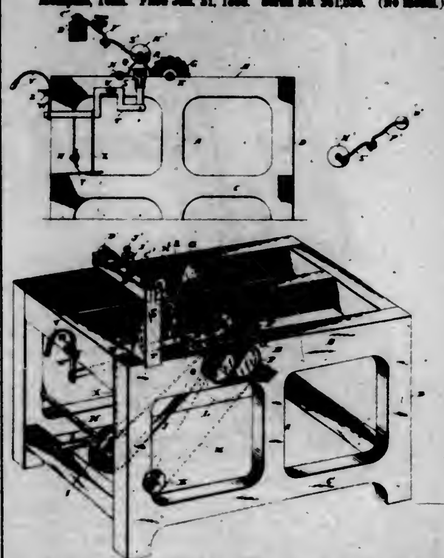
384,174. CAR-COUPLING. ROBERT M. CLEMHEAD and JOHN V. WHEELS, Schenectady, N. Y. Filed Jan. 20, 1888. Serial No. 261,342. (No model.)

Claim.—1. In a car-coupler, the combination of the draw-head having a slot in the upper portion and a horizontal link-opening located centrally therethrough, the coupling-pin consisting of the main portion or body and the head portion having two pivotal points, at one of which, forward of the main portion or body of the pin, it is pivoted to the draw-head, the rotative horizontal rod suitably journaled, the rigid arm affixed to said rod centrally, and the pivotal connection between said arm and the other pivotal point of the coupling-pin, all arranged to operate substantially as set forth.

2. In a car-coupler, the combination of the draw-head B, having the horizontal centrally-located link-opening *b* and the slot C in the upper portion of the draw-head, the coupling-pin comprising the main part *d* and the head *c*, which is pivoted at *f* to the draw-head, the rotative rod D, having the rigid arm F, and the pivotal connection H between said arm and coupling-pin, all arranged to operate substantially as shown and described.

3. In a car-coupler, the combination of the draw-head having the horizontal centrally-located link-opening *b* and the slot C, the coupling-pin having a main portion or body, *d*, and a head, *c*, said head being pivoted to the draw-head at *f*, the rotative rod D, cranked at either end and having the rigid arm F, the connecting-bar H between said arm F and the body *d* of the coupling-pin, the rod I, and the chain J, connecting said rod I with the arm F, all arranged substantially as and for the purposes described.

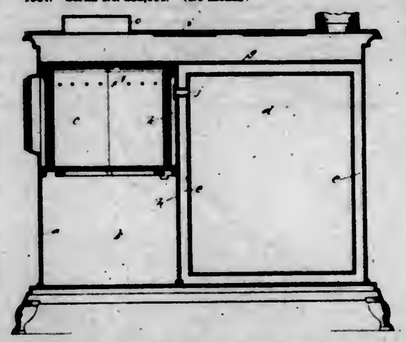
384,175. CONSTRUCTION OF TROUGHS FOR WATER-CLOSETS. WILLIAM B. FARRER, Jr., New York, N. Y. Filed Oct. 7, 1887. Serial No. 251,694. (No model.)



Claim.—1. In a water-closet, a trough formed with a series of basins located at different levels, each having curved sides and being curved upon the bottom, substantially in the manner described, so connected with each other by curved surfaces that a ridge or elevation is formed between the same.

2. In a water-closet, the combination, substantially as hereinbefore set forth, with the trough provided with a series of basins located at different levels, of a seat-board composed of a series of independent boards covering each basin, placed at different levels, and so constructed and arranged that the openings therein shall be in each case the same distance above the level of the corresponding basin in the trough.

3. In a water-closet, a trough composed of detachable sections so constructed and arranged that any number of said sections may be joined together, each section being formed into a series of basins located at different levels and curved upon the bottom, substantially in the manner described, said basins being each so connected with each other by curved surfaces that a ridge or elevation is formed between the same.

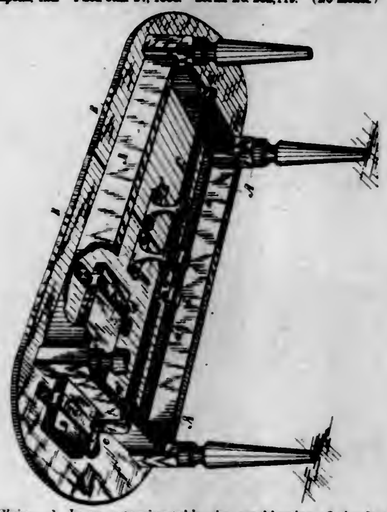


384,176. CIRCULAR SAWING MACHINE. JAMES R. RIPLEY, Memphis, Tenn. Filed Jan. 21, 1888. Serial No. 261,598. (No model.)

Claim.—1. The combination, with the main frame, saw, and saw-operating mechanism, of a presser-roll supported above the main frame by a pair of spring-arms pivotally secured to each other, in the manner and for the purposes herein set forth.

2. The combination, with a saw, means for driving the same, a feed-roller shaft having a gear, and an auxiliary shaft provided with a gear adapted to engage the gear on the feed-roller shaft, of a presser-roll supported by a pair of spring-arms, the adjacent extremities of which are pivotally secured together, and a set-screw to regulate the pressure of the presser-roll.

384,177. OVEN. ROBERT SMITH, Cambridge, Mass. Filed Apr. 7, 1887. Serial No. 233,901. (No model.)

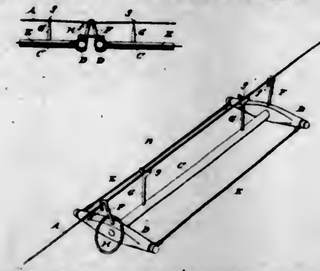


Claim.—1. A stove having a fire-box, a space, *k*, and perforations *l* in the lining thereof, an oven, a confined or dead air chamber surrounding the oven, and a tube or flue, *j*, extending through one side of said chamber and connecting the upper portion of the oven with the space *k*, whereby gases, odors, &c., from articles in the oven may escape to the fire-box.

2. In a stove or range, the combination, with the fire-box, of the bottomless casing *e*, having closed or imperforate sides located above

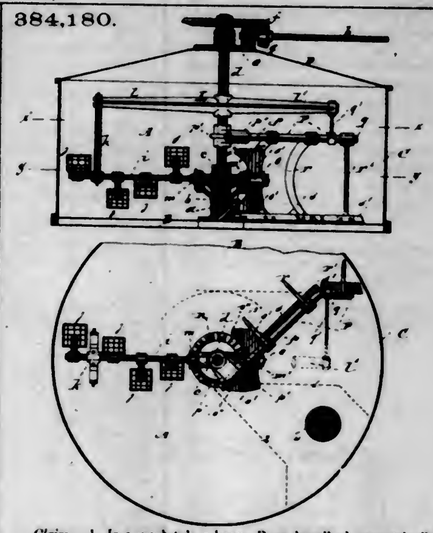
the top of the stove and coinciding with an opening therein, and provided with a horizontal perforated top higher than the top of the stove, the interior of said casing constituting a chamber above the top of the stove communicating with the fire-box and receiving air through its perforated top to be mingled with the gaseous products of combustion between the fire-box and the top of the stove, as set forth.

384,178. EXTENSION-TABLE. SYLVANUS S. SUTHERLAND, Indianapolis, Ind. Filed Jan. 27, 1888. Serial No. 262,119. (No model.)



Claim.—1. In an extension-table, the combination of the frame formed as an entire non-extensible part, the top of the table formed in two parts and arranged to slide on said frame, and the means, substantially as described, for operating said top, all substantially as set forth.

2. The combination, in a table, with the frame, of the top arranged to slide on said frame, screw-threaded parts secured to said top, and a right and left hand screw journaled in suitable bearings on said frame and arranged to engage with said screw-threaded parts, substantially as set forth.



3. The combination, with the frame A, provided with the longitudinal cleats *a* on its side pieces, of the table-top formed of two parts and arranged to slide on said frame, having clips *b*, arranged to engage with said cleats, hangers B', secured to each part of said top, provided with screw-threaded nuts on the lower ends, and the right and left hand screw C, journaled in suitable bearings on the frame and engaging with the nuts on said hangers, substantially as set forth.

384,179. CLOTHES-DRIER. EUGENE S. SUTTON, Snohomish, Wash. Filed Aug. 13, 1887. Serial No. 246,876. (No model.)

Claim.—In a device to hang out clothes to dry, the combination, with the line A, of the sections or frames B, consisting of the bars C D and wires E, the upwardly and outwardly extending rods F, provided with the hooks *f*, the rods G, provided with the forks *g*, and the detachable rings H, substantially as specified.

384,180. MASH-TUB. GUSTAV TILGNER and JULIUS C. WILCKE, Chicago, Ill.; said Wilcke assignor to said Tilgner. Filed Oct. 29, 1887. Serial No. 253,799. (No model.)

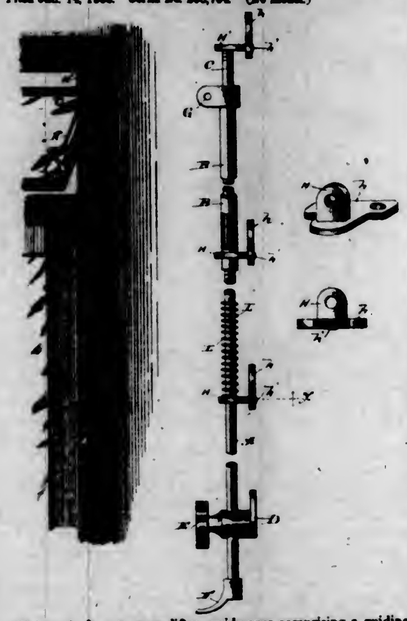
Claim.—1. In a mash-tub, a beam, P, as described, eccentrically fastened to a vertical rotary shaft, a beam, L, radially fastened to the same shaft, *d*, and said beams L and P being connected by rod *q'*, and arms *r r* and *r'*, having blades *s* and *s'* attached, running parallel to the respective parts *p* and *q* of the beam P, all combined substantially as and for the purpose specified and shown.

2. In a mash-tub, a beam, P, as described, eccentrically fastened to a vertical rotary shaft, *d*, arms *r r* and *r'*, sweeping-blades *s* and *s'*, being parallel to the respective parts *p* and *q* of beam P, and discharge-openings *u*, all combined substantially as and for the purpose specified and shown.

3. In a mash-tub, the combination of the shaft *i*, provided with stirrers, fixed pinion *m*, loose pinion *m'*, the same being rigidly attached to a screw-propeller, *o*, having wings *o'*, as described, and crown-wheel *n*, secured to a step, *a*, substantially as and for the purpose specified and shown.

4. In a mash-tub, the shafts *d* and *h*, said shaft *d* carrying sweeping-blades *s* and *s'*, bevel-wheels *f* and *g*, pillow-block *a*, casting *c*, having sockets into which are firmly secured the shaft *d* and pivot *b*, the shaft *i*, provided with stirrers and extending through an opening in said casting *c*, so as to rest with one of its ends in bearings forming parts of said casting *c*, fixed and loose pinions *m* and *m'* upon the shaft *i*, the loose one being rigidly attached to a screw-propeller, *o*, and crown-wheel *n* upon the step *a*, all combined substantially as and for the purpose specified and shown.

5. In a mash-tub, the combination of blades *s* and *s'*, when attached by means of arms *r r* and *r'* to a beam, P, and being parallel with the same, said beam eccentrically secured to a vertical rotary shaft, *d*, and stirrers attached to a horizontal rotary shaft revolving around the shaft *d* when said shaft *i* extends with one of its ends through a casting, *c*, provided with bearings for said end of the shaft *i*, the same having a fixed and a loose pinion, *m* and *m'*, and both engaging with a fixed crown-wheel, *n*, upon the shaft *a*, substantially as and for the purpose specified and shown.



384,181. COFFIN-FASTENER. WILLIAM H. TORRENS, Richmond, Ind., assignor to the J. M. Hutton & Company, same place. Filed Mar. 13, 1888. Serial No. 267,069. (No model.)

Claim.—1. The combination, with the plate A, having segmental cut-away portion I, of the shank rotatably secured in said plate and having an arm working in said cut-away portion, and provided with a handle, the slotted plate, and the spring acting on said shank, substantially as and for the purpose specified.

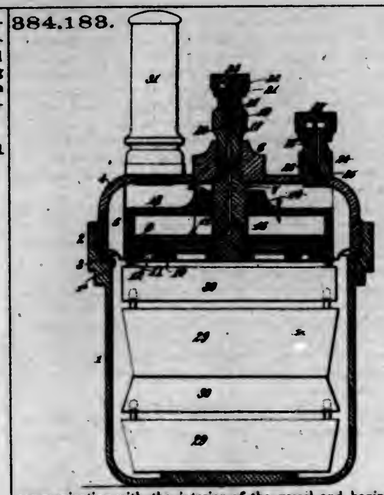
2. The combination, with the plate A, having upon one side a central boss, D, and the notched lug E, and upon the other side the segmental cut-away portion I, of the shank rotatably secured in said plate and projecting through said boss, the arm on said shank working in said cut-away portion, and the spring having one end secured in the notch of said lug and the other end secured to the shank, substantially as and for the purpose specified.

384,182. TRANSOM-LIFTER. JOHN F. WOLLENSAK, Chicago, Ill. Filed Jan. 14, 1888. Serial No. 260,764. (No model.)

Claim.—1. In a transom-lifter, guide-eyes comprising a guiding-collar and a flange pivotally connected thereto, whereby the flange is adjustable in any position in the plane of the place to which it is attached, substantially as described.

2. In a transom-lifter, the combination of a lifting-rod comprising a lower solid portion and an upper tubular portion having a bearing on a solid guide-rod fixed at the upper end, and a solid guide-rod fixed at the upper end and furnishing a bearing for the hollow lifting-rod, substantially as described.

3. In a transom-lifter, the combination of a lifting-rod comprising a lower solid portion and an upper tubular portion bearing upon a guide-rod fixed at the upper end, a guide-rod fixed at the upper end furnishing a bearing for the hollow lifting-rod, a lifting-arm, and adjustable guide-eyes, substantially as described.



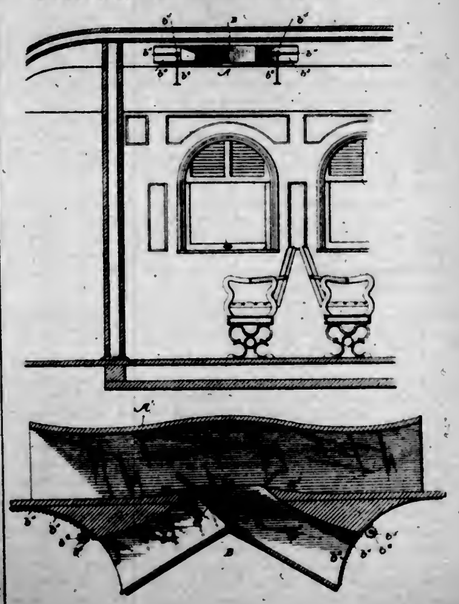
384,183. VULCANIZING APPARATUS. ALONZO B. WOODARD, Andover, assignor of one-half to Richard W. Barney, Hornellsville, N. Y. Filed Aug. 18, 1887. Serial No. 247,391. (No model.)

Claim.—1. The combination, with a vulcanizing-vessel having a rigid bar depending from its cover, of a head and a piston, one rigidly and the other movably mounted on said bar and forming a steam-tight air-chamber between the head and the piston, and an air-escape from said chamber, substantially as described.

2. The combination, with the cover of a vulcanizing-vessel having vertical concentric guides, of a central bar, a piston movable upon said bar and having a depending peripheral flange bearing on the vertical guides, a rigid head on the bar packed within the flange of the piston, and a valve closing a channel in the bar, which communicates with the space between the head and the piston and with the outer air, substantially as described.

3. The combination, in a vulcanizing-vessel, of a cover having interior concentric vertical guides and provided with a central bar depending inside the cover, and having a channel leading to a valve-chamber in a plug above the cover, of a piston moving on said bar and having a depending flange bearing on the guides, a head rigidly mounted on the bar within the flange of the piston, a spring-actuated valve in the chamber of the plug above the cover, a screw-cap adapted to bear against the stem of said valve, and an air-conducting plug

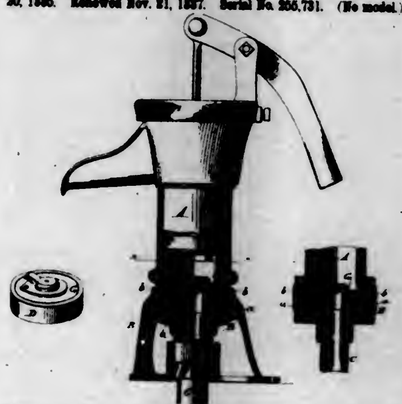
384,183.



communicating with the interior of the vessel and having a valve closed by a screw-cap, substantially as described.

4. The combination, with a vulcanizing-vessel, of a series of vertical concentric guides mounted internally upon the cover, a central bar depending therefrom, a piston moving on said bar and having a depending flange bearing on said guides, a head rigidly mounted on the bar within said flange, an air-conducting plug having a valve and communicating with the interior of the vessel, and a similar plug having a channel communicating with a channel in the bar, said plug having a valve-seat, a spring-closed valve, and a screw-cap which may be engaged with the valve-stem, substantially as described.

5. The combination, with the cover 4, having vertical guides 5 and provided with a central bar, 7, of the piston 13, having a packing and nut surrounding said bar, the head 8, having a packing, 9, the ring 10, having annular flange 11, the plug 18, having valve-chamber 19, communicating with an air-channel, 17, in the bar 7, the valve 20, and screw-cap 23, substantially as described.



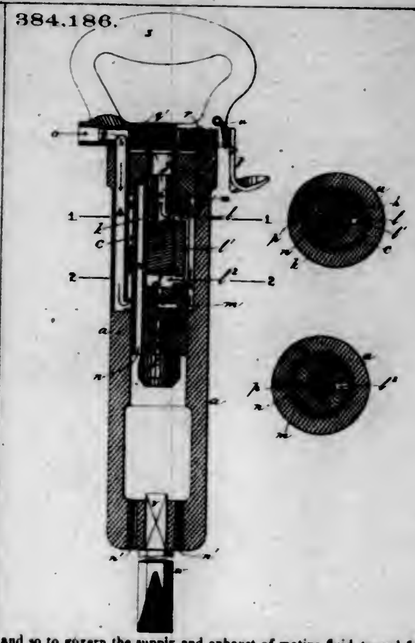
384,184. CAR-VENTILATOR. WASHINGTON WRIGHT, Clayton, N. J. Filed Dec. 12, 1887. Serial No. 257,655. (No model.)

Claim.—1. In a car-ventilator, the combination of a casing to be placed on the outside of a car and forming a continuously-extending passage, the casing having an outward swell or expansion in its exterior face to be opposite an opening in the car when the casing is in position, a casing to be placed on the inside of a car and forming a continuously-extending passage, this casing having an inward-projecting angle in its interior face to be opposite the opening in the car when this casing is in position, and opposite the expansion in the outer casing when both casings are in position, and a vane pivoted at or near the angle and protruding through the opening in the car into the outer casing, substantially as described.

2. In a car-ventilator, the combination of a casing to be placed on the outside of a car and forming a continuously-extending passage, the casing having an outward swell or expansion in its exterior face to be opposite an opening in the car when the casing is in position, a casing to be placed on the inside of a car and forming a continuously-extending passage, this casing having an inward-projecting angle in its interior face to be opposite the opening in the car when this casing is in position, and opposite the expansion in the outer casing when both casings are in position, and being provided with valves or dampers to regulate the draft, and a vane pivoted at or near the angle and protruding through the opening in the car into the outer casing, substantially as described.

384,185. **PUMP.** MILO J. ALTHOUSE, Waupun, Wis. Filed Jan 30, 1886. Renewed Nov. 21, 1887. Serial No. 255,731. (No model.)

Claim.—1. As an improvement in the construction of metallic pumps, the combination of the metallic body, the metallic base, and the intermediate wooden seat having a vertical grain, located between the two metal parts, and the bolts, whereby the latter may be forcibly seated against opposite sides of the wood.

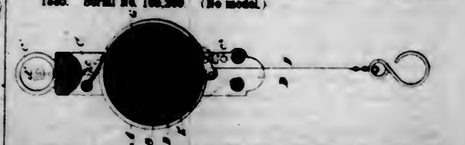


2. In a pump, the combination of metallic body and base portions provided with annular lips on their opposing faces, with the intermediate wooden seat, and the bolts or fastening devices, whereby the metallic parts are bound together and seated into the wood, substantially as described and shown.

3. The pump-base provided with the recess or pocket in its top and with a lip, *a*, therein, and the metal body provided with the lip *b*, in combination with the intermediate wooden valve-seat having its grain arranged vertically, as described and shown, whereby the wood is encircled and confined in position and the metallic parts brought into intimate contact with its upper and lower surfaces.

384,186. **DIRECT-ACTING ENGINE.** GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Dec. 16, 1887. Serial No. 258,095. (No model.)

Claim.—1. The combination of a cylinder, a piston fitting therein, a tubular piston-rod formed on or secured to said piston and provided with separate inlet and exhaust passage, a distribution-valve fitting within a chamber or cavity in said piston-rod and having a central supply-passage extending from its open end to a lateral port and annular passage adjacent to its opposite closed end, the port and passages being so arranged as to communicate alternately with the said inlet and exhaust passage of the piston-rod, an inlet-passage in the piston-rod communicating with that portion of the chamber therein beneath the distribution-valve and communicating with the inlet-passage through the piston-rod to the port and central supply-passage of the distribution-valve, and a combined inlet and exhaust passage in the piston-rod leading to and from the bottom of the chamber therein beneath the distribution-valve, the whole operated to hold and reverse the distribution-valve at the proper times, and so to govern the supply and exhaust of motive fluid to and from the piston and distribution-valve, substantially as set forth.



384,186.

2. The combination of a cylinder, a piston fitting therein, a tubular piston-rod formed on or secured to said piston and provided with a separate inlet and exhaust passage, a distribution-valve fitting within a chamber or cavity in said piston-rod and having a central supply-passage extending from its open end to a lateral port and annular passage adjacent to its opposite closed end, the port and passages being so arranged as to communicate alternately with the said inlet and exhaust passage of the piston-rod, an inlet-passage in the piston-rod communicating with that part of the chamber therein beneath the distribution-valve and communicating by a connecting inlet-passage with the inlet-passage through the piston-rod to the port and central supply-passage of the distribution-valve, a combined inlet and exhaust passage in the piston-rod leading to and from the bottom of the chamber therein beneath the distribution-valve, and an inlet-passage in the piston-rod communicating with the chamber therein above the upper shoulder of the distribution-valve when in its lowest position within the said chamber, the whole operating to positively hold and reverse the distribution-valve at the proper times, and so to govern the supply and exhaust of motive fluid to and from the piston and distribution-valve, substantially as set forth.

3. The combination, with a cylinder, a piston and rod working therein, a distribution-valve, and a regulating or controlling valve working in a casing formed diametrically through the base of the handle of the machine for governing the supply of motive fluid to the distribution-valve, of a specially-shaped lever, *l*, connected with the regulating or controlling valve and coupled by a spring with the handle used for directing and holding the machine to its work, substantially as and for the purpose described.

384,187. **SUSPENDING DEVICE.** EDWARD BLACKMAN, Brooklyn, assignor, by mesne assignments, to the Ansonia Brass and Copper Company, and Walcott A. Hull, both of New York, N. Y. Filed May 12, 1886. Serial No. 168,269. (No model.)

Claim.—1. In a suspending device, the combination of a rotary drum, a band or like device wound upon the same and passing to the lamp or other article to be suspended, a counterbalance-spring connected to and acting in conjunction with the drum, a brake extending partly around the drum and acting on said band or like device, and a guide upon said brake, over which said band or like device passes, substantially as specified.

2. The combination of a rotary drum, a band or like device wound upon the same and passing to the lamp or other article to be suspended, a counterbalance-spring connected to and acting in conjunction with the drum, a brake-strap of flexible material, as G, extending partly around the drum and acting on said band or like device, and a guide upon said brake, over which said band or like device passes, substantially as specified.

384,188. **SPRING-TOOTH FOR HARROWS.** WARREN H. BRINKERHOFF, Auburn, N. Y. Filed Jan. 4, 1888. Serial No. 259,764. (No model.)

Claim.—1. A flat spring harrow-tooth, having a narrow portion of greater hardness than adjoining portions, the said harder portion being cohesively joined to the main body of the tooth and extending from the extreme earth-engaging point toward the opposite end of the tooth, the said hardened portion being located at the point of greatest wear and forming a part of the front surface of the tooth, substantially as described.

2. A flat spring-tooth having a narrow central portion of said tooth harder than adjoining side portions, said central portion extending from the earth-engaging point toward the opposite end of said tooth and forming the central part of the front surface of the tooth, substantially as described.

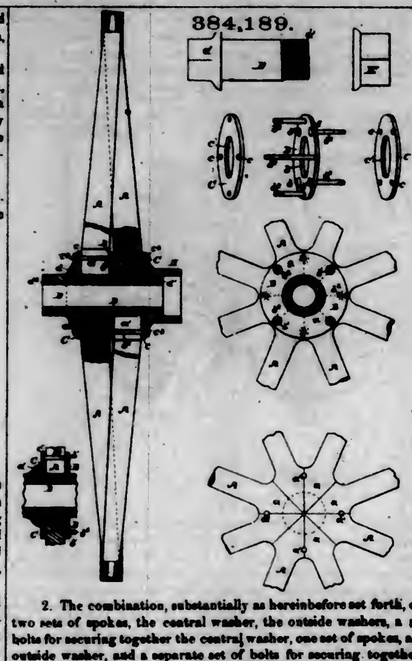
3. A flat spring harrow-tooth having its pointed end provided with a central portion harder than its side portions cohesively joined thereto, said central portion being of greater thickness than the edges, substantially as described.

4. A harrow-tooth having a portion of greater hardness than adjoining portions, said portion extending from the extreme earth-engaging point toward the opposite end of the tooth and gradually diminishing in hardness toward the edge of the tooth, substantially as described.

5. A harrow-tooth the central portion of which is harder than adjoining integral portions, said portions extending from the earth-engaging point toward the opposite end of the tooth and gradually diminishing in hardness toward the edges of the tooth, substantially as described.

6. A flat spring harrow-tooth of curved or arched form, having the front of the earth-engaging portion of the same composed of three transverse sections cohesively united in one integral body, the center portion being of greater hardness than the side portions, substantially as described.

7. As a new article of manufacture, a blade of greater width than thickness for engaging materials having a wearing action thereon, having a centrally-located harder portion, the said blade diminishing in hardness toward its edges, substantially as described.

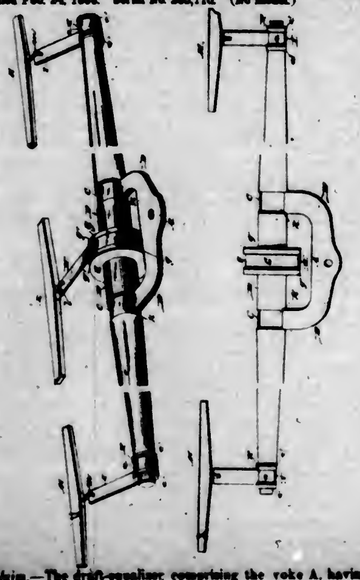


8. As a new article of manufacture, a blade of greater width than thickness for engaging materials having a wearing action thereon, and having its wearing-edge provided with a centrally-located harder portion, the said harder portion gradually diminishing in hardness toward the edges of the blade, substantially as described.

9. A harrow-tooth having the upper part of its main body doubled back upon itself, (to increase vibration and elasticity,) the lower portion of its main body terminating in a forwardly-projecting pointed end, said pointed end having a central portion harder than side portions adjacent thereto, substantially as described.

384,189. **VEHICLE-WHEEL.** GEORGE R. BAGLEY, Ringgold, Ga., assignor of two-thirds to Charles W. Gray and Fred A. Vaughan, both of same place. Filed Aug. 31, 1887. Serial No. 248,205. (No model.)

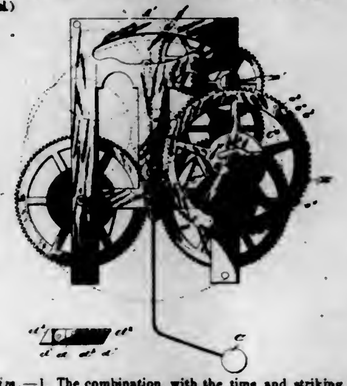
Claim.—1. The combination, substantially as hereinbefore set forth, of the two sets of spokes, a single central washer, the outside washers, the bolts for securing the outside washers to the central washer and for clamping the spokes thereto, and the axle-box that extends through the washers, having a head formed on one end that bears against one of the washers and screw-threaded at the opposite end to receive a nut that bears upon the other outside washer.



384,189.

2. The combination, substantially as hereinbefore set forth, of the two sets of spokes, the central washer, the outside washers, a set of bolts for securing together the central washer, one set of spokes, and an outside washer, and a separate set of bolts for securing together the central washer, the other set of spokes, and the other outside washer.

3. The combination, substantially as hereinbefore set forth, of the two sets of spokes, each set having their ends brought together to form the center of the wheel, a washer between the two sets of spokes, a washer on the outer side of each set of spokes, bolts extending in opposite directions from the central washer through the outside washers and through the edges of the spokes, the securing-nuts on the bolts, and the axle-box secured to the spokes and washers.



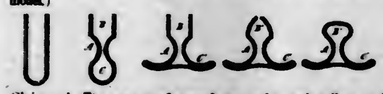
384,190. **DRAFT-EQUALIZER.** CHARLES R. BURNETT, Girard, Ill. Filed Feb. 24, 1888. Serial No. 265,110. (No model.)

Claim.—The draft-equalizer, comprising the yoke A, having the

bearing *a*, mounted on a suitable vertical bolt on the vehicle, and provided with bearings C C at the ends of its arms, the draft-bar D, having peripheral grooves K K, mounted in the said bearings and held from lateral play, and the straps, ropes, or chains wound on the said bar and having the singletrees attached thereto, as specified.

384,191. CLOCK STRIKING MECHANISM. CHARLES R. BURNHAM, White Plains, N. Y. Filed Oct. 27, 1887. Serial No. 253,543. (No model.)

Claim.—1. The combination, with the time and striking train mechanism of a clock, of a count-wheel having a series of beveled teeth intersected by flat-faced stop-teeth, the tops of which are partially beveled, and a series of pins or studs, a stop-pawl connected to the striking-train, and a pinion attached to the time-train, said pawl and pinion relatively operating to respectively stop and start the movement of the count-wheel, substantially as described.



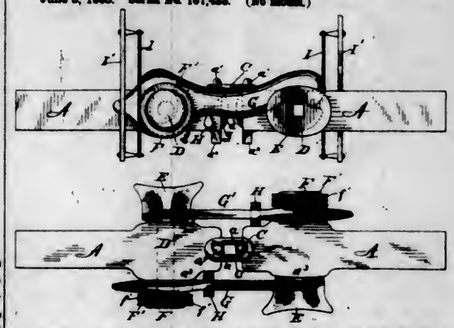
2. The combination, with the time and striking train mechanism of a clock, of a count-wheel constructed as set forth, a pinion to start the movement thereof, and a pawl to limit and stop its movement, substantially as described.

3. The combination, with the time and striking mechanisms of a clock, of the pinion having one or more movable teeth or dogs, the count-wheel constructed with teeth and pins, as set forth, and the stop-pawl, all arranged and operating as set forth.

4. The combination, with the time and striking mechanisms of a clock, of a pinion having one or more movable teeth or dogs mounted on the rear projecting end of the hand-arbor, the count-wheel having the form of teeth set forth, the bearing-stud for the count-wheel having a flange, the bifurcated spring-washer, and the stop in connection with the striking mechanism, substantially as described.

5. The combination, with the time and striking mechanisms of a clock, of a pinion having one or more movable teeth or dogs mounted on the rear projecting end of the central or hand arbor, the count-wheel having a series of teeth and studs or pins, as set forth, the teeth or dogs of said pinion engaging with the said studs or pins, and a revolving stop-pawl arranged above the count-wheel in connection with the striking mechanism, and having a projecting pin which engages with the teeth of the said count-wheel, and bearing on a portion thereof to stop the revolution of the count-wheel, substantially as described.

384,192. METHOD OF MAKING BUTTONS, &c. SHUBAEL CORTLE, New York, N. Y. Filed Dec. 9, 1887. Serial No. 257,384. (No model.)



Claim.—1. The process of manufacture of a stud, collar, or sleeve button of thin metal without an opening into its interior, and having two flanged portions and a connecting-shank, substantially as herein described, which consists in first forming a tube of metal of substantially uniform thickness and closed at one end; second, compressing and thereby reducing the diameter of said tube at about its middle portion; third, closing the opening in said tube by pressing together and into close contact the metal around the edge of the opening in said tube, substantially as described.

2. The process of manufacture of a stud, collar, or sleeve button of thin metal without an opening into its interior, and having a hollow head, a double base, and a hollow connecting-shank, which consists in first producing a tube closed at one end; second, compressing and so reducing the diameter of said tube at about its middle portion; third, flattening the closed part of said tube to form a flange of greater diameter than the uncompressed portion of said tube; fourth, closing the opening in said tube by pressing into close contact the metal around the edge of the opening in said tube, substantially as described.

3. The process of manufacture of a stud, collar, or sleeve button of thin metal without an opening into its interior, and having a hollow head, a double base, and a hollow connecting-shank, which consists in first producing a tube closed at one end; second, compressing and so reducing the diameter of said tube at about its middle portion; third, closing the opening in said tube by pressing into close contact the metal around the edge of the opening in said tube, and, fourth, flattening the portion of the tube so closed to produce a flange of greater diameter than the non-compressed part of said tube, substantially as described.

384,193. CAR-COUPLING. JOHN COUP, New York, N. Y. Filed June 3, 1886. Serial No. 167,483. (No model.)

Claim.—1. A car-coupling formed of a hook pivoted to the side of a draw-head by means of a transverse shaft and a cam hub-piece which, by its semi-rotation, is adapted to raise the said hook and throw it forward, so as to disengage it from the adjacent car when it is to be uncoupled, substantially as shown and set forth.

2. A car-coupling formed of a curved hook pivoted to the side of the draw-head on an eccentric-cam, and arranged to swing vertically and hook on to a pallet-shaped cam or coupling-block on the adjacent draw-head, substantially as shown and set forth.

3. In a car-coupling, a transverse shaft or rod passing through the draw-head and carrying on one of its ends an eccentric-cam on which is assembled the coupling-hook for connecting two cars, and on the other end of it a pallet-shaped cam for engaging the hooked end of the coupling of an adjacent car, substantially as shown and set forth.

4. In a car-coupling, a cam for actuating or moving the coupling-hook upward and forward, so as to disengage it from the coupling or draw-head of the adjacent car, substantially as shown and set forth.

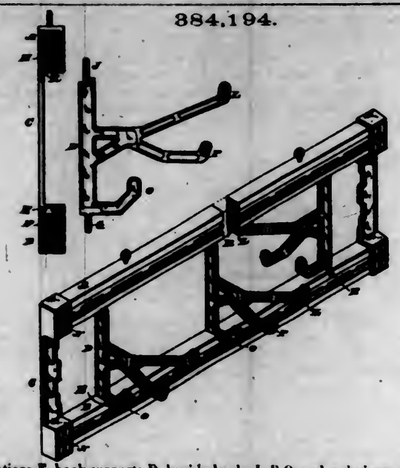
5. In a car-coupling, a cam for moving and disengaging the coupling-hook, provided with a hub circumferentially wound with a chain or cord for rotating it, so as to operate or release the coupling-hook, as desired, substantially as shown and set forth.

6. A draw-head for coupling cars, provided with a vertically-swinging coupling-hook pivoted to its side by an eccentric-cam and provided with a laterally-projecting stop, on the top of which the said coupling-hook rests, substantially as shown and set forth.

7. A car-coupling consisting of a draw-head, with a vertically-moving hook pivoted to its side by an eccentric-cam and provided with means for operating the said cam and thereby the coupling-hook by means of a system of levers and rods attached to the car and connected with the periphery of the hub of the cam by cords or chains wound circumferentially thereon, substantially as shown and set forth.

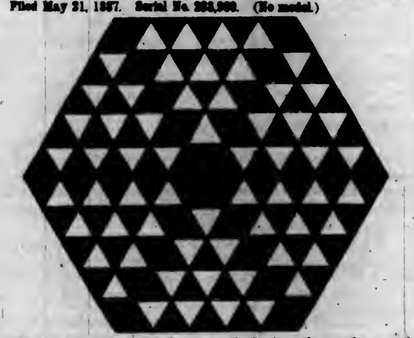
8. In a car-coupling, a coupling piece or cam in approximately pallet shape adapted to receive and hold the hooked end of a coupling-hook pivoted to the side of the draw-head of an adjacent car, substantially as shown and set forth.

9. A stop or guide-rest and a cam-shaped or sloping seat to engage thereon, applied, respectively, to either the coupling-hook or to the side of the draw-head, so as to cause the free end of the coupling-hook to move into position to couple or uncouple accordingly as it is thrown forward or backward by the actuating-cam, substantially as shown and set forth.



384,194. CLOTHES-RACK. JOHN DANNER, Canton, Ohio, assignor to the John Danner Manufacturing Company, same place. Filed Jan. 13, 1888. Serial No. 260,637. (No model.)

Claim.—1. As a new article of manufacture, a clothes-rack consisting, essentially, of the bar A, having a downwardly-projected flange, K, and perforations H, bar B, having transverse groove E and perforations F, hook-supports D, having hooks L P O, and end pieces, C, for securing the bars A and B to each other at the proper distance apart, when combined and arranged substantially as shown and described, and for the purpose set forth.



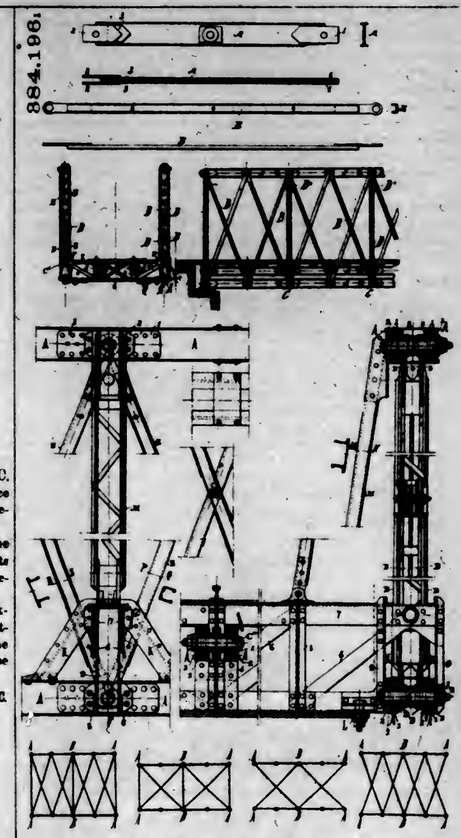
2. The combination, in a clothes-rack, of the bars A and B, the said bar B having cross-grooves E and perforations F, hook-supports D, having end pivots, G and J, and hooks L P O, substantially as described, and for the purpose set forth.

3. The combination, in a clothes-rack, of bars A and B, hook-support D, pivotally secured thereto, and end pieces, C, having outwardly-projecting sockets M, to embrace and cover the ends of the said bars, substantially as shown and described, and for the purpose set forth.

384,194.

384,195. GAME-BOARD. CHARLES R. DURYEA, Washington, D. C. Filed May 21, 1887. Serial No. 238,980. (No model.)

Claim.—1. A game-board composed of triangular sections, each divided into similar smaller sections, of which those are colored whose sides are parallel with the sides of the inclosing section.



2. A game-board having the form of any regular plane figure and composed of triangular sections, each divided into similar smaller sections, of which those are colored whose sides are parallel with the sides of the inclosing section.

3. A game-board composed of triangles, each divided into smaller triangles, of which those are colored whose sides are parallel with the corresponding sides of the inclosing triangle, and which are so placed that along the lines of junction between the large triangles the smaller colored triangles will lie with their bases abutting the bases of similar-colored triangles in the adjoining large triangles.

4. A game-board having the form of a regular hexagon and composed of six equilateral triangles, each divided into smaller triangles, of which those are colored whose sides are parallel with the corresponding sides of the inclosing triangle.

384,196. METALLIC BRIDGE. MARIUS LÉONARD RODOLPHE DUVAL, Paris, France, assignor to the Compagnie de Fives-Lille, same place. Filed Feb. 6, 1888. Serial No. 263,413. (No model.) Patented in France Mar. 26, 1885, No. 167,570.

384,196.

Claim.—1. A trussed girder of variable height comprising, in combination with diagonals adapted to be more or less inclined, so as to vary the height, a chord or chords provided with holes for the connection of the diagonals and with other spaced holes, so that said diagonals can be connected therewith at different inclinations, substantially as described.

2. A chord or stringer composed of one or more lines of similar-flanged elements, each provided at the ends with forked jaws differently spaced at the two ends and connected together with the jaws intermeshed, substantially as described.

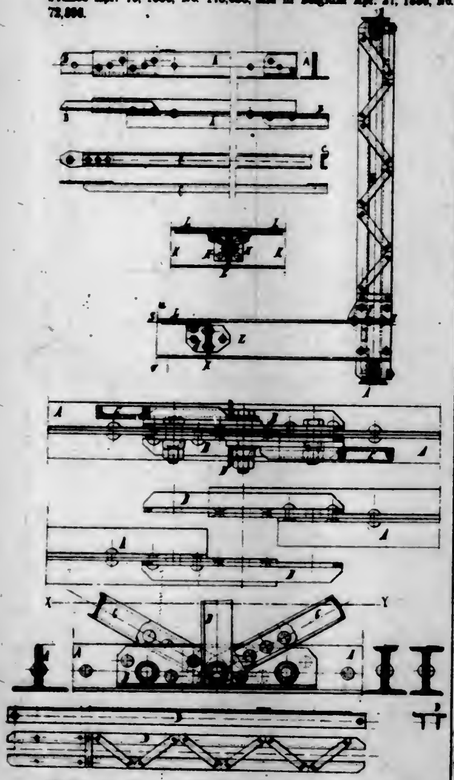
3. In a trussed girder, and in combination with the lattice bars or diagonals, the chord or chords composed of separate sections or elements, and provided with holes in the ends for coupling-pins for connecting the ends of the chord elements and the ends of the diagonals, and provided with other spaced holes additional to those required for the connections aforesaid, whereby the height of the girder can be varied by inclining the diagonals more or less and connecting them with the chord elements by means of such additional holes, substantially as described.

4. A trussed girder of variable height having vertical posts provided with extension-pieces for increasing the length by addition to the main portion thereof, substantially as described.

5. A trussed girder of variable height having vertical posts formed of two channel-irons symmetrically arranged with reference to the vertical axis of the girder and connected with the chords by the coupling-pins which unite together the elements of the said chords, said posts being of variable length between the chords, substantially as described.

6. In a trussed metallic bridge and in combination, the principal girder, skeleton cross-girders connected with the principal girders by a single horizontal pin at each end and stayed to prevent turning on said pins, substantially as described.

7. The skeleton cross-girders with double walls, in combination with the vertical posts of the principal girders embraced by the ends of said walls and secured thereto by a single pin at each end, and the



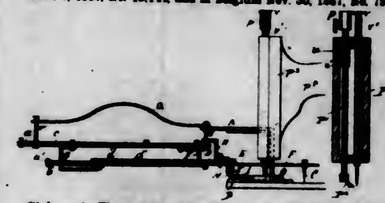
coupling-pins in the chords of the said principal girders, the lower part of the said cross-girders being connected with the heads of the last-mentioned coupling-pins, substantially as described.

8. In combination with the cross-girders, the stringers composed of elements united to each other and to the said cross-girders by a pin at each joint, substantially as described.

9. In a truss or bridge, the combination, with the cross-girders and the lattice or skeleton web of the principal girders, of the upper and lower chords and the stringers, each composed of one or more lines of elements the same for all, joined together, substantially as described.

10. The combination of chord and lattice elements, the cross-girders, the elements of the stringers, and the coupling-pins, the said chord elements having intermediate holes to receive said pins when necessary to vary the height of the principal girders, and the elements of the lattice being adjustable, substantially as described

384,197. METALLIC BRIDGE. MARTIN LEONARD RENOUD DUVAL, Paris, France, assignor to the Compagnie de Five-Lille, same place. Filed Feb. 2, 1888. Serial No. 263,419. (No model.) Patented in France Apr. 19, 1886, No. 175,693, and in Belgium Apr. 27, 1886, No. 72,896.

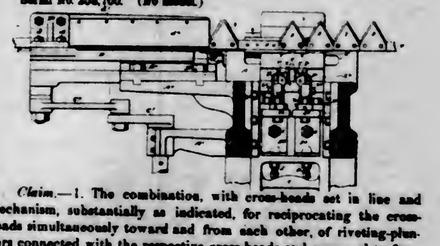


Claim.—1. In a trussed girder, the chord elements, each composed of irons secured together so that one projects beyond the other at each end, and connecting-irons projecting beyond the longer branch of the element, thus forming stepped projections, the ends of adjacent chord elements being overlapped and secured together, substantially as described.

2. The double posts constituted by two angle-bars turned back to back, connected by cross-pieces and spaced, in combination with a chord, lattice-bars or diagonals lapped on the web of said chord, and pins—one at each end of the posts—connecting them with the said chord and said lattice-bars or diagonals, substantially as described.

3. In a truss or bridge, and in combination with the principal girders having vertical posts, the cross-girders of I-iron having the flanges on one side removed and fitted against the sides of said posts, and the angle-pieces between the tops of the cross-girders and the sides of said posts, substantially as described.

4. In a truss or bridge, and in combination with the principal girders, the cross-girders and the stringers, the horizontal diagonals attached to said stringers and said cross-girders by the triple or three-sided angle-pieces, substantially as described.



384,198. EMBROIDERING ATTACHMENT FOR SEWING-MACHINES. EDUARD FRANKENBERG, Hanover, Prussia, Germany. Filed Nov. 29, 1887. Serial No. 256,394. (No model.) Patented in England Nov. 7, 1887, No. 15,144, and in Belgium Nov. 30, 1887, No. 79,498.

Claim.—1. The combination of an embroidering-frame provided with an eye, a pantograph provided with a vertical arm, and an angular connecting-bar horizontally adjustable in said eye and vertically adjustable on said arm, substantially as described.

2. The combination of an embroidering-frame, a detachable clamp provided with thumb-screws for attachment to said frame and with an eye, a pantograph provided with a vertical arm, an angular connecting-bar comprising a horizontal arm adjustable in said eye and a slotted vertical arm vertically adjustable on said arm of the pantograph, a set-screw in said eye for clamping said bar, and screws for uniting said vertical arms, substantially as described.

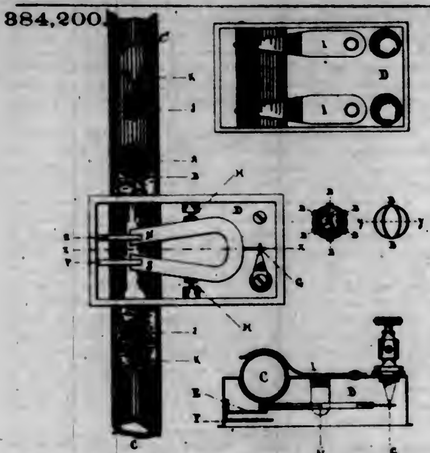
384,199. RIVETING-MACHINE. JOHN B. FREEZ, Akron, Ohio, assignor of one-half to C. B. Sheldon, same place. Filed Dec. 22, 1887. Serial No. 258,700. (No model.)

Claim.—1. The combination, with cross-heads set in line and mechanism, substantially as indicated, for reciprocating the cross-heads simultaneously toward and from each other, of riveting-plungers connected with the respective cross-heads and arranged to form opposing pairs for upsetting the ends of each of the rivets at one operation, substantially as set forth.

2. The combination, with cross-heads having riveting-plungers attached, substantially as indicated, of a push-bar operating at right angles to the movement of the riveting-plungers, and mechanism, substantially as indicated, for reciprocating the push-bar to feed successive sections and move the section-bar between the plungers in position for riveting, substantially as set forth.

3. The combination, with cross-heads and riveting-plungers attached, a push-bar, and mechanism for operating the same, substantially as indicated, of a holder for the sections, said holder having a movable head adapted to move the sections toward the section-bar, substantially as set forth.

4. The combination, with feed-roll having groove for feeding two wires and reciprocating cross-head, the latter having dies attached for severing the wires as they are fed by the rollers, of riveting-plunger for upsetting the rivets formed by the severing-dies, substantially as set forth.

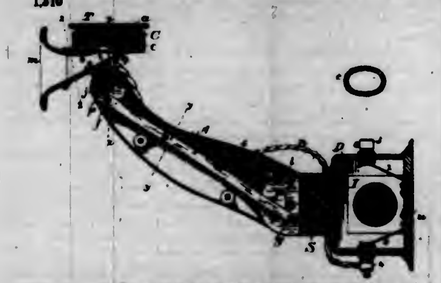


5. The combination, with feed-roller and reciprocating cutting-dies, substantially as indicated, of projecting lip and opposing springs connected with each die adjacent the cutting-surface thereof, and arranged, substantially as indicated, for holding the rivets in place on the cutting-dies, substantially as set forth.

6. The combination of riveting device, mechanism for feeding the sections and section-bar, feed-rolls for feeding the wires, and cutting-dies for cutting the wire into rivets and carrying the rivets into position for riveting, the parts being timed to co-operate with each other, substantially as set forth.

384,200. MAGNETO-ELECTRIC LIQUID-LEVEL INDICATOR. JOHN J. GUNDAR, Newark, N. J. Filed Sept. 5, 1887. Serial No. 248,791. (No model.)

Claim.—1. In magnetic circuit-controllers for liquid-level indicators, a movable permanent magnet whose motion in one direction is limited by a non-magnetic stop and in the opposite direction by an electric contact-point, substantially as described.



2. A magnetic circuit-controller consisting of a pivoted permanent magnet in a casing of non-magnetic material, and provided with a non-magnetic back-stop and a magnetic attractor for holding the magnet in a normal position against said stop, substantially as described.

3. A float for magneto-electric liquid-level indicators, consisting of a hollow glass ball having magnetic material on its outside, substantially as and for the purpose set forth.

4. In a liquid-level indicator, the combination of the tube of non-magnetic material, C, the magnetically-surrounded glass float A, with the grooved casing of non-magnetic material, D, containing the pivoted magnet N S, the non-magnetic stop E, the magnetic attractor F, and the electric contact-points G, all arranged substantially as described, and for the purpose set forth.

384,201. TELEPHONE-TRANSMITTER. ELISHA T. GILLILAND, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed Sept. 19, 1885. Serial No. 177,869. (No model.) Patented in Belgium Jan. 27, 1886, No. 71,772, and in England Jan. 29, 1886, No. 1,910.

Claim.—1. The combination of a telephone-transmitter, a hollow arm pivoted to said transmitter and to a fixed support, and a rigid bar inclosed in said hollow arm and pivoted at one end to said transmitter and at the other to said support, substantially as described.

2. A telephone-transmitter having a fixed horizontal diaphragm upon which the current-varying medium rests, a downwardly-projecting tube or passage through which the sound-waves are directed upon the diaphragm, combined with a hinged arm, upon the free end of which the transmitter is pivoted, and a mechanical connection between the transmitter and a fixed support whereby the movement of the transmitter to vary its distance from a fixed point automatically turns the transmitter upon its pivot, so as to keep the diaphragm always in a horizontal position, substantially as described.

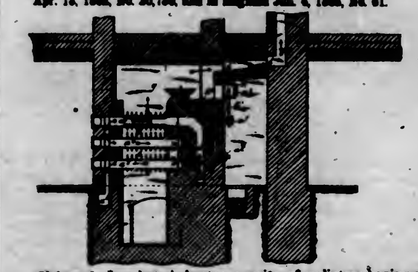
3. The combination, with a telephone containing a body of mobile material, of a vertically-swinging arm upon which said telephone is mounted, and means for maintaining said telephone in a horizontal position as the arm is swung up and down, substantially as set forth.

4. The combination, with a telephone containing a body of mobile material, such as finely-divided carbon particles, constituting the current-varying medium, of a vertically-swinging arm upon which said telephone is mounted, and means for maintaining said telephone in a horizontal position as the arm is swung up and down, substantially as described.

384,202. WATER-HEATER. DAVID GROVE, Berlin, Germany. Filed Nov. 16, 1886. Serial No. 152,060. (No model.) Patented in Germany Apr. 18, 1882, No. 20,720, and in England Jan. 4, 1883, No. 61.

Claim.—1. In a heating apparatus, a heating-chamber, water-coils located within said chamber, a gas-flue leading from a suitable generator to a canal within said heater, a burner provided at the upper part of said canal, and an air-duct opening above said burner for supplying air for the combustion of the gases, with an exit or chimney for the products of combustion, substantially as described.

2. In a heating apparatus, a heating-chamber, coils for containing the water to be heated arranged within said chamber, a canal or duct within said chamber in connection with a suitable gas generator or reservoir, a burner at the termination of said canal, air-passages arranged within said heating-chamber, and openings from said air-passages into the chamber above the burner, with an exit to the chimney for the products of combustion, substantially as described.



3. In a heating apparatus, a heating-chamber, water-coils in said chamber, and a gas-canal in the center of said chamber, terminating in a burner and in connection with a suitable gas reservoir or generator, with air-passages arranged between said canal and the water-coils, said passages being in connection with each other, with an inlet-opening to the bottom one, and with an outlet from the upper one above the burner, with an exit or chimney for the products of combustion, substantially as described.

4. The combination of the gas-chambers r^4, the canals or flues $r r'$, and the burner b with the coils s and canals or flues s^1 s^2 s^3 s^4, substantially as described and shown.

5. In a heating apparatus, a heating-chamber, water-coils arranged therein, a canal or duct for the gas or other heating medium, said canal terminating in a burner, and a valve arranged within said canal in proximity to the burner, with devices for regulating the same, substantially as described.

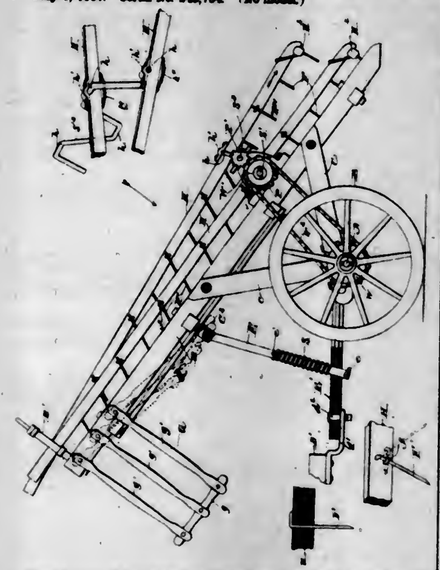
6. The combination of the rod or shaft w' with the shaft or axle w^2 and the cams or tappets w^3, and the burner b, substantially as described and shown.

384,203. AIR-HEATER. DAVID GROVE, Berlin, Germany. Filed Dec. 21, 1886. Serial No. 182,269. (No model.) Patented in Germany Apr. 18, 1882, No. 20,720, and in England Jan. 4, 1883, No. 61.

Claim.—1. In a hot-air heater, a series of radiators having passages connected for the products of combustion to pass through, and in connection with a suitable chimney, said flues being arranged within a heating-chamber, a combustion-chamber in connection with one of said flues, a gas-supply for said combustion-chamber, and a burner therein, and air-ducts for supplying air thereto, suitable inlet-pipes to the heating-chamber for the cold air, and outlet-pipes therefrom to the apartments to be heated, combined with a water-receptacle contained in said chamber, substantially as described.

2. A hot-air heater having a combustion-chamber supplied with fuel from a suitable source, a contracted opening forming a burner for the combustion of the fuel, and a series of air-ducts arranged upon either side of the combustion-chamber for supplying air to promote combustion, the air-ducts of each series being in connection with each other, to form circuitous passages, and one of said ducts of each series being in connection with the outside air, substantially as described.

3. In combination, the combustion-chamber and the gas-duct leading into the same, said chamber having a contracted opening serving as a burner formed by two jaws, one of which is adjustable to increase or diminish the size of the opening, substantially as described.



4. An air-heater having a heating-chamber with radiating-tubes therein, a combustion-chamber and a gas-supply duct and an air-supply duct to furnish gas and air to create combustion, and a contracted opening acting as a burner between the gas-supply duct and the combustion-chamber, said opening being formed by two jaws, one of which is adapted to slide, and is provided with rollers and operating-rods, substantially as described.

384,204. NUT-LOCK. JOHAN A. HARD, Denver, Colo., assignor of one-half to Henry L. Prentice, same place. Filed Aug. 27, 1887. Serial No. 247,902. (No model.)

Claim.—A nut-lock composed of the metallic plate A, having projections *b* and *g* formed integral therewith, and provided with the V-shaped spring-arm C, having outer looped end, *c*, substantially as and for the purpose specified.

384,205. HAY-LOADER. CHARLES A. HENRY, Monticello, assignor to William A. Overing and Adam Reichart, Sandy Spring, Iowa. Filed July 8, 1887. Serial No. 243,734. (No model.)

Claim.—1. In combination with the loader-frame D, having its side bars only extended beyond the same at the upper end, the guide-frame H', supported by the extended portions of the side bars, said guide-frame consisting of two parallel horizontal bars and the bolts connecting the said bars, and arranged in pairs so as to form retaining-guides A^3, and the rake-bars H, having their upper ends working through the guides, as set forth.

2. In combination with the loader-frame, the guide-frame H', supported at the upper end thereof, and comprising two parallel bars connected by bolts, which are arranged in pairs, so as to form retaining-guides, and the rake-bars H, working between the bolts, as set forth.

3. In combination with the loader-frame, the folding guard-frame G, consisting of a series of bars which are pivotally attached at their upper ends to the sides of the loader-frame, so as to fold up against the sides of the latter or to open outward and downward therefrom into an operative position, as set forth.

4. In combination with the loader-frame, the folding guard-frame G, pivotally attached at its upper ends to the upper ends of the loader-frame, and consisting of the strips *g'* and cross-strips *g*, the said strips being pivoted together at their meeting points, so that the entire frame can be folded into a small compass against the side of the loader-frame, as set forth.

5. In combination with the vibratory rake-bars H, the feeding-fingers F', having their ends turned at an angle and passed into the bars, whereby the angle ends of the fingers form trunnions therefor, by means of which the fingers can be swung around and thus adjusted into any inclined position, and a staple encircling the fingers and passed into the rake-bars to lock the fingers into the desired position, as set forth.

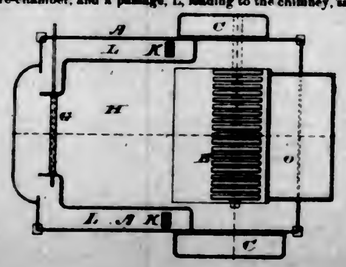
6. In combination with the rake-bars of a hay-loader, the crank-shaft connected to the same, and the shield-plates A^4, fitted to the under side of the rake-bars at the points where the crank-shaft is attached to prevent the hay from winding on said shaft, as set forth.

7. In combination with the stationary bed of the frame, having the diagonally-crossed beams C', the casting C^3, secured to said beams at their point of crossing the upright E, the lower portion of which is encircled by a coiled spring, S, one end of the spring bearing against the upright and the other end against the tongue-hound, said tongue-hound E' having a slot therein through which the lower end of the upright passes and has movement, substantially as described.

8. In combination with the loader-frame, the guide-frame H', secured to the ends of the frame above, beyond, and forward of the bed, said guide-frame being composed of parallel bars connected together by bolts which are arranged in pairs, so as to form retaining-guides, the rake-bars H, working between the bolts, and the folding frame G, composed of a series of bars which are pivotally attached to the side bars, as set forth.

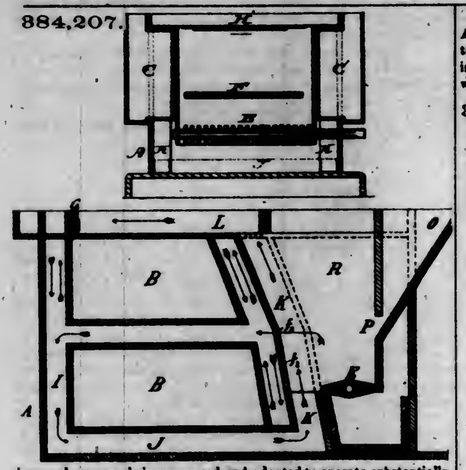
384,206. BOLT-LOCK. WILLIAM A. JORDAN, New Orleans, La. Filed Dec. 27, 1887. Serial No. 259,178. (No model.)

Claim.—1. A bolt having a shank provided with enlarged flattened inner and outer portions, the enlargement at the outer end having a screw-thread thereon to receive a nut, substantially as and for the purpose set forth.



2. A bolt having a shank provided with an enlarged flattened outer end, and shoulders at the inner terminus of the said enlargement, in combination with a washer having a slot therein eccentric to its diameter, whereby the aforesaid shoulders of the bolt are automatically engaged, substantially as described, and for the purpose set forth.

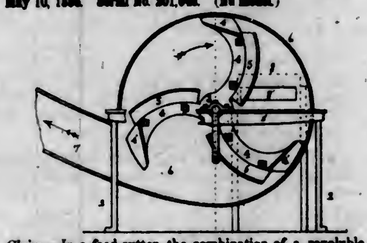
3. The combination of a bolt having a shank provided with enlarged flattened inner and outer portions, the latter having a screw-thread thereon, a washer provided with a slot adapted to slip over the end of the bolt and engage the shoulders at the inner end of its outer enlarged portion, and a screw-nut to fit the threaded end of the bolt, substantially as and for the purpose set forth.



4. In combination with the perforated ends of railroad-rails and the fish-plates adapted to connect same, the bolts E, each having a shank provided with an enlarged flattened inner and outer portion, the washers *m* and *o*, slotted as described, and the screw-nut K, adapted to fit a screw-thread on the outer end of the bolt, substantially as described, and for the purpose specified.

384,207. SELF-FEEDING COOKING-STOVE. CHARLES E. KIDD, Newark, N. J. Filed Feb. 21, 1887. Serial No. 228,315. (No model.)

Claim.—1. The improved cooking-stove herein described, combining therein a fire-chamber, R, ovens B B, a passage, F, between said ovens, a flue, *f'*, formed in the wall f^2 in line with passage F, leading into the passage F, and passages I J, leading below the lower oven, an upward passage, K, leading from the passage J and lying adjacent to the fire-chamber, and a passage, L, leading to the chimney, said cham-



384,207.

bers and passages being arranged and adapted to operate substantially as and for the purposes set forth.

2. The improved cooking-stove combining therein a fire box or chamber, ovens B B, with passage F between, a flue, *f'*, formed in the wall f^2 in line with passage F, leading into said passage F, passages I J, and lateral tubes or passages K, adjacent to the fire-box, passage L to the chimney or smoke-pipe, an upper passage, H, over the upper oven, and a damper, G, said parts being arranged and adapted to operate substantially as set forth.

384,208. FEED-CUTTER. ORTON C. LITTLE, Menasha, Wis. Filed May 10, 1886. Serial No. 201,643. (No model.)

Claim.—In a feed-cutter, the combination of a revoluble spider having the curved arms 4, and curved knives 5, secured upon the outer curve of the arms, said arms being thin the length of the knives in a direction transverse to their plane of rotation, and having their outer extremities extending beyond the knives and enlarged in the aforesaid direction and forming the fan-wings 4', surrounding said spider, with the circular case 6, having the opening 8' in its side and the elevating discharge-spout 7 in its circumference, all arranged and operating substantially as described.

384,209. DADO-CUTTER. JONATHAN R. MERRIAM, Grand Rapids, Mich., assignor, by direct and mesne assignments, to William R. Fox, same place. Filed May 27, 1886. Serial No. 203,493. (No model.)

Claim.—1. In a dado-cutter, the combination of the outer saws, A and B, arranged a parallel distance apart, with a wabble-saw, C, intermediate of the saws A B and arranged at an angle thereto within the space between them, substantially as described.

2. In a dado-cutter, the combination of the outer saws, A B, arranged a parallel distance apart, with a wabble-saw, C, arranged in the space between the saws A B at an angle to said saws, the collars D, for supporting the saws, and fastening means, as E, substantially as described.

3. In a reversing dado-cutter, the combination of the wabble-saw C with the side saws, A and B, each side saw having a segment cut away, so as to permit the overlapping of the saw C, substantially as shown and described.

4. In a dado-cutter, the combination of the outer parallel saws, A B, a wabble-saw arranged at an angle to the outer saws and between the same, with the collars D, having outer parallel faces and inner inclined faces arranged to clamp the saw C between them, and with means for securing the parts together, substantially as described.

384,210. STEP-LADDER. JOHN T. MILLER, Chicago, Ill. Filed Oct. 1, 1887. Serial No. 251,265. (No model.)

Claim.—1. A hinge for step-ladders, consisting of an inverted-U-shaped saddle clip or bracket, C, adapted to be secured by its horizontal plate or member to the top step, D, and by its vertical plates or members to the side bars, A, and rear support, B, in the manner and for the purpose set forth.

2. The combination, with a folding step-ladder, of a supplementary support or legs, E, of a less length than the main support B, and adapted to fold out of the way when not in use in a radial plane parallel with the main support, essentially as herein described.

3. A step-ladder having a shelf or bucket support, C, hinged immediately beneath the top step and near the front edge of same, in combination with the turn-buttons or hooks *g*, essentially as and for the purpose set forth.

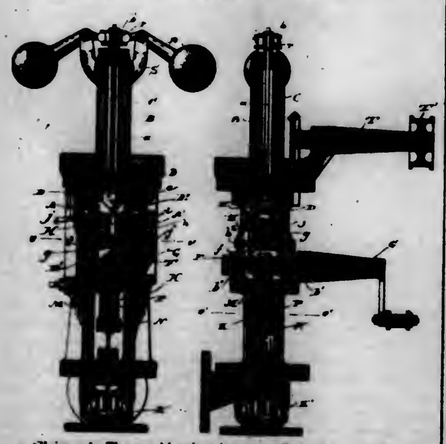
384,211. METHOD OF SEWING BOOKS. WILLIAM W. NEIL, Philadelphia, Pa., assignor to William F. Murphy's Sons, same place. Filed May 24, 1887. Serial No. 239,209. (No model.)

Claim.—1. The method of sewing signatures, consisting in passing the thread in at the back of the signature, then carrying the thread along the interior thereof, and then passing it out to the back, returning it to the interior at a point on the back beyond its point of exit, thus forming a loop on the back of the signature, then carrying the thread along the interior of the signature, and then passing it out through the back of the said signature and into the back of the next signature, then along the interior thereof, and then out, interlocking it with the loop on the first signature, then into the back of the said second signature in such a manner as to form a loop on the back thereof, then carrying it along the interior of the second signature, and then out, and after knotting the thread with the thread at the adjacent end of the first signature passing it into the back of the third signature, then forming a loop on the back thereof interlocking with the loop on the back of the first signature, substantially as described.

2. The method of sewing signatures, consisting in passing the thread in at the back of the signature near one end thereof, then carrying the thread along the interior of the signature toward the center, passing the thread out to the back and returning it at a point on the

back beyond the point of exit, thus forming a loop on the back of the signature, then carrying the thread along the interior of the signature and passing it out near the other end, then passing the thread into the interior of the next signature and along the same, then out and interlocking it with the loop on the first signature, then into the second signature in such a manner as to form a loop on the back thereof, and then passed out, and, after knotting it with the thread at the adjacent end of the first signature, into a third signature, forming a loop on the back thereof in a similar manner, interlocking with the loop of the first signature, then forming looms in a similar manner on the backs of other signatures, the loop of each signature interlocking with those of the last two signatures, and the threads at the ends of each signature being knotted with the threads of the adjacent ends of the previous signatures, substantially as described.

384,212. FIRE-BUCKET LOW-WATER ALARM. JOHN NOLAN, Philadelphia, Pa., assignor to the Automatic Electric Alarm Company, Camden, N. J. Filed Oct. 28, 1887. Serial No. 253,563. (No model.)

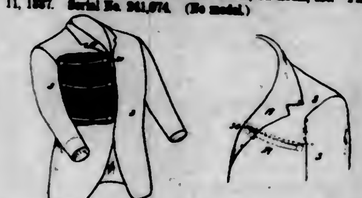


Claim.—1. The combination, with a rigid bracket or bail-support, the guide-bar, and a normally-broken electric circuit connected therewith, of the float, the elastic rod extending therefrom and passing through said guide-bar, the contact-piece attached thereto, and the alarm-bell in said broken circuit, substantially as described.

2. In a fire-bucket low-water alarm, the combination, with the rigid bracket or bail-support, the guide-bar below said bracket, a normally-broken electric circuit connected therewith, and an alarm in said broken circuit, of a float, a rod extending therefrom and passing through said guide-bar, and an adjustable contact-piece on said rod, substantially as described.

3. In a fire-bucket low-water alarm, the combination, with a rigid bucket-support, of a broken circuit having two stationary contact-points in close relation to each other and to the bucket-support, a float, a movable contact-piece adapted to engage said contact-points, a connection between said float and said movable contact-piece, and a guide for said connection, substantially as described.

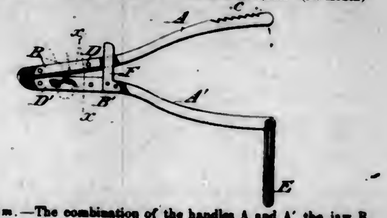
384,213. CUT-OFF FOR STEAM-ENGINES. BRUNO V. NORDBERG, Milwaukee, Wis., assignor to the Bruno Nordberg Company, same place. Filed Dec. 20, 1887. Serial No. 258,463. (No model.)



Claim.—1. The combination, in a cut-off for steam-engines, of a tripping-head connected with the governor-arms, a lifting trip-lever toggled to a rock-shaft that is operated by the eccentric of the engine, and a valve-hanger having a pin for engagement with a notch on the lifting trip-lever, as set forth.

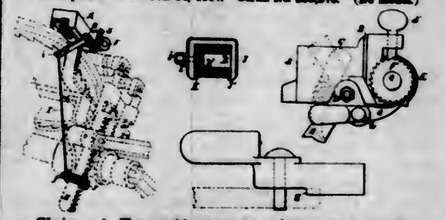
2. The combination, with the lifting trip-lever and the trip-head and operating mechanism, of the valve-hanger and its engaging-pin and a spring for forcing the lifting trip-lever into engagement with the engaging-pin, substantially as described.

3. The combination, with the valve-hanger and its engaging-pin, of the jacket, the rock-shaft and lifting trip-lever toggled to the rock-shaft, and the spring for forcing the lifting trip-lever into engagement with the pin of the valve-hanger, as set forth.



384,214. COAT. WILLIAM H. CRESS, St. Louis, Mo. Filed June 11, 1887. Serial No. 241,074. (No model.)

Claim.—1. A coat or like garment provided at its front breadths with a metallic or suitable water-proof stiffening-brace having its ends transversely thickened, and secured between the arm and front edge of the garment, substantially as described.

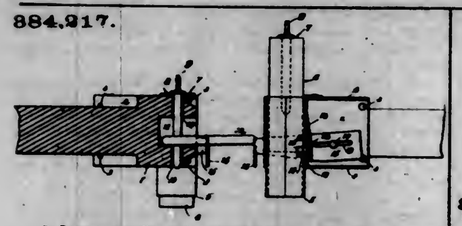


2. A coat or like garment provided at its front with a metallic or suitable water-proof stiffening-brace having its outer end curved to fit the lapel-fold, and secured between the arm and front edge of the garment, substantially as described.

384,215. CASTRATING-INSTRUMENT. JAMES PHILLIPS, Washington, Iowa. Filed Nov. 28, 1887. Serial No. 256,344. (No model.)

Claim.—The combination of the handles A and A', the jaw B, having tongue *b*, the jaw B', having groove *a*, the plates D and D', secured to the jaws and having cutting-edges, and the bar F, all arranged to operate substantially as specified and shown.

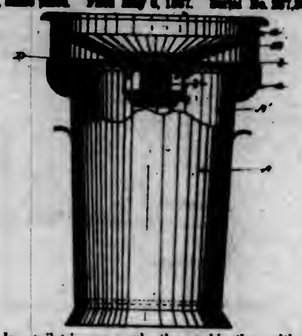
384,216. INK-FOUNTAIN FOR PLATEN PRINTING-PRESSES. WILLIAM H. PRIOR, Jr., Cleveland, Ohio, assignor to Chandler & Price, same place. Filed Oct. 24, 1887. Serial No. 253,272. (No model.)



Claim.—1. The combination, with ink-fountain, feed-roll, and ratchet-wheel, substantially as indicated, of bell-crank lever pivoted to the fountain, and push-pawl pivoted to the lever in position to engage the ratchet-wheel, said pawl having an offset and shoulder adapted to engage either side of the lever, substantially as set forth.

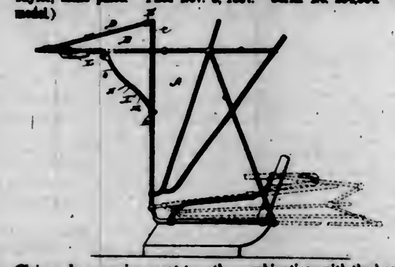
2. The combination, with ink-fountain and attachments, substantially as indicated, of clamp J and link L, for actuating the fountain from the movement of the inking-roller frame, said clamp being adapted to embrace three sides of such inking-roller frame, and a set-screw for fastening the clamp, such set-screw serving also as a pivotal connection for the link, substantially as set forth.

384,217. CAR-COUPLING. WILLIAM G. RUTLEDGE, Galveston, Tex. Filed Dec. 28, 1887. Serial No. 259,313. (No model.)



Claim.—1. In a car-coupling, a vertical movable U-shaped frame mounted in guides on a draw-head and adapted to support a coupling-pin, a horizontal movable U-shaped piece mounted in supports on the draw-head and extending across the lower edge of link-recess in draw-head, and spring-catches on the draw-head adapted to engage the coupling-pin frame and to be thrown out of engagement by the horizontal U-shaped piece, substantially as shown and described.

384,217.

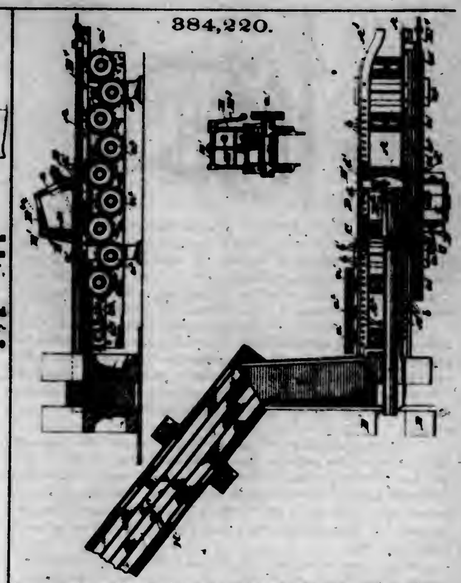


2. In a car-coupling, a draw-head, 1, having casings 2, with guides 5, having notches 15*, and spring-catches 13, U-shaped coupling-pin frame, sliding U-shaped piece 16, having slots 18, engaging pins 17, and the projections 20, substantially as described.

384,218. TOILET JAR COMMODE. LEVI W. SWAFFORD and CHARLES A. BOSSE, Vicksburg, Miss.; said Bosse assignor to A. G. Herdenstein, same place. Filed May 6, 1887. Serial No. 237,203. (No model.)

Claim.—In a toilet jar commode, the combination, with the vessel or body A, having the trough *a*, of the cover B, having the downwardly-projecting wall *b*, and a splash-board, *a'*, secured upon said cover, with an open space between the wall *b* and said splash-board, said splash-board extending down into the trough *a*, as and for the purpose set forth.

384,219. CARRIAGE-TOP. MILES B. TAYLOR, Janesville, Wis., assignor of three-fourths to John Sally, Fred Vandewater, and H. E. Taylor, same place. Filed Nov. 5, 1887. Serial No. 254,304. (No model.)



Claim.—In a carriage-cent top, the combination, with the bow C, and the swinging bow B, hinged thereto and provided with bearing-blocks L, of rule-jointed braces I', secured with their rule-jointed ends to said swinging bow and at their opposite ends to the bow C, and formed with the curved portions M, N, and O, substantially as set forth.

384,220. BLOOM-SHEAR TABLE AND CROP-END CONVEYER. FRANCIS H. TRENT, Joliet, Ill., assignor of two-thirds to Reuben S. Smith and Charles Pottgieser, both of same place. Filed June 21, 1887. Serial No. 242,023. (No model.)

Claim.—1. The combination, with a bloom-shear, of a table provided with two guide-rails, the movable part of the shear moving from one guide-rail toward the other, the said guide-rails being located further apart than the width of the bloom, substantially as described.

2. The combination, with a bloom shear and table, of a hinged adjustable bloom-stop, substantially as described.

3. The combination, with a bloom-shear and a table provided with feeding-rollers, of two guide-rails located further apart than the width of the bloom, one of said rails at the end of the table opposite the shear being provided with an inward bend reducing the distance

between the guides to about the width of a bloom, substantially as described.

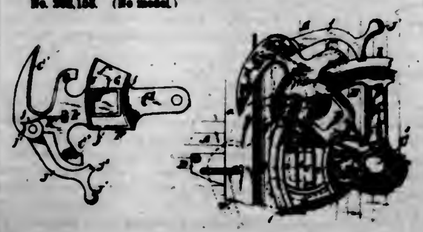
4. The combination, with a bloom-shear and bloom-table provided with feeding-rollers and provided with guiding-rails, of a bloom-stop mounted on and adjustably secured to said rails, substantially as described.

5. The combination, with a bloom-shear table provided with guiding-rails, of a hinged bloom-stop adjustably secured to the said guide-rails, substantially as described.

6. The combination, with a bloom-shear table provided with guiding-rails, of adjustable bearing-plates mounted on said guide-rails, and a bloom-stop hinged or pivoted upon said bearing-plates, substantially as described.

7. A bloom-stop for a shear-table, consisting of bearing-plates, arms pivoted to said plates, and a yielding cross-head connecting said arms.

8. A bloom-stop for a shear-table, consisting of bearing-plates provided with uprights or standards, arms pivoted to said plates, a cross-head connecting said arms, a rock-shaft mounted in the said standards, having an arm connected by a link to the cross-head, and an actuating-arm, substantially as described.



9. The combination, with a bloom-shear, of a crop-end conveyer, substantially as described.

10. The combination, with a bloom-shear, of a crop-end conveyer consisting of a bed, conveyer-chain, guide-rails, and operative mechanism, substantially as described.

11. The combination, with a bloom-shear, of a delivery-chute located beneath the same, and an endless-chain conveyer extending beneath the delivery end of said chute, substantially as described.

12. A crop-end conveyer consisting of a bed having sprocket-wheels on each side of the same, an endless conveyer-chain consisting of two drive-chains and connecting cross-bars, and guiding-rails above and projecting over the conveyer-chain, substantially as described.

384,221. SEAL-LOCK. CHARLES H. WARNER, Omaha, Nebr., assignor to John L. McCague, same place. Filed Jan. 27, 1888. Serial No. 262,164. (No model.)

384,221.

Claim.—1. The combination, with the door and the wall, of the hasp or latch which vibrates about a pivot and which fastens the door to the wall independently of the seal, the seal-receptacle, and means, substantially as described, connected with the hasp or latch for marring the seal at the time when the locking hasp or latch is rocked on its pivot out of its locked position, substantially as described.

2. The combination, with the door and the wall, of the seal-receptacle and the hasp or latch which fastens the door to the wall independently of the seal, of which two parts one rocks relatively to the other about a pivot, and means, substantially as described, connected with one of said parts for marring the seal during the time that the said rocking part is moving around said pivot, substantially as described.

3. The combination, with the door and the wall, of the vibrating hasp or latch which locks the door to the wall independently of the seal, and is directly accessible from the outside of the door, the seal-receptacle adapted to be covered by the hasp when the parts are locked, and a knife which after the parts are locked is immovable until the hasp has commenced to move from the locked position, substantially as set forth.

4. The combination, with the door and the wall, of the vibrating hasp or latch which locks the door to the wall and is situated entirely on the outside of the door, the seal-receptacle, and a knife operated at the time the hasp is moving out of its locked position for marring the seal, substantially as set forth.

5. The combination, with the hasp or latch which rocks about a pivot and which locks the door to the wall and the seal-receptacle, of the knife which is inaccessible when the parts are locked, and is immovable across the seal independently of the hasp, and is movable across the seal independently of the door, substantially as set forth.

6. The combination of the hasp or latch vibrating about a pivot, the fixed fastener with which it engages, the seal-receptacle stationary relatively to the hasp or latch, and the vibrating seal-cover, said seal receptacle and cover being situated between the said pivot and the said fixed fastener for the hasp or latch, substantially as described.

7. The combination of the vibrating hasp or latch, the seal-receptacle stationary relatively to the hasp or latch, and the seal-cover formed with or rigidly attached to the hasp or latch, and having an aperture closed with a glass that vibrates relatively to the receptacle in a plane parallel to the face of the seal, substantially as set forth.

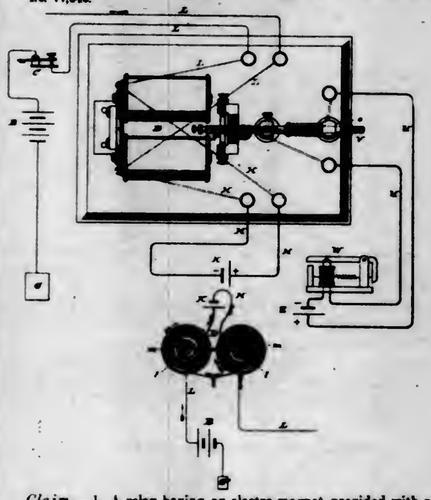
8. The combination of the vibrating hasp or latch, the pivot therefor, the seal-receptacle having flanges concentric with the said pivot, and the seal-cover having flanges also concentric therewith, substantially as set forth.

9. The combination, with the door and the wall, of the vibrating locking hasp or latch pivoted to one of the aforesaid parts, the seal-receptacle rigidly secured to the same, said part, the knife, said knife and seal-receptacle being immovable relatively one to the other, the seal-cover, and the fixed fastener for the hasp or latch secured to the other of said parts, substantially as set forth.

10. The combination, with the door and the wall, of the seal-receptacle secured to one of said parts, the knife, also secured to the same part, the pivot about which the knife vibrates curvilineally across the seal-holder, and an imperforate seal-cover, substantially as described, whereby the knife is rendered inaccessible while the door and the wall are locked together, substantially as set forth.

11. The combination, with the seal-receptacle secured to the door, of the vibrating seal-cover, the pivot which holds the seal-cover, the knife carried by the seal-cover and projecting inwardly therefrom, and the hooked hasp attached to the seal-cover and adapted to be grasped by the hand for causing the knife to move curvilineally across the seal-receptacle, substantially as set forth.

12. The combination, with the seal-receptacle and the cover therefor, of which parts one rocks relatively to the other about a pivot, the knife secured to one of said parts and immovable independently of the hasp, and the hasp connected to the rocking part, of a lock supplemental to the hasp which positively holds the seal and the knife in their closed position relatively to each other, and which is movable relatively to the hasp while the latter is in its closed position, substantially as set forth.



13. The combination, with the seal-receptacle, the hinged hasp, and the staple or fixed fastener, of the lock supplemental and pivoted directly to the hasp and movable relatively to the hasp while the latter remains in the locked position in the staple or fastener, substantially as set forth.

14. The combination of the door and the wall of the seal-receptacle, the rocking hooked hasp, and the knife, all situated entirely outside of the door or wall, the staple or fixed fastener with which the hooked hasp engages, the locking-dog supplemental to the hasp and pivoted thereto above the staple or fastener, and the stationary abutment on the exterior surface of the car or wall for the said dog and situated above the staple, substantially as described.

15. In a seal-lock, the combination, with the knife and the seal-receptacle, of a seal retainer or support independent of the knife bearing against the central part of the upper or outer face of the card or seal to hold said central part from displacement by the knife, substantially as set forth.

16. In a seal-lock, the combination, with the knife and the seal-receptacle, of the seal retainer or support independent of the knife, arranged across the printed or marked portion of the seal, and bearing against the surface on lines in proximity to the line of cut, substantially as set forth.

384,222. RELAY. JOHN R. WATSON, Louisville, Ky., assignor to the International Electric Company, same place. Filed Apr. 11, 1887. Serial No. 234,360. (No model.) Patented in Belgium Apr. 12, 1887. No. 77,046.

Claim.—1. A relay having an electro-magnet provided with a helix of low resistance connected in a constantly-closed local voltaic circuit passing its current in one direction, a permanent magnet with its poles in the magnetic field of said helix, and a helix of high resistance connected in the main voltaic circuit passing its current in the opposite direction, whereby the magnetizing influence of the low-resistance helix is hampered by the main-line current, substantially as specified.

2. An electro-magnetic relay provided with a permanent magnet and having a coil of low resistance on the same core with its main-line helix and included in a constantly-closed local voltaic circuit passing a current of similar polarity to that of the permanent magnet in the opposite direction to that of the main voltaic current in the main-line helix to set up therein induced currents opposite in direction to the extra or otherwise induced currents of said main line to neutralize the same, substantially as specified.

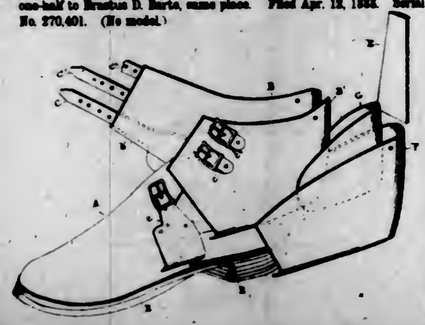
384,223. CLAW-BAR. ARCHIBALD B. WYCKE, Kingman, Kans. Filed Sept. 1, 1887. Serial No. 248,510. (No model.)

Claim.—1. A claw-bar consisting of a handle, said handle having formed on its lower end laterally-extending bearings or projecting portions *b* B, through which pass a pivot-bolt, a wedge formed on said handle in the rear of said bearings, and jaws attached to said handle by the pivot-bolt, so that the wedge formed on the handle will be passed between the heels of the pivoted jaws, so as to bring the points together when the handle is moved rearwardly upon its pivot, substantially as shown, and for the purpose set forth.

2. The combination, in a claw-bar, of a handle provided at its lower end on opposite sides with laterally-projecting bearings or projecting portions *b* B, having a perforation through which passes a bolt,

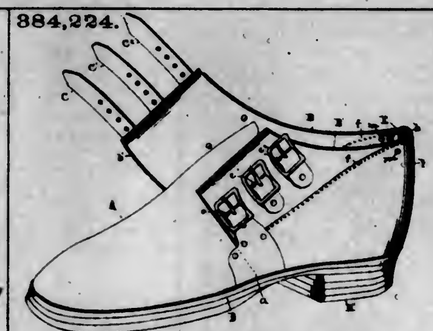
384,223.

the wedge-shaped portion formed on the lower end of the handle rear of the bearings, jaws having recesses within which the bearings formed on the handle lie, the heels of said jaws being tapered, so that the point of the wedge will lie between the same, and a bolt for connecting the jaws to the handle, substantially as described.



3. In a claw-bar, a handle, A, provided at its lower end with a shoulder-bearing, a wedge, D, formed integral with the handles above and rear of the bearing, jaws E E, having recesses adapted to lie over the shouldered bearings, a bolt for connecting the jaws pivotally to the handle, and compressible washers interposed between the jaws and head and nut of the bolt, the parts being combined substantially as shown, and for the purpose set forth.

4. The combination, in a claw-bar, of a handle provided at its lower end with a depending portion, B, having shoulders *b b*, a wedge-shaped depending portion, D, formed integral with the portion B and the handle, claws having sockets, and a bolt for pivotally securing said claws to the handle, substantially as shown, and for the purpose set forth.



5. The combination, in a claw-bar, of a handle provided at its lower portion with means for pivotally securing thereto claws, said handle-bar also being provided with a wedge-shaped portion, D, and shoulders *g* and *g'*, against which shoulders stops formed on the claw-bars are adapted to abut, substantially as and for the purpose specified.

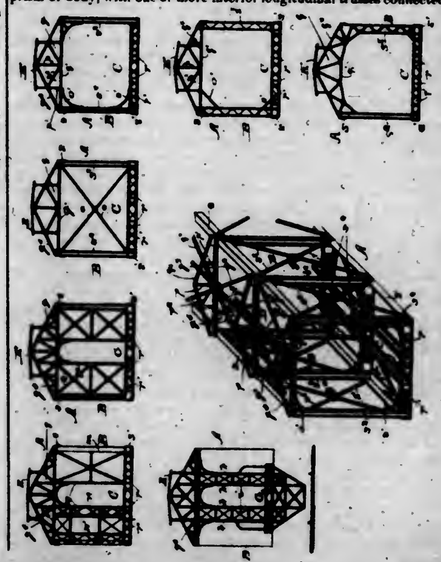
6. The combination, with a handle, of a claw-bar having shoulders *g g'*, a depending portion with circular shoulders *b* formed thereon, and a wedge-shaped portion, D, claws E E, having sockets adapted to fit over the shoulders *b b*, a bolt for securing the parts to each other, and a spring attached to the lower end of the handle-bar, so as to exert a downward spring-pressure upon the heels of the claws, substantially as and for the purpose set forth.

384,224. SHOE. MARTIN YEAGLE, Watsontown, Pa., assignor of one-half to Brantus D. Barto, same place. Filed Apr. 12, 1888. Serial No. 270,601. (No model.)

384,224.

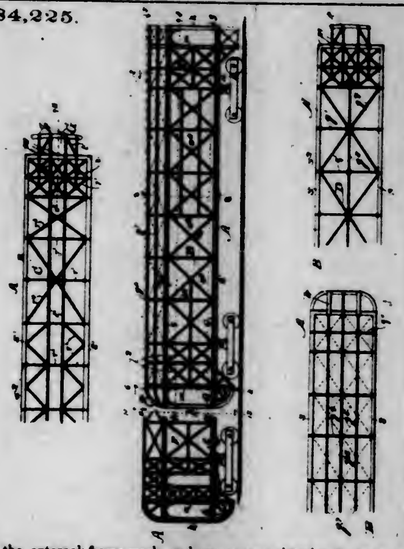
Claim.—The herein shown and described shoe, composed of the vamp and the quarters secured together by back and side seams, the end of one quarter being extended to form a flap, the inner stay, E, the outer stay, F, of one piece and extending from one side seam to the other, and secured at its ends by the said side seams, the upper edge inclining from back to front, as shown, and secured to the quarters by a row of stitching, and the lower edge being lasted in, the straps C C' C² and the corresponding straps, *c c'* *c²*, provided with buckles, the straps C and *c* being widened at their lower ends to overlap the said side seams and lasted in, and the sole and the heel, substantially as specified.

384,225. FRAME FOR RAILWAY-CARS. MAX A. SCHEIER, Phœnixville, Pa. Filed Oct. 7, 1887. Serial No. 251,776. (No model.)



Claim.—1. A railway-car frame in which each exterior longitudinal face is constructed of a statically-formed truss with skeleton members and one chord for each pair of adjacent trusses in common, the whole forming a complete skeleton tube, substantially as described.

2. A railway-car frame consisting of a hollow statically-constructed skeleton prism or body having a number of panel-points in each of the faces of the longitudinal sides of the frame, which panel-points intersect or coincide at the junction of the sides of the frame with the longitudinal chords thereof, substantially as described.



3. A railway-car frame consisting of an exterior longitudinal frame-work having interior transverse-vibration trusses, substantially as described.

4. A railway-car frame consisting externally of a skeleton prism or body, with one or more interior longitudinal trusses connected with the exterior frame-work, substantially as described.

5. A railway-car frame having a body in the form of a skeleton prism or body, with one or more interior longitudinal trusses connected

384,225.

with the external frame-work, and one or more interior transverse-vibration trusses connected also to the frame-work, substantially as described.

6. A railway-car frame having externally a skeleton prism or body, with one or more vertical transverse statically-constructed overhead roof-trusses, having web members throughout its entire length, substantially as described.

7. A railway-car frame having externally a body in the form of a skeleton prism, with one or more interior transverse-vibration trusses and one or more vertical transverse statically-constructed overhead roof-trusses, having web members throughout its entire length, all connected together substantially as described.

8. A railway-car frame having externally a body in the form of a skeleton prism, with one or more interior longitudinal trusses and one or more transverse statically-constructed overhead roof-trusses, having web members throughout its entire length and suitable connections for rigidly connecting the same together, substantially as described.

9. A railway-car frame externally in the form of a skeleton prism or body, with one or more interior longitudinal trusses and one or more vertical transverse statically-constructed overhead trusses, having web members throughout its entire length and one or more interior transverse-vibration trusses, all connected together substantially as described.

10. A railway-car frame having an upper and lower deck frame projecting beyond the ends of the body of the main frame, connected by columns or girders at their extreme ends, substantially as described.

11. A railway-car frame having an upper and lower deck frame projecting beyond the ends of the body of said frame, connected by columns and girders at their extreme ends extending above said upper and below said lower decks, substantially as described.

12. A railway-car frame having a truss-body with an upper and lower deck frame projecting beyond the ends of the body, connected by columns or girders at the ends thereof, and having columns or girders *m* built into the end wall of the body, with projecting ends of members *k*, substantially as described.

13. A railway-car frame in the form of a prism or body having trussed side, top, and bottom faces, in combination with one or more longitudinal interior trusses, substantially as described.

14. A railway-car frame having trussed side, top, and bottom faces, in combination with one or more lateral interior trusses connecting the sides, top, and bottom, substantially as described.

15. A railway-car frame having trussed side, top, and bottom faces, in combination with one or more longitudinal interior trusses and one or more lateral interior trusses, all connected together substantially as described.

16. A railway-car frame consisting of a trussed body, in combination with projecting trussed platforms, substantially as described.

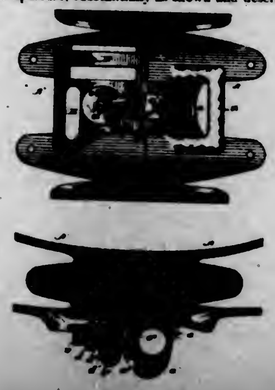
17. A railway-car frame consisting of a trussed body, in combination with trussed platforms and trussed projecting roof portions, connected, respectively, to the body of said frame, substantially as described.

18. A railway-car frame consisting of trussed longitudinal side, top, and bottom faces, in combination with a trussed roof-supporting frame, substantially as described.

19. A railway-car frame having four or more longitudinal external members, with diagonal and vertical members connecting the sides of said frame to said longitudinal members and diagonal and horizontal members connecting the top and bottom of such frame to said longitudinal members, substantially as described.

20. A railway-car frame having vertical and diagonal braces in its side faces, in combination with diagonal and horizontal braces in its top and bottom faces and knee-braces between the sides and top and bottom faces, substantially as described.

384,226. METHOD OF MAKING BUTTONS. SHUBAL CUTLER, New York, N. Y. Filed Dec. 9, 1887. Serial No. 257,335. (No model.)



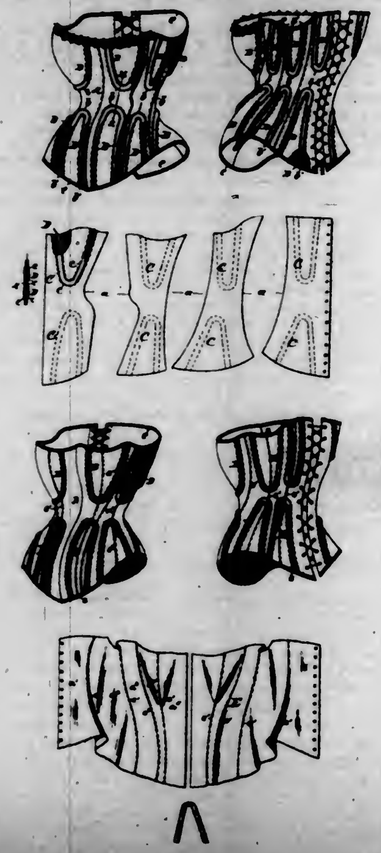
Claim.—1. The process of manufacture from a single piece of metal of a stud, collar, or sleeve button having two flanged portions united by a hollow shank or post, one of said flanged portions being hollow and the other solid, which consists in first producing a tube of thin metal, A, having at one end a solid or thickened portion, B; second, compressing and so reducing the diameter of said tube adjacent to said thickened portion B, as at C, and, third, closing the open end of said tube by pressing into close contact the metal around the edge of the opening in said tube, substantially as described.

2. The process of manufacture from a single piece of metal of a stud, collar, or sleeve button having a hollow head, a hollow shank, and a solid back or base, which consists in first producing a tube of thin metal, A, having at one end a solid or thickened portion, B; second, compressing and so reducing the diameter of said tube adjacent to said thickened portion B, as at C; third, drawing out or flattening said solid or thickened portion B, as at B', and, fourth, closing the open end of said tube by pressing into close contact the metal around the edge of the opening in said tube, substantially as described.

3. The process of manufacture from a single piece of metal of a stud, collar, or sleeve button having a back and shank of thin metal and a solid head, which consists in first producing a tube of thin metal, A, having at one end a solid or thickened portion, B; second, compressing and so reducing the diameter of said tube adjacent to said thickened portion, as at C; third, closing the open end of said tube by pressing into close contact the metal around the edge of the opening in said tube, as at *a'*, and, fourth, flattening the portion so closed, as at *a''*, substantially as described.

384,227. HORSE-COLLAR FASTENING. ARTHUR H. DAVIS and GEORGE KEITH, Earlville, Ill. Filed Mar. 29, 1888. Serial No. 268,790. (No model.)

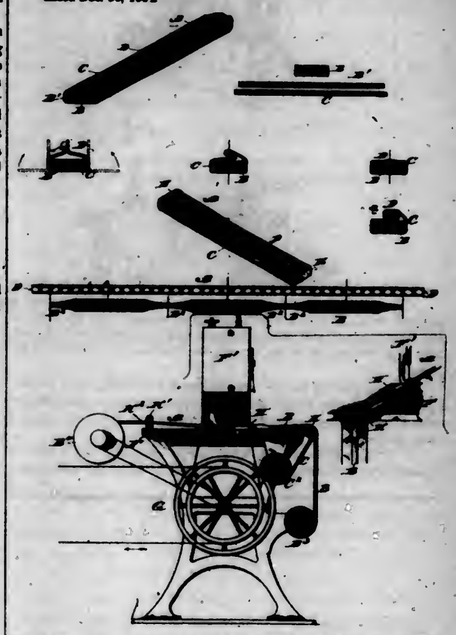
Claim.—1. As an improvement in collar fasteners or couplings, the herein-described irons or frames having the stud or post provided with an inclined groove and a slot, the pivotally-secured spring-hold button having a central hole or aperture, and the spring inclosed in said hole or aperture, substantially as shown and described.



2. The combination, with the iron or frame A, having a groove or recess, *a*, and a stud or post provided with an inclined groove and a horizontal slot or recess, of the frame A', having a loop flying over said stud or post and resting in said groove or recess *a*, and the spring-held button having a nose entering said inclined groove and horizontal slot or recess, substantially as shown and described.

3. As an improvement in fasteners or collar-couplings, the iron or frame having the central groove or recess, the stud or post having an inclined groove and a slot, the button having a projecting nose, the spring located in said button, and the stop-pins, substantially as shown and described.

4. The combination, with the iron or frame having the dovetail and the short studs, a central curved portion, and the stud or post having an inclined groove and a slot, of the iron or frame having a loop, the spring-held button provided with a nose, and the lug or head and the stop-pins, substantially as shown and described.



REISSUES.

10,935. CORSET. CATHARINE A. GRISWOLD, New York, N. Y. Filed Dec. 30, 1887. Serial No. 259,491. Original No. 362,949, dated Feb. 23, 1887.

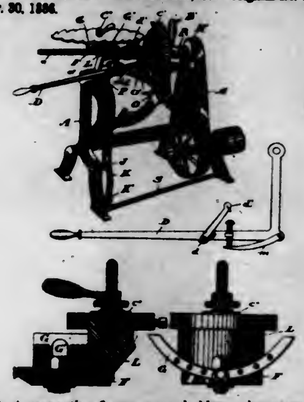
Claim.—A corset provided with longitudinally edgewise-curved stiffeners or stays incorporated and inclosed in correspondingly-curved pockets or folds, constituted in and by the material of the corset-body, and extending in a series along the top or bottom edges, or both, of the corset-body, through said body from said edges to substantially the waist-line of the corset, and with their apices located at said waist-line, and with both extremities of each said curved stiffeners or stays terminating at one and the same edge of the corset-body, substantially as and for the purpose set forth.

10,936. HAIR-CRIMPER. ISAAC W. REYNOLDS, Philadelphia, Pa., assignor to the Philadelphia Novelty Manufacturing Company, same place. Filed Mar. 30, 1888. Serial No. 267,903. Original No. 369,264, dated Dec. 30, 1884.

Claim.—1. As a new article of manufacture, hair-crimper stock consisting of a continuous core of soft-metal wire and a covering-strip of flexible non-metallic fabric applied thereto, said core attached continuously to the said fabric, the edges of said strip seamed by a continuous seam, the said stock adapted to be cut into suitable lengths, substantially as and for the purpose described.

2. As a new article of manufacture, a flat hair-crimper composed of a ductile, non-elastic core of soft-metal wire and a covering-strip of non-metallic fabric, the edges of said fabric secured together by a continuous seam, said wire attached to said covering-strip from end to end, substantially as described.

3. In a hair-crimper, a soft-metal core consisting of a central body, B, and a flat self-sustaining strip, B', in combination with a covering of textile fabric, substantially as and for the purpose set forth.



4. In a hair-crimper, a soft-metal core consisting of a central body B in combination with a flat self-sustaining strip, B', laid upon said body B and having thin lateral edges, and a textile covering, C, surrounding said interposed strip B' and attached thereto continuously from end to end, substantially as and for the purposes set forth.

5. As a new article of manufacture, a continuous length of hair-crimper stock, consisting of a soft-metal core and a covering of flexible non-metallic fabric, said fabric being attached to said core by a longitudinally-stitched seam, said stitches passing through both the covering and the core, the said stock adapted to be cut into suitable lengths, substantially as and for the purpose described.

6. A flat metal hair-crimper having a textile or woven covering united thereto from end to end by a series of stitches in which the threads pass through both sides of the covering and through the metallic core of the said crimper, and having the sides of the needle-holes swaged down upon the threads, so that the said covering shall not strip from the said core when the said crimper is cut into various lengths, substantially as described.

7. In a hair-crimper, a soft-metal wire having the length thereof provided with swells and contractions B BP, so that the body of the crimper may be of a different diameter from the ends thereof, in combination with a textile covering, C, attached to said wire continuously from end to end, substantially as described.

10,937. SAW-FILING MACHINE. SAMUEL C. ROGERS, Hamilton, Ontario, Canada, assignor to the Kerr Emery Wheel Company, (Limited.) Filed Mar. 14, 1888. Serial No. 267,189. Original No. 338,787, dated Mar. 30, 1886.

Claim.—1. A supporting-frame, a saw-holder, a sharpener, and a pivoted lever carrying a pawl arranged to engage with the teeth of the saw being operated upon, combined with a templet, and an adjustable stop independent of the templet for regulating the motion of the lever.

2. A supporting-frame, a saw-holder, a sharpener, and a pivoted operating-lever carrying a suitably-shaped templet, in combination with a movable frame carrying the grinding-wheel, and a stop on said movable frame.

3. A supporting-frame, a saw-holder, a sharpener, and a pivoted operating-lever carrying an adjustable templet, combined with a movable frame carrying the grinding-wheel, and a stop on said movable frame.

4. A supporting-frame, a saw-holder, a sharpener, and a pivoted operating-lever carrying an adjustable templet, in combination with a movable frame carrying the grinding-wheel, and an adjustable stop on said movable frame.

5. A supporting-frame, a saw-holder, a sharpener, and a pivoted lever carrying a pawl arranged to engage with the teeth of the saw being operated upon, and a templet pivoted on the said lever and held at any desired angle by an adjusting-screw, in combination with the movable frame, and a stop on said frame carrying the grinding-wheel.

6. A supporting-frame, a saw-holder, a sharpener, and a pivoted lever having attached to it a standard, *d*, carrying the pawl *d'*, working on a vertical pivot and having a spring device to keep the pawl pressed against the saw when the lever is in use.

7. The combination of an arm, *c*, base F, block G, and cone *c'*, provided with means for holding the saw, substantially as described.

8. In a saw-filer, the combination of a lever, D, attached at one end to a table and carrying the pawl *d'*, the arm *c*, the base F, the block G, and the cone *c'*, provided with means for holding the saw, substantially as and for the purpose specified.

9. The combination of the lever D, attached at one end to a table, an adjustable templet, M, an oscillating frame, B, provided with stops O and M', and emery-wheel *c'*, substantially as described.

10. In a saw-filer, the combination of a cone, *c'*, provided with means for holding the saw, a base, F, block G, arm *c*, table A', lever D, pawl *d'*, templet M, oscillating frame B, provided with stops, and emery-wheel, substantially as described.

11. The combination of a slotted arm, *c*, concave base F, convex block G, and cone *c'*, provided with screw and jam-nuts, substantially as described.

12. In a saw-filer, the combination of a bent lever, D, attached at one end to a table and carrying the pawl *d'*, the slotted arm *c*, the concave base F, the convex block G, and the cone *c'*, provided with screw and jam-nuts for holding and moving the saw, substantially as described.

13. The combination of the bent lever D, attached at one end to a table, an adjustable templet, M, and oscillating frame B, provided with stops O and M', and emery-wheel *c'*, substantially as described.

14. In a saw-filer, the combination of a cone, *c'*, provided with screw and jam-nuts, concave base F, convex block G, slotted arm *c*, table A', bent lever D, pawl *d'*, templet M, oscillating frame B, provided with stops, and emery-wheel, substantially as described.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE GÉRARD.

Decided May 22, 1888.

1. EMPLOYMENT OF THE WORDS "AS SHOWN AND DESCRIBED" IN CLAIMS OF DESIGN PATENTS.

It is well understood that, while the courts, when construing the validity, scope, and extent of the claims in patents, will regard the words "as shown and described" as ever present, and when absent will not construe patents to embrace more than is shown and described, it is the policy of the Office while it has control over applications to insist that the form and phraseology adopted and employed by applicants should not be misleading nor unintelligible to the common people who seek to deal with patent property. It has therefore been customary to require that the words "as shown and described" shall be employed in the claims of design patents, in order that the patents may be limited to the subject-matter shown and described. The introduction of such words operates as a guide-post to inform all persons that the patent is limited to the precise invention shown and described, and that there is no hidden mystery nor secret trap by which those who attempt to enter the same field of invention or to use other articles may be arrested in their efforts or mulcted in damages.

2. EMBRACING MORE THAN ONE INVENTION.

A design application will not be permitted to embrace more than one subject of invention. The same principles in this particular which control in mechanical applications must obtain in design applications. A distinct and separate invention relating to the form or configuration cannot be lawfully included in a patent embracing a distinct and separate invention as to surface ornamentation—as, for instance, an alto-relievo cannot be joined with an ornamentation or picture to be worked into a woolen fabric; but when the shape and the ornamentation are parts of the same article of manufacture, so that both unite in producing the same result, then they are not distinct and separate within the purview of the rule.

3. WHAT ELEMENTS OR FEATURES OF DESIGN ARE COVERED AND PROTECTED BY A DESIGN PATENT.

Under the statute the design must be a *finished* and *completed* thing—must be one entire and integral thing. It cannot consist of several integral different designs aggregated, so as to protect the several individual parts, nor so that these parts may be separately applied to other and different articles or parts of articles of manufacture.

4. DOCTRINES OF COMBINATIONS AND GENUS AND SPECIES NOT APPLICABLE IN DESIGNS.

The doctrines of combinations and elements of combinations and of genus and species obtaining in mechanical inventions cannot be applied to designs. In a mechanical combination, when one element is withdrawn that combination ceases; but in a design a subordinate and unimportant feature may be withdrawn and yet the design as a whole remain, and to simulate the predominant features would infringe the whole.

5. TEST OF INFRINGEMENT.

The test of infringement is the "identity of appearance, determined by the eye of the ordinary observer." (*Gorham Company* v. *White.*) As the subject of identity of the design is addressed to the eye of the ordinary observer—the public—so the questions of the extent and character of claims in patents for distinctive and segregable parts must be determined largely by the skill and judgment of the experts of the Office.

6. OBJECTIONS RELATING TO NON-SEGREGABILITY—TO WHOM APPEALABLE.

Objections to claims for non-segregable parts relate to the merits rather than to form, and upon rejection the appeal should go to the Examiners-in-Chief.

7. SUBJECTS FOR DESIGN ALSO SUBJECTS FOR MECHANICAL PATENTS.

A new and original design under the statutes may also be the subject of a mechanical patent. (*Ex parte Schulze-Berge*, 42 O. G., 293.)

DESIGNS FOR PLATES AND OTHER DISHES.

ON appeal.

Application of Emile Gérard, filed November 27, 1885, No. 184,131.

Messrs. Burke, Fraser & Connett for the applicant.

HALL, *Commissioner:*

Applicant appeals in this case from the action of the examiner in the three following particulars:

First. In requiring applicant to incorporate into his specification a brief statement of the leading features of his design.

Second. In requiring applicant to state his respective claims separately and singly as to each subject of the claims, instead of incorporating a preamble introductory to all the claims—"In a design for a plate or dish," &c.—and then adding the statement of what is claimed in such design. The examiner also required that the applicant should add to his claims the usual words, "as shown," &c.

Third. The rejection of claims 3, 5, 6, 7, and 8, in that they were not for distinctive and segregable matter as required by *ex parte Pope*, (26 O. G., 290.)

Applicant in his appeal requests the Commissioner to instruct the examiner by what principles he should be guided in rejecting claims because of non-distinctiveness and non-segregability, in view of the frequency of the citation of *ex parte Pope*, and also to determine whether a rejection on this ground should be regarded as relating to the merits which gives an applicant the right of appeal to the Examiners-in-Chief, or whether it should be regarded as an objection relating to form, which would be appealable to the Commissioner.

The design for which applicant seeks a patent is a dish of certain form and shape, the upper surface of which bears certain ornamentation. The dish is made with a central circular depression or bowl, while the rim is rectangular with defined corners. The corners are ornamented with a peculiar design, while the bowl and panels possess their own respective designs or ornamentation.

The claims are as follows:

In a design for a plate or dish, the following defined novel and

segregable features, substantially as hereinbefore described, and as shown in the accompanying photographs, namely:

1. The design for the shape of the dish, consisting of a rectangular outline with the corners formed by straight lines *a a*, forming obtuse angles with the sides, and the circular arc *b*, interposed between the lines *a a*.

2. The design for the shape of the dish, consisting of the depressed center of circular outline, and the rim with square outline, with its corners formed by lines *a a* at obtuse angles with the sides, and intervening circular arc *b*.

3. The design for the corner of the dish, consisting of circular arc *b* and straight lines *a a*, forming the edge outline of the dish, with a surface ornamentation consisting of a circular figure, A, entering said arc *b*, and a concentric border, B, extending to and interrupted by said lines *a a*.

4. The design for the surface ornamentation of the corner of the dish, consisting of a circular figure, A, composed of a conventionalized flower with radial petals, and the concentric border B, characterized by the circular row of pointed figures *e e*, radiating from the common center.

5. The design for the rim of the dish, consisting of the corner ornamentations A B, and the intervening panels C C, filled with ornamentation consisting of diagonally-arranged figures, as shown.

6. The ornamentation for the panels C C on the rim of the dish, consisting of diagonal bands *h*, *i*, *j*, *k*, and *l*.

7. The ornamentation for the depressed center of the dish, consisting of the figures D D.

8. The ornamentation for the depressed center of the dish, consisting of the annular border G.

9. The ornamentation for the depressed center of the dish, consisting of the radial figures D D, the annular border G, interrupted by said figures and appearing to pass beneath them, and the central rosette, E.

The examiner allowed claims 1, 2, 4, and 9, but rejected claims 3, 5, 6, 7, and 8, the ground of his decision being that these latter claims did not embrace parts or features which were distinctive and segregable from the entire design.

It appears from the official action of the examiner and his statement in reply to the appeal that he has waived and abandoned the formal objections as to the "distinctive features" of the design and the introduction of the preamble to the claims, and only insists upon the use of the customary words "as shown and described," &c. As to the latter subject, I concur with the views expressed by the examiner. It is well understood that, so far as the validity, scope, and extent of a patent are concerned, these words are immaterial. The courts regard them as ever present, for the patent can extend no further and embrace no more than is shown and described; but the Office has control over the form and phraseology of the patents issued by it to the extent of rendering them easily intelligible to the common people, so that they cannot be the means of deluding or misleading those who seek to deal either with patent property or the articles of manufacture made under such exclusive privileges. The introduction of those words operates as a guide-post to point the fact, which many, but by no means all, persons know, that a patent is limited to the very subject-matter "shown and described" and its equivalents, and that there is no hidden mystery nor secret trap by which those who attempt to enter the field of invention in the same class of arts or to use other articles of manufacture may be arrested in their efforts or mulcted in damages. It has always been customary to use those words in claims of design patents. It is the policy of the Office to require them to be used, and the action of the examiner in requiring them in this case must be affirmed.

As to the rejected claims, an examination of the statutes relating to design patents shows that the subject-matter, "a new and original design," relates to an article of manufacture. A new and useful article of manufacture may also be the subject of a mechanical patent, (*ex parte Schulze-Berge*, 43 O. G., 266,) depending upon its construction or mode of construction; but it may possess a new and original form or surface ornamentation, or both. Shape must relate to the outward form or contour, while the surface ornamentation relates to illustrations and delineations that are printed or impressed upon or woven into it.

So far as applicable, the statutes and rules pertaining to mechanical patents relate also to designs. Letters Patent issued on one application will not be permitted to embrace more than one subject of invention in designs. The same principles in this particular which control in mechanical patents must obtain in this. The statute provides (R. S., sec. 4929) that—

> Any person who, by his own industry, genius, efforts, and expense, has invented and produced any new and original design for a manufacture, bust, statue, alto-rilievo, or bas-relief; any new and original design for the printing of woolen, silk, cotton, or other fabrics; any new and original impression, ornament, pattern, print, or picture to be printed, painted, cast, or otherwise placed on or worked into any article of manufacture; or any new, useful, and original shape or configuration of any article of manufacture, the same not having been known or used by others before his invention or production thereof, or patented or described in any printed publication, may * * * obtain a patent therefor.

The peculiar disjunctive character of this section relative to the two classes of invention, *shape* and *ornamentation*, when considered in conjunction with the statutes, decisions of the courts, and rules of practice of the Patent Office applicable to mechanical patents, is conclusive that a distinct and separate invention as to form or configuration cannot be lawfully and properly embraced in the same patent with a distinct and separate invention as to surface ornamentation. An alto-relievo cannot be joined with an ornamentation or picture to be worked into a woolen fabric in the same patent; but when the shape and the ornamentation are parts of the same article of manufacture, so that both unite in producing the same result—viz., the usefulness of beauty in the same article—then they are not distinct and separate within the purview of the rule. Such an instance can scarcely be held to be an exception to the rule. As already stated, the invention which is the subject of the design patent cannot exist separate and apart from the article of manufacture. An article of manufacture may wear the garment of form and also that of surface ornamentation; but both features combine to constitute a single garment, and the article remains the same article of manufacture. Its usefulness is one and integral. The design of form may have been conceived and applied first; but when that of surface-ornamentation came into existence and was applied the two in their application blended and united in a new creation, which was one and indivisible. In such a case a patent for the design consisting of shape and surface ornamentation possibly might not protect the shape alone; but this question is not before me, and I only suggest, but do not express, any opinion upon it. I conclude simply that the designs of form and those of surface ornamentation, when applied to the same article of manufacture, constitute the proper subjects for single Letters Patent.

What elements or features of design are covered and protected by a design patent? In the language of the statute, *the thing* to be patented must be new and original, and it must have been invented and *produced*. It must necessarily be a *finished* and *completed* thing. Whether it consists of form or surface delineations, or both, the design must be one entire and integral thing. It cannot consist of several integral different designs aggregated, so as to protect the several parts individually and separately, nor so that these parts may be separately applied to other and different articles or parts of articles of manufacture made or hereafter to be made. The doctrines of combinations and elements of combinations and of genus and species which obtain in mechanical inventions cannot be applied to designs. Shape and contour and surface delineations may have predominant features—may be divisible, in a certain sense, into parts; but these parts do not co-ordinate and coact as elements in mechanical combinations do. In the latter when an element is withdrawn that combination ceases. In a design some of the subordinate and unimportant features may be withdrawn and yet the design as a whole remain, and to simulate the predominant features would infringe the whole, upon well-known principles to be stated hereinafter.

Curves or outlines, areas or surfaces, and solids, all having forms and contours, may be classified, depending upon their co-ordinates or relations of curve and angle. The curves of conic sections, the sphere, cube, and paraboloid, &c., may be classified mathematically; but they are incapable of differentiation into varieties and species. As matters of beauty and ornamentation addressing themselves to the eye, they are always the same. The moment either loses its quality of cube or sphere, so as to become a variety of cube or sphere, it ceases to exist and becomes something else. If it be cubical or spherical, though not a perfect cube or sphere, it does not change to a species or variety, but retains a resemblance which will still classify and arrange it as one or the other. Genus possesses constant qualities which are common to all included varieties or species. The variations or modifications upon which the species depend relate to features of structure other than mere similitude of form and shape. Every bust could be classified under genus and species if complexion, eyes, nose, mouth, and hair—common features of the races of men—were to be considered; but the design of a bust does not depend upon the representation of these features as such. The bust of Henry Clay would not be patentable as such, for that would prevent other artists from making busts of the same individual. So, also, of portraits to be impressed upon or woven into fabrics. That which is patentable is the ideal characteristic pertaining to the design which the artist has created and not borrowed or copied. There is in this respect but one characteristic which is common to mechanical and design patents, and that is *equivalency*. With reference to mechanical inventions, an equivalent is defined to be—

> a thing that performs the same function, and performs that function in substantially the same manner, as the thing of which it is alleged to be the equivalent. (*Mason* v. *Graham*, 23 Wall., 275; *Potter* v. *Stewart*, 15 Blatch., 360.)

But designs are addressed to the eye, and their usefulness relates to the enjoyment of the beautiful which their consideration and contemplation awaken. The protection afforded by the patent law for such inventions necessarily depends upon identity, which embraces the idea of equivalency in the law of patents. The reproduction and simulation by others of the invented design are forbidden.

The Supreme Court of the United States in *Gorham Manufacturing Company* v. *White* (14 Wall., 511) has clearly stated and limited the force and meaning of a patent for a new and original design. That case was appealed from the Circuit Court for the Southern District of New York. The court below held views approved by the Supreme Court as to the identity of design, but instructed that this identity was to be determined by the eye of the expert and not that of the ordinary observer. The judgment proceeded upon this idea that a design was a subject of art and skill, and its qualities and characteristics must be determined by experts skilled in such arts. As to the standard of distinction in the matter of identity, or the means and manner of defining the subject of a design patent, the Supreme Court differed from the circuit court. The opinion is a leading one upon this subject:

> The thing invented or produced for which a patent is given is that which gives a peculiar or distinctive appearance to the (article of) manufacture, or article to which it may be applied or to which it gives form. The law manifestly contemplates that giving certain new and original appearances to a manufactured article may enhance its salable value, may enlarge the demand for it, and may be a meritorious service to the public. It therefore proposes to secure for a limited time to the ingenious producer of these appearances the advantages flowing from them. Manifestly the mode in which these appearances are produced has very little, if anything, to do with giving increased salableness to the article. It is the appearance itself which attracts attention and calls out favor or dislike. It is the appearance itself, therefore, no matter by what agency caused, that constitutes mainly, if not entirely, the contribution to the public which the law deems worthy of recompense. The appearance may be the result of peculiarity of configuration, or of ornament alone, or of both conjointly; but in whatever way produced, it is the new thing or product which the patent law regards. To speak of the invention as a combination or process, or to treat it as such, is to overlook its peculiarities. As the acts of Congress embrace only designs applied, or to be applied, they must refer to finished products of invention rather than to the process of finishing them, or to the agencies by which they are developed. A patent for a product is a distinct thing from a patent for the elements entering into it, or for the ingredients of which it is composed, or for the combination that causes it. We do not say that in determining whether two designs are substantially the same, differences in the lines, the configuration, or the modes by which the aspects they exhibit are not to be considered; but we think the controlling consideration is the resultant effect. Such was the opinion of Lord Chancellor Hatherly in *McCrea* v. *Holdsworth*. That was a suit to restrain an infringement of a design for ornamenting a woven fabric. The defense was a denial that the design used by the defendants was the same as that to which the plaintiff was entitled. The ornament on both was, in part, a star; but on one it was turned in an opposite direction from that in the other, yet the effect of the ornament was the same to the eye. The Lord Chancellor held the important inquiry was whether there was any difference in the effect of the designs, not whether there were differences in the details of ornament. "If," said he, "the designs are used in exactly the same manner and have the same effect, or nearly the same effect, then of course the shifting or turning round of a star, as in this particular case, cannot be allowed to protect the defendants from the consequences of the piracy." This seems most reasonable, for, as we have said, it is the effect upon the eye which adds value to articles of trade or commerce. So in *Holdsworth* v. *McCrea*, Lord Westbury said: "Now, in the case of those things in which the merit of the invention lies in the drawing, or in forms that can be copied, the appeal is to the eye, and the eye alone is the judge of the identity of the two things. Whether, therefore, there be piracy or not is referred to an unerring judge, namely, the eye, which takes the one figure and the other figure and ascertains whether they are or are not the same." This was said in a case where there was nothing but a drawing of the design.

We are now prepared to inquire what is the true test of identity of design. Plainly, it must be sameness of appearance, and mere difference of lines in the drawing or sketch, a greater or smaller number of lines or slight variances in configuration, if sufficient to change the effect upon the eye, will not destroy the substantial identity. An engraving which has many lines may present to the eye the same picture and to the mind the same idea or conception as another with much fewer lines. The design, however, would be the same. So a pattern for a carpet or a print may be made up of wreaths of flowers arranged in a particular manner, so that none but very acute observers could detect the difference; yet in the wreaths upon one there may be fewer flowers, and the wreaths may be placed at wider distances from each other. Surely in such a case the designs are alike. The same conception was in the mind of the designer, and to that conception he gave expression.

If, then, identity of appearance, or (as expressed in *McCrea* v. *Holdsworth*) sameness of effect upon the eye, is the main test of substantial identity of design, the only remaining question upon this part of the case is, whether it is essential that the appearance should be the same to the eye of an expert. The court below was of opinion that the test of a patent for a design is not the eye of an ordinary observer. The learned judge thought there

could be no infringement unless there was "substantial identity" "in view of the observation of a person versed in designs in the particular trade in question—of a person engaged in the manufacture or sale of articles containing such designs—of a person accustomed to compare such designs one with another, and who sees and examines the articles containing them side by side." There must, he thought, be a comparison of the features which make up the two designs. With this we cannot concur. Such a test would destroy all the protection which the act of Congress intended to give. There never could be piracy of a patented design, for human ingenuity has never yet produced a design in all its details exactly like another, so like that an expert could not distinguish them. No counterfeit bank-note is so identical in appearance with the true that an experienced artist cannot discern a difference. It is said an engraver distinguishes impressions made by the same plate. Experts, therefore, are not the persons to be deceived. Much less than that which would be substantial identity in their eyes would be indistinguishable in the eyes of men generally, of observers of ordinary acuteness, bringing to the examination of the article upon which the design has been placed that degree of observation which men of ordinary intelligence give. It is persons of the latter class who are the principal purchasers of the articles to which designs have given novel appearances, and if they are misled and induced to purchase what is not the article they supposed it to be; if, for example, they are led to purchase forks or spoons, deceived by an apparent resemblance into the belief that they bear the "cottage" design, and therefore are the production of the holders of the Gorham, Thurber, and Dexter patent, when in fact they are not, the patentees are injured, and that advantage of a market which the patent was granted to secure is destroyed. The purpose of the law must be effected if possible; but, plainly, it cannot be if, while the general appearance of the design is preserved, minor differences of detail in the manner in which the appearance is produced, observable by experts but not noticed by ordinary observers—by those who buy and use—are sufficient to relieve an imitating design from condemnation as an infringement.

We hold, therefore, that if in the eye of an ordinary observer giving such attention as a purchaser usually gives, two designs are substantially the same, if the resemblance is such as to deceive such an observer, inducing him to purchase one supposing it to be the other, the first one patented is infringed by the other. * * *

A large number of witnesses, familiar with designs, and most of them engaged in the trade, testify that, in their opinion, there is no substantial difference in the three designs, and that ordinary purchasers would be likely to mistake the White designs for the "cottage"—viz., that of the plaintiffs. This opinion is repeated in many forms of expression, as that they are the same pattern; that the essential features are the same; that seven out of ten customers who buy silverware would consider them the same; that manufacturers as well as customers would consider them the same; that the trade generally would so consider them; that, though there are differences, they would not be noticed without a critical examination; that they are one and the same patern, &c., &c. This is the testimony of men, who, if there were a substantial difference in the appearance, would most readily appreciate it. Some think the White designs were intended to imitate the other, and they all agree that they are so nearly identical that ordinary purchasers of silverware would mistake one for the other. On the other hand, a large number of witnesses have testified on behalf of the defendant that the designs are substantially unlike; but when they attempt to define the dissimilarity they specify only the minor differences in the ornamentation of which we have heretofore spoken. Not one of them denies that the appearance of the designs is substantially the same, or asserts that the effect upon the eye of an observer is different, or that ordinary purchasers, or even persons in the trade, would not be led by their similarity to mistake one for another. Their idea of what constitutes identity of design seems to be that it is the possibility of being struck from the same die, which of course cannot be if there exists the slightest variation in a single line. They give little importance to configuration, and none to general aspect. Such evidence is not an answer to the complainant's case. It leaves undisputed the facts that whatever differences there may be between the plaintiff's design and those of the defendant in details of ornament, they are still the same in general appearance and effect, so much alike that in the market and with purchasers they would pass for the same thing, so much alike that even persons in the trade would be in danger of being deceived.

From these observations of the Court it is clear that "identity of appearance, determined by the eye of the ordinary observer," is the test of piracy or infringement, and defines the protection which a patent affords to the inventor. This identity does not descend to the mere lines and dots, the various and infinite details of the design, but depends rather upon the predominant and characteristic features, the *tout ensemble*. Even with changes, variations, or omissions of these, if the indicted design contains the dominating features, or as a whole so simulates the original design covered by patent, that "there is identity of appearance," or, as expressed in *McCrea* v. *Holdsworth*, "sameness of effect upon the eye," then it is guilty of infringement:

If in the eyes of an ordinary observer, giving such attention as a purchaser usually gives, two designs are substantially the same—if the resemblance is such as to deceive such an observer, inducing him to purchase one supposing it to be the other, the first one patented is infringed by the other.

This is the protection afforded, and while an applicant may embrace claims covering distinctive and segregable parts of his design, as recognized in *ex parte Pope*, this will not increase or enlarge the extent of his protection. He does not thereby secure a patent for more than one design, and that one is the whole completed and finished design, made up of the distinctive and segregable parts, combined with the non-distinctive and non-segregable.

I am aware of what was said by Mr. Justice McLean as to combination of parts in *Root* v. *Ball & Davis*, (4 McLean, 177, 1846,) and by Commissioner Fisher (*ex parte Bartholomew*, C. D., 1869, 103) as to generic claims and variations. (See, also, *ex parte Sheppard*, C. D., 1870, 22.) But *Gorham Company* v. *White* is later and higher authority, and certainly is conclusive as to what may be patented as a design.

In *ex parte Bartholomew* Commissioner Fisher says:

Thus, if the invention were of a design for an ornamental button the face of which was grooved with radial rays, it would seem that the first designer of such a button might properly describe a button of five rays, and, having stated that a greater number of rays might be used, might claim a design consisting, generally, of radial rays, or of "five or more" rays, and that it could not be necessary for him to take out a patent for each additional ray that could be cut upon this button. So if the design were the ornamentation of long combs by a chain of pearls it would seem that a claim for such a design might be maintained against one who arranged the pearls either in curved or straight lines, or who used half pearls only, and that such modifications, if they had occurred to the designer, might properly have been enumerated in his specification as possible and equivalent variations. In short, I can see no reason under the law why designs may not be generic, why what are called "broad claims" may not be made to them, and why the doctrine of artistic or æsthetic equivalents may not be applied to them.

But it is evident that whatever form the claim for the button or the comb assumed the patent would protect whatever simulated its identity to the eye of the ordinary observer. In the case of the button this would be true whether there were more or less than five rays. There may be variations and immaterial departures from the specific details set forth in the patent which will be perfectly protected by it. The claim may be made "broadly," so as to cover them; but it cannot state them so broadly or generically as to cover a design not yet conceived, and which, as a work of art, would be so different from that exhibited in the patent that the eye of the ordinary observer would regard it as new and different. To permit such claims would enable the patentee to forestall the future and to usurp the ownership of unconceived and uncreated subjects of shape and ornamentation.

What, then, is the purpose of claims for distinctive and segregable parts? Evidently to enable the applicant for himself, and the Patent Office for the public, to point out those predominant and controlling features in a design the use of which alone would be regarded as preserving the identity of a design, even when other parts are omitted. Unquestionably whatever features or parts of a design which, if used by another, would constitute an infringement may be used by and protected to the patentee, and that is the limit and extent of the variation which the law will sanction or permit. The whole subject resolves itself back into a question of identity—sameness to the eye of an ordinary (unskilled) observer. The common observer is not familiar with the genus and species of design, (if such distinctions can have any existence,) and his liability to be misled or deceived in matters of resemblance and identity does not depend upon them. While, therefore, there is some little analogy between claims for distinctive and segregable parts in design patents and claims for elements and co-acting parts in mechanical patents, they are not founded upon the same principles.

An applicant may seek to patent a design for a stove in which is included the form or shape of the stove with the surface ornamentation for its sides and top. In such case he cannot secure a claim for the design as to ornamentation as applied to the sides and top of *any* stove, regardless of its form and configuration. If he wishes to secure a design for a side or panel of a (any) stove, he must take out a separate patent for that. In the case supposed his patent will cover the ornamentation, with such variations thereof as will preserve its identity upon the form or shape of the stove—with such variations thereof as will preserve its identity to the eye of the ordinary observer of both. He cannot in the same patent secure claims for distinct and separate parts independent of the whole design. (*Ex parte Neil*, MS. Dec., vol. 24, 266; *ex parte Hill*, MS. Dec., vol. 28, 124.)

Undoubtedly in cases like the present, where the design consists of a combination of shape and ornamentation, claims covering greater variation may be allowed, based upon distinctive and segregable parts, than where shape alone or ornamentation alone is the subject of the design. Thus the shape of the dish in the case under consideration, with some slightly distinctive features of ornamentation, might more easily deceive or mislead the eye of the ordinary observer than such distinctive feature of the ornamentation applied to a dish of wholly different shape and contour. As the subject of identity or sameness of design is addressed to the judgment of the eye of the ordinary observer, so the questions of the extent and character of claims in patents for distinctive and segregable parts must be determined largely by the skill and judgment of the experts of the Office. Whenever the claim is to such distinctive and predominant parts as when used and applied to an article of manufacture would induce the ordinary observer to accept them as the whole design, the claim should be allowed; but when the segregation goes so far that the identity of the whole design ceases, and the ordinary observer would not be likely to recognize the sameness or resemblance between the segregated parts and the whole design, they should not be allowed. The ordinary observer—the public—is not learned in patent law nor the nice distinctions in matters of claims. The public is not required to be skilled in matters of art. In dealing with designs, patented or unpatented, ordinary observers judge of the design as a whole, and are not called upon to dissect and analyze it with accuracy. To permit claims for parts that belong to details which possess no distinct and visible resemblance to and create in the mind no impression of the whole design would be to set traps for the unskilled and unwary. This is against public interest and will not be tolerated.

Claims for distinctive and segregable parts of a design indicate the skilled judgment of the Office as to what parts and features of the design, if segregated from the whole and applied to an article of manufacture, would accord with the eye of the ordinary observer and preserve the identity of the original and entire design. Evidently such claims should be carefully scrutinized; otherwise the applicant may in the same patent cover a multiplicity of designs. The courts would probably not interfere to defeat such patents nor to limit them to the one original design, but, regarding each distinct design as an original, would rest the validity of the patent upon the discretion vested in the Commissioner as to such matters.

In the present case there is no claim presented for the design of the form of the dish and its ornamentation as a whole, unless the preamble and nine paragraphs can be regarded as one claim. I do not see how claims can be allowed for distinctive and segregable parts of a design when there is no claim for the whole design. If patented, is the completed design to be free and its distinctive parts subject to patent? Or is the entire and finished design to be protected because the eye of the ordinary observer is required to recognize its identity with some of the segregated parts? Evidently, if variation in designs is to be recognized by allowing claims for distinctive parts, they must be formulated with reference to the whole design. The interests of the public require this.

In the case under consideration claim 1 is for the rectangular rim of the dish with reference to the central bowl or any ornamentation whatever. Claim 2 is for the shape of the bowl with circular outline and the rim, without reference to the ornamentation. These two claims together would cover simply the shape of the dish, "as shown and described," but without such words or the implication of the law would embrace the rim with any kind of a central part, and the bowl with any kind of a rim, and the whole shape without any ornamentation. In effect, as was stated in *ex parte Hill*, the claims would cover two designs, in which case applicant should be required to take out two patents. Claim 3 covers the corners of the dish with their surface ornamentation. Claim 4 is for the surface ornamentation of the corners. Claim 5 is for the ornamentation of the corners and panels, composing the entire rim of the dish. Claim 6 covers the ornamentation of the panels of the rim. Claims 8 and 9 relate alone to the ornamentation; but these claims for ornamentation do not appear to be limited to a dish of the form and shape shown, and, as already stated, this is essential where a design consisting of both form and surface ornamentation is to be embraced in a single patent.

The examiner calls attention to the fact that under *ex parte Harris* (38 O. G., 104) objections to claims for non-segregable parts relate to the merits rather than to form, and an appeal from such rejection should go to the Examiners-in-Chief. I concur in this view and follow that decision; but as the present appeal is taken as to matters of form as well as merits, I have felt justified in giving more consideration to the case than I otherwise would. The decision is affirmed as to the requirement that the words "as shown and described" be used in the claims, and the case is remanded to the Primary Examiner to take such further action on the claims as he may see proper, in view of the principles expressed herein. If applicant desires to appeal from such action, his

appeal from rejection of claims covering distinct and segregable parts must be taken to the Examiners-in-Chief.

EX PARTE GÉRARD.

Decided May 22, 1888.

DESIGN FOR PLATES AND OTHER DISHES.

1. The relation of genus and species does not exist in designs. The question involved in designs is one of identity.
2. A patent for a design must be limited to a single invention; but such patent may cover any variation or modification, provided the distinct and predominant features so far remain as to preserve the identity of the original completed design.

ON appeal.

Application of Emile Gérard, filed April 20, 1887, No. 235,564.

Messrs. A. C. Fraser & Co. for the applicant.

HALL, *Commissioner:*

In this case applicant seeks to patent designs consisting of both shape and surface ornamentation. Six dishes are shown in the drawings, all differing in shape and contour. Each dish is ornamented with its own surface ornamentation; but the entire surface ornamentation of each dish is unlike that of any of the other five. In the shape of each is some slight feature, such as a notch or indentation at a corner, and in the surface ornamentation of each is also found some features which are common to all. These features the applicant chooses to call distinct and segregable parts of his design, and upon them attempts to found a genus of design and its subordinate species. There is, and in the nature of the case can be, no entire and complete design—no one single design. Consequently, there is no claim for a single design as a whole, with other claims for distinct and segregable parts; but an attempt is made to apply the principles of generic and specific claims, which obtain in applications for mechanical patents.

Applicant devises certain rather unimportant forms relating to shape, and certain surface ornamentation; then exercising his skill and ingenuity in producing dishes of various shapes, he introduces his specific features of surface ornamentation. He claims, broadly, his specific features, and also incorporates claims for as many various and different forms of dishes, with their varied and different ornamentation, as his imagination can produce. He has presented nineteen claims, one of which covers the shape of the dish and the remaining eighteen cover the surface ornamentation of eighteen different dishes.

Claim 19 is as follows:

The design for the shape of a plate or similar dish, consisting of straight sides, rounded ends, indentations *a a* at the approximate junction of the sides and ends, and radial ribs *f f*, extending from said indentations across the rim.

With this broad claim for the shape or form applicant presents, as just stated, eighteen claims for as many different designs, based upon the fact that they possess some one or more features of form common to the parent design, or in common with each other.

On July 22, 1887, the examiner advised applicant as follows:

The Statute of Designs (section 4929 R. S.) provides for a new and original shape for an article of manufacture, or a new and original ornamentation thereof. A new and original shape may also have a new and original ornamentation; but a generic claim must be made for applicant's invention in accordance with the doctrine in *ex parte E. N. Eagle*, (C. D. 1870, 127.)

A claim may also be made for one of the species belonging to applicant's invention, but not for all the species which may exist under the generic invention. (*Ibidem.*)

On renewed consideration of the application above entitled it appears that there is no generic claim covering applicant's invention as disclosed, while there are many claims for various species and fragments thereof, contrary to the practice as above indicated. The objections noted in previous Office letter are therefore withdrawn, and will not be insisted on at the present time, being dominated by the above-noted objection.

This action, as I understand, was not a rejection nor an objection to any specific claim, but was simply a declaration that the examiner could not proceed to a consideration of the case until applicant had presented a claim for one entire completed design. He required a generic claim to be made. This action being repeated, the applicant appeals to the Commissioner.

In another appeal by this applicant I have had occasion to discuss the nature and character of claims for distinctive and segregable parts, and my remarks in that case are equally applicable to this. I think the examiner was correct in requiring applicant to submit a claim for the one entire completed design invented by him, for from that alone can it be determined what is and what is not distinct and segregable. As explained in *ex parte Gérard*, above referred to, this depends upon identity as determined by the eye of an ordinary observer. Without the original entire design it is impossible to make comparison or define the segregable parts. The examiner was unfortunate, I am disposed to think, in acting upon this supposed analogy of mechanical patents and requiring—

a generic claim for applicant's invention in accordance with the doctrine in *ex parte Eagle*, (C. D., 1870, 127.)

The relation of genus and species, in my opinion, does not exist in designs. As explained in the other case of applicant, the question is one of indentity. A patent for a design must be limited to a single invention; but such patent will cover any variation or modification, provided the distinct and predominant features so far remain as to preserve the identity of the original completed design.

The decision of the examiner was correct, and is affirmed; but the case is remanded, and the examiner is at liberty to modify his statement of the requirement or take such other action as he may see proper, in accordance with this decision.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 16, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 467 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 19, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of envelopes and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

DESIGNS.

18,378.—LAMP.—*Samuel Clarke*, Child's Hill Works, county of Middlesex, England. Application filed March 6, 1888. Serial No. 266,351. Term of patent 14 years.

18,379.—BONNET AND MILLINERY STAND.—*James Benjamin Clifford*, San Francisco, Cal. Application filed March 20, 1888. Serial No. 267,908. Term of patent 7 years.

18,380.—CARPET-SWEEPER CASING.—*Walter J. Drew*, Grand Rapids, Mich., assignor to *The Bissell Carpet Sweeper Company*, same place. Application filed February 23, 1888. Serial No. 265,053. Term of patent 14 years.

18,381.—BENCH-PLANE CUTTER.—*Amos Fales*, Rock Fall, Conn. Application filed July 16, 1887. Serial No. 344,551. Term of patent 14 years.

18,382.—ORNAMENTATION OF KNIT FABRICS.—*Jeremiah P. Harriman*, Woonsocket, R. I. Application filed March 10, 1888. Serial No. 266,883. Term of patent 14 years.

18,383.—FRINGE.—*George S. Hensel, Louis D. Valetton*, and *Frank E. Cook*, Philadelphia, Pa., assignors to *Hensel, Colladay Company*, same place. Applications filed April 28, 1888. Serial No. 272,210. Term of patent 7 years.

18,384.—SLIPPER-VAMP.—*Hugo L. Hiller*, New York, N. Y. Application filed April 16, 1888. Serial No. 270,877. Term of patent 7 years.

18,385.—SKIRT.—*Lizzie Roys*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed May 18, 1888. Serial No. 274,315. Term of patent 3½ years.

18,386.—LADY'S COSTUME.—*Jennie Sheils*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed May 18, 1888. Serial No. 274,313. Term of patent 3½ years.

18,387.—HANDLE FOR FORKS, &c.—*George W. Shiebler*, Brooklyn, N. Y. Application filed April 9, 1888. Serial No. 270,147. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,583.—LAUNDRY PREPARATIONS.—*Jesse Ascough*, Handsworth, near Birmingham, county of Stafford, England. Application filed February 17, 1888. Used since 1876.
"A disk having a groundwork representing crystals."

15,584.—GINGHAMS.—*Berkshire Manufacturing Company*, (*Limited*,) Frankford, Pa. Application filed April 26, 1888. Used since December, 1867.
"The word 'BERKSHIRE.'"

15,585.—CIGARS AND SMOKING AND CHEWING OR PLUG TOBACCO.—*James Elwin*, Minneapolis, Minn. Application filed March 31, 1888. Used since September 15, 1885.
"The words 'ALL STOCK AND NO STYLE' within quotation-marks embraced within a parallelogram."

15,586.—ANTISEPTIC OR BLOOD-PURIFYING MEDICINE.—*Herman G. Grisbaugh*, Kansas City, Mo. Application filed May 4, 1888. Used since September, 1886.
"The word 'FOAM.'"

15,587.—MEDICATED FOODS.—*Alexander Horlick*, Racine, Wis. Application filed May 15, 1888. Used since April, 1888.
"The word 'MALTOAT.'"

15,588.—EXTRACT OF SARSAPARILLA COMPOUND, EXTRACT OF JAMAICA GINGER, LIVER AND KIDNEY PILLS, AND COUGH-SYRUP.—*Kilgore & Wilson*, Belfast, Me. Application filed April 19, 1888. Used since January 20, 1888.
"The representation of a mortar and pestle, the former bearing the monogram 'K & W,' with two Greek crosses at the extreme right and left of the fac-simile label, with a particular arrangement of the names of the diseases for which the medicines and pills are intended."

15,589.—MEDICINE FOR THE CURE OF RHEUMATISM AND CHRONIC BLOOD DISEASES.—*Charles F. Kirkendall*, Pittsburg, Pa. Application filed May 14, 1888. Used since March 19, 1888.
"The word 'LARUMA.'"

15,590.—MINERAL WATER AND MINERAL SALTS AND PASTILS AND TROCHES MADE FROM THE SALTS.—*Koenig Wilhelm's-Felsenquellen*, Ems, Germany. Application filed April 25, 1888. Used since 1878.
"The representation of a pile of rocks in a pool of water, from the top of which a powerful spring flows, falling into said pool, the whole surmounted by an arch and surrounded by a double circle, within which appear the words 'KOENIG WILHELM'S-FELSENQUELLEN.'"

15,591.—SAFETY-RAZORS.—*Henry B. Leach*, Boston, Mass. Application filed May 2, 1888. Used since April, 1886.
"The word 'GEM.'"

15,592.—MEDICINE FOR HORSES AND CATTLE.—*Fr. J. Leimer*, Chicago, Ill. Application filed May 4, 1888. Used since May 1, 1888.
"The words 'DR. LEIMER'S WALK'ER.'"

15,593.—MEDICINAL PREPARATION FOR THE CURE OF DISEASES OF THE BLOOD AND SKIN.—*Eli Lilly & Company*, Indianapolis, Ind., and Kansas City, Mo. Application filed June 6, 1887. Used since 1882.
"The word 'McDADE.'"

15,594.—LAGER-BEER, SODA, AND MINERAL WATERS.—*Ludorff & Nache*, New York, N. Y. Application filed April 18, 1888. Used since October 1, 1887.
"The representation of a bull's head, defiant, frothing at the mouth, and showing more or less of the neck."

15,595.—SYRUPS FOR COUGHS AND COLDS.—*Marvelous Cough Syrup Company*, Havre de Grace, Md. Application filed April 7, 1888. Used since December 3, 1887.
"The word 'MARVELOUS' in connection with a monogram composed of the letters 'M C S.'"

15,596.—CHAMPAGNE-WINE.—*George H. Mumm & Co.*, Rheims, France. Application filed May 3, 1888. Used since December 15, 1887.
"A gilt, bronze, or copper band applied to the upper part of the neck of the bottle underneath the capsule or foil."

15,597.—HEPATIC COMPOUND.—*John F. Neal*, Lampasas, Tex. Application filed May 3, 1888. Used since January 1, 1888.
"A five-pointed star with its points touching an inclosing circle."

15,598.—LIQUID AND POWDER DISINFECTANTS.—*William Pearson & Co.*, Hamburg, Germany. Application filed May 8, 1888. Used since April 15, 1887.
"The word 'CREOLIN.'"

15,599.—CROUP REMEDY.—*Henry C. Peckham*, Freeport, Mich. Application filed April 23, 1888. Used since April 2, 1888.
"A picture representing a lady and gentleman seated at a center-table, and at the side of each a little girl supporting a banner on which are inscribed the words 'PECKHAM'S CROUP REMEDY SAVES LIVES.'"

15,600.—BUTTER.—*Pfister & McKey*, New Orleans, La. Application filed May 3, 1888. Used since 1878.
"The representation of a moon placed on a shield, with a face therein, showing a crescent, with the words 'ORIGINAL DUNDEE CREAMERY.'"

15,601.—REMEDY FOR PHTHISIS, NEURASTHENIA, CONSTIPATION, AND INTESTINAL INDIGESTION.—*Reed & Carnrick*, New York, N. Y. Application filed May 6, 1888. Used since February 1, 1888.
"The word 'PANCRO-BILIN.'"

15,602.—REMEDIES FOR PROMOTING THE GROWTH OF THE TEETH AND BONES.—*The Reynolds Manufacturing Company*, Cincinnati, Ohio. Application filed May 9, 1888. Used since March 5, 1888.
"The word 'TOOTH-FOOD.'"

15,603.—LEATHER OIL-POLISH.—*Hermann J. Max Stosck*, New York, N. Y. Application filed May 3, 1888. Used since February 15, 1888.
"The representation of a crown."

15,604.—LINIMENT, OINTMENT, AND CONDITION POWDERS.—*Thomas Veazie*, Elmira, N. Y. Application filed February 8, 1888. Used since September, 1886.
"The word 'BROS.'"

15,605.—CHAMPAGNE-WINE.—*Veuve Pommery Fils & Co.*, Rheims, France. Application filed April 4, 1888. Used since February 29, 1888.
"A medallion bearing the representation of a lion rampant, and a band connected with and extending from the said medallion."

15,606.—CHAMPAGNE-WINE.—*Veuve Pommery Fils & Co.*, Rheims, France. Application filed April 4, 1888. Used since February 29, 1888.
"The word 'AUTHENTIQUE' within a parallelogram."

15,607.—CHAMPAGNE-WINE.—*Veuve Pommery Fils & Co.*, Rheims, France. Application filed April 4, 1888. Used since February 29, 1888.
"The word 'GENUINE' within a parallelogram."

LABELS.

5,625.—Title: "GOLDEN RIDGE APPLE WINE."—*Bryan Atwater*, Berlin, Conn. Application filed May 7, 1888.

5,626.—Title: "DR. H. M. BETTS' LIVER CAPSULES."—*H. M. Betts*, La Grange, Ind. Application filed May 21, 1888.

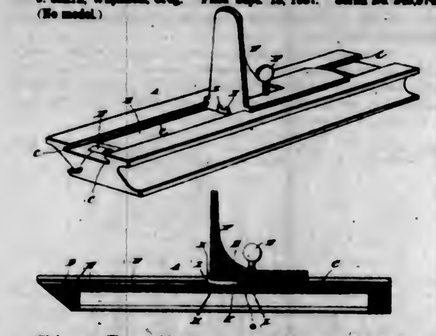
5,627.—Title: "DAVIES' BALM OF GILEAD OR PECTORAL BALSAM."—*E. Gomer Davies*, De Smet, Dak. Ter. Application filed May 15, 1888.

5,628.—Title: "DENTIFRICE ODORATA."—*David Genese*, Baltimore, Md. Application filed May 17, 1888.

5,629.—Title: "NOTE TO PHARMACISTS AND SPECIAL NOTE TO PHYSICIANS." (FOR MIXTURE OF GUAIAC, STILLINGIA, &c.)—*William H. Griffith*, New York, N. Y. Application filed May 16, 1888.

5,630.—Title: "MARVELOUS COUGH SYRUP."—*Marvelous Cough Syrup Company*, Havre de Grace, Md. Application filed April 9, 1888. (Trade-Mark Registered.)

5,631.—Title: "HUNT'S CURE FOR SKIN DISEASES AND ERUPTIONS."—*Albert Benjamin Richards* and *Mathew Venable Cheatham*, Sherman, Tex. Application filed May 16, 1888.



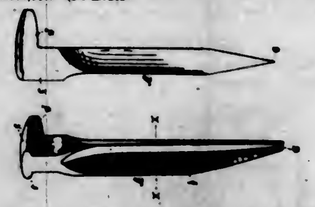
5,632.—Title: "CHEATHAM'S CHEAH BALSAM." (FOR A MEDICINE.)—*Albert Benjamin Richards* and *Mathew Venable Cheatham*, Sherman, Tex. Application filed May 16, 1888.

5,633.—Title: "LA BONTA'S FRENCH SHAMPOO CREAM."—*Rachel R. Westcott*, Syracuse, N. Y. Application filed May 21, 1888.

PATENTS

GRANTED JUNE 12, 1888.

384,228. SAW-MILL DOG. MILTON J. ARMSTRONG and BENJAMIN J. SMITH, Wagontire, Oreg. Filed Sept. 13, 1887. Serial No. 249,574. (No model.)

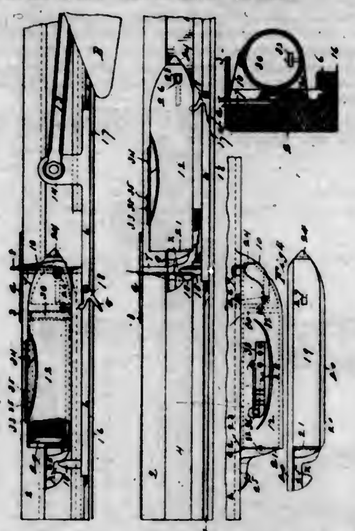


Claim.—1. The combination, in a saw-mill carriage, of the head-block having the bearing-roller on its front end, the longitudinally-movable knee, and the pivoted dog secured to the knee and depending therefrom, said dog being adapted to be raised by the roller, for the purpose set forth, substantially as described.

2. The combination, in a saw-carriage, of the head-block having the bearing-roller, the longitudinally-movable knee arranged on the head-block, and the dog pivoted to the said knee and having the forward-projecting upturned engaging-point, and provided on its under side with the inclined side M, for the purpose set forth, substantially as described.

3. The combination of the head-block having the bearing-roller with the longitudinally-movable knee, the dog pivoted thereto and adapted to be raised by the roller, and the device to adjust the dog, substantially as described.

4. The combination of the head-block, the bearing-roller journaled at one end thereof, the knee movable longitudinally on the head-block, the dog pivoted under the knee, having the points N at its front end adapted to engage a log, and the screw P, bearing on the dog to adjust the latter, so as to cause its front end to ride over the roller, and thereby hold its points in engagement with the log, substantially as described.

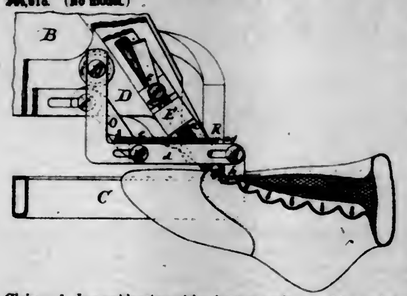


384,229. RAILWAY-SPIKE. CHARLES BAKER, Windsor, Ontario, Canada, assignor to William Gray, Detroit, Mich. Filed Mar. 20, 1888. Serial No. 267,869. (No model.)

Claim.—1. As a new article of manufacture, a railway-spike, A, triangular in cross-section, with parallel edges to the bevel of the point, and provided with an angular groove, b, in its flat face, said groove extending from the solid head to the extreme point of the spike, substantially as described.

2. A railway-spike, A, triangular in cross-section and having parallel edges to the bevel of the point A, an angular groove, b, formed in the flat face of said spike and extending from the head c to the extreme end of the point a, and flanges d e, formed upon the said head c, substantially as and for the purposes described.

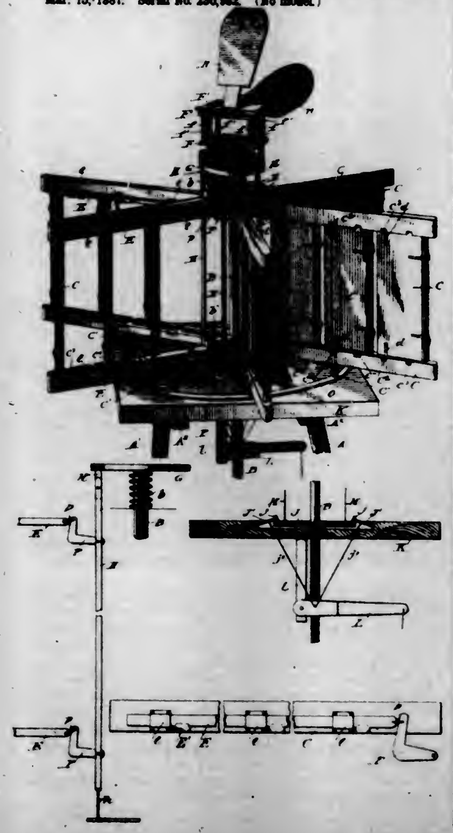
384,230. SHUTTLE AND SHUTTLE-OPERATING MECHANISM FOR SEWING-MACHINES. WALTER H. BURDETT, Boston, Mass., assignor to the Morley Button Sewing Machine Company, same place. Filed Jan. 10, 1887. Serial No. 223,987. (No model.)



Claim.—1. Shuttle-actuating mechanism for sewing-machines, consisting of a longitudinally-reciprocating bar, 6, having on it a pin engaging with the shuttle-carriage, and having a bell-crank lever pivoted thereon, one of whose arms is capable of swinging against said carriage, a shuttle-carriage having a notch therein in which the end of said pin engages loosely, combined with the shuttle-raceway of a sewing-machine in which said carriage and bar move, having a projection upon one of its walls, against which the second arm of said bell-crank lever is carried by the movement of said bar while the carriage and shuttle are passing through the thread-loop, substantially as set forth.

2. The shuttle 12, having the spring-actuated bell-crank lever 26 pivoted therein, having a hook on one arm thereof, combined with the shuttle-carriage 19, having a socket, 24, to receive the nose of the shuttle, a socket, 27, to receive said hook, and provided with the abutment-plate 21, substantially as set forth.

3. Shuttle-operating mechanism for sewing-machines, combined with the shuttle-race thereof, consisting of a shuttle-carrying slide-bar having a longitudinal reciprocating motion on a line with said race, a shuttle-carriage seated within said race and having an engagement with said slide-bar, and a bell-crank lever, substantially as described, attached to said bar, and having an engagement with a projection upon the wall of the shuttle-race and with the shuttle-carriage while the latter is moving, substantially as set forth.



384,231. PRESSER-FOOT FOR BUTTON-SEWING MACHINES. WALTER H. BENNETT, Boston, Mass., assignor to the Morley Button Sewing Machine Company, same place. Filed July 18, 1887. Serial No. 244,618. (No model.)

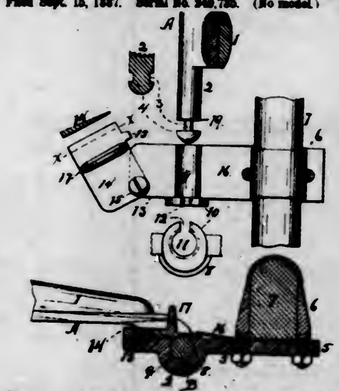
Claim.—1. In combination with a button-sewing machine and the button-attaching devices thereof, a bearing having slots substantially parallel to the table of the machine, and a presser-foot secured to said bearing by means of pins which engage the slots, the presser-foot having a rearwardly-extending open-ended slot, all substantially as described, for the object set forth.

2. In combination with a button-sewing machine, the button-attaching devices thereof, and a presser-foot having a rearwardly-extending open-ended slot, and secured to a slotted bearing by means of pins which engage the said slots, and a spiral spring connecting said foot and bearing and operating substantially as shown and described, for the object set forth.

384,232. WINDMILL. ALLEN W. BRODRICK, Mahomet, Ill. Filed Mar. 15, 1887. Serial No. 230,962. (No model.)

Claim.—1. In a windmill, a series of radial vertical sections having swinging doors or panels provided with projections, and sliding plates capable of sliding to engage or release said doors or panels.

2. In a windmill, a series of radial vertical wings made up of radial arms, swinging doors or panels arranged between the arms, the said doors or panels being provided with projections, and sliding plates arranged upon the radial arms and having projections engaging the projections from the doors or panels.



3. In a windmill, radial wings made up of a series of upper and lower radial arms provided with the notches C^3, C^3, and C^3, the swinging doors or panels having the projections *d*, and the sliding plates E, engaging the projections.

4. In a windmill, radial wings having the swinging doors or panels, the sliding plates E, engaging the doors, and the rods connected to the sliding plates and to the plate J, and the shaft J' and wheels *j*, for depressing the plates, substantially as described.

5. In a windmill, radial wings having swinging doors or panels, sliding plates having projections engaging the doors or panels, the vertical operating-rods connected to the sliding plates by bell-crank levers, and the regulating-vanes connected to the operating-rods, substantially as described.

6. In a windmill, radial wings having swinging doors or panels, sliding plates engaging with the doors or panels, vertical operating-rods connected to the sliding plates, the plate G, connected to the operating-rods, and the regulator-vane provided with a cam connected to the plate G, substantially as described.

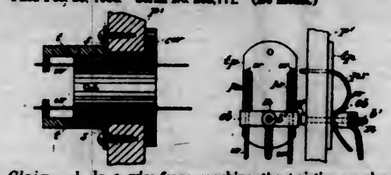
384,233. THILL-COUPLING. SIMEON R. CASTLE, Syracuse, N. Y. Filed Sept. 15, 1887. Serial No. 249,736. (No model.)

Claim.—1. In a thill-coupling, a thill-iron provided with a coupling-pin having on one end a head and a flattened neck, substantially as described.

2. In a thill-coupling, a thill-iron provided with a coupling-pin having a head and flattened neck, an axle-iron provided with a seat for the coupling-pin and its neck and open on top, a spring having one end secured by the clip-arms, and a lock-piece pivoted upon the axle-iron and beveled across its free end, and swinging horizontally around under the free end of the spring and onto the coupling-pin, substantially as described.

3. The combination, with a coupling-pin seated in the axle-iron, of a spring secured upon the axle clip-arms, and a beveled lock-piece swinging horizontally upon a pivot-bolt in the axle-iron around under the free end of the spring and onto the axle-iron, substantially as described.

384,234. LANTERN. JOHN CHARLESON, Brooklyn, N. Y., assignor to William Vogel & Bro., same place. Filed Feb. 4, 1888. Serial No. 262,965. (No model.)

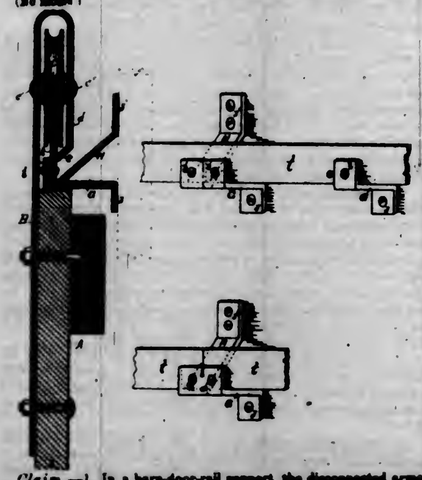


Claim.—1. The combination, with the deflecting-cap of a lantern, a globe, and a supporting-wire, as 1, secured to the deflecting-cap, of a globe-holding device consisting of a single piece of wire curved into a form greater than a semicircle and having the end portions bent up vertically, said bent-up parts having their ends rigidly secured to the deflecting-cap of the lantern, substantially as described.

2. The combination, with the deflecting-cap of a lantern, a globe, and a supporting-wire, as 1, formed with a curved part and an eye, of a globe-holding device consisting of a single piece of wire curved into a form greater than a semicircle and supported at the back by said supporting-wire 1, then carried forward and bent back on itself, and then carried vertically in advance of the diameter of the globe, and having the vertical part secured to the under face of the deflecting-cap, substantially as and for the purpose specified.

3. The globe-holder herein described, consisting of a single wire curved into a circular form of more than one-half of a circle, then having the strand bent down on itself and the end posts carried vertically in advance of the diameter of the circle and formed with a curve, and an additional vertically-arranged supporting-wire secured to the middle of the circular part of the holding-wire, said vertical parts being adapted to be secured to a deflecting-cap of a lantern, substantially as described, and for the purpose stated.

384,235. FENCE-MACHINE. SOLOMON CORBATH, Cookport, Pa. Filed Feb. 20, 1888. Serial No. 264,771. (No model.)



Claim.—1. In a wire-fence machine, the twisting mechanism herein described, comprising the chain-wheel *cw*, having the cylindrical shank *cw'*, revolving in sleeve *s*, the sleeve *s*, secured to the frame, the twister *t*, mounted on said shank, engaging and revolving with it, and having ears *e*, with openings for the fence-wires, substantially as shown and described.

2. The tension device combining the plate *tp* and its grooved semicircular pieces *pr*, the clamp-block *cb*, held to the post by a bolt, and the lever-nut *n*, for tightening the grip of the clamp upon the fence-wire, substantially as shown and described.

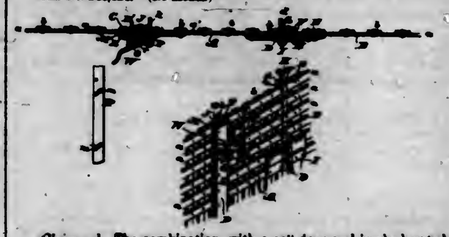
3. In combination, in a wire-fence machine, a frame, F, carrying twisters *t*, with ears *e*, rotating within sleeves *s*, secured in the frame, operated by chain-wheels *cw*, connected to the twisters by means as described, and driven by the chain *ci* through crank *c*, substantially as shown and described.

384,236. COMBINED DOOR-HANGER, RAIL, AND RAIL-BRACKET. WILLIAM CROSS, Havana, N. Y. Filed Oct. 10, 1887. Serial No. 251,807. (No model.)

Claim.—1. In a barn-door-rail support, the disconnected arms G H, the arm G horizontally constructed with an upturned front lip, *i*, and a bent foot or rest at its attaching end, the arm H angularly constructed, having an upturned front lip, *i*, and an upturned foot or rest at its attaching end, in combination with rail-section *f*, resting upon and secured to the back of said lips, substantially as shown and described.

2. In combination, the rail-bracket having an upturned front lip, *i*, back of and to which rail-sections *f f*, having square abutting ends resting upon the bracket, are secured, said lip at its foot having an angular arm, H, and a horizontal arm, G, verging therefrom, and each terminating in a bent foot or rest at its attaching end, substantially as described.

3. A door-hanger consisting of a suitable frame bent in U form over the sheave C, and having the angularly-bent end *e* beneath said sheave, at the extremity of its back arm, in combination with rail-sections *f f*, secured to front lip or lips, *i*, of a support having arms G H, in pairs, angularly and horizontally constructed and each terminating in a bent foot or rest at its attaching end.



384,237. PENCIL AND INVENTORY CHECK. CALEB S. DE WITT, Lockport, Ill. Filed Dec. 7, 1888. Serial No. 194,915. (Model.)

Claim.—1. A set or series of checks or tickets having the letters and figures marked thereon in the manner substantially as set forth, and numbered in consecutive order to represent the quantity of goods or articles in the box or package to which they attach, substantially as and for the purpose specified.

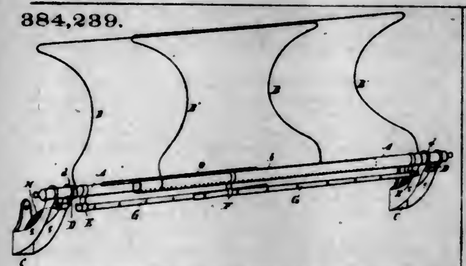
2. A set or series of checks or tickets having consecutive inventory numbers for constantly showing the quantity of goods sold from the package to which they attach, and also to represent at any time the quantity of goods remaining unsold in the package to which said checks or tickets are attached, substantially as set forth.

384,238. BOLT. CARL DEIBELE, Canton, Ohio, assignor to the Diebold Safe and Lock Company, same place. Filed Aug. 13, 1887. Serial No. 246,826. (No model.)

Claim.—1. The combination, with a coil-door and jambs located along the opposite edges of the door, of plates secured to the jambs and spaced therefrom, forming grooves corresponding to the length of the door, a bar secured to the hinge edge of the door to project in the groove along the jamb, and a locking-bar independent of the door and supported in the groove along the jamb at the free edge of the door, the said locking-bar being supported to move vertically and laterally over the free edge of the closed door, substantially as set forth.

2. The combination, with a jail-coil-door jamb, of the plate L, secured to the jamb to form a groove, *s*, and an angle-iron jamb-support, J, substantially as set forth.

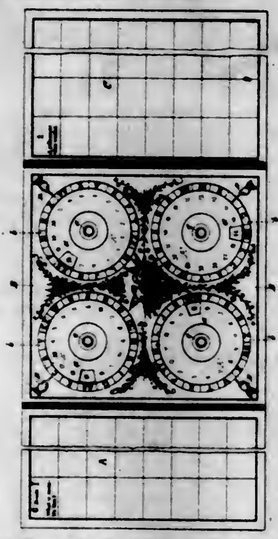
3. The combination, in the door-jamb D, of the vertical bars E and F, the angle-iron G, and the horizontal bars *a*, projected beyond the bar F to form a vertical groove, H, which is adapted to receive and secure the vertical hinged edge of the door, substantially as set forth.



4. The locking-heap W, having the projecting pin *r*, adapted to pass into the perforations *s* and to secure the locking-bar when in locking position, substantially as set forth.

384,239. PILLOW-SHAM HOLDER. JOHN W. DOBIE, Detroit, Mich. Filed Feb. 3, 1887. Serial No. 226,269. (No model.)

Claim.—1. The combination, with the bracket C, having arms *c c*, formed with eyes, as described, the inner one of which is slotted, of the rotatable extensible main bar and the stop D on said main bar, substantially as described.



2. The combination, with the bracket C, formed with arms *c c*, having eyes, as shown, the inner one of which is slotted, of the rotatable extensible main bar, the stop D, secured thereto, and the spring

384,239.

H, having one end secured to said bracket, and the other end engaging said stop, substantially as and for the purpose specified.

384,240. GAME. WILLIAM C. DUNN, New York, N. Y. Filed Jan. 27, 1888. Serial No. 262,111. (No model.)

Claim.—1. The combination of disks revoluble about their centers, a radial slot in each disk, and a border on the outer edge of each disk divided into equal spaces and each space containing a symbol, with a sheet of suitable material having a plane surface, to which said revoluble disks are attached, series of numbers inscribed in circles upon said plane surface, so that when said disks are turned said numbers may be successively seen through said slots, index-hands eastamped upon said plane surface—one for each disk—outside the perimeter of said disk and pointing to the center thereof, two leaves of equal size having plane surfaces and flexibly attached by one edge each to an opposite side of said plane-surfaced sheet, so as to fold thereon, a series of equal spaces marked upon the inner side of each leaf, a pair of symbols and a question eastamped within each of said spaces upon one leaf, and a series of numbers and answers eastamped within the spaces upon the other leaf, and the said pairs of symbols so arranged with regard to the symbols on the said revoluble disks that when the corresponding symbols upon two of said disks are set opposite the said index-hands a number corresponding to each disk may be seen through the slot thereof, which numbers constitute an arithmetical problem, the solution of which gives the number of the answer to the question eastamped, as aforesaid, with said pair of symbols upon one of said leaves, which number and answer are eastamped, as aforesaid, upon the other leaf, substantially as and for the purpose set forth.

2. The combination of the disks 1, 2, 3, and 4, the slots *a* of said disks, and the border *b* thereof, divided and marked with symbols, as specified, with the plane-surfaced sheet B, to which the disks 1 2 3 4 are revolubly attached by their centers *e e e e*, the circles of numbers E E E E inscribed, as aforesaid, upon said sheet B, the index-hands D D D D, also eastamped thereon, the leaves A and C, flexibly attached to said sheet B, and each divided into spaces and eastamped, as specified, all substantially as and for the purpose set forth.

384,241. UPRIGHT PIANO. WILLIAM H. DUTTON, Philadelphia, Pa. Filed Oct. 9, 1886. Serial No. 215,705. (No model.)

Claim.—1. An upright piano the upper portion or head of the frame-work of which is of skeleton or box-like structure, in order to render said upper portion of said frame-work a musically-vibratory framing, substantially as set forth.

2. An upright piano the upper portion or head of the frame-work of which is a skeleton or box-like structure, the component members of which are so joined or framed together as to embody between them openings or tone-conductors which both render said head a musically-vibratory framing and afford top channels of egress for the tone which exists to the rear of the sounding-board within the casing of the instrument, substantially as set forth.

3. An upright piano the upper portion or head of the frame-work of which is a skeleton or box-like structure, the component members of which are so joined or framed together as to embody between them openings or tone-conductors which both render said head a musically-vibratory framing and afford top channels of egress for the tone which exists to the rear of the sounding-board within the casing of the instrument, and which is provided with a controllable lid which serves as a swell to said tone-conductors, substantially as set forth.

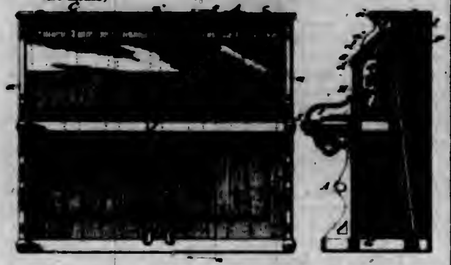
4. An upright piano the upper portion or head of the frame-work of which is channeled or provided with openings or tone-conductors which render said head a musically-vibratory framing and afford top channels of egress for the tone which exists to the rear of the sounding-board within the casing of the instrument, and which is as to its said head provided with a reverberator or other suitable tone-deflecting device, which serves to deflect the tone escaping from the openings or tone-conductors forward or to the front of the instrument, substantially as and for the purposes set forth.

5. An upright piano the upper portion or head of the frame-work of which is channeled or provided with openings or tone-conductors which render said head a musically-vibratory framing and afford top channels of egress for the tone which exists to the rear of the sounding-board within the casing of the instrument, which is as to its said head or casing provided with a reverberator or other suitable tone-deflecting device, which serves to deflect the tone escaping from the openings or tone-conductors forward or to the front of the instrument, and which is also provided with a controllable lid which serves as a swell to said tone-conductors, substantially as set forth.

6. In combination with the casing and with the action of an upright piano, a sound deadening or muffling dome or action-noise chest composed of material through which sound will not pass, applied in front of and inclosing the action, substantially as and for the purpose set forth.

7. An upright piano the upper portion or head of the frame-work of which is channeled or provided with openings or tone-conductors which render said head a musically-vibratory framing and afford channels of egress for the tone which exists to the rear of the sounding-board within the casing of the instrument, and which is also provided with a muffling-dome or action-noise chest for incasing the key-action and deadening its sound, substantially as set forth.

8. An improved frame-work for an upright piano, consisting of a pin-block, a back board, and a series of vertical framing-studs disposed between said pin-block and back board at given intervals and without intermediate filling-blocks in such manner as to constitute the head of the frame-work a skeleton or vibratory framing, and to form in it a series of vertical passages or tone-conductors, substantially as set forth.



384,242. UPRIGHT PIANO. WILLIAM H. DUTTON, Philadelphia, Pa. Filed Mar. 12, 1887. Renewed Feb. 20, 1888. Serial No. 264,694. (No model.)

Claim.—1. In combination with the casing of an upright piano, and with the action contained in said casing, a sounding-dome of thin sounding-board wood applied in front of and inclosing the action, substantially as and for the purposes set forth.

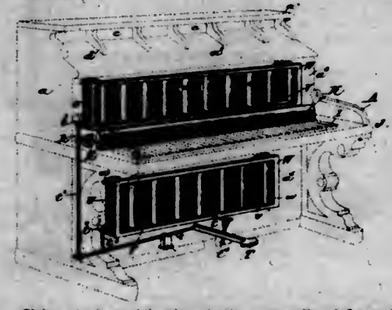
2. In an upright piano, the sounding-board in front of the action, formed as a dome and secured to the pin-block at its upper portion and to the sides of the casing at its sides, substantially as set forth.

384,243. UPRIGHT PIANO. WILLIAM H. DUTTON, Philadelphia, Pa. Filed July 1, 1887. Renewed Feb. 20, 1888. Serial No. 264,695. (No model.)

Claim.—1. An upright piano the top portion or head of the frame-work of which is provided with channels or tone-conductors having forwardly-facing mouths, substantially as and for the purposes set forth.

2. An upright piano the upper portion or head of the frame-work of which is provided with channels or tone-conductors having forwardly-facing mouths, and which is provided with a sounding-deflector, substantially as and for the purposes set forth.

3. An upright piano the upper portion or head of the frame-work of which is a skeleton or box-like structure, the component members of which are so joined or framed together as to embody between them openings or tone-conductors, and the pin-block of which is, as to its upper level, lowered, dressed off, or notched out, to afford forwardly-facing mouths to said tone-conductors, substantially as set forth.



4. In an upright piano of the character hereinbefore set forth, in combination with the tone-conductors having forwardly-facing mouths, the internal deflector, substantially as and for the purposes set forth.

5. An improved frame-work for an upright piano, consisting of a pin-block, a back board, and a series of vertical framing-studs each tapering in two directions, and disposed between said pin-block and back board at given intervals in such manner as to constitute the head of the framing a skeleton or vibratory framing, and to form in it a series of vertical passages or tone-conductors, substantially as set forth.

6. As an article of manufacture, a piano pin-block having a series of notches or openings cut through its upper portion, substantially as and for the purposes set forth.

7. In an upright piano, the following elements in combination: a frame-work having a skeleton head provided with tone-conductors having forwardly-facing mouths, a cover superimposed upon the head, an internal deflector within the tone-conductors beneath said cover, and a sounding-deflector, substantially as and for the purposes set forth.

384,244. UPRIGHT PIANO. WILLIAM H. DUTTON, Philadelphia, Pa. Filed Mar. 12, 1887. Renewed Feb. 20, 1888. Serial No. 264,696. (No model.)

Claim.—1. An upright piano having a sounding-deflector intermediate between and extending from the pin-block to the front of the casing, substantially as and for the purposes set forth.

2. An upright piano having a sounding-deflector intermediate between and extending from the pin-block to the front of the casing, in combination with a casing-front containing or embodying a sounding-board surface, substantially as and for the purposes set forth.

3. An upright piano having a sounding-deflector intermediate between and extending from the pin-block to the front of the casing, in combination with a casing-front containing slats, substantially as set forth.

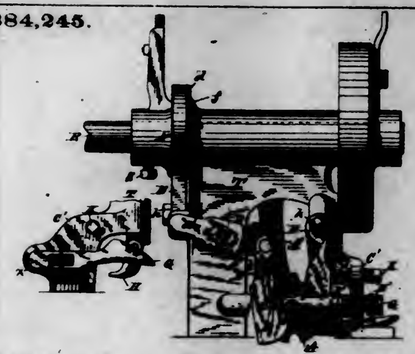
4. An upright piano having a sounding-deflector intermediate between and extending from the pin-block to the front of the casing, in combination with a casing-front containing slats and provided with a key-board swell, substantially as set forth.

5. An upright piano the top portion or head of the frame-work of which is provided with channels or tone-conductors having forwardly-facing mouths, in combination with a sounding-deflector or sound-board intermediate between and extending from the pin-block to the front of the casing, and with a casing-front containing slats, substantially as set forth.

6. An upright piano the front face of the casing of which contains a panel-surface consisting, essentially, of two series of alternating slats respectively disposed in parallel planes, substantially as set forth.

7. An upright piano the front face of the casing of which contains a panel-surface consisting, essentially, of two series of alternating slats respectively disposed in parallel planes, and which is provided with suitable means for occasioning the approach or recession of the respective series of slats, substantially as set forth.

8. An upright piano the front face of the casing of which contains a panel of slats, the said panel consisting of two series of semi-cylindric reverberating alternating slats lying in parallel planes, and by series reversely disposed, in order that when the slats of one series are brought into contact with the slats of the other series the said slats may register edge to edge and constitute a corrugated panel-surface, substantially as set forth.

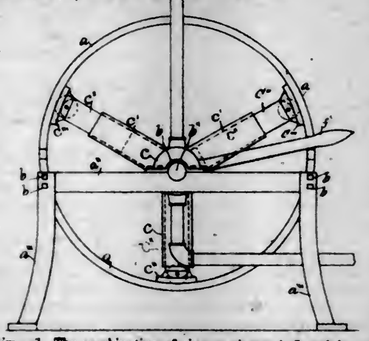


9. The combination, to form the front face of the casing of an upright piano, of a panel frame, a slat frame contained within said panel frame and having a series of separated slats, and a second slat frame containing a corresponding series of separated slats alternately disposed with respect to the slats of the first series, and which is movable with respect to the slat frame first referred to, in order to occasion the meeting or lapping of the edges of the slats, and thereby to provide or to close openings between the slats of the respective series, substantially as set forth.

10. The combination, in an upright piano, of a panel frame for its front face, a slat frame contained within said panel frame and having a series of separated slats, a second slat frame containing a corresponding series of separated slats alternately disposed with respect to the slats of the first series, and which is movable with respect to the slat frame first referred to, in order to occasion the meeting or lapping of the edges of the slats, and thereby to provide or to close openings between the slats of the respective series, and suitable means under the control of the player for occasioning the relative approach or separation of the slats of the aforesaid respective series, substantially as set forth.

384,245. KNOTTER FOR GRAIN-BINDERS. CONRAD FARMER and GEORGE LEUBER, Milwaukee, Wis. Filed Mar. 1, 1886. Serial No. 193,663. (No model.)

Claim.—1. In twine binders for harvesters, the combination of the shaft R, collar N, provided with lug M, slide E, provided with



384,245.

elliptically-shaped recess L and angular recesses O and P, said slide being adapted to be moved upward and downward by the circular movement of said lug M within said recess, lever D, centrally pivoted to the supporting-frame T, pawl B, and ratchet-wheel C, affixed to the side of the cord-holding disk A, substantially as and for the purpose set forth.

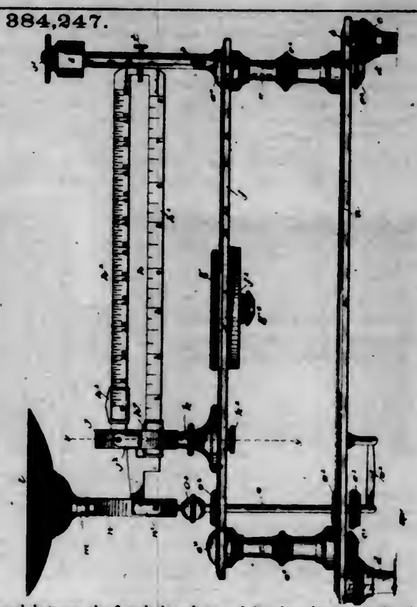
2. In a cord-knotter for grain-binders, the combination of the shaft R, collar N, provided with lug M, slide E, having recesses L, O, and P, said slide E being guided in its reciprocating movement by the bolt *h*, operating in slot *g* and connecting at its lower end by a movable joint with the pawl-lever D, lever D, formed in two parts adjustably secured together and pivoted to the frame T upon the shaft or trunnion *d'*, pawl B, and ratchet-wheel C, said wheel C being affixed to the side of the cord-holding disk A, substantially as shown and described.

384,246. STEAM-ENGINE. FRIEDRICH FISCHER, Des Moines, Iowa. Filed July 26, 1887. Serial No. 245,073. (No model.)

Claim.—1. The combination of ring *a*, pieces *a'* *a''*, and legs *a'''*, bolts *b*, bearings *b'*, shaft *b''*, wheels *l* and *l'*, rings *d'''*, hub *c*, with cylinder *c'*, pistons *c''*, rollers *c'''*, packing-rings *d*, ports *d'* and *d''*, valve *f*, with handle *f'*, ports *f''*, and grooves *f'''*, ring *g*, with ports *g'*, *g''*, and *g'''*, box *h*, with rim *h'*, rings *h''*, space *h'''*, and small port *k*, substantially as and for purposes stated.

2. The combination of the ring *a*, with rollers *c'''*, pistons *c''*, cylinders *c'*, hub *c*, ports *d'* and *d''*, valve *f*, ports *f''*, grooves *f'''*, the ring *g*, with ports *g'*, *g''*, and *g'''*, and box *h*, with rim *h'*, rings *h''*, space *h'''*, and port *k*, substantially as set forth, for purposes stated.

3. The combination of shaft *b''*, hub *c*, cylinders *c'*, pistons *c''*, rollers *c'''*, with ports *d'* and *d''*, the valve *f*, with ports *f''* and groove *f'''*, the ring *g*, with ports *g'*, *g''*, and *g'''*, substantially as and for the purposes stated.



4. The combination of pistons *c''*, cylinders *c'*, hub *c*, and shaft *b''*, with valve *f*, ring *g*, and box *h*, substantially as and for the purposes stated.

5. The combination of ring *g*, with ports *g'* and *k*, and the box *h*, with rim *h'*, rings *h''*, and space *h'''*, substantially as and for purposes stated.

384,247. PRESCRIPTION-WEIGHING SCALE. CALVIN H. FITCH, Poultney, Vt. Filed July 15, 1887. Serial No. 244,304. (No model.)

Claim.—1. A prescription-scale comprising a pan and a beam provided with the permanently-fixed sliding weights, a bearing-plate, a post to which the beam is pivoted and which is detachably connected to the said bearing-plate, a foundation-plate, and removable posts interposed between the foundation-plate and bearing-plate to render the former detachable from the bearing-plate, whereby the parts of the scale may be readily disassembled and the scales "knocked down" for storage and transportation, substantially as described.

384,247.

2. A foundation-plate provided with leveling-feet, a bearing-plate, and detachable posts connecting the two plates, and a spirit-level arranged in the upper plate and rotatable therein, so as to be brought lengthwise and crosswise of the plate, to ascertain the level of said late longitudinally and transversely, combined with a scale-pan, a scale-beam, and bearings therefor arranged upon the bearing-plate, substantially as described.

3. A scale having a rotary spirit-level consisting of a block provided with a bubble-tube, a cap connected with said block by screw-threads, and having a sight for the bubble-tube, and the bearing-plate of the scales having a pocket in which the level is arranged, substantially as described.

4. A scale-beam having two ridgidly-connected or integral graduated members, with the zero-point of the lower member in vertical alignment with the knife-edge of the beam, and provided with permanently-affixed sliding weights, combined with such knife-edge, bearings therefor, and a scale-pan and its counterpoise, substantially as described.

5. The post provided with oppositely-moving beam-locking devices, a cam for moving said devices, and a cap covering the same and adapted to rotate it, substantially as described.

6. A post having longitudinal recesses or kerfs, combined with oppositely-moving beam-locking devices, a serpentine cam engaging said beam-locking devices, and means to rotate said cam to grasp and release the beam, substantially as described.

7. A scale-beam having an equalizing device in the form of a screw arranged at its free end, combined with a post and beam-locking devices co-operating with said equalizing device, and means to move said devices toward and from said equalizing device, substantially as described.

384,248. DADO-CUTTER. WILLIAM R. FOX, Grand Rapids, Mich. Filed Mar. 10, 1888. Serial No. 266,911. (No model.)

Claim.—1. A dado-cutter consisting of two outer saws arranged parallel to each other, and intermediate saws arranged at an angle thereto, adjustable with the outer saws, to lessen or widen the cut, substantially as described.

2. A dado-cutter consisting of outer parallel saws and inner inclined saws occupying the intermediate space, the outer and inner saws being connected in pairs or series, and adjustable toward or from each other, to lessen or widen the cut, substantially as described.

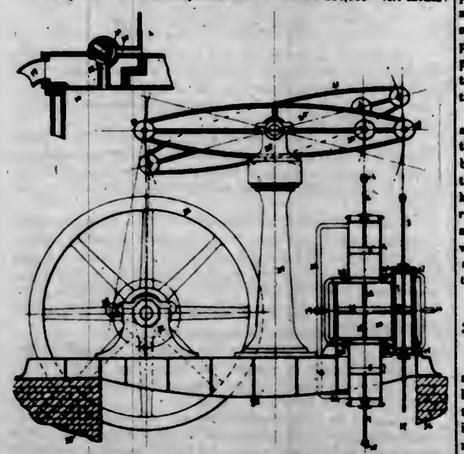
3. A dado-cutter consisting of outer parallel saws and inner inclined saws connected in pairs or series, and mounted upon a right and left hand screw-threaded sleeve, whereby the saws are adjusted to different widths, substantially as described.

4. In a dado-cutter, parallel outer saws, inner inclined saws, flanged rings for connecting the saws together in pairs or series, and outer rings internally screw-threaded, one upon each side, connected one to each set of saws, and a right and left hand screw-threaded sleeve, upon which the rings are mounted and by which the series of saws are adjusted, substantially as described.

5. The combination, in a dado-cutter, of the outer rings A A, having inner flanges, straight and inclined saws arranged in series and supported on said inner flanges, thimbles and screws for securing the rings and saws of each set together, and a right and left hand screw-threaded sleeve adapted to corresponding threads on the rings A A, substantially as described.

6. The combination, in a dado-cutter, of the straight and inclined saws arranged in pairs, a right and left hand screw-threaded sleeve for adjusting the saws, having depressions on its face, and a wrench for operating the sleeve, having projecting pins adapted to the depressions, substantially as described.

7. A dado-cutter consisting of two outer adjustable saws arranged parallel to each other, intermediate inclined saws adjustable with the outer saws, and a fixed inclined saw between the adjustable inclined saws, substantially as described.



8. A dado-cutter consisting of two outer adjustable saws arranged parallel to each other, and a double set of intermediate inclined saws, the saws of each set being adjustable with the respective outer saws, substantially as described.

384,249. RAILROAD-RAIL JOINT. NATHAN T. FRAME, Jamestown, Ohio. Filed Sept. 24, 1887. Serial No. 250,548. (No model.)

Claim.—The solid coupling-piece, Fig. 2, in combination with the two rails having their crowns and bases meeting not on the same vertical line, so as to give a diagonal strain upon the continuous or combined rails, substantially as set forth.

384,250. TRIPLE-EXPANSION ENGINE. HARVEY F. GASKILL, Lockport, N. Y. Filed Sept. 20, 1887. Serial No. 250,163. (No model.)

Claim.—1. The combination, substantially as set forth, in a triple-expansion engine, of a double-acting high-pressure power-cylinder and a double-acting low-pressure power-cylinder arranged side by side, and two single-acting power-cylinders for intermediate pressure, arranged at the ends of the double-acting cylinders, whereby the exhaust from one grade into the next grade is through short and direct passages.

2. The combination, substantially as set forth, in a triple-expansion engine, of two double-acting power-cylinders arranged side by side, and two single-acting power-cylinders arranged at the ends of the double-acting cylinders, when the pistons of said cylinders move synchronously together in the same direction.

3. The combination, substantially as set forth, in a triple-expansion engine, of the high-pressure, the intermediate-pressure, and the low-pressure power-cylinders with the beam, when said cylinders have their pistons connected to the beam at two or more different points on the same side of its center.

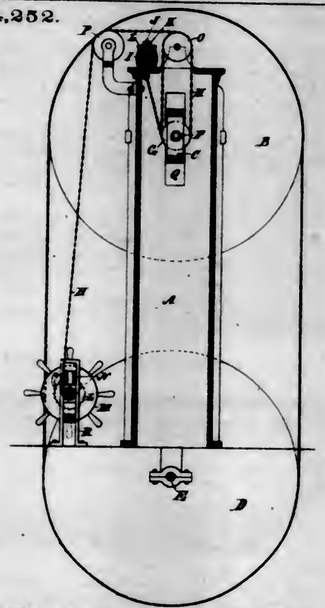
4. The combination, substantially as set forth, in a triple-expansion engine, of the high-pressure power-cylinder, the low-pressure power-cylinder at the side thereof, and the intermediate-pressure power-cylinders at the ends thereof and in line with the low-pressure cylinder.

384,251. SIPHON. FRED H. GILE, Alfred, Me. Filed July 5, 1887. Serial No. 243,772. (No model.)

Claim.—1. In a siphon, the combination, with a valveless tube having at its lower end an enlargement formed substantially as described, a discharge-pipe near its upper end, and a suitable packing at its top, of a valveless plunger fitting in said tube, and a plunger-rod passing through said packing and adapted to raise the plunger to the space in the tube above the discharge-pipe and to depress it into the enlargement at the bottom of said tube, substantially as and for the purpose set forth.

2. In a siphon, the combination, with a tube having an enlargement at its lower end, a discharge-pipe near its upper end, and a suitable packing at its top, of a valveless plunger fitting in said tube, a plunger-rod passing through said packing and adapted to raise the plunger to the space in the tube above the discharge-pipe and to depress it into the enlargement at the bottom of the tube, and a stop adapted to limit the downward motion of the plunger-rod and thus to prevent the depression of the plunger into said enlargement, substantially as and for the purpose set forth.

3. In a siphon, the combination with a tube having a suitable packing at its upper end, of a discharge-pipe opening from the tube at a point below the packing and terminating in a constricted tip, substantially as described, a valveless plunger fitting in said tube, and a plunger-rod passing through the packing and adapted to depress the plunger to the bottom of the tube and to raise it to the space in the tube above the opening of said discharge-pipe, substantially as and for the purpose set forth.



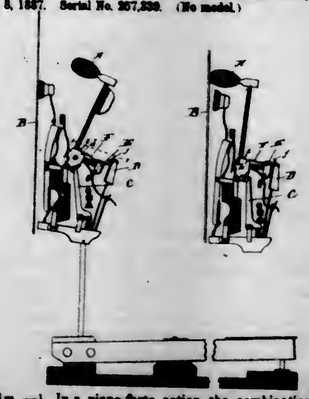
4. The combination with the tube *a*, having the enlargement *a'* and opening *f* at its lower end, the stuffing-box at its upper end, and the discharge-pipe *i j*, opening from it at a point below the stuffing-box, of the plunger lying within the tube, the plunger-rod passing through the packing and adapted to raise and lower the plunger, the knob *d*, fastened to the top of the plunger-rod and formed with the recess *d'*, and the lug *d''*, projecting upward from the top of the tube and adapted to enter the recess *d'* upon the depression of the knob when the same is in one position, but to prevent the complete depression of the knob when it is rotated to a different position, substantially as and for the purpose set forth.

384,252. BAND-SAW MILL. WILLIAM GILLIS, Buckingham, Quebec, Canada. Filed Sept. 20, 1887. Serial No. 251,009. (No model.)

Claim.—1. A band-saw mill comprising, in combination, an upper and lower saw-wheel, the former carried in a yoke and having a pulley on the wheel-shaft, a spring secured to a fixture, a chain attached to said spring and supporting said shaft-pulley, pulleys carrying said chain, and a windlass winding said chain upon a drum journaled on spring-bearings which resist the strain of the chain, whereby all the springs will respond simultaneously to keep the saw at a uniform tension, as set forth.

2. In a band-saw mill, the combination, with the upper saw-wheel journaled in movable bearings and a pulley on said shaft, of a spring secured to a fixture, a chain attached to said spring and supporting

384,252.



said shaft-pulley, pulleys carrying said chain, and a windlass winding said chain to adjust the tension of the saw, as set forth.

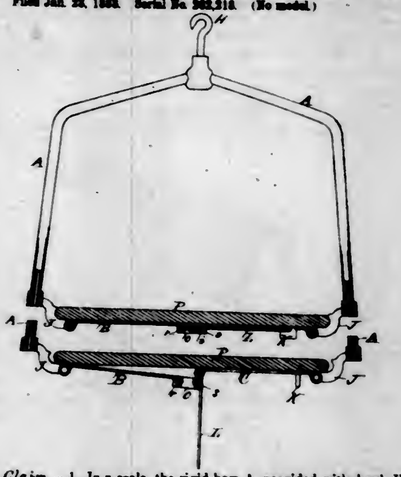
384,253. MAP-CASE. ARTHUR H. HALL, Chicago, Ill. Filed June 25, 1887. Serial No. 242,501. (No model.)

Claim.—A map-case consisting of end pieces, a covering or front piece, and a hinged back piece forming a door for giving access to the interior of the case for the insertion or removal of a wall-map and its roller, said map-case being provided with fastenings for securing the case when closed, substantially as shown and described.

384,254. PIANO-FORTE ACTION. STILLWELL B. HARCOURT, Chicago, Ill., assignor to The W. W. Kimball Company, same place. Filed Dec. 8, 1887. Serial No. 257,339. (No model.)

Claim.—1. In a piano-forte action, the combination, with the hammer and the back-catch, of a spring, F, borne by the hammer and having contact with the catch at the latter part of the key-stroke, substantially as set forth.

2. In a piano-forte action, the combination, with the hammer, the butt, and the back-catch, of a spring, F, secured to the butt and contacting with the catch at the latter part of the stroke, substantially as set forth.



3. In a piano-forte action, the combination, with the hammer, the butt, the bunter, and the back-catch, of the spring secured to the butt resting upon the bunter and striking the catch, substantially as set forth.

384,255. WIRE STRETCHER OR CLAMP. WILLIAM HAVINS, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,192. (No model.)

Claim.—A wire-clamp comprising a stationary jaw, A, provided near one end with a fulcrum-arm, B *b*, at the opposite end with an upright standard, and having an intermediate bearing-shoulder, *a*, a movable jaw, D, eccentrically pivoted to said standard, and a lever-arm, C, resting against the fulcrum *b* and pivoted to the movable jaw D, said stationary and movable jaws and lever-arm being relatively organized, substantially as shown, whereby the wire may be held and stretched approximately in the line thereof, substantially as described.

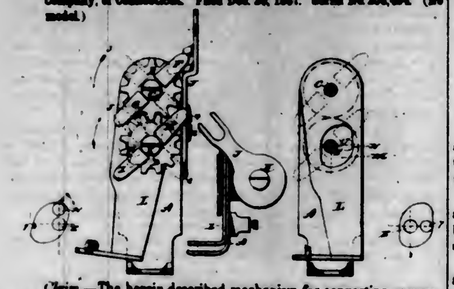
384,256. SCALE-PAN. HENRY J. HERRINGER, Cincinnati, Ohio. Filed Jan. 28, 1888. Serial No. 262,218. (No model.)

Claim.—1. In a scale, the rigid bow A, provided with hook H and jaws J for the reception of plate P, in combination with draw-levers B C, connecting plates *o o*, and eccentrically-jointed lever L, whereby the plate P is clamped or released, as desired, substantially as shown and described.

2. In a scale, the rigid bow A, its jaws J and hook H, in combination with levers B C, connected together through the instrumentality of links *o o* and eccentrically-hinged lever L, in conjunction with keeper K, substantially as shown and described, and for the purpose specified.

3. The rigid bow A, its retaining-jaws J and hanging hook H, in combination with draw-levers B C, connected together through the instrumentality of links *o o*, and operating-lever L, which is hinged to lever C, and fulcrumed between said links below the said hinge, whereby an eccentric movement is effected, in conjunction with keeper K, properly secured, all substantially as shown and described, and for the purpose noted.

384,257. EMBROIDERING ATTACHMENT FOR SEWING-MACHINES. ALBERT W. JOHNSON, New Haven, Conn., assignor to the Pearlsen Button Hole Attachment Company, of Connecticut. Filed Apr. 26, 1886. Serial No. 200,203. (No model.)



Claim.—1. In an embroidery attachment for sewing-machines, the combination, with a supporting-frame, A, of two wheels, C D, geared together and provided with wings 1 2 3 4, an operating-lug connected and actuated by the needle-bar and impinging alternately against said wings, whereby an intermittent rotary movement is given to said wheels, the thread-carrier, and means for communicating motion from said wheels to the thread-carrier, substantially as described.

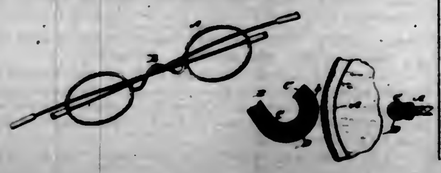
384,257.

2. The combination of the frame A, carrier E, wheels C D, provided with wings 1 2 3 4, eccentric or cam F, spring H, and an operating-lug connected to and actuated by the needle-bar and impinging alternately against said wings, substantially as described.

384,258. MECHANICAL MOVEMENT. ALBERT W. JOHNSON, New Haven, Conn., assignor to the Pearlsen Button Hole Attachment Company, of Connecticut. Filed Dec. 20, 1887. Serial No. 258,054. (No model.)

Claim.—The herein-described mechanism for converting reciprocating into an intermittent rotary motion, consisting of a pair of gear-wheels of equal size and teeth working together, each wheel provided with radial arms, with a reciprocating device from which a projection extends and so as to work in a path between said arms, substantially as described, and whereby the said reciprocating-movement in one direction will impart rotation to one wheel, and that one wheel communicate its rotation to the other wheel, but when moving in the opposite direction the said reciprocating movement will impart rotation to the said other wheel, and the said other wheel will communicate its rotation to the first-mentioned wheel, the rotation of the wheels being in the same direction under both operations.

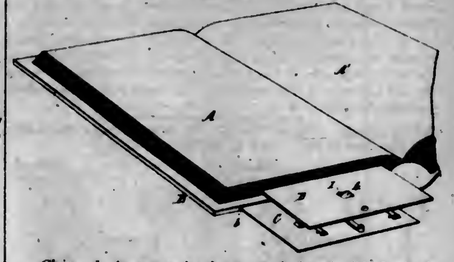
384,259. UPHOLSTERED FURNITURE. FRANK G. JOHNSON, New York, N. Y. Filed Aug. 11, 1886. Serial No. 210,570. (No model.)



Claim.—1. In upholstered furniture, the socket-plate consisting of the circular sockets *a a a* and plate A A A, in combination with the supporting-strips B B, substantially as and for the purpose set forth.

2. In upholstered furniture, the socket-plate consisting of the circular sockets *a a a* and plate A A A, in combination with the adjustable holding-screw C and supporting-strips B B, substantially in the manner and for purposes described.

3. In upholstered furniture, the socket-plate consisting of the circular sockets *a a a*, plate A A A, and legs *a' a' a'*, in combination with the adjustable holding-screw C and supporting-strips B B, as and for the purposes set forth.



4. In upholstered furniture, the socket-plate consisting of the circular sockets *a a a*, plate A A A, and legs *a' a' a'*, in combination with the springs D' D', adjustable screw C, and supporting-strips B B, as and for the purposes described.

384,260. SPECTACLE-BRIDGE. GEORGE JOHNSON, Detroit, Mich. Filed Sept. 2, 1887. Serial No. 248,632. (No model.)

Claim.—The combination, with the steel eye-frames of spectacles, of a separate bridge made of gold or non-corrosive metal tubing forced into close contact with a steel core, said non-corrosive metal drawed away near the extremities sufficient to expose the steel and form a concaved seat conforming to the eye-frame, said steel frame and steel core being brought together in the said seat and the whole united by solder, substantially as described.

384,261. ARM OR HAND REST. WILL M. KINNARD, Dayton, Ohio. Filed Mar. 5, 1888. Serial No. 266,171. (No model.)

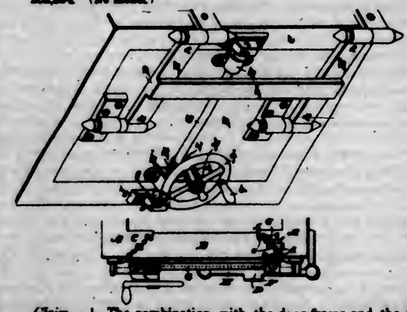
Claim.—1. An arm or hand rest attached to the lid of a book, arranged to be adjusted to any convenient height to correspond with the level of the page to be written upon, substantially as and in the manner described.

2. A hand or arm rest attached to the lid of a book, constructed substantially as described, to be adjusted to various levels, arranged to be folded or moved into the back out of the way when not in use, substantially as set forth.

3. A hand or arm rest for books inclosed in the lid of the book and capable of being drawn out and elevated to any desired height to correspond with the face of the page, substantially as described.

4. A hand-rest for books, consisting of two plates adapted to fold together and fold or slide into an opening in the side of the book when not in use, substantially as and for the purpose described.

5. A book provided with a hand-rest concealed within the side of the book, arranged to be drawn out and adjusted to any desired height, substantially as described.



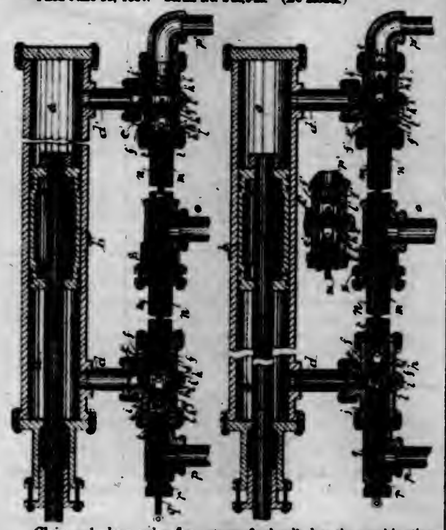
6. A hand-rest for books, consisting of two plates, C D, hinged together by the rods F F, and provided with the pawl G and ratchet H, substantially as described.

7. A rest for books, consisting of two plates hinged together as described, and sliding or folding into the side of a book, in combination with a lock or latch for fastening it in or out, substantially as described.

8. A hand or arm rest for record-books, consisting of two plates inclosed within the lid of the book and adapted to be drawn out sufficiently to permit the elevation of the upper plate, in combination with the internal shoulder or stop, *b'*, substantially as described.

9. A hand-rest for books, consisting of two plates hinged together, the upper one adapted to be raised and adjusted to any convenient height, as described, the whole inclosed within an independent frame or casing to be inserted in the lid of a book, substantially as and for the purpose described.

384,262. OPERATING MECHANISM FOR DOORS OF SAFES AND VAULTS. ALBERT KIRK, Canton, Ohio, assignor to the Diebold Safe and Lock Company, same place. Filed Oct. 14, 1887. Serial No. 252,234. (No model.)



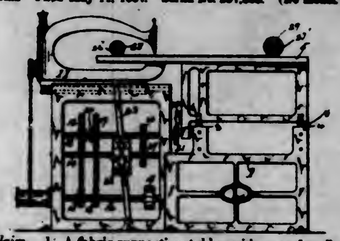
Claim.—1. The combination, with the door-frame and the door hinged thereto and capable of a tilting movement on its own pivotal connection independent of its swinging movement on its hinge-con-

section with the door-frame, of a rotary presser-shaft, a worm-wheel and worm for rotating said shaft, and eccentric mechanism connected with the shaft and frame, whereby the rotary movement of the shaft will cause the door to move bodily toward and away from its seat in the frame, substantially as set forth.

2. The combination, with the door-frame and the door hinged thereto, of presser-shafts having lugs or arms projected laterally therefrom, a link connecting the projecting arms, a worm-wheel having a crank-connection with the link, and a worm in engagement with the worm-wheel and provided with an operating-crank whereby the presser-shafts are simultaneously rotated, substantially as set forth.

3. The combination, with the door-frame and the door hinged thereto, of a presser-shaft having an eccentric aperture or groove in the end thereof, open at one side, a stationary pin adapted to engage the said eccentric groove, and means for rotating the presser-shaft, substantially as set forth.

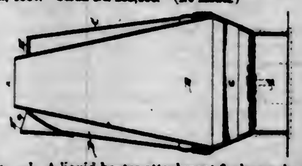
384,263. STEAM-FEED VALVE. LEWIS T. KLINE, Alpena, Mich. Filed June 30, 1887. Serial No. 242,942. (No model.)



Claim.—1. In a valve for a steam-feed cylinder, the combination with a valve-casing, *f*, having a steam-inlet pipe connected with one end and an exhaust-pipe connected with the opposite end, and provided with a groove, *i*, having a steam-port, *e*, of the valve *g* within the said casing, and provided with the solid portion *h* and the supporting-rings *l* upon each side of the portion *h*, and the bars *k*, connecting the said part *h* to the rings *l*, and the stem *q*, passed through the packing-box *v* and connected to the portion *h*, substantially as set forth.

2. The combination, with a log-carriage and a steam-cylinder inclosing a piston, having a piston-rod connected with the said carriage for propelling the same, of the valve-casing *f*, provided with a groove, *i*, having a steam-port, *e*, connected to one end of the said cylinder by the pipe *d*, the valve *g* within the casing *f*, and provided with the solid portion *h*, and having the bars *k* and supporting-rings *l*, the valve-casing *f'*, provided with a groove, *i'*, having a steam-port, *e'*, connected with the opposite end of the said cylinder by the pipe *d'*, the valve *g'* within the casing *f*, and provided with the solid portion *h'*, and having the bars *k'* and the supporting-rings *l'*, the rod *m*, with its ends secured to the valves *g* and *g'*, the pipe *n*, surrounding the said rod *m*, and with one end connected to the valve-casing *f* and its opposite end connected to the valve-casing *f'*, the valve-stem *q*, connected to one of the said valves, the steam-inlet pipe *o*, connected to the pipe *n*, and the exhaust-pipes *p* and *p'*, connected, respectively, to the outer ends of the valve-casings *f* and *f'*, substantially as and for the purpose set forth.

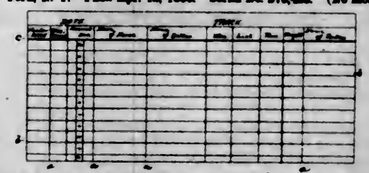
3. The combination, with a steam-cylinder provided with valve-casings *f* and *f'*, located at and connected by port-openings to each end of the said cylinder, a steam-pipe, *n*, connecting the inner ends of the said casings to each other and provided with a steam-inlet pipe, of the valve-disks *h* and *h'* within the said casings, a rod, *m*, within the pipe *n*, and pivotally secured by its opposite ends to the said disks, the valve-stem *q*, passed into the outer end of one of the said casings, and with its inner end pivotally connected to the outer side of one of the valve-disks, and exhaust-pipes connected to the outer ends of the valve-casings, substantially as and for the purpose set forth.



384,264. QUILTING-MACHINE. C. TYLER LAMPHERE, Hyattville, Conn. Filed May 11, 1887. Serial No. 237,893. (No model.)

Claim.—1. A fabric-supporting table, guideways for allowing the reciprocating movement of said table, a rack attached to said table, and a pinion engaging said rack, in combination with a sewing-machine, guideways for said machine arranged transversely with regard to the guideways for said table, a lever for moving said sewing-machine, and a single set of devices for automatically operating said lever and said pinion to produce simultaneous motion of the said table and sewing-machine in the same plane, but at right angles to each other, substantially as set forth.

2. In combination with a fabric-supporting table reciprocally movable in a right line, a sewing-machine simultaneously movable in the same plane, but at right angles to the line of movement of said table, a lever, as at 23, hinged at one end and connected to the sewing-machine at its free end, and a pattern-roll engaging and controlling said lever, as described, and for the purpose specified.



384,265. LIQUID-HEATER. JOHN C. MCFARREN, Hope, Kans. Filed Nov. 22, 1887. Serial No. 255,998. (No model.)

Claim.—1. A liquid-heater attachment for lamps, having a non-conducting portion, G, and a handle, H, secured to said non-conducting portion, as set forth.

2. In a liquid-heater attachment for lamps, the neck A, the inner and outer shells having their lower edges secured together, the reversely-conical non-conducting portion G, connecting the neck with the junction of the lower edges of the shells, and the handle H, secured to the portion G, as set forth.

384,266. TURF-RACING RECORD-BOOK. PETER MITCHELL, New York, N. Y. Filed Apr. 12, 1883. Serial No. 270,423. (No model.)

Claim.—A turf-racing record and memorandum book composed of a series of leaves having their front pages ruled with vertical and horizontal lines *a b c*, to form columns and spaces for the reception of entries comprising a tabulated record of a race, and provided on the top with a horizontal column or space running from end to end, with the words "Date" and "Track" permanently placed therein, and a similar column or space immediately underneath, divided at intervals by the intersecting vertical lines *a* into smaller spaces, and carrying the words permanently placed therein of "Number race, Distance, Amount bet, Name of horse, Name of bettor, Won, Lost, Time, Weight, Name of jockey," constituting the permanent headings, all substantially as described and shown, and for the purpose specified.

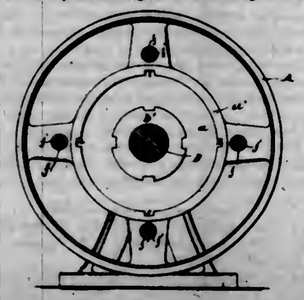
384,267. HOE-CULTIVATOR. JAMES W. MELVET, Jeffersville, Ind. Filed Feb. 6, 1888. Serial No. 263,101. (No model.)

Claim.—1. A cultivating implement which embraces two pairs of parallel shoes which have cutting-edges, connecting-bars which secure each pairs of shoes together, and a forwardly and downwardly inclined hoe in each pair of shoes, secured by its ends in each member of each pair, substantially as described.

2. In a cultivating implement, the combination, with a series of

384,267.

cutting shoes or runners, of two coincident inclined hoes or cutters which are arranged transversely of the shoes or runners and are secured thereon at a distance apart corresponding to the width of the rows of plants, and handled bars which connect the hoe-carrying shoes, and which are of such conformation as to bestride and pass over and along the rows of plants, substantially as and for the purposes set forth.

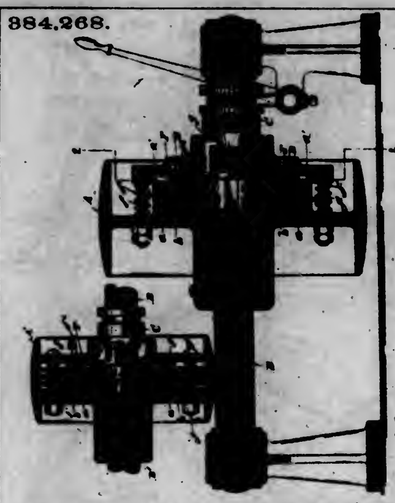


3. The combination, in a cultivator, of the described pairs of shoes or runners having cutting-edges and connected together as shown, each pair being provided with a transversely-placed inclined hoe, the inner end of each of which extends through the inner member of its pair of shoes or runners, substantially as and for the purposes set forth.

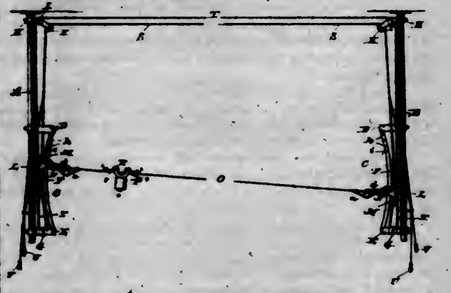
4. In a cultivator for plants in rows, the combination, with a pair of cutting shoes or runners, each of which is provided with a forwardly and downwardly inclined slot which is closed above and below, of a hoe which is adapted to such slots, and which projects through the same, and which is provided in its lower portion with an open slot of a width corresponding to the thickness of the shoe or runner, whereby the upper portion of the hoe is embraced by the slot in the shoe or runner, and whereby the lower portion of the shoe or runner is embraced by the slot in the hoe, substantially as described.

384,268. FRICTION-CLUTCH. ANTHONY NELSON, Boston, Mass., assignor to James Bennett Forsyth, same place. Filed Apr. 30, 1887. Serial No. 236,631. (No model.)

Claim.—1. In a friction-clutch, pulley carrying longitudinally-sliding plates *a*, and shaft B, carrying longitudinally-sliding plates *b*, in combination with follower D, having inclines *f'*, and cap F, having corresponding inclines, substantially as and for the purpose set forth.



2. In a friction-coupling, pulley A, having a lateral annular flange, *a'*, friction-plates *a b*, follower D, and means for partially rotating it, in combination with cap F, covering the annular flange *a'*, within which



lie the friction-plates and the follower, substantially as described.

3. In a friction-clutch, friction-plates *a b*, provided with grooves 7, substantially as and for the purpose set forth.

384,268.

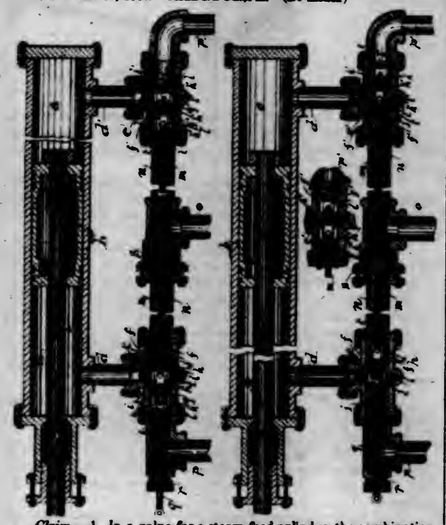
384,269. ELEVATED WAY. NELSON NEWMAN, Springfield, Ill., assignor to George A. Sanders, same place. Filed Dec. 13, 1887. Serial No. 257,657. (No model.)

Claim.—1. The combination of the posts A B, the frames C, extending from the posts and comprising the horizontal bars D E, and vertical guide-bars F, detachably bolted to said bars, the sheaves G, journaled to the bottom bars, E, the brackets H, secured to the tops of the posts and having the sheaves I K, the vertically-movable travelers guided on bars F, the track-cable stretched between said travelers, the car on the track-cable, the cord S, stretched over sheaves K and connected to the travelers, and the cord T, stretched over the sheaves I, passing under sheaves G, and also attached to the travelers, substantially as described.

2. The combination of the vertical guide-bars F, provided with the series of openings *h*, the adjustable trip-pins *i* in said openings, the travelers movable vertically on the guides and having the spring-catches *d* and the springs *a*, the track-cable stretched between the travelers, and the car on the track-cable, having shoulders adapted to be engaged by the catches, and having the lugs to engage and compress the springs, substantially as described.

3. The combination of the vertical guides having the trip-pins *i*, the travelers movable vertically on said guides, the spring-catches *d*, pivoted to said travelers, and having rearward-extending arms *g*, adapted to engage pins *i*, the spring-arms *a*, attached to the travelers, the cable stretched between the travelers, and the car thereon, said car having the shoulders *s*, adapted to be caught by the catches *d*, and having the lugs *t*, adapted to engage and compress the spring-arms, substantially as shown.

384,270. FENCE. JOHN S. OTT, Augusta, Ky. Filed Mar. 19, 1888. Serial No. 267,793. (No model.)



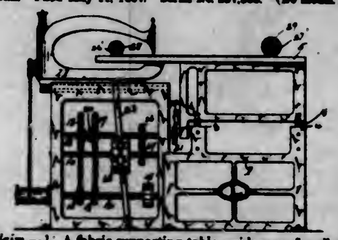
Claim.—1. In a fence, the combination, with the pickets, of the links or connections between the pickets, having the short bars C and

section with the door-frame, of a rotary presser-shaft, a worm-wheel and worm for rotating said shaft, and eccentric mechanism connected with the shaft and frame, whereby the rotary movement of the shaft will cause the door to move bodily toward and away from its seat in the frame, substantially as set forth.

2. The combination, with the door-frame and the door hinged thereto, of presser-shafts having lugs or arms projected laterally therefrom, a link connecting the projecting arms, a worm-wheel having a crank-connection with the link, and a worm in engagement with the worm-wheel and provided with an operating-crank whereby the presser-shafts are simultaneously rotated, substantially as set forth.

3. The combination, with the door-frame and the door hinged thereto, of a presser-shaft having an eccentric aperture or groove in the end thereof, open at one side, a stationary pin adapted to engage the said eccentric groove, and means for rotating the presser-shaft, substantially as set forth.

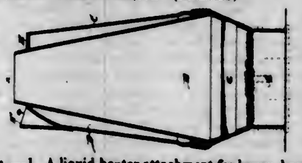
384,263. STEAM-FEED VALVE. LEWIS T. KLEIN, Alpena, Mich. Filed June 30, 1887. Serial No. 243,242. (No model.)



Claim.—1. In a valve for a steam-feed cylinder, the combination with a valve-casing, *f*, having a steam-inlet pipe connected with one end and an exhaust-pipe connected with the opposite end, and provided with a groove, *i*, having a steam-port, *e*, of the valve *g* within the said casing, and provided with the solid portion *h* and the supporting-rings *l* upon each side of the portion *h*, and the bars *k*, connecting the said part *h* to the rings *l*, and the stem *q*, passed through the packing-box *v* and connected to the portion *h*, substantially as set forth.

2. The combination, with a log-carriage and a steam-cylinder inclosing a piston, having a piston-rod connected with the said carriage for propelling the same, of the valve-casing *f*, provided with a groove, *i*, having a steam-port, *e*, connected to one end of the said cylinder by the pipe *d*, the valve *g* within the casing *f*, and provided with the solid portion *h*, and having the bars *k* and supporting-rings *l*, the valve-casing *f'*, provided with a groove, *i'*, having a steam-port, *e'*, connected with the opposite end of the said cylinder by the pipe *d'*, the valve *g'* within the casing *f*, and provided with the solid portion *h'*, and having the bars *k'* and the supporting-rings *l'*, the rod *m*, with its ends secured to the valves *g* and *g'*, the pipe *n*, surrounding the said rod *m*, and with one end connected to the valve-casing *f* and its opposite end connected to the valve-casing *f'*, the valve-stem *q*, connected to one of the said valves, the steam-inlet pipe *o*, connected to the pipe *n*, and the exhaust-pipes *p* and *p'*, connected, respectively, to the outer ends of the valve-casings *f* and *f'*, substantially as and for the purpose set forth.

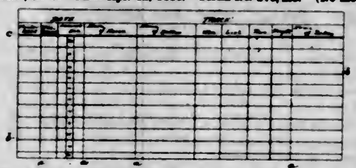
3. The combination, with a steam-cylinder provided with valve-casings *f* and *f'*, located at and connected by port-openings to each end of the said cylinder, a steam-pipe, *n*, connecting the inner ends of the said casings to each other and provided with a steam-inlet pipe, of the valve-disks *h* and *h'* within the said casings, a rod, *m*, within the pipe *n*, and pivotally secured by its opposite ends to the said disks, the valve-stem *q*, passed into the outer end of one of the said casings, and with its inner end pivotally connected to the outer side of one of the valve-disks, and exhaust-pipes connected to the outer ends of the valve-casings, substantially as and for the purpose set forth.



384,264. QUILTING-MACHINE. C. TYLER LADDEMAN, Mystic, Conn. Filed May 11, 1887. Serial No. 237,986. (No model.)

Claim.—1. A fabric-supporting table, guideways for allowing the reciprocating movement of said table, a rack attached to said table, and a pinion engaging said rack, in combination with a sewing-machine, guideways for said machine arranged transversely with regard to the guideways for said table, a lever for moving said sewing-machine, and a single set of devices for automatically operating said lever and said pinion to produce simultaneous motion of the said table and sewing-machine in the same plane, but at right angles to each other, substantially as set forth.

2. In combination with a fabric-supporting table reciprocally movable in a right line, a sewing-machine simultaneously movable in the same plane, but at right angles to the line of movement of said table, a lever, as at 23, hinged at one end and connected to the sewing-machine at its free end, and a pattern-roll engaging and controlling said lever, as described, and for the purpose specified.



384,265. LIQUID-HEATER. JOHN C. MCFARREN, Hope, Kans. Filed Nov. 22, 1887. Serial No. 255,866. (No model.)

Claim.—1. A liquid-heater attachment for lamps, having a non-conducting portion, G, and a handle, H, secured to said non-conducting portion, as set forth.

2. In a liquid-heater attachment for lamps, the neck A, the inner and outer shells having their lower edges secured together, the reversely-conical non-conducting portion G, connecting the neck with the junction of the lower edges of the shells, and the handle H, secured to the portion G, as set forth.

384,266. TURF-RACING RECORD-BOOK. PETER MITCHELL, New York, N. Y. Filed Apr. 12, 1888. Serial No. 270,423. (No model.)

Claim.—A turf-racing record and memorandum book composed of a series of leaves having their front pages ruled with vertical and horizontal lines *a b c*, to form columns and spaces for the reception of entries comprising a tabulated record of a race, and provided on the top with a horizontal column or space running from end to end, with the words "Date" and "Track" permanently placed therein, and a similar column or space immediately underneath, divided at intervals by the intersecting vertical lines *a* into smaller spaces, and carrying the words permanently placed therein of "Number race, Distance, Amount bet, Name of horse, Name of bettor, Won, Lost, Time, Weight, Name of jockey," constituting the permanent headings, all substantially as described and shown, and for the purpose specified.

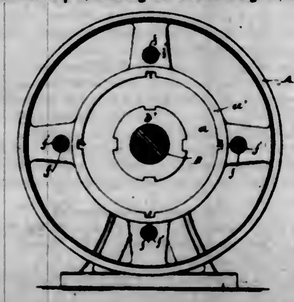
384,267. HOE-CULTIVATOR. JAMES W. HULVEY, Jonesville, Ind. Filed Feb. 6, 1888. Serial No. 263,101. (No model.)

Claim.—1. A cultivating implement which embraces two pairs of parallel shoes which have cutting-edges, connecting-bars which secure each pair of shoes together, and a forwardly and downwardly inclined hoe in each pair of shoes, secured by its ends in each member of each pair, substantially as described.

2. In a cultivating implement, the combination, with a series of

384,267.

cutting shoes or runners, of two coincident inclined hoes or cutters which are arranged transversely of the shoes or runners and are secured thereto at a distance apart corresponding to the width of the rows of plants, and handled bars which connect the hoe-carrying shoes, and which are of such conformation as to bestride and pass over and along the rows of plants, substantially as and for the purposes set forth.

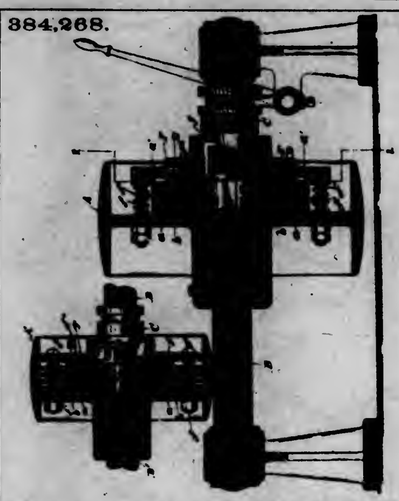


3. The combination, in a cultivator, of the described pairs of shoes or runners having cutting-edges and connected together as shown, each pair being provided with a transversely-placed inclined hoe, the inner end of each of which extends through the inner member of its pair of shoes or runners, substantially as and for the purposes set forth.

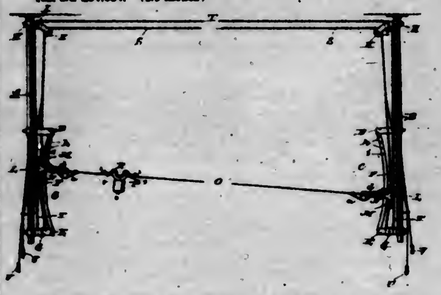
4. In a cultivator for plants in rows, the combination, with a pair of cutting shoes or runners, each of which is provided with a forwardly and downwardly inclined slot which is closed above and below, of a hoe which is adapted to such slots, and which projects through the same, and which is provided in its lower portion with an open slot of a width corresponding to the thickness of the shoe or runner, whereby the upper portion of the hoe is embraced by the slot in the shoe or runner, and whereby the lower portion of the shoe or runner is embraced by the slot in the hoe, substantially as described.

384,268. FRICTION-CLUTCH. ANTHONY HALDEN, Boston, Mass., assignor to James Bennett Forsyth, same place. Filed Apr. 20, 1887. Serial No. 235,631. (No model.)

Claim.—1. In a friction-clutch, pulley carrying longitudinally-sliding plates *a*, and shaft B, carrying longitudinally-sliding plates *b*, in combination with follower D, having inclines *f''*, and cap F, having corresponding inclines, substantially as and for the purpose set forth.



2. In a friction-coupling, pulley A, having a lateral annular flange, *a'*, friction-plates *a b*, follower D, and means for partially rotating it, in combination with cap F, covering the annular flange *a'*, within which



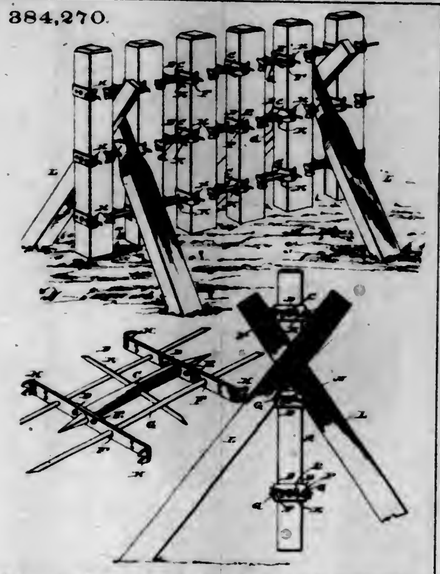
lie the friction-plates and the follower, substantially as described.

3. In a friction-clutch, friction-plates *a b*, provided with grooves 7, substantially as and for the purpose set forth.

384,268.

384,269. ELEVATED WAY. HIRAM HEWHAM, Springfield, Ill., assignor to George A. Sanders, same place. Filed Dec. 12, 1887. Serial No. 257,697. (No model.)

Claim.—1. The combination of the posts A B, the frames C, extending from the posts and comprising the horizontal bars D E, and vertical guide-bars F, detachably bolted to said bars, the sheaves G, journaled to the bottom bars, E, the brackets H, secured to the tops of the posts and having the sheaves I K, the vertically-movable travelers guided on bars F, the track-cable stretched between said travelers, the car on the track-cable, the cord S, stretched over sheaves K and connected to the travelers, and the cord T, stretched over the sheaves I, passing under sheaves G, and also attached to the travelers, substantially as described.



2. The combination of the vertical guide-bars F, provided with the series of openings *h*, the adjustable trip-pins *i* in said openings, the travelers movable vertically on the guides and having the spring-catches *d* and the springs *a*, the track-cable stretched between the travelers, and the car on the track-cable, having shoulders adapted to be engaged by the catches, and having the lugs to engage and compress the springs, substantially as described.

3. The combination of the vertical guides having the trip-pins *i*, the travelers movable vertically on said guides, the spring-catches *d*, pivoted to said travelers, and having rearward-extending arms *g*, adapted to engage pins *i*, the spring-arms *a*, attached to the travelers, the cable stretched between the travelers, and the car thereon, said car having the shoulders *e*, adapted to be caught by the catches *d*, and having the lugs *f*, adapted to engage and compress the spring-arms, substantially as shown.

384,270. FENCE. JAMES S. ORR, Augusta, Ky. Filed Mar. 19, 1888. Serial No. 267,789. (No model.)

Claim.—1. In a fence, the combination, with the pickets, of the links or connections between the pickets, having the short bars C and

384,270.

the lateral arms secured to the edges of the pickets, substantially as specified.

2. In a fence, the combination, with the pickets, of the links or connections having the bars C, sharpened at their ends and driven into the edges of the pickets, and the lateral arms embracing the edges of the pickets and having spurs adapted to be driven thereinto, substantially as specified.

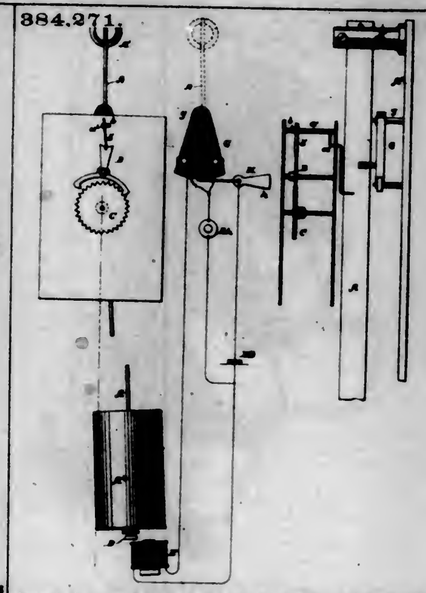
3. In a fence, the combination, with the pickets, of the bar C, the lateral arms attached to the said bar and having spurs on their ends and the rods or wires passing through apertures in the arms and extending parallel with the fence, substantially as specified.

4. In a fence, the combination, with the pickets, of the bars C, the lateral arms attached to the pickets, and the barb-rod attached to the bar and projecting beyond the sides of the pickets, substantially as specified.

5. In a fence, the combination, with the pickets, of the bar C, having its sharpened ends engaged in the edges of the pickets, the lateral arms having perforations E E and I I and the apertures F F therein, the spurs H on the ends of the arms, the rods or wires inserted in the apertures F and engaged by the spurs, and having their ends turned out to form barbs, and the barb-rods inserted in apertures in the bar C and extending beyond the sides of the pickets, substantially as specified.

6. In a fence, the combination of the pickets, the links or connections between the pickets, having the bar C, the arms D D, and the rods or wires G G, engaging the said arms and extending parallel with the fence, and the inclined braces having notches M M in their inner sides engaged with the said rods or wires, substantially as specified.

7. In a fence, the combination, with the vertical pickets, of the intermediate horizontal bars, C, having sharpened ends engaged in the adjacent edges of the pickets, substantially as specified.



384,271. ELECTRIC PENDULUM CLOCK. ALBERT L. PARDELLE, New York, N. Y., assignor to the Manhattan Clock Company, of Colorado. Filed Mar. 23, 1887. Serial No. 232,141. (No model.)

Claim.—1. The combination, in an electric clock, of an electrically-driven pendulum, the driving-magnet which operates said pendulum, its battery and circuit, the moving switch actuated by the driven pendulum, the electrical contacts thereon, and circuit-connections whereby the driving-magnet is intermittently energized to vibrate the pendulum without opening the battery-circuit.

2. The combination of the electrically-driven pendulum, the driving-magnet, its battery and circuit, switch devices actuated by the pendulum in its vibration, a brush and contacts on the switch, and a branch or short circuit through which the battery is short-circuited when the pendulum is at and near the limit of its swing, substantially as set forth.

3. The combination of the electrically-driven pendulum, the driving-magnet, its battery and circuit, switch devices actuated by the pendulum, three switch-contacts, the middle one being connected

384,271.

through the magnet with one pole of the battery and the other two connected with the same pole of the battery outside of the magnet, and the switch-brush connected with the opposite pole of the battery.

4. The combination of the electrically-driven pendulum, switch devices intermittently operated by the pendulum, the driving-magnet and its battery and circuit, and a weighted or gravity brush which bears on the switch.

5. The combination of the electrically-driven pendulum, electric-switch devices actuated thereby, electric contacts on the under or bottom face of the switch, and a brush which bears on the contacts.

6. The combination of the electrically-driven pendulum, the pendent pivoted switch, the contact or contacts on its curved bottom face, and a brush bearing thereon.

7. The combination of an electric-clock pendulum formed of a strip of flexible non-resilient material; electro-magnetic devices for driving it, and mechanism actuated thereby.

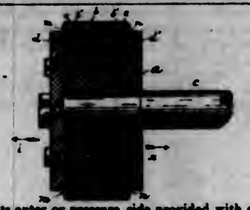
8. A clock-pendulum formed of a flat tape or web of flexible non-resilient material adapted to be suspended at one end and weighted at the other.

9. In an electric clock, the combination of a pendulum, switch devices actuated thereby, a driving-magnet which is intermittently energized by the action of the switch devices, and a spring intermittently drawn against the pendulum by the magnet to impart impulses of vibration thereto.

10. The combination, with a vibrating pendulum, of a spring intermittently drawn against the pendulum to impart impulses of vibration thereto.

11. The combination of a non-resilient pendulum, a spring intermittently draws against the pendulum to impart impulses of vibration thereto, and electro-magnetic devices controlled by the pendulum for operating the spring.

12. The combination of a pendulum composed of non-resilient flexible material, a spring intermittently operated to impart impulses of vibration thereto, and electro-magnetic devices controlled by the pendulum for operating the spring.



13. The combination, in an electrical clock, of a pendulum, electro-magnetic devices for driving it, a clock-train driving-wheel, C driving devices by which the wheel is driven by the pendulum, and independent locking devices which prevent the movement of the train-driving wheel except by the action of the pendulum.

14. The combination of the notched driving or pallet lever B, the rock-shaft *a'*, actuated by the pendulum, the arm or lever *b'*, and the set-screw or similar device for clamping the arm *b'* in or on the rock-shaft.

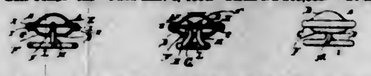
384,272. METALLIC PACKING FOR STEAM-CYLINDER PISTONS. JEFFERSON PETTEE, Brooklyn, N. Y. Filed Mar. 17, 1888. Serial No. 267,469. (No model.)

Claim.—1. As an article of manufacture, a packing-ring for steam-

384,272.

pistons, having its outer or pressure side provided with corrugations, whereby steam is admitted beneath the ring, substantially as shown and described.

2. As an article of manufacture, a packing-ring for steam-pistons, having its outer or pressure side and its inner face provided with communicating or coincident corrugations, substantially as shown and described.



3. The combination, with a steam-piston provided with grooves or recesses, as *b*, of a packing-ring having its outer or pressure side radially corrugated, substantially as shown and described.

4. The combination, with a steam-piston having grooves or recesses, as *b*, of a packing-ring having its outer or pressure side and its inner or under face provided with coincident or communicating corrugations, substantially as shown and described.

5. The combination, with a steam-piston having grooves or recesses, as *b'*, of a packing-ring, as *c*, and corrugations for admitting steam at the side of and under the ring, substantially as shown and described.

6. A packing-ring for steam-cylinder pistons, cut as shown, provided with a tongue fixed to one end thereof and moving in a groove or recess formed in the other end, the tongue being formed of a metal having a higher degree of expansion under the influence of heat than that of which the ring is composed.

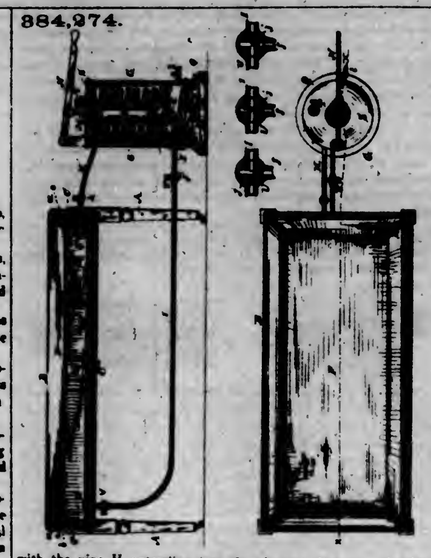
384,273. BUTTON. OLE ANDERSEN and THOMAS PATTISON, San Luis Obispo Cal. Filed Mar. 1, 1888. Serial No. 265,968. (No model.)

Claim.—1. In a button, the combination of the head having the slotted plate, the apertured plate, and the cap B, embracing the said plates, and the back having a clutch to engage the apertures in the plate, substantially as specified.

2. In a button, the combination of the head having the slotted plate D, provided with a central depression, the apertured plate E above the slotted plate, and the cap B, and the back having a clutch passing through the slot in the lower plate and engaging the apertures in the upper plate, substantially as and for the purpose specified.

3. In a button, the combination of the apertured plate E, having notches in its periphery, the slotted plate arranged beneath the same and having vertical studs or projections engaging the said notches, and the cap embracing and attached to the said plates, and the back having a clutch passing through the slot in the lower plate and engaging the apertures in the upper plate, substantially as specified.

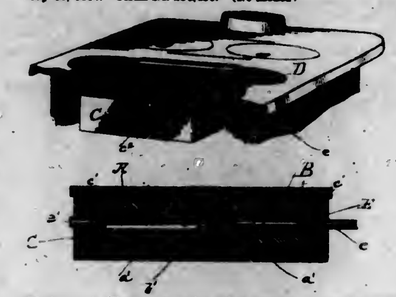
384,274. INVALID-BED INFLATING AND HEATING APPARATUS COMBINED. RUSSELL K. PELTON, Cleveland, Ohio. Filed Jan. 23, 1888. Serial No. 261,606. (No model.)



Claim.—1. The combination of an annular chamber, P, having a coiled pipe therein, and a pump within the said coil surrounded by an external casing, the lower terminal of the coil being in open connection with said pump, and its upper end connected with the induction-pipe H, and a pipe, I, with its lower terminal in the cylinder of the pump, with valves *d e*, intermediate between the inlet of the pipe I and outlet to the coil, arranged in conjoint relation to the chamber E and bed B, substantially in the manner as described, and for the purpose set forth.

2. The combination, with the bed connected with a frame forming an air and water chamber below the sacking, of pipes H and I, in open connection with said chamber, provided with faucets, and a three-part cock, U, arranged in connection with the pump and coil J around the pump within the annular chamber P, substantially as described, for the purpose set forth.

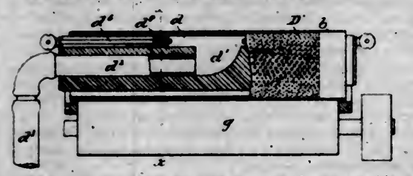
3. The pump encircled by a pipe-coil within the annular chamber P, pipes H and I, respectively in connection with the coil, pump, and chamber E, in combination with the faucets and three-part cock, with a base provided with a burner below the said chamber P, arranged to operate conjointly in the manner and for the purposes set forth.



4. The combination, with the pump having operant mechanism connected therewith, a pipe, I, leading from the valve *d*, opening to the chamber E, with a three-part cock forming a connection in said pipe between the pump and chamber E, of a pipe-coil, J, terminating at one end with the valve *e*, opening into the pump, and its upper end

384,274.

with the pipe H, extending into the chamber E, arranged substantially as described, for the purpose set forth.

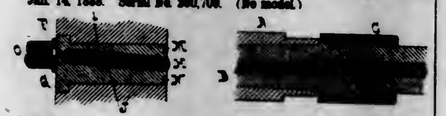


384,275. OIL-BURNER. CHARLES H. PHELPS, Chicago, Ill. Filed May 16, 1887. Serial No. 238,409. (No model.)

Claim.—1. The combination of the retort A, having openings *a' a'*, located on the under side thereof, the supply-pipe B, secured therein and having a downwardly-discharge opening, *b'*, and the box C, having a lid, *c'*, as described, whereby draft-openings may be provided, substantially as specified.

2. The combination of the box C, having a lid, *c'*, and draft-openings *c c*, with a retort, A, supported within said box by pins and having on its under side the openings *a' a'*, and a supply-pipe, B, secured within said retort and having a downwardly-discharge opening, *b'*, at its inner end, substantially as specified.

384,276. SUCTION-BOX FOR PAPER-MAKING MACHINES. JAS D. PICKLES, Manchester, Conn., and WILLIAM F. PICKLES, Lafayette, Pa. Filed Oct. 26, 1887. Serial No. 253,236. (No model.)

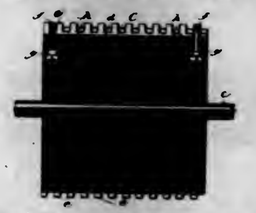


Claim.—1. In combination with the wire of a paper-making machine, the suction-box fixed against rotation, with a revolving perforated shell movable on the box, and the carrier-roll *g*, supporting the shell throughout the length of the perforated part, all substantially as described.

2. The combination, in a paper-making machine, the revolving and perforated shell, the suction-box held within the shell against rotation and having a lengthwise channel with an outlet-opening, the weighted levers pivoted to the frame of the machine and each secured to the suction-box at one end of the lever, the rotary carrier-roll extending beneath and supporting the revolving shell, and the roll-driving mechanism, all substantially as described.

3. In combination, the suction-box D, adjustably supported on the frame of a paper-making machine, with the lengthwise channel d' and outlet d^2, the adjustable heads d^3, movable in the said channel d, the revolving shell mounted on the suction-box, and the rotary carrier-roll that supports and drives the perforated shell, all substantially as described.

384,277. **BREECH-LOADING FIRE-ARM.** HARRY M. POPE, Hartford, Conn., assignor of one-half to Dudley S. Seymour, same place. Filed Jan. 14, 1888. Serial No. 260,709. (No model.)



Claim.—1. The combination of the receiver A, provided with a forward extension, the barrel B, provided with a rearward extension accurately and removably fitted within the receiver, and the sleeve C, interiorly screw-threaded and fitted to the exterior of the forward projection of the receiver and to the exterior of the adjacent part of the barrel, and adapted by being turned upon its axis to rigidly fasten the barrel to the receiver, all substantially as described.

2. The combination of the receiver A, provided with an exteriorly screw-threaded forward extension, the barrel B, removably fitted to the receiver and provided with an exterior screw-thread of smaller diameter and less pitch than that of the receiver A, and the sleeve C, provided at one end with an interior screw-thread conforming to the screw-thread of the receiver A, and at the other end with an interior screw-thread conforming to the screw-thread of the barrel B, all substantially as described.

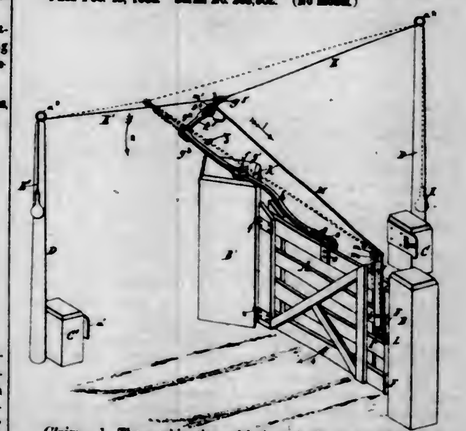
3. The combination of the breech-block F, the bushing G, adjustably fitted within the breech-block, and the firing-pin H, working within that bushing diagonally to the axis thereof, substantially as described.

384,278. **CLAY-DISINTEGRATOR.** GEORGE FOTH, Indianapolis, Ind. Filed Aug. 15, 1887. Serial No. 246,944. (No model.)

Claim.—1. In clay-disintegrators, the combination, with a rotating cylinder having an abutting surface set opposite thereto and co-operating therewith to feed and shred the clay, of a series of teeth projecting beyond said cylinder and furnished with longitudinal cutting edges or crowns at the outer ends thereof, whereby the clay may be clipped or shredded as the same is fed by the cylinder, substantially as described.

2. In clay-disintegrators, the combination, with a rotating cylinder having an abutting surface set opposite thereto and co-operating therewith to feed and shred the clay, of the longitudinal bars retained by said cylinder, and the series of interspaced teeth projecting from said bars and beyond the surface of the cylinder, said teeth being furnished with cutting edges or crowns at the outer ends thereof to coact with the abutting surface and clip or shred the clay as the same is fed by the cylinder, substantially as described.

3. In clay-disintegrators, the combination, with the main frame, and with a rotating cylinder fixed therein and having longitudinal toothed cutting bars projecting beyond the face thereof, of a positively-revolving companion cylinder fixed opposite thereto in said frame, and having a smooth face with which said cutting-bars directly co-operate to shred the clay as the same is fed between said cylinders, substantially as described.



4. In clay-disintegrators, the combination, with the main supporting-frame, of a rotating cylinder having longitudinal bars retained therein and a series of teeth projecting from said bars beyond the surface of the cylinder with cutting-crowns at the outer edges of said teeth, and a positively-revolving companion cylinder fixed in said frame, and having a smooth face with which the cutting-teeth directly co-operate to shred the clay as the same is fed between the cylinders substantially as described.

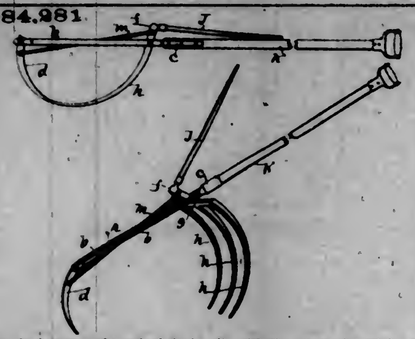
384,279. **CORN-SHOCK BINDER AND COMPRESSOR.** HENRY B. PFEVENBERGER, Tiffin, Ohio. Filed Jan. 7, 1888. Serial No. 260,050. (No model.)

Claim.—The improved shock-compressor herein described, comprising a plate having the open V-shaped slot in one end, a pair of ears, E, secured to the opposite end of the plate, a hand-lever pivoted at this end of the plate between the said ears and having a recess in its side near the handle, a clamp pivoted in said recess and having a corrugated face to co-operate with one wall of the recess, and a projecting thumb-piece, and a cord secured to the end of the plate near the pivot of the lever and adapted to be passed around the shock through the V-shaped slot and the recess in the lever and to be engaged by the clamp, as set forth.

384,280. **FARM-GATE.** WILLIAM H. RAMSDALE, Versailles, Mo. Filed Feb. 13, 1888. Serial No. 263,802. (No model.)

Claim.—1. The combination, with the swinging gate and its latching-post, of one or more latches, G, levers H H', toggle-joint links I I' and the lever J, substantially as described.

2. The combination, with the swinging gate and its weighted operating-cords E E', of the jointed lever K, pivoted to the hinging-post and formed of parts k k', one of said parts having the slot g, substantially as described.



3. The combination, with the gate, its hinging and latching posts standards, and weighted operating-cords, of one or more latches connected to lever mechanism, as H H', I I', and J, and pivoted rod M and slotted jointed lever K, substantially as described.

4. The combination of the jointed slotted lever K, for operating the gate, and the pivoted rod M, for operating the lever J of the latch mechanism, substantially as and for the purpose described.

384,281. **HAY AND FODDER FORK.** SQUAVE S. RAMSLEBAR and MARTIN C. RAMSLEBAR, Carlisle, Iowa. Filed Jan. 16, 1888. Serial No. 260,993. (No model.)

Claim.—1. A fork for handling corn-fodder, comprising a long straight handle having a tine hinged to its lower end, an elbow-shaped lever pivoted to the same handle at some distance from the pivoted tine, two or more tines fixed to the said lever, and a rod connecting

384,281.

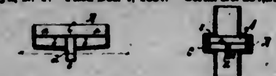
the single tine at the end of the handle with the crown-shaped lever, arranged and combined to operate in the manner set forth.

2. The metal handle A, having a socket, e, adapted to receive a wooden handle, a pivoted tine, d, a lever, f, having a cross-head, g, and two or more parallel tines, h, projecting from said cross-head, an arm, J, and a rod, m, constructed and combined substantially as shown and described, for the purposes stated.

384,282. **ORNAMENTED METALLIC SURFACE.** FRANK REED, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed May 31, 1887. Serial No. 239,732. (No model.)

Claim.—As an article of manufacture, a sheet, vessel, or other article of metal having a portion of its surface covered by a polished irisated pattern in relief, the remaining surface being relatively low and having a dead or frosted finish, substantially as described.

384,283. **PLOW.** ALBERT C. RENNEBARK, Evansville, Ind. Filed Apr. 6, 1888. Serial No. 269,796. (No model.)



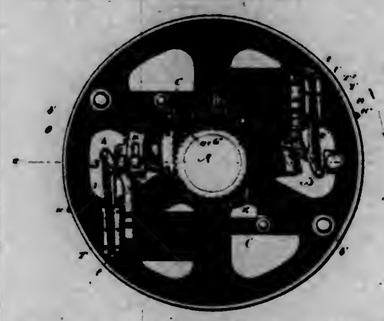
Claim.—1. A plowshare having a landside or gunsel with a notched and rounded or recessed rear portion, a, adapted to fit into a landside having a recess and a counterpart lug, forming a lock-joint, substantially as described.

2. A landside recessed at B, pointed and provided with a lug, b, and a lip or flange, c, having a base flange or rib, d, and an extension, D, adapted to enter the recess D' of the standard E, as shown and described.

3. The combination of the standard E, pointed and recessed, as described, with a plowshare having a gunsel notched at a, and with a landside having a recess, B, a counterpart lug, b, and an extension, D, substantially as described.

384,284. **GAS-PRESSURE REGULATOR.** CHARLES L. ROWLAND, Brooklyn, N. Y. Filed Dec. 7, 1887. Serial No. 257,215. (No model.)

Claim.—In a gas-pressure regulator, the combination of a chamber, A, having a centrally-perforated bottom, and a float, C, consisting of a diaphragm, a, fitting closely in said chamber, and a stem, c, said stem being recessed longitudinally along its side and fitting closely in the perforation in the bottom of the chamber, substantially as and for the purpose described.



384,285. **ASTRONOMICAL APPARATUS.** HARRY L. RUSS, Woodland, Cal. Filed Sept. 3, 1887. Serial No. 248,765. (No model.)

Claim.—1. In an apparatus illustrating the phenomena of day and night, the oval box h, having a cover, f, which is divided and marked to represent and illustrate the zodiac, the ball d, representing the sun, the envelope of light g, having the rod h and guides j, said rod passing through the center of the ball d, in combination with the ball a, representing the earth, and revolving freely upon the inclined spindle attached to the pedestal c, substantially as and for the purpose set forth.

2. The combination, in a teaching apparatus, of the oval box having a projecting top and bottom, the ball d, the envelope of light g, having the rod h, the globe a, and pedestal c, having an inclined spindle, b, substantially as and for the purpose described.

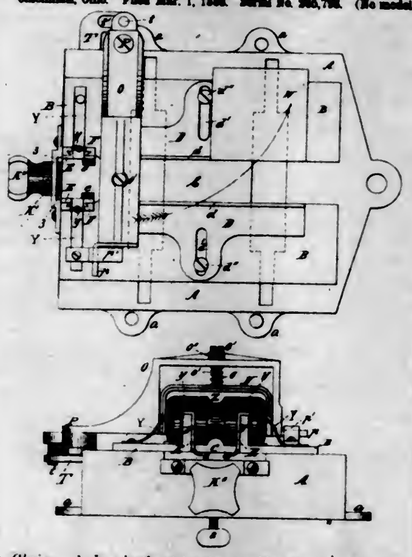
384,286. **STEAM-ENGINE GOVERNOR.** CHARLES SCHMID, Chicago, Ill., assignor of one-half to George Farnsworth, same place. Filed Sept. 22, 1886. Serial No. 214,316. (No model.)

Claim.—1. In a governor for valve-gears, the combination, with the main governor-wheel and its weighted arms suitably connected with the eccentric for shifting the same on the main shaft, of two springs, V, connected both with said weighted arms and with the main wheel, whereby said springs will exert force at all times against the inward movement of said weighted arms, substantially as described.

2. In a governor for valve-gears, the combination, with the main governor-wheel and its arms suitably connected with the eccentric for shifting the same on the main shaft, of bars R, connected to the weighted arms, and springs V, connected with said bars and with the main wheel, said springs exerting force against the inward movement of the weighted arms, substantially as described.

3. In a governor for valve-gears, the combination, with the main governor-wheel and its weighted arms suitably connected with the eccentric for shifting the same on the main shaft, or adjustable guards suitably connected with said weighted arms for determining the extent of their inward movement, substantially as described.

4. In a governor for valve-gears, the combination, with the main governor-wheel and its weighted arms suitably connected with the eccentric for shifting the same on the main shaft, of bars R, the sliding bars S, and suitable bearings for said sliding bars, substantially as described.



5. In a governor for valve-gears, the combination, with the main governor-wheel and its weighted arms suitably connected with the eccentric for shifting the same on the main shaft, of bars R, the slid-

ing bars S, pivoted to said bars, the pivoted bearings T for the sliding bars, and the springs V, substantially as described.

6. In a governor for valve-gears, the combination, with the main governor-wheel and its weighted arms suitably connected with the eccentric for shifting the same on the main shaft, of the bars R, the slide-bars S, the bearings T for said sliding bars, and suitable mechanism for adjusting the movement of said sliding bars within the bearings, substantially as described.

7. In a governor for valve-gears, the combination, with the main governor-wheel and its weighted arms suitably connected with the eccentric for shifting the same on the main shaft, of the dependent bars R, the sliding bars S, the pivoted bearings T, and the supplemental spring W, substantially as described.

384,287. LEATHER-TRIMMING MACHINE. GOTTLAVE SCHMIDT, Cincinnati, Ohio. Filed Mar. 1, 1888. Serial No. 265,798. (No model.)

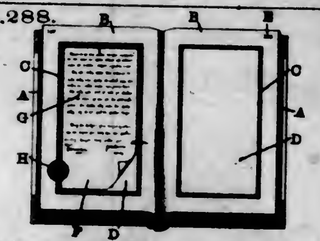
Claim.—1. In a leather-trimming machine, the laterally-adjustable guides carrying the cutting-knives, in combination with the pressure-roller mounted in a carrier pivoted to the bed-plate and connected with the guides, whereby the latter are automatically opened and closed by the swinging movements of the roller, substantially as described, and for the purpose set forth.

2. In a leather-trimming machine, a pressure-roller pivoted to the machine and connected with the guides by a cam or eccentric, in the manner described, for opening or closing the guides automatically by the movement of the pressure-roller, substantially as and for the purpose described.

3. In a leather-trimming machine, the guide-plates B B, with depending lugs H H, in combination with the screw-bolt K and sliding wedges J J, substantially as and for the purpose specified.

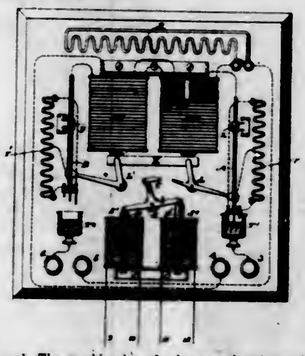
4. The combination, with the adjustable guides carrying the knives of a pressure-roller journaled in a spring-pressed vertically-sliding yoke mounted in a carrier pivoted in such manner that the roller can be swung clear of the guides, substantially as described, and for the purposes set forth.

5. In a leather-trimming machine, the screw-bolt K and sliding wedges J J, in combination with the adjustable collar S and wedge T, substantially as and for the purpose described.



6. In a leather-trimming machine, a pressure-roller provided with a central groove, *z*, in combination with the guides and knives arranged to be adjusted to correspond with the groove *z*, for cutting round strips, substantially as and for the purpose specified.

7. The double guide-plates B B and D D, the latter adjustable upon the former to make the upper part of the channel wider than the lower part, substantially as and for the purpose described.



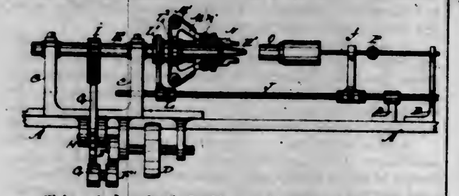
384,288. RECORD-BOOK AND METHOD OF MAKING THE SAME. JAMES W. SEE, Hamilton, Ohio. Filed June 20, 1887. Serial No. 241,821. (No model.)

Claim.—1. That improvement in the art of making records which consists in gumming the appropriate surfaces of the leaves of the record-book, impressing the record-matter with absorbable ink upon the face surface only of a loose sheet of paper, applying moisture to the back of such impressed sheet, affixing such sheet to the gummed leaf of the record-book, and applying a mark of identification jointly upon the surface of the affixed record-sheet and upon the uncovered surface of the book-leaf, substantially as described.

2. In a record, the combination of a book having leaves provided with appropriate gummed surfaces, a record-sheet having record-matter impressed upon its face surface and absorbed toward its other surface affixed to such gummed book-leaf, and a mark of identification applied jointly on the affixed record-sheet and an uncovered portion of the surface of the book-leaf, constructed substantially as and for the purpose set forth.

384,289. AUTOMATIC SWITCH FOR SECONDARY BATTERIES. JOHN S. SELLON, Hatton Gardens, County of Middlesex, England, assignor to the Electrical Accumulator Company, of New York. Filed Aug. 30, 1887. Serial No. 248,262. (No model.) Patented in England Jan. 13, 1883, No. 317; in France June 30, 1883, No. 156,154, and in Germany July 17, 1883, No. 27,868.

Claim.—1. The combination of a dynamo-electric machine and a secondary battery to be charged thereby, a switch or circuit-changer in the charging-circuit, a switch or circuit-changer in a separate circuit, an electro-magnet in the charging-circuit, and an electro-magnet in the said separate circuit, both said magnets controlling the movements of the switch or circuit-changer, a second electro-magnet in the said separate circuit, and an electro-magnet in circuit with the secondary battery, both co-operating to control the movements of the switch or circuit-changer.



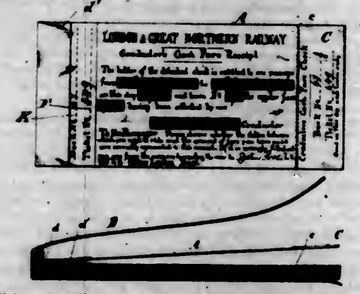
2. The combination of a dynamo-electric machine and a secondary battery in electrically-independent circuits, an electro-magnetic coil in the dynamo-circuit, an electro-magnetic coil in the battery-circuit, and an electro-magnetic switch or circuit-changer controlled by the co-operation of the two first-named magnets to electrically unite the battery and dynamo in one circuit.

3. The combination of a dynamo-electric machine and a secondary battery in electrically-independent circuits, an electro-magnetic switch or circuit-changer for uniting said circuits, and an electro-magnetic coil in the battery-circuit operated by variations in electro-motive force to control said switch or circuit-changer.

4. The combination of a dynamo-electric machine and a secondary battery electrically connected in one circuit, two electro-magnetic coils in multiple-arc branches of said circuit operated by variations in electro-motive force, and an electro-magnetic circuit-changer located in the main circuit between said multiple-arc branches controlled by the first-named electro-magnets.

5. The combination of a dynamo-electric machine and a secondary battery in one circuit, an artificial resistance, and an automatic electro-magnetic circuit-changer operated by variations in the current flowing in said circuit to divide said circuit into two independent closed circuits, one containing the dynamo and resistance and the other the battery.

384,290. MACHINE FOR FINISHING BOTTLE-NECKS. HARRY SIMPLE, Hamilton, Ontario, Canada. Filed Nov. 14, 1887. Serial No. 255,182. (No model.)



Claim.—1. In a bottle-finishing machine, the combination of an oscillating shaft, E, one end of which is provided with an adjustable plug for shaping the inside of bottle-necks, substantially as and for the purpose hereinbefore described.

2. In a bottle-finishing machine, the combination of an oscillating shaft provided with a clutch, L', collar L², socket-guide M', arms M, knuckle-joints N', and adjustable jaws N, substantially as and for the purpose specified.

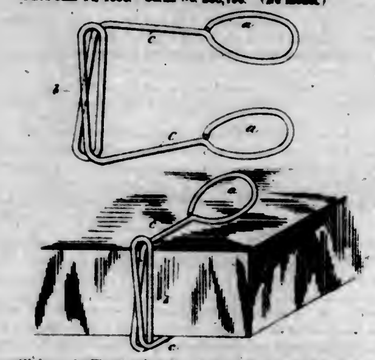
3. In a bottle-finishing machine, the combination of an oscillating shaft, E, with plug E', socket-guides M', arms M, with knuckle-joints and jaws, the clutch L', collar L², and the rod J, substantially as set forth and described.

384,291. PASSENGER-TICKET. VERNE R. SHEPARD, Covington, Ky. Filed Dec. 30, 1886. Serial No. 188,793. (No model.)

Claim.—1. A ticket or card having a writing-surface composed of a foundation of some positive color with a preparation of spermaceti, wax, and turpentine, or similar composition spread thereon, and the whole covered by a coating of coloring material of the desired color, substantially as shown and described.

2. A ticket or card having a central portion of uniform thickness with thickened end portions, substantially as and for the purpose set forth.

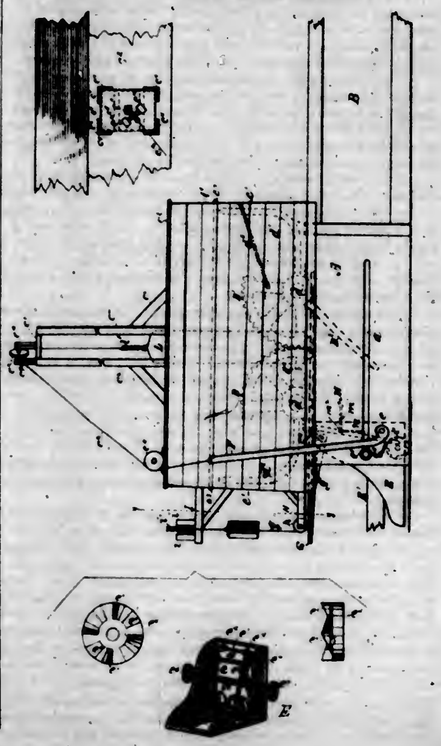
3. A book of tickets or receipts, A, having blank spaces B, prepared with a composition, substantially such as described, and also provided with checks C and ends *d*, the said ends and checks being thickened, substantially as and for the purpose set forth.



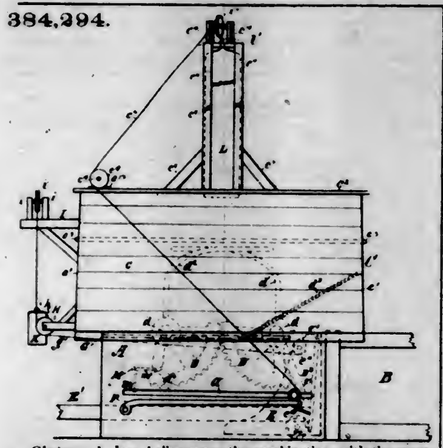
384,292. FIRE-ESCAPE. WILLIAM T. SMITH, Birmingham, Ala. Filed Mar. 7, 1888. Serial No. 266,492. (No model.)

Claim.—1. The combination, with a closed article of furniture having a slot in its front face and doors in its side, of a drum situated within the said piece of furniture, a flexible ladder adapted to be wound around the said drum, a bag or receptacle carried by the said drum, and a lever secured at the rear of the said drum and adapted to engage therewith for the purpose set forth, and having its opposite extremity extending out through the slot in the front face of the article of furniture.

2. A drum, a flexible ladder carried thereby, a receptacle carried by the said ladder, and a spring-lever having its extremity secured at the rear of the drum and adapted to engage therewith, in combination with a support having a slot in its front face to receive the free extremity of the lever.



384,293. TIDY-FASTENER. CORA S. SIMMONS, Braddock, Pa. Filed Jan. 14, 1888. Serial No. 260,796. (No model.)



Claim.—1. The fastener herein described, consisting of a piece of wire, *c*, having a loop, *a*, formed at each end, the rectangular spring *b*, formed from the central portion of the wire *c*, and the loops *a*, brought the one directly above the other, substantially as set forth.

2. The herein-described fastener having a circular loop, *a*, on each end of the same and bent in such a manner as to bring the one above the other, and a spring, *b*, formed from the central portion of the wire *c*, as and for the purpose set forth.

384,294. BALING-PRESS. BENJAMIN C. SCOTT, Kansas City, Mo. Filed Mar. 29, 1887. Serial No. 232,913. (No model.)

384,294.

Claim.—1. In a baling-press, the combination, with the receptacle for the material to be baled, provided with a feed-opening, of a reciprocating plunger, feed-compressing clamps over said feed-opening, and an intermediate recoiling-weight actuated by said reciprocating plunger, for the purpose described.

2. In a baling-press, the combination, with the baling-chamber, of the receptacle for the material to be baled, in communication therewith, having a suitable feed-opening, a reciprocating plunger in said receptacle, feed-clamps upon said press upon opposite sides of said feed-opening, a recoiling-weight extending into said feed-opening between the said plunger when retracted and the baling-chamber, and a suitable lever operated by said plunger to raise said weight, for the purpose specified.

3. In a baling-press, the combination, with the receptacle for the material to be baled, having a feed-opening for the said material, of a plunger, transverse rock-shafts geared together upon opposite sides of said feed-opening and provided with arms arranged in a clasping relation, and a lever for operating said shafts, as shown and described.

4. In a baling-press, the combination, with the receptacle for the material to be baled, having a feed-opening for the said material, of a plunger, transverse rock-shafts upon opposite sides of said feed-opening, provided with arms arranged in a clasping relation, opposite meshing-gear on said shafts, and a lever operating said shafts and lying in the path of the said plunger, for the purpose described.

5. In a baling-press, the combination, with the receptacle for the material to be baled, provided with a feed-opening and with longitudinal slots, of a plunger in said receptacle, transverse rocking shafts upon opposite sides of said feed-opening, provided with arms arranged in a clasping relation, opposite meshing-gear on said shafts, a lever on one of said shafts, and a shaft on said plunger extending through said slots in said receptacle and contacting with the said lever, for the purpose described.

6. In a baling-press, the combination, with the receptacle for the material to be baled, having a longitudinal slot in its side and a feed-opening, of a plunger therein, transverse rocking shafts on said receptacle upon opposite sides of said feed-opening and provided with arms arranged in a clasping relation, opposite meshing-gear on said shafts, a lever on one of said shafts, a shaft on said plunger, provided with anti-friction devices extending through said slot in said receptacle and in the path of said lever, a latch on the side of said receptacle, having a flexible end portion lying in the path of and actuated by the said shaft on said plunger, a projection on one of said gears engaging with said latch, and a spring for disengaging said arms, as shown and described.

7. In a baling-press, the combination, with the receptacle for the material to be baled, provided with longitudinal slots and a feed-opening, of a plunger, anti-friction devices on opposite sides of said plunger extending through said slots in said receptacle, a receiving-chamber above said receptacle, provided with an opening, transverse rock-shafts on said press on opposite sides of said feed-opening and provided with arms arranged in a clasping relation, opposite meshing-gear on said shafts, a lever on one of said shafts lying in the path of said anti-friction devices, a latch on the side of said receptacle, having a flexible end portion lying in the path of and actuated by said anti-friction devices on said plunger, a projection on said gear engaging with said latch, a spring connected with the meshing-gear and to the said receiving-chamber, suitable standards upon said receiving-chamber on opposite sides of said opening, a pulley on said standards and another on the side of said receiving-chamber, a lever pivotally attached at one end to the side of the said receptacle opposite to that provided with the said gear and lying in the paths of the said anti-friction devices on said plunger, a weight between and guided by the standards on said receiving-chamber and extending into the said chamber, a spring attached to said weight, and a cable attached to the said spring at one end and extending over the said pulleys on the said standards and the said chamber, and connected to the upper end of the said lever on the side of said receptacle, for the purpose specified.

8. In a baling-press, the combination, with the receptacle for the material to be baled, provided with a feed-opening, of a recoiling-plunger in said receptacle, an automatically-sliding plate adapted to cover said opening, a weight on said press, adapted to propel said plate over said feed-opening in one direction, and a dog on said plunger for engaging said plate and moving it in an opposite direction, as described.

9. In a baling-press, the combination, with the receptacle for the material to be baled, provided with a feed-opening, of a recoiling-plunger in said receptacle, an automatically-sliding plate, adapted to cover said feed-opening, a weight on said press adapted to propel said plate over said feed-opening in one direction, a dog on said plunger adapted to move said plate in an opposite direction, a yielding lever connected with said dog, and a traction-roller provided with a tripping-cam in the path of said lever and in the said receptacle, substantially as described.

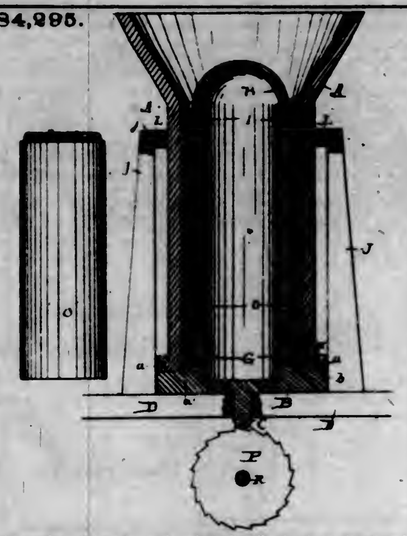
10. In a baling-press, the combination, with the receptacle for the material to be baled, provided with a feed-opening, of a recoiling-plunger in said receptacle having traction-rollers, one of which is provided with a cam, a sliding plate adapted to cover said feed-opening, a weight adapted to propel said plate over said feed-opening in one direction, a dog pivotally attached to said plunger and adapted to move said plate in an opposite direction, and a lever connected to said dog at one end and contacting with said cam on one of said rollers at the opposite end, for the purpose described.

11. The combination, in a baling-press, with the hollow plunger provided with the traction-rollers, one of which is provided with a cam, of a transverse rock-shaft journaled in the upper end of said plunger, dogs fixed on said rock-shaft and projecting above the plane of the top of said plunger, and a lever connected with said rock-shaft and said dogs at one end and contacting with the cam on one of said rollers at the opposite end, for the purpose specified.

12. In a baling-press, the combination, with the receptacle for the material to be baled, provided with a feed-opening, of a recoiling plunger in said receptacle having anti-friction devices, an auxiliary receiving-chamber attached to and above said receptacle and provided with an opening registering with said feed-opening, stationary supports on the end of said chamber and pulleys on said supports, a sliding plate adapted to cover said opening between said chamber and said receptacle and provided with longitudinal slots, a cable attached to said plate at its rear end and extending through said slots in said plate and over said anti-friction devices on said plunger, and also over the said pulleys at the end of the said receiving-chamber, and a weight at the end of said cable, as shown and described.

13. In a baling-press, the combination, with the receptacle for the material to be baled, having a suitable feed-opening, of a plunger, transverse shafts on said press on opposite sides of said opening and provided with arms arranged in a clasping relation, a weight provided with longitudinal transverse slots, and a suitable elevating-lever connected with said weight, for the purpose described.

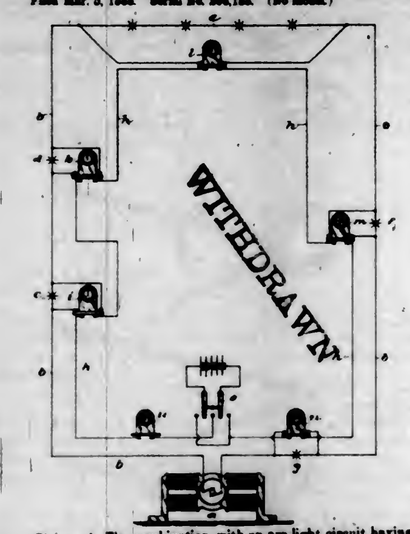
14. In a baling-press, the combination, with the receptacle for the material to be baled, having a suitable feed-opening, of a plunger, transverse shafts on said press on opposite sides of said opening and provided with arms arranged in a clasping relation, a weight provided with longitudinal transverse slots, a spring connected to said weight, and a suitable elevating-lever connected with said spring, for the purpose described.



384,295. MANUFACTURE OF ARTICLES FROM HYDRAULIC CEMENT. JOHN W. STOCKWELL, Portland, Me. Filed Mar. 15, 1887. Serial No. 230,934. (No model.)

Claim.—1. The herein-described improvement in the art of manufacturing artificial stone from hydraulic cement and sand or other like material, which consists of first mixing the materials together when in a dry state, then compacting them into suitable molds, and then allowing them to absorb sufficient water to moisten the mass and to effect the chemical combination, substantially as described.

2. The herein-described improvement in the art of manufacturing artificial stone, which consists in mixing together hydraulic cement and sand or other matrix material when in a dry state, then introducing such mixture into a suitable mold, shaking or vibrating the said mold to settle and compact the material, and finally allowing it to absorb sufficient water to moisten the mass, substantially as described.



3. The herein-described improvement in the art of manufacturing artificial stone from hydraulic cement, which consists in first mixing the cement with suitable matrix material, then compacting it in the

384,295.

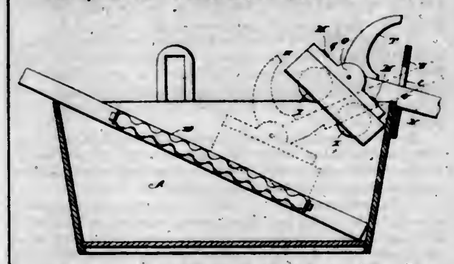
position where it is to be used, and finally allowing it to absorb sufficient water to effect the chemical combination, substantially as described.

384,296. ARC-LIGHT SYSTEM. BERNARD R. SWEET, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,183. (No model.)

Claim.—1. The combination, with an arc-light circuit having the lamps thereon distributed at different stations, of an independent circuit containing individual electro-magnetic circuit-changing devices, said devices being distributed at different stations, a polarized electro-magnetic switch device connected with each individual electro-magnetic circuit-changing device and included in a shunt-wire around a particular lamp or lamps, and a battery and pole-changing switch at the main station, whereby the lamp or lamps of any station may be brought into the arc-circuit or disconnected therefrom, substantially as described.

2. The combination, with an arc-light circuit including lamps arranged in series, of an independent circuit connected with an electro-magnetic circuit-opening mechanism at a particular station, a shunt-circuit around the lamp or lamps of said station, including the armature of an electro-magnetic switch, the electro-magnets of said electro-magnetic switch device being included in said independent circuit, a shunt-wire, *w*, normally closed around said coils, said shunt-wire being open at a particular period of time during the movement of the electro-magnetic circuit-opening mechanism, and the switch and battery at a central station, whereby the electro-magnetic switch may be operated when said shunt-wire is opened, as described.

3. The combination, with an electric-light circuit including lamps placed at different subscribers' stations, of an individual electric circuit extending from the central office through a circuit-opening mechanism placed at each of the different stations, and polarized electro-magnetic switch devices, one placed in connection with the shunt-wire around the lamp or lamps of each station and the individual circuit-opening mechanism of said station, and a battery and pole-changing switch at the central station, whereby, during the simultaneous operation of the various individual circuit-opening devices, the lamp or lamps of any station may be brought into circuit or disconnected therefrom, substantially as described.



4. The combination, with a circuit including an individual circuit-opening mechanism, of means for throwing current of opposite polarities thereon, and an electro-magnetic switch included in said circuit, and a shunt-circuit around the electric-arc lamp, which is opened or closed by said electro-magnetic switch accordingly as current of one polarity or the other is sent to line.

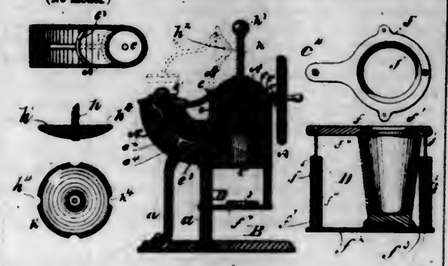
384,297. ADJUSTABLE JOINT. GEORGE C. SWEETT, Norwich, Conn., assignor to William A. Allen, same place. Filed Mar. 17, 1888. Serial No. 267,495. (No model.)

Claim.—An adjustable joint for display-frames, photo head-rests, and the like articles, consisting of two disks having their confronting faces formed, respectively, with a boss with beveled perimeter and a recess to receive the same, in combination with devices, substantially as herein described, for clamping together said disks.

384,298. WASHING-MACHINE. THEODORE THOEN, St. Clair, Pa. Filed Apr. 21, 1887. Serial No. 235,657. (No model.)

Claim.—1. The combination of the tub having the ear B, provided with opening C, the wash-board, the rubber having the rollers bearing on the wash-board, the guide-arm N, hingnd to the rubber and extending and working loosely through the opening C, and the handle T, projecting upward from the hinged end of arm N, substantially as described.

2. The combination of the tub having the ear B, provided with opening C, the wash-board, the case H, having the rollers bearing on the wash-board, the guide-arm N, hinged to the case and extending through the opening C, said arm having its hinged end inclined upward on its under side at R and provided with the handle T, and the wedge-shaped block S on the upper side of the case H, for the purpose set forth, substantially as described.



3. In a rubber, the combination of the case H, the guide-bar pivoted on the upper side thereof and having its inner end inclined, and the inclined or wedge-shaped block S, adapted to bear under the inner end of the guide-bar, for the purpose set forth, substantially as described.

4. In combination with the tub having the ear B, provided with opening C, the rubber having the rollers to bear on the wash-board, the guide-arm N, hinged to the rubber and provided with a notch, U, said guide-arm passing and working loosely through the opening C, and its notch engaging the edge of the tub to suspend the rubber when not in use.

5. In combination with the ear B, provided on the tub or sudsbox and having the opening C, the wash-board D, the rubber having the rollers to bear on the wash-board, the guide-arm N, hinged to the

rubber and passing and working loosely through the opening C, and the curved handle T, attached to the arm N at the hinged end thereof, said handle T being curved forward and upward to be grasped by the hand, as set forth.

384,299. ICE-SHAVER. FRANK K. WAY, Springfield, Ohio, assignor to John Foos, same place. Filed Apr. 7, 1886. Serial No. 198,045. (No model.)

Claim.—1. The combination, with the vertical revolving cylinder open at the bottom and provided with suitable cutting-knives in the periphery thereof, of an adjustable receptacle-holding device under said cylinder, substantially as specified.

2. The combination, with the outer casing having a vertical cylinder revolving in a chamber therein, a reservoir or conduit opening into the side of said chamber, and a receptacle-holding device under said cylinder, of the vertically-reciprocating piston adapted to be forced downward through said cylinder and means for automatically returning said piston to its normal position, substantially as set forth.

3. The combination, with the outer casing provided with a chamber for the revolving cutting-cylinder, the curved conduit opening into said chamber, the hinged cover adapted to close said conduit, and the follower pivoted to said cover, substantially as set forth.

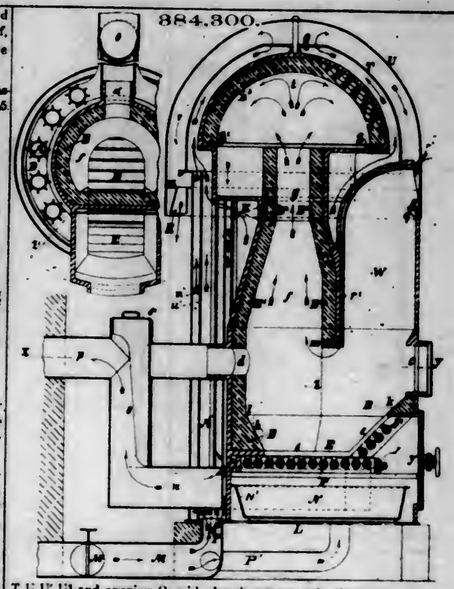
4. The combination, with the vertical ice-cutting cylinder, of a stationary plate under said cylinder, a supporting-plate under said stationary plate, and an elastic connection between said stationary plate and said supporting-plate, substantially as and for the purpose set forth.

5. The combination, with the outer casing, the revolving cutting-cylinder therein, suitable gearing for driving said cylinder, and a piston adapted to be forced through said cylinder, of the semi-spherical cap adapted to inclose said gearing and provided with an opening in the top thereof adapted to receive and guide the stem of said piston, substantially as set forth.

6. The combination, with the vertically-revolving cylinder having suitable cutting-knives therein, of an adjustable supporting device under said cylinder and means for expelling the cuttings or shavings from said cylinder into the receptacle, substantially as set forth.

7. The combination, with the vertical revolving cylinder provided with the knives therein and the deflecting-strips over said knives, of the reciprocating piston notched out to fit over said deflecting-strips and adapted to be forced through said cylinder, substantially as set forth.

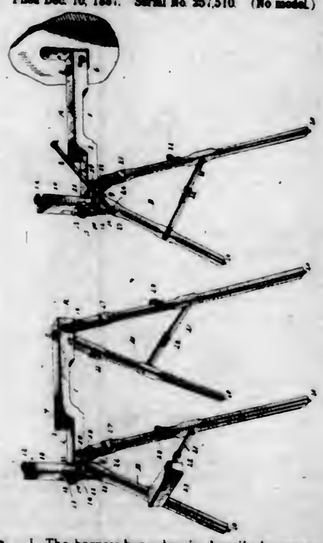
8. The combination, with the outer casing having the chamber A' and the curved conduit or reservoir A^3, of the vertical revolving cylinder provided with a series of cutting-knives, the said chamber being open at the bottom and adapted to form a bearing for the lower end of the cylinder, which is also open, substantially as set forth.



9. The combination, with the revolving cutting-cylinder and the plate provided with an opening therein under said cylinder, of the suspended plate f^3, having the sleeves thereon, springs in said sleeves, and connecting-rods extending through said springs and attached to said plate, substantially as set forth.

10. The combination, with the vertical revolving cutting-cylinder, of the conduit leading thereto and a follower in said conduit, said follower being adapted to fit said conduit, and being curved to conform to said cylinder, substantially as set forth.

384,300. STOVE. KARL WIESE, Landeck Bath, Silesia, Germany. Filed June 10, 1886. Serial No. 204,698. (No model.)



Claim.—The combination, in a furnace having the usual grate, fire-pot, direct and indirect flue-escapes, and ash-pot provided with air-inlets, of the feed-tube W, the air-feed located in the rear thereof and communicating with the fire-pot, the conical flue F, formed by the depending walls B', and situated directly over the fire-pot, the direct flue d, in line with feed-door c, the indirect flue-escape, the flue g, forming a continuation of flue f, the cupola i, surmounting said flues and fed W, diving-flues in communication with said cupola, smoke-chamber D, surrounding the ash-pit and the indirect smoke-escape flue communicating with the latter, a double hot-air chamber formed by the casing

884,300.

T U U^2 U^3 and opening Q, said chamber communicating at its lower end with air-supply pipe M, the pipe P^2, and the exit-pipe R, all operating substantially as and for the purpose set forth.

384,301. HARNESS-HORSE. THEODORE WILLSEA, Rochester N. Y. Filed Dec. 10, 1887. Serial No. 257,510. (No model.)

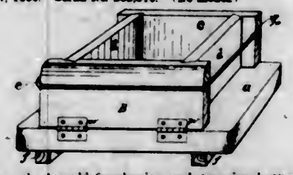
Claim.—1. The harness-horse herein described, composed of a horizontal bar supported on legs attached thereto to swing outward and fold up against the horizontal bar, a standard, 10, hinged to the upper face of the horizontal bar, and formed with a lug, 14, on its outer face, and a lever, 16, pivotally mounted on the end of the horizontal bar, and formed with a cam-groove in its inner face to engage the lug on the standard, substantially as described, and for the purpose specified.

2. The harness-horse herein described, composed of a horizontal bar, A, formed with a cut-away section, 1, in its under part and a cut-away section, 2, in its upper part, and provided with a stud, 5, near its end and hooks in its sides, a lever, 16, pivoted on the end of the horizontal bar, and formed with a cam-groove in its inner face, a standard, 10, hinged to the horizontal bar, and provided with a lug, 14, to engage the cam-groove of the lever, and legs provided with hinges pivoted to the horizontal bar to turn in the direction thereof, braces formed with keepers to hold the legs, and jointed braces between the legs, substantially as described.

3. The combination, with the holding-frame of a harness-horse, of legs pivoted thereto to fold against the frame or bar, and having jointed braces between them, as 21, and a tool-box fixed to pivots of one link or arm of said jointed braces, substantially as described.

384,302. GAS-BRACKET. JOHN WISSEL, Hoosick Falls, N. Y. Filed Aug. 11, 1887. Serial No. 246,719. (No model.)

Claim.—1. A horn-shaped arm for a bracket or chandelier formed with an air-space extending from the top or smaller end to the larger end thereof, and provided with a pipe and with a burner-receiving connection at its opposite ends, substantially as specified.

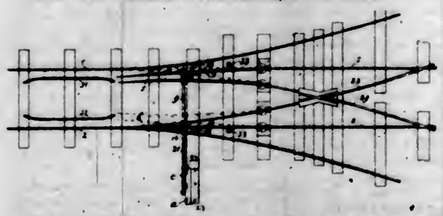


2. In an arm for a bracket or chandelier, the combination of a curved natural horn, a burner-connecting piece secured to its smaller end, and an arm-supporting piece secured to its large end, substantially as specified.

3. A horn-shaped arm or bracket having an aperture extending from tip to butt, in combination with a pipe passing throughout, a non-conducting filling, a flange-plate embracing the butt of the horn, and a tip-receiving thimble mounted on the tip of the bracket, substantially as specified.

4. A horn-shaped bracket, A, bored as at A', and having the tubes or pipes B C, the former screw-threaded, as at B', in combination with the thimble E, tip F, and plate D, substantially as specified.

5. The combination of the service-pipe X with the horn-shaped bracket A, centrally bored and screw-threaded, as at A' A^2, and having the screw-threaded pipe B, the plate D, flanged, as at D^2, perforated, as at D', the tube C, the thimble E, screw-threaded, as at E' A^3, and flanged, as at E^2, and the burner-tip F, substantially as specified.



384,303. BUTTER-MOLD. FRANK P. AYER, Lebanon, Conn. Filed June 17, 1886. Serial No. 205,516. (No model.)

Claim.—1. A mold for shaping and stamping butter, consisting of stamped bottom *a*, wedge-shaped ends *d d*, with beveled edges, the grooved and hinged sides, and means for clamping said parts together, substantially as described.

2. In combination with the bottom *a*, the end pieces, *d d*, loosely tenoned thereto and having wedge-shaped ends and beveled edges, the hinged side pieces having grooves on their inner sides shaped to receive the end pieces, and the pivoted wire binder *e*, substantially as described.

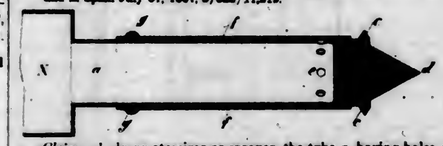
384,304. THREE-WAY SPLIT SWITCH. JAMES D. BAILEY, Utica, N. Y. Filed Feb. 16, 1888. Serial No. 264,227. (No model.)

Claim.—1. The combination, with a railroad-track, of four split rails, a shifting-bar for operating the rails, stops on the shifting-bar, the split rails in couples being held between each pair of stops, and each split rail independently movable between the stops on the shifting-bar, and springs for keeping the rails of each couple apart.

2. The combination of the rails 1, 2, 3, 4, 5, and 6, the shifting-bar 9, and the springs 14 and 15.

3. The combination, with the stationary rails, of four movable split rails between the stationary rails, a shifting-bar for moving the split rails, two of the movable rails being adapted to be brought into contact with each of the stationary rails, the two being movable on the shifting-bar to which they are connected, the stationary stops on the shifting-bar, and a spring for separating the rails between the stops, substantially as set forth.

384,305. COUPON-TICKET RACK. HENRY BEDKLEY, Reading, Pa. Filed Jan. 6, 1888. Serial No. 260,972. (No model.)

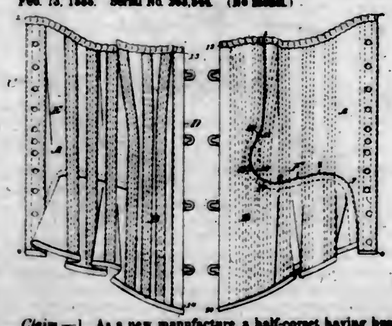


Claim.—1. A ticket-rack consisting of a flat board or plate provided with partitions and stops, in combination with ticket-clips superimposed upon each other between said partitions and supported by said stops, substantially as set forth.

2. A ticket-rack consisting of a flat board or plate provided with partitions and stops, in combination with ticket-clips superimposed upon each other between said partitions and supported by said stops, and with a suitable clamp, E, substantially as set forth.

3. A ticket-rack consisting of a flat board or plate provided with stops and with partitions bent at right angles on their top edge, in combination with ticket-clips superimposed upon each other between said partitions and supported by said stops, substantially as set forth.

4. A ticket-rack consisting of a flat board or plate provided with partitions and stops, in combination with ticket-clips bent in opposite directions at either end and superimposed upon each other between said partitions and supported by said stops, substantially as set forth.



384,306. APPARATUS FOR SPRAYING LIQUIDS. FRANÇOIS FERDAND BOURDIL, Paris, France. Filed Jan. 26, 1888. Serial No. 261,904. (No model.) Patented in France May 12, 1887, No. 183,536; in England May 27, 1887, No. 7,762; in Belgium May 27, 1887, No. 77,631; in Germany June 4, 1887, No. 41,549; in Italy June 30, 1887, XLIII, 186, and in Spain July 31, 1887, 5/322/11,219.

Claim.—1. In an atomizer or sprayer, the tube *a*, having holes *c* for the passage of liquid, and a projecting rim, *e*, against which liquid from the holes abuts, combined with the elastic impervious sheath *f*, that covers the holes *c*, whereby the liquid from the tube *a* is directed by the sheath *f* against the rim *e* and thereby atomized or sprayed, substantially as hereinbefore described.

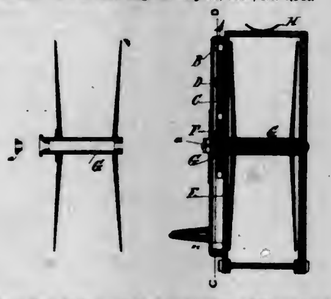
2. In an atomizer or sprayer, the combination of the tube *a*, having external bead, *g*, and holes *c*, plug *b* in the end of the tube *a*, said plug having rim *e*, and of the impervious elastic sheath *f*, whereby the liquid is directed by the sheath *f* against the rim *e* and thereby atomized, substantially as described.

384,307. CORSET. G. ALBERTUS CLARK, Bridgeport, Conn. Filed Feb. 13, 1888. Serial No. 263,846. (No model.)

Claim.—1. As a new manufacture, a half-corset having bust and hip swells and consisting of sections joined together by a curved and recurved seam extending from the top of the bust-swell downward, then curving forward and recurving backward, then extending back-

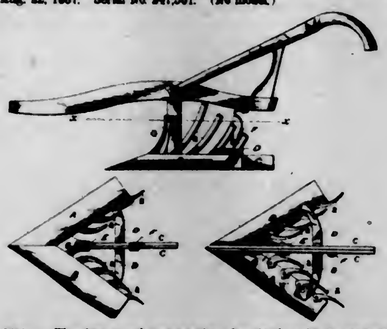
ward along the waist-line, and finally curving downward over the hip to the bottom of the corset at or near the back-stay.

2. A half-corset having bust and hip swells and consisting of two sections only, said sections being joined together by a curved and recurved seam extending from the top of the bust-swell downward, then curving forward and recurving backward, then extending backward along the waist-line, and finally curving downward over the hip to the bottom of the corset at or near the back-stay.



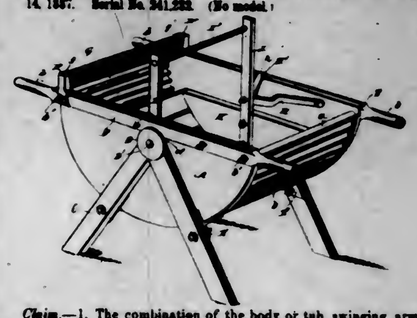
384,308. **ROLLS FOR IRON-ROLLING MILLS.** ARTHUR W. H. COLLARD, Pittsburg, Pa. Filed Apr. 7, 1888. Serial No. 269,961. (No model.)

Claim.—1. In a roll for metal-rolling, an interior central portion formed of brick or earthern material, and the outer portion of metal, which incloses the central portion, substantially as and for the purposes described.



2. The roll formed of an outer portion of metal and a center piece of brick material, having necks *a* and *a'* formed at its extremities, substantially as and for the purpose set forth.

384,309. **FISHING-REEL.** HUBERT H. CORDER, Tuckenhay House, Totnes, South Devon, England. Filed June 9, 1887. Serial No. 240,742. (No model.) Patented in England May 28, 1887, No. 7,841.

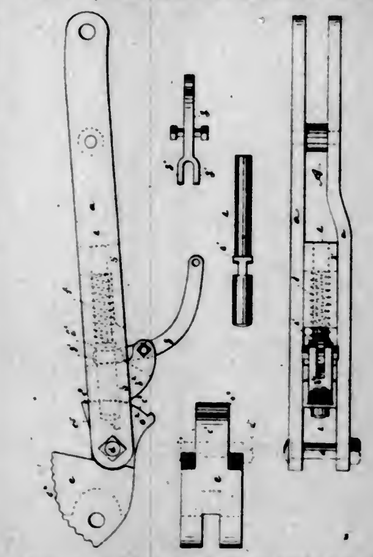


Claim.—In a fishing-reel, the combination of the casing having a side plate, E, the reel G, provided with bearings and journaled upon a central pin carrying at its shouldered end a conical bearing, against which the winch-plate is secured by lock-nuts, the conical bearing *a*, the winch-plate A, the internal wheel-rim, B, the carrier-wheel C, and the wheel F, substantially as set forth.

384,310. **POTATO-PLOW.** SAMUEL DENNOW, Lewis, Iowa. Filed Aug. 22, 1887. Serial No. 247,561. (No model.)

Claim.—The improved potato-plow herein described, consisting of the inclined blades, the shoe or drag secured thereto, as shown, the curved brace-arms secured at their outer ends to the under rear edges of the blades, and their inner ends secured to the said shoe by the bolts which unite them, the standard, and also the rear brace for the beam, supported by the said shoe, the guard on the standard, and the flat curved bars secured at their lower ends to the under inner elevated edges of the blades, substantially as specified.

384,311. **WASHING-MACHINE.** JOHN H. DOUD and FARUS ROBBINS, Walnut, Kans.; said Robbins assignor to said Doud. Filed June 14, 1887. Serial No. 241,232. (No model.)



Claim.—1. The combination of the body or tub, swinging arms pivoted at one end to the sides of the tub, the rubber pivoted to the free ends of said arms, and the supporting-arms extending upward from the swinging arms and engaging the upper edges of the sides of the tub, substantially as set forth.

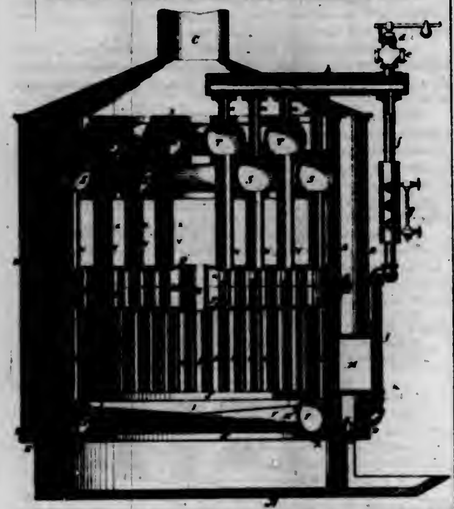
2. In a washing-machine, the combination of the tub A, bars B B, secured to the upper edges thereof, and having their ends extended to form handles *b b*, grooved brackets F F, secured to the bars B B, and the wringer-bar G, removably fitted at its ends in the said brackets, substantially as and for the purpose set forth.

3. In combination with the suds-box, the brackets F, the wringer-bar removably fitted in the brackets, and the splash-plate *g*, secured to the lower edge of the said bar and passing within the upper edge of the tub, substantially as specified.

4. In combination with the suds-box having the corrugated bottom, the bolts *b'*, passing through the ends of the corrugated bottom and the sides of the suds-box, the brackets F, held to the sides of the suds-box by the bolts *b'*, and the wringer-bar fitted in the brackets, substantially as specified.

384,312. **CAR-COUPLING.** FRANK A. FOX, New York, assignor to Charles H. Bishop, Brooklyn, N. Y., and Roderick S. Bourn, Bridgeport, Conn. Filed Mar. 16, 1888. Serial No. 267,304. (No model.)

Claim.—1. The combination of top and bottom bars *a a* and of perforated cross-pieces *b b'*, the cross-piece *b* having lateral extension *b²*, with the draw-head *c*, sliding bolt *e*, and spring *f*, the sliding bolt *e* having shoulder *e'*, and with the operating-lever *g*, pivoted to extension *b²*, and having a forked end, *g'*, that engages bolt *e*, substantially as specified.



2. The combination of draw-bar A with a sliding bolt, spring, and

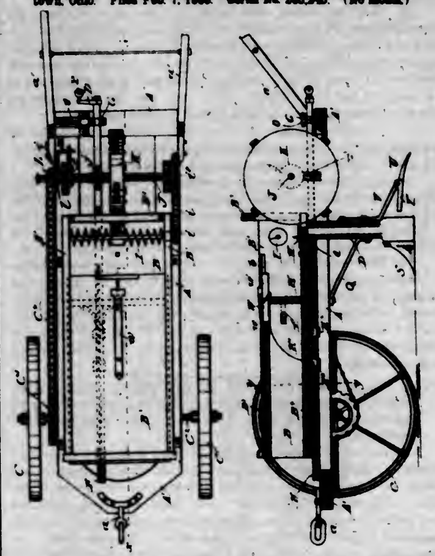
operating-lever, and with a pivoted draw-head, *c*, having a corrugated face, *c'*, substantially as specified.

3. The combination of draw-bar A, having the cross-piece *b*, that is provided with lateral extension *b²*, and of sliding bolt, spring, and operating-lever, with a pivoted draw-head, *c*, having the lateral hook-shaped extension *c²*, that is adapted to engage the extension *b²*, substantially as specified.

4. The combination of a draw-bar, A, with a sliding bolt, spring, and operating-lever, and with a pivoted draw-head, *c*, having a perforation for engagement with the sliding bolt, the edge of the draw-head being straight at one side of the perforation and being curved and hook-shaped at the other side of the perforation to limit the motion of the draw-head in both directions, substantially as specified.

384,313. **SECTIONAL STEAM-BOILER.** JOHN A. GREENOUGH, New York, N. Y. Filed Oct. 15, 1887. Serial No. 252,402. (No model.)

Claim.—1. In a boiler, the plates O P, forming the water-chamber and being at the top of the fire-box, combined with the circular pipe at the lower portion of the fire-box, a series of pipes connecting the said pipe and chamber and forming the walls of the fire-box, a series of circular pipes at the top of the boiler, an exit therefrom for steam, and a series of pipes connecting the said series of circular pipes with the said water-chamber, substantially as and for the purposes set forth.



2. In a boiler, the plates located at the top of the fire-box and forming between them the water-chamber, combined with the pipe at the lower portion of the fire-box, a series of pipes connecting said pipe and said chamber and forming the walls of the fire-box, a series of circular pipes at the top of the boiler, an exit therefrom for steam, a series of pipes connecting the said series of circular pipes with said water-chamber, and flue-pipes for the products of combustion extending through said water-chamber, substantially as set forth.

3. In a boiler, the plates located at the top of the fire-box and forming between them the water-chamber, combined with the pipe at the lower portion of the fire-box, a series of pipes connecting said pipe and said chamber and forming the walls of the fire-box, a series of circular pipes at the top of the boiler, an exit therefrom for steam, a series of pipes connecting the said series of circular pipes with said water-chamber, flue-pipes extending through said water-chamber, and flue-pipes passing upward from the fire-box through the said vertical pipes which connect the said series of circular pipes with the said water-chamber, and through the circular pipes at the top of the boiler, substantially as and for the purposes set forth.

4. In a boiler, the plates located at the top of the fire-box and forming between them the water-chamber, combined with the pipe at the lower portion of the fire-box, a series of pipes connecting said pipe and said chamber and forming the walls of the fire-box, a series of circular pipes at the top of the boiler, a series of pipes connecting the said series of circular pipes with said water-chamber, flue-pipes extending through said water-chamber, a steam-dome with its escape and safety valve, and pipes connecting the steam-dome with the said series of circular pipes, substantially as and for the purposes set forth.

5. In a boiler, the plates located at the top of the fire-box and forming between them the water-chamber, combined with the pipe at the lower portion of the fire-box, a series of pipes connecting said pipe and said chamber and forming the walls of the fire-box, the series of alternating circular pipes S T at the top of the boiler, an exit therefrom for steam, a series of pipes connecting the said series of circular pipes with said water-chamber, and flue-pipes for the products of combustion extending through said water-chamber, substantially as set forth.

384,314. **COTTON-SEED PLANTER.** SAMUEL R. HAKE, Youngstown, Ohio. Filed Feb. 7, 1888. Serial No. 263,945. (No model.)

Claim.—1. In a planter, the combination of the hopper having a slot in its end and bottom and having a discharge-opening in its bottom communicating with the said slots, the partition E, means for automatically moving said partition to reduce the capacity of the hopper and force the seed to the said discharge-opening, the feed-shaft having a right and left spiral to feed the seed from the sides of the hopper to the said discharge-opening, and the feed-wheel having its edge adapted to work through the said slots and discharge-opening, substantially as and for the purpose described.

2. The combination, with the hopper, of the grain-tube made in two corresponding parts, each part having a corresponding vertical groove, and the spring for yieldingly holding the said parts together, and the feed-wheel having feed-tappets which are adapted to work through the said grooves and between the parts of the said grain-tube, substantially as and for the purpose described.

3. The combination, with the hopper and the grain-tube having an opening in one side, of the feed-wheel and the feed-tappet having a web portion to fit in the opening and a head or plunger to work through the said grain-tube, substantially as described.

4. The combination, with the hopper having a grain-discharge opening and the feed-wheel, of the feed-tappet having a web portion and a head or plunger which tapers in cross-sectional area from end to end, substantially as set forth.

5. The herein shown and described feed-tappet, composed of a base-plate, a web portion, and a head or plunger.

6. The combination, with the hopper having a discharge-opening and the feed-wheel, of the double-edged knife guard extending vertically in the said hopper, substantially as described, and for the purpose specified.

7. The combination, with the hopper and the adjustable wall or partition, of the extension having a threaded socket and the threaded rod engaging with said socket, substantially as described.

8. The combination, with the hopper having a narrow slot in its bottom, the wall E, the wide extension E', extending through the said slot and having a threaded socket at its lower end below the hopper, of the braces *f* and the threaded rod engaging with the said socket, substantially as specified.

9. The combination, with the hopper and the adjustable wall or partition, of the sliding cover having a stop projecting within the path of the said wall, substantially as described, for the purpose specified.

10. The combination, with the hopper and the adjustable wall or partition, of the sliding cover, the stop set at an incline to the said wall.

and the spring secured to the cover at one end and having the stop secured to its free end, substantially as described.

11. The combination, with the hopper, the adjustable wall or partition, and the threaded shaft for adjusting the said wall or partition, of the counter-shaft, the gearing for imparting motion from the counter-shaft to the threaded shaft, and the adjustable bearing having the outer end of the threaded shaft journaled therein, whereby the said counter and threaded shafts may be thrown in and out of gear at will, substantially as and for the purpose described.

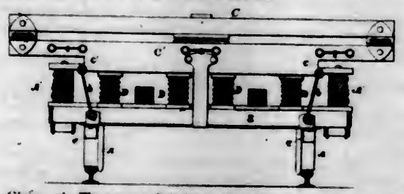
12. The combination, with the hopper, the adjustable wall, the threaded shaft, the counter-shaft, and the gearing connecting the counter and threaded shafts, of the adjustable bearing *i*, having the outer end of the threaded shaft journaled therein, the spring, and the cam-lever for compressing the spring, having the said bearing mounted on its outer end and throwing the said counter and threaded shafts out of gear, substantially as described, for the purpose specified.

13. In a cotton-planter, the combination, with the frame and the grain-spout, of the braces Q and R, adjustably connecting the grain-spout with said frame, substantially as shown and described.

14. In a cotton-planter, the combination, with the grain-spout having a slot in its side, of the combined coverer and cultivator, the bracket V, having a slot and having its upper end bent at right angles to enter the slot in the grain-spout, and the bolt *s'*, adjustably connecting the bracket with the grain-spout, substantially as set forth.

15. The combination, with the hopper, the adjustable wall or partition, the threaded shaft, the counter-shaft, and the gearing connecting the threaded and counter shafts, of the adjustable bearing *i*, having the outer end of the threaded shaft journaled therein, the clutch *k*, the pinion L, having clutch *l*, and the shipper-lever for throwing the clutches *l* and *l'* out of gear, substantially as and for the purpose described.

384,315. MANUFACTURE OF DYE-STUFFS. MARTIN HERZBERG, Elberfeld, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Company, same place. Filed Feb. 21, 1888. Serial No. 264,831. (Specimens.)



Claim.—1. The process herein described of making new brown dye-stuffs, which consists in combining the salts of diazo compounds of aniline, toluidine, xylidine, cumidine, and the nitro-derivatives of the same, amidoazo-benzol, amidoazo-toluol, amidoazo-xylol, alpha and beta naphthylamine, or their sulpho and carbo acids, and tetrazo compounds of benzidine, benzidine-sulpho, tolidine, diamido-stilbene, or their sulpho or carbo acids, with Bismarck brown, (triamidoazo-benzol or triamidoazo-toluol,) substantially as hereinbefore described.

2. The rendering of the insoluble colors obtained as aforesaid soluble in water by a sulphonating process, substantially as hereinbefore described.

384,316. MANUFACTURE OF DYE-STUFFS. MARTIN HERZBERG, Elberfeld, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Company, same place. Filed Feb. 21, 1888. Serial No. 264,832. (Specimens.)

Claim.—The brown coloring-matter herein described, which has the following characteristics: it exists as a brown powder easily soluble in water, dyes cotton, wool, and silk a splendid brown in a boiling bath of common salt, cotton likewise in a boiling alkaline or soap bath, which color will not be altered by acetic acid; by adding muriatic acid to the aqueous solution the free acid of the dye-stuff is formed; with concentrated sulphuric acid the dye-stuff described dissolves into a dirty violet-brown color.

384,317. CAR-TRUCK. MOSES G. HUBBARD, Philadelphia, Pa. Filed July 5, 1887. Serial No. 243,341. (No model.)

Claim.—1. The car-truck bolster pivoted at its center to the car and mounted on the vertical spiral torsional springs, in combination with the draft-links of the car-wheels, whereby the car-wheels can vibrate both vertically and laterally without frictional resistance from the draft, substantially as described.

2. The combination of the elastic draft-links, a car-truck bolster pivoted at its center to the car and mounted on the vertical spiral torsion-springs, with the truck-wheels, whereby the truck-wheels can vibrate in all directions from the rail without frictional resistance from the draft, substantially as and for the purposes set forth.

3. The spiral torsion-springs constructed as described, and located one pair each side of each safety-sill and all in line transversely across the truck-frame, substantially as described and shown.

4. The abetting sills located near the bolster and adapted to act also as supporting-sills, in combination with the pendent links for supporting the bolster, substantially as and for the purposes set forth.

5. The combination of the springs, constructed and located substantially as described, with the flexible truck-frame having double-plated wheel-pieces, whereby the truck may be more safely made with convenient base to admit of the wide thin cross-sills between the bolster and springs, substantially as described.

6. The flexible truck-frame constructed, substantially as described, with double-plated wheel-pieces, and the springs constructed and located therein, as set forth and shown, in combination with the brakes located between the wheels, substantially as and for the purposes described.

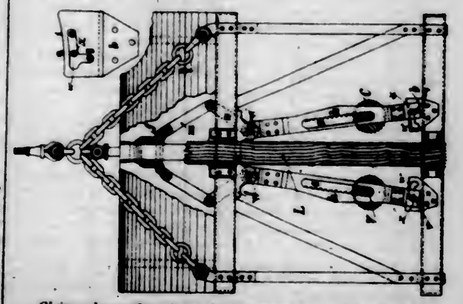
7. The combination of the bolster, the vertical springs, the spring-platform, and the vertical check-loop, constructed and arranged substantially as and for the purposes described.

8. The combination of the extended bolster and the vertical spiral torsion-springs with the anti-friction outer bolster-bearings to diminish the circular or twisting strain upon the vertical springs, substantially as set forth.

9. In a car-truck, the combination of the lower spring support or platform rigidly attached to the truck-frame, the spiral torsion-springs mounted thereon, and the truck-bolster mounted, as described, in such manner that the lateral motion thereof shall be controlled by the springs, whereby both the vertical and lateral movements of the car or its wheels are controlled and cushioned by the same springs, for the purposes substantially as described.

10. The combination of a lower spring support or platform rigidly attached to the truck-frame, the vertical spiral torsion-springs mounted thereon, the truck-bolster mounted on the springs, and the elastic draft-links, whereby the attachment of the car to the wheels is made elastic in every direction, for the purposes substantially as set forth.

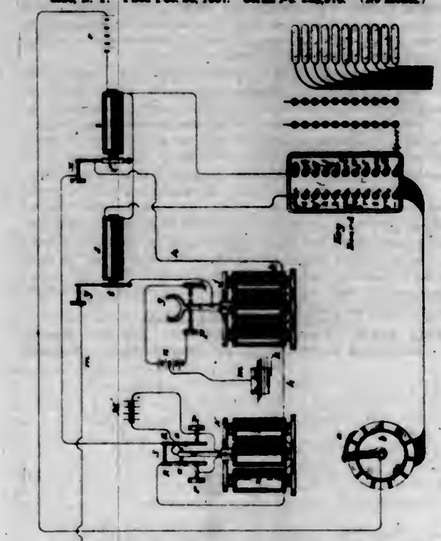
384,318. RIVET. ALBERT KIRBY, Canton, Ohio, assignor to the Diebold Safe and Lock Company, same place. Filed Nov. 29, 1887. Serial No. 256,449. (No model.)



Claim.—1. A rivet having an outside portion of soft iron, embracing a central portion of hardened steel, a portion of which has been removed before hardening, substantially as described, and for the purpose set forth.

2. A rivet having an outside portion of soft iron, embracing a central portion of steel having one head formed by upsetting the iron and steel, the other formed of the soft iron over the end of the steel, substantially as described, and for the purpose set forth.

3. A rivet having a wedge of steel welded in head thereof and hardened, substantially as described, and for the purpose set forth.



4. A rivet, preferably of soft iron, having a central perforation and hardened-steel pin driven in said perforation, substantially as described, and for the purpose set forth.

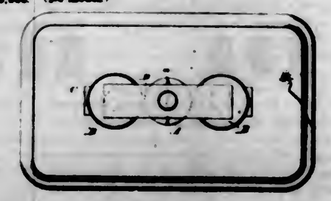
384,319. SAFETY DEVICE FOR ELEVATORS. CONSTANTIN KLEIN and FRIEDRICH PIEKOWSKI, Königshütte, and AUGUST GROSS, Beuthen, Prussia, Germany. Filed Jan. 31, 1888. Serial No. 262,590. (No model.)

Claim.—In a safety-clutch for elevators, the combination of the spring F, the toggle-links *m n*, the slotted arms *h*, the guides *b*, the toothed wheels V, provided with pinions adapted to work in the slots in the arms *h*, and the guide-beams I, all substantially as described.

384,320. PRINTING-TELEGRAPH. EDWARD J. HALLETT, Bay Side, N. Y. Filed Feb. 26, 1887. Serial No. 228,978. (No model.)

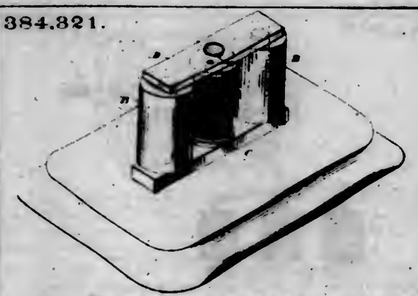
Claim.—1. In combination with the main-line and the trailer-circuit, two sets of closing-keys or their equivalent included in branches of the trailer-circuit, and a magnet in the branch circuit of one set of keys for altering the condition of the main-line circuit, substantially as and for the purposes hereinbefore set forth.

2. The combination, at the transmitting-station, of the main-line or working circuits, its circuit-breaker and pole-changer, the escapement circuit and automatic pole-changer and escapement operating or controlling devices included therein, the trailer-circuit and the trailer, the two sets of keys or their equivalent, and the magnet of the main-line-circuit controller included therein, said magnet being in the branch circuit of one set of keys, these elements being combined and having the mode of operation substantially as hereinbefore set forth.



3. Two sets of keys or their equivalent, each set having a common electrical connection insulated from that of the other set, in combination with separately-insulated contacts therefor, one contact of one set and one contact of the other set being electrically connected to the same segment of a sunflower-wheel or segment-disk, substantially as and for the purposes hereinbefore set forth.

4. The main line, the printing-circuit, the neutral relay B, having its magnet in the main line and controlling contacts in the printing-circuit, and the two press-magnets included in branches in said printing-circuit, the connections being substantially such as hereinbefore described, so that the printing-circuit will be through one or the other of said magnets, according to the condition of the main line when reversals on it cease.



5. The main line, the printing-circuit, the neutral relay B, and the two press-magnets, in combination with a neutral relay, I, a polarized relay, A, and circuit-connections, substantially as described, whereby the printing-circuit is maintained open so long as reversals continue in the main line.

6. The magnet consisting of the spools E E' and the intermediate bare or unwound core, F, affixed to a common yoke, and two independent armatures, substantially as and for the purposes hereinbefore set forth.

384,321. POLARIZED ELECTRO-MAGNET. EDWARD J. HALLETT, Bay Side, N. Y. Filed Feb. 17, 1887. Renewed Apr. 5, 1888. Serial No. 269,660. (No model.)

384,321.

Claim.—The herein-described polarized magnet, consisting of the three electro-magnets affixed to a common yoke, with an armature pivoted to the core of the intermediate magnet and adapted to rock from pole to pole of the exterior magnets, said armature being inductively magnetized through its pivotal connection with the pole of the intermediate magnet, which is maintained in a closed circuit during the operation of the instrument, substantially as and for the purposes set forth.

384,322. PRINTING-TELEGRAPH. EDWARD J. HALLETT, Bay Side, N. Y. Filed Feb. 26, 1887. Renewed Apr. 5, 1888. Serial No. 269,661. (No model.)

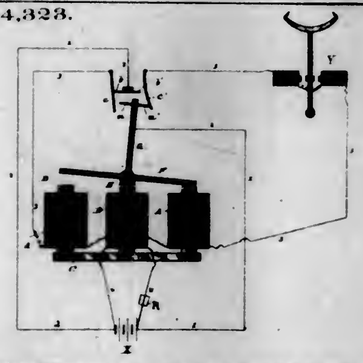
Claim.—1. The combination of the laterally-movable type-wheel, the shifting mechanism, the printing-pad, and the press-pallet, which during the first part of its stroke completely shifts and brings to rest the movable type-wheel and subsequently effects the printing, substantially as and for the purposes hereinbefore set forth.

2. The combination of the two laterally-movable type-wheels, the shifting mechanism, the two independent press-pallets, each of which during the first part of the stroke completely shifts and brings to rest the movable type-wheels and subsequently effects the printing, and the press-pad common to the two pallets, substantially as hereinbefore set forth.

3. The combination of the two laterally-movable type-wheels, the shifting mechanism, the slotted shield, the press-pad common to both press-pallets, and two independent press-pallets, each of which during the first part of its stroke completely shifts and brings to rest the movable type-wheels and subsequently effects the printing operation, substantially as hereinbefore set forth.

4. The combination of the two independent press-pallets, the type-wheels, and the two sets of shifting mechanisms, one for each pallet, the combination being and acting substantially as hereinbefore set forth.

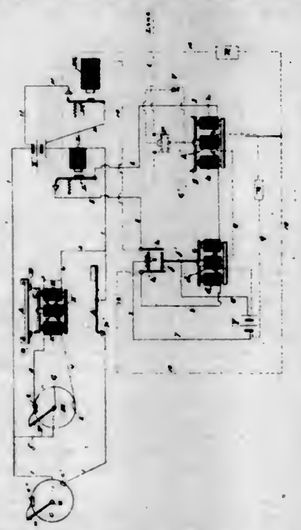
5. The two type-wheels, the two independent press-pallets and wheel-shifting mechanism operated thereby, and the press-pad, in combination with the two magnets, one for each pallet, substantially as and for the purposes hereinbefore set forth.



6. The combination of the type-wheel, the press-pallet, the shifting-dog thereon, and the shifting-lever provided with an incline, *g*, and straight face *h*, substantially as and for the purposes hereinbefore set forth.

384,323. AUTOMATIC POLE-CHANGER. EDWARD J. HALLETT, New York, N. Y. Filed Apr. 5, 1888. Serial No. 269,664. (No model.)

Claim.—An automatic pole-changer which contains two coils or sets of coils, the one in circuit with the contacts of the pole-changer, the other in a permanently-closed circuit in derivation thereto, whereby

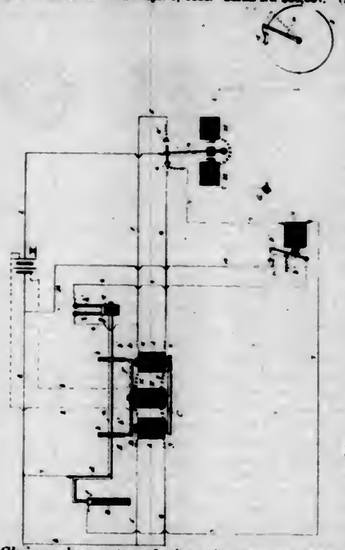


384,323.

a division of the current supplying the pole-changer is effected, a part passing through the contacts and a part acting with permanent induction upon the armature, substantially as and for the purposes herein-before set forth.

384,324. AUTOMATIC TELEGRAPHY. EDWARD J. MALLETT, New York, N. Y. Filed Apr. 5, 1888. Serial No. 269,635. (No model.)

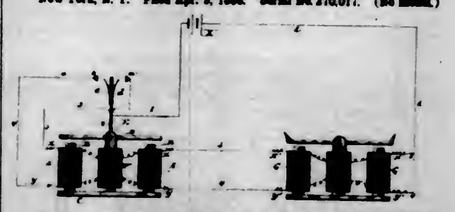
Claim.—1. The combination, with the trailer-circuit and trailer included therein, of the scape-fork circuit, escapement operating or controlling devices therein, an automatic pole-changer for throwing reversals upon the scape-fork circuit, and a stopping-magnet in the trailer-circuit controlling contacts in the scape-fork circuit, whereby the closing of the trailer-circuit shall operate the stopping mechanism to effect the stoppage of said automatic pole-changer and escapement operating or controlling devices, substantially as and for the purposes hereinbefore set forth.



2. The combination, with an automatic telegraph-transmitter, means for actuating the same, and a stopping-magnet in the trailer-circuit of the transmitter controlling contacts in the scape-fork circuit of the transmitter, of a starting-magnet in the scape-fork circuit controlling contacts in the trailer-circuit, said starting-magnet being brought into action by the stoppage of the transmitter, and when thus called into action automatically operating to release the transmitter from the control of the stopping mechanism, substantially as hereinbefore set forth.

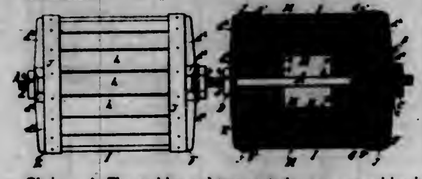
3. The combination of the trailer-circuit and trailer included therein, the scape-fork circuit and escapement operating or controlling devices included therein, an automatic pole-changer for throwing reversals upon the scape-fork circuit, a stopping-magnet in the trailer-circuit controlling contacts in the circuit in which the automatic pole-changer is included, and a starting-magnet controlling contacts in the stopping-magnet circuit brought into action by the operation of the stopping mechanism, and operating when thus brought into action to release the automatic pole-changer from the control of the stopping mechanism, substantially as hereinbefore set forth.

4. The trailer-circuit, including the anvils and keys, together with the doubly and oppositely wound car-escapement magnet having its two windings respectively connected with the two branches of a circuit in derivation to that which includes the keys, said branches being connected to separate segments, through one and the other of which alternately the derived circuit is completed at the times and in the manner substantially as and for the purposes hereinbefore set forth.



5. The trailer-circuit, including the transmitting-keys or needles and anvils, and the transmitting-trailer and sunflower-disk provided with an interval or car-segment, together with the doubly-wound car-escapement magnet, and the two-segment car-disk and trailer included in a branch of said circuit, the car-trailer revolving at half the speed of the transmitting-trailer and operating to close the branch circuit alternately through opposite segments of the car-disk, substantially as and for the purposes hereinbefore set forth.

384,325. AUTOMATIC TELEGRAPHY. EDWARD J. MALLETT, New York, N. Y. Filed Apr. 5, 1888. Serial No. 269,637. (No model.)



Claim.—In a system of telegraphy, the combination, with the escapement-circuit of the receiving-instrument, the escapement-magnet included therein, and a current-diverter for diverting the current from the said escapement-magnet at regular intervals, of a magnet normally influenced at corresponding intervals from the transmitter and contact-points operated by said magnet when thus influenced to neutralize the action of the current-diverter, substantially as and for the purposes hereinbefore set forth.

384,326. AUTOMATIC POLE-CHANGER. EDWARD J. MALLETT, New York, N. Y. Filed Apr. 9, 1888. Serial No. 270,017. (No model.)

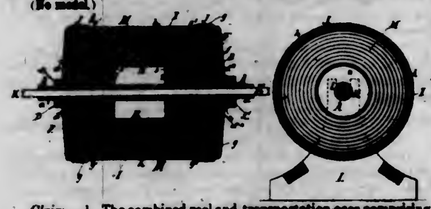
Claim.—An automatic pole-changer the magnet of which is doubly and oppositely wound, one winding included in a circuit completed through one of the sets of contacts of the pole-changer, and the other winding included in a circuit in derivation to the one first named, and completed through the other set of contacts of the pole-changer, substantially as set forth.

384,327. TRANSPORTATION-CASE FOR COILED LEAD PIPE. HENRY J. HILLAR, Utica, N. Y. Filed Feb. 6, 1888. Serial No. 263,066. (No model.)

Claim.—1. The packing and transportation case comprising in its construction a central screw-threaded tie bar or axle, A, provided with a stop collar or shoulder, D, heads E G F, nuts B and C, and protecting inclosing portion I, substantially as and for the purpose described.

2. The combined packing and transportation case comprising the cylinder and inclosing body portion, two outer heads, and an intermediate head, one of which outer heads and the intermediate head being arranged to slip away from the other outer head for the insertion of the coils of pipe, substantially as described.

3. The combination, with the screw-threaded tie bar or axle A, shoulder D, heads E and G, and nut B, of the head F, formed with the counterbore or socket *f*, and the nut C, substantially as and for the purpose described.



4. The combination, with the body portion, of the heads E and F, chamfered or formed with a bearing and abutting surface at *g*, and provided with hoops which aid in forming endless recesses between themselves and the chamfered or bearing portions of the heads, substantially as and for the purpose described.

5. The combined packing and transportation case comprising the cylinder, an inclosing body portion formed of staves joined together by flexible connections, two outer heads, and an intermediate head, one of which outer heads and the intermediate head being arranged to slip away from the other outer head for the insertion of the coils of pipe, substantially as described.

6. The combination of the outer inclosing portion, I, of the packing and transportation case, formed of staves flexibly connected, except at one edge of each of the last staves, with the outer heads, E, F, and G, cylinder H, a screw-threaded tie axle or bar, A, having shoulder D, and the nut C, substantially as described.

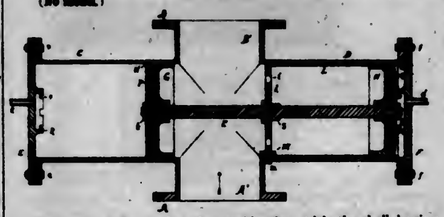
7. The body portion I of the combined reel and transportation-case, formed of staves connected together by flexible connections applied wholly on the inner surface of the staves with no portions of the connections exposed externally of the case and liable to injury by coming in contact with objects over which the case may be rolled, substantially as described.

384,328. COMBINED REEL AND TRANSPORTATION-CASE. HENRY J. HILLAR, Utica, N. Y. Filed Feb. 6, 1888. Serial No. 263,065. (No model.)

Claim.—1. The combined reel and transportation-case comprising in its construction a central screw-threaded tie-tube, A, provided with a stop collar or shoulder, D, heads E G F, nuts B and C, and protecting and inclosing portion I, substantially as and for the purpose described.

2. The combined reel and transportation-case comprising a central screw-threaded tie-tube, A, of greater length than the case stop collar or shoulder D, a laterally-sliding head, F, nut C, an outer removable protecting flexible inclosing portion, I, and a removable axial shaft, K, substantially as described.

3. The combined reel and transportation-case having a body portion formed of staves flexibly connected except at one of the edges of the last two staves, a reel-cylinder, an intermediate slipping head, and two outer heads, one of which slips away from the other for the removal of the body portion, so that the pipe may be wound upon the reel-cylinder, substantially as described.



384,329. COMBINED REEL AND TRANSPORTATION-CASE. HENRY J. HILLAR, Utica, N. Y. Filed Apr. 13, 1888. Serial No. 270,620. (No model.)

384,329.

Claim.—The combination of the tie-bar C, either tubular or solid, screw-threaded, and provided with a shoulder and a nut, the heads A A', the body portion B, and the reel F, substantially as and for the purpose described.

384,330. VALVE. GEORGE H. MOORE, Norwich, Conn., assignor to Estelle C. Moore, same place. Filed May 20, 1887. Serial No. 238,085. (No model.)

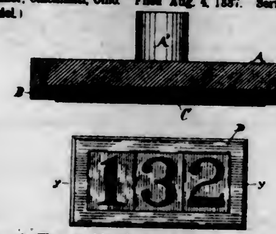
Claim.—1. In a valve, the combination, with the shell having lateral extensions upon opposite sides of the water-way or passage therethrough, said extensions being in the form of cylinders closed at their outer ends, of a piston-head mounted within each of said cylinders, a stem connecting said piston-heads with each other, an expansible cylinder mounted upon and carried by said stem, and means for exerting pressure against said piston-heads alternately, whereby said expansible cylinder is moved in opposite directions to open and close the passage through the shell and is evenly balanced between said piston-heads, substantially as described.

2. In a valve, the combination, with the shell having lateral extensions upon opposite sides of the water-way or passage therethrough, said extensions being in the form of cylinders closed at their outer ends, a piston-head mounted within each of said cylinders, a stem connecting said piston-heads with each other, a gate consisting of an expansible cylinder mounted upon and carried by said stem, said expansible cylinder having an inlet-opening facing the inlet end of the passage through the shell, and inlet and exhaust pipes communicating with the cylindrical extensions of the shell, whereby fluid or liquid under pressure is admitted thereto to operate said piston-heads, substantially in the manner and for the purpose set forth.

3. In a valve, the combination, with the shell A B, having the lateral cylindrical extensions C D, of the piston-heads G H, stem K, a disk secured to said stem between its ends, expansible cylinder L, supported at one end by said disk and at the opposite end by one of the piston-heads, and pipes *d e*, communicating with the interior of cylinders C D, substantially as shown and described.

4. In a valve, the combination, with shell A B, cylinder C D, located upon opposite sides thereof, heads E F, secured to the outer ends of said cylinders and having the circular flanges R, provided with openings *r*, stem K, piston-heads G H, packing-disks N O, and washers P Q, secured to said stem at its ends, disk I, secured to said stem between its ends, expansible cylinder L, mounted upon said disk and one of the piston-heads, substantially in the manner shown and described, and pipes *e d*, extending through the heads of cylinders C D within the circle described by the flanges R, arranged and operating substantially as set forth.

5. In a valve, the combination, with the shell A B, having the laterally-extending cylinders C D, of piston-heads G H, located within said cylinders, stem K, connecting said piston-heads, disk I, and cylinder L, mounted upon said stem, said latter cylinder having the opening *t*, and a stop for preventing circumferential movement of said cylinder L, whereby its opening *t* is retained in a plane substantially diametrical to the water-way or passage through the shell, substantially as and for the purpose described.

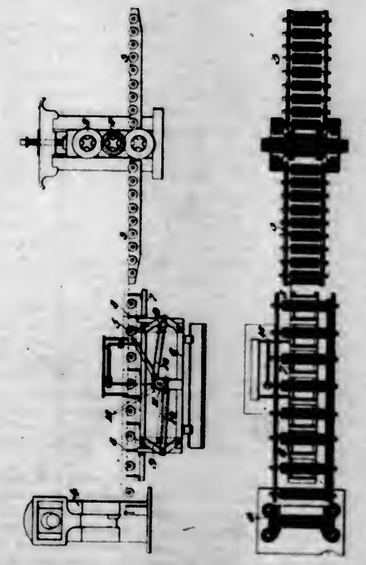


6. In a valve, the combination, with the shell having the lateral cylindrical extensions, the piston-heads located therein, the stem connecting said piston-heads and the disk, and expansible cylinder having opening *t*, mounted on said stem, arranged and operating substantially in the manner set forth, of guide-block M, secured to the inner wall of one of the cylindrical extensions and projecting within said opening *t* of the expansible cylinder, substantially as described.

7. In a valve, the combination, with the shell A B, cylinders C D, stem K, piston-heads G H, disk I, having the perforations *i*, and cyl-

inder L, having an inlet-passage in its side adjacent to the inlet-passage A' of the shell, of a guide for preventing circumferential movement of said cylinder L, and means for introducing fluid or liquid under pressure within the cylinders C D and for exhausting the same therefrom, substantially in the manner shown and described.

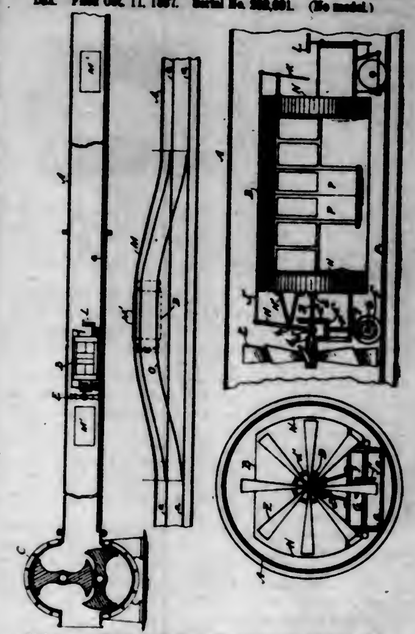
8. In a valve, the combination, with the shell A B, cylinder C D, stem K, piston-heads G H, and disk I, of the expansible cylinder L, having its ends located in peripheral grooves in said disk and one of said piston-heads, whereby the periphery of said cylinder is substantially in the plane of the peripheries of said disk and piston-heads, substantially as set forth.



384,331. DEVICE FOR FORMING LETTERS AND DESIGNS ON SHEET METAL. JAMES O'CONNOR, Newport, Ky., assignor to Williams & O'Connor, Cincinnati, Ohio. Filed Aug. 4, 1887. Serial No. 246,096. (No model.)

Claim.—1. The combination, substantially as specified, of the die-frame D, the interchangeable loose steel type fitted to said frame, the rubber counter, and counter-holder, said counter-holder having a shank for attaching it to the movable plunger of a die-press.

2. The combination of the rubber counter C, the counter-holder A A', and stripe B, the die-holder D, the removable dies, and anvil F, substantially as shown and described.



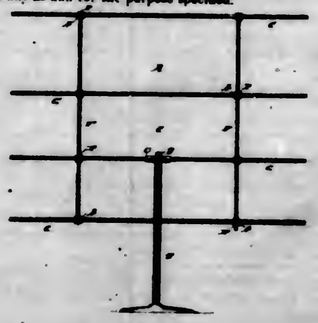
384,332. APPLIANCE FOR ROLLING-MILLS. DAVID B. OLIVER, Allegheny City, Pa. Filed Apr. 25, 1888. Serial No. 271,783. (No model.)

Claim.—1. An improvement in appliances for mills, which consists of the combination of the following elements: a series of driven conveying rollers and scales having their platform arranged beneath the rollers, one of said elements being movable to cause the metal to rest upon the platform, substantially as and for the purposes described.

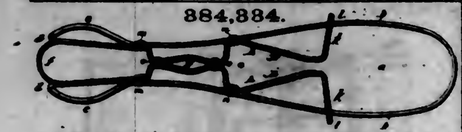
2. As an improvement in appliances for rolls, the combination, with the rolls and the shears, of the following elements, viz: a series of driven conveying-rollers leading from the rolls to the shears, and scales whose platform is situate beneath the conveying-rollers, one of said elements being movable to cause the metal to rest upon the platform, substantially as and for the purposes described.

384,333. PNEUMATIC RAILWAY. THOMAS W. PEYTON, Welney, Ind. Filed Oct. 11, 1887. Serial No. 252,091. (No model.)

Claim.—1. The combination, with a pneumatic tube and means, as a compressing-engine, for producing a current of air therein, of a car and a fan mounted upon one end of said car and in operative connection with the car-axle, substantially as shown and described.



2. The combination, with a pneumatic tube and means, as a blower or compression-engine, for producing a current of air therein, of a car, a fan mounted thereon and in operative connection with the car-axle, and means, as a lever and clutch, for throwing said fan out of gear, substantially as shown and described.

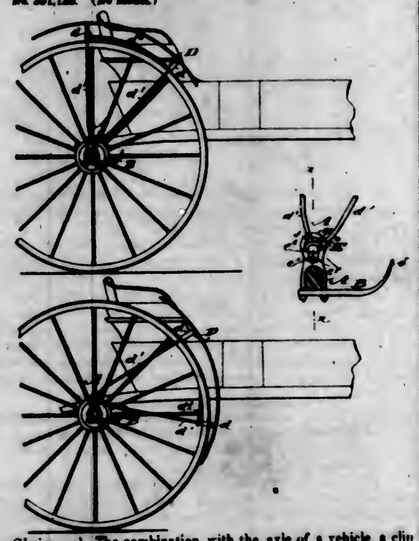


3. The combination, with a pneumatic tube, of means for inducing a current of air therein, a railway-track, a lateral offset or enlargement within the tube, a switch located within said offset, doors in the side of the tube, and a railway-car provided with curved flanges at the respective ends, whereby said flanges may conform to the side of the tube when opposite to the doors, substantially as shown and described.

4. The combination of the car B, flanges N N, tube A, and a switch placed sufficiently near to the outside of the tube to permit the said flanges to touch said tube when opposite to the doors of the station, substantially as shown and described.

384,334. DISPLAY-FRAME. JAMES J. REMMENGAM, Centralia, Ill. Filed Apr. 14, 1888. Serial No. 270,603. (No model.)

Claim.—1. In a shoe-rest, the combination of the outer frame, *b*, open at its rear end and terminating in spring-arms *c*, and the inner frame, *c*, open at its front end and terminating in the spring-arms *b*, substantially as and for the purpose specified.



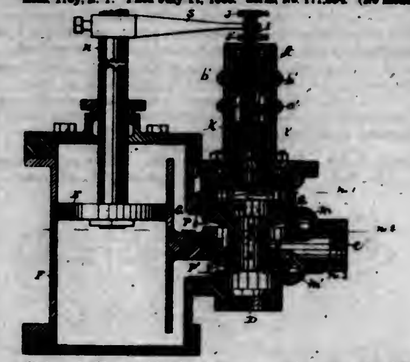
384,334.

2. The within-described shoe-rest, comprising the outer frame, *b*, forming the sole-rest, and the heel-springs *c c*, provided with the jaws *d d*, and the inner frame, *c*, secured to the outer frame and comprising the heel-loop *f*, the forward-extending spring-arms *b b*, having the jaws *l l*, and the intermediate loop or socket to enable the rest to be attached to a frame, substantially as and for the purpose specified.

3. The combination, with the display-frame having the standard B, provided on its upper end with a horizontal sleeve, C, and the frame having horizontal rods G, one of which is mounted in the said sleeve and locked firmly in position by a set-screw, of the collars adjustably mounted on the horizontal bars and having tapped apertures in their sides, the shoe-rests comprising the outer frames, *b*, having spring-arms at their rear ends, and the inner frames having heel-loops, forward-extending spring-arms, and loops or sockets between the same, and the set-screws mounted in the tapped apertures in the collars and engaging the slots or sockets in the shoe-rests, substantially as and for the purpose specified.

4. The herein-described shoe-rest, comprising the two frames *b c*, one arranged within the other, each frame having a closed and an open end and each having spring arms or jaws at the open ends, the spring arms or jaws of one frame engaging and sliding upon the other frame, as set forth.

384,335. WHEEL-FENDER FOR CARRIAGES. ARTHUR C. ROGERS and HENRY STRAW, Faribault, Minn. Filed Sept. 30, 1887. Serial No. 251,129. (No model.)



Claim.—1. The combination, with the axle of a vehicle, a clip held upon said axle, and a stop-bar projecting therefrom, of a hub revolving in the clip, arms radiating from the hub, a fender secured to said arms, and means, substantially as described, for retaining the fender over the wheel.

2. The combination, with the axle of a vehicle, a clip held upon said axle, provided with a compound recess in the upper end, and a stop-bar projecting horizontally outward from the axle and clip, of a hub provided with an essentially-rectangular projection upon one face adapted to rotate in said recess, arms radiating from the hub, a fender secured to said arms, and a retaining-cap-plate attached to said projection, substantially as and for the purpose herein set forth.

3. A fender and drum-protector for vehicles, consisting of a clip provided with a compound recess in the upper end and a horizontal stop-bar attached at the lower end, a hub having a projection adapted to turn in said recess, and a fender supported from said hub, whereby the fender may be held above or in front of the wheel, as set forth.

4. A fender and drum-protector for vehicles, consisting of a clip provided with a compound curve in the upper end and a horizontal stop-bar having a bifurcated end attached to the under side, a hub having a projection adapted to enter said recess, a cap attached to said projection adapted to retain the hub and clip in engagement, and a fender supported from said hub, substantially as and for the purpose specified.

384,336. WATER-ENGINE VALVE. GEORGE RAM and WILLIAM RAM, Troy, N. Y. Filed July 17, 1888. Serial No. 171,894. (No model.)

Claim.—1. The combination, in a water-engine valve, of a differential sliding cylinder-port valve having an inclosing-chamber provided with run-around ducts opening at each end by ports into said chamber, the ports at one end of said ducts being opened and closed by said valve, with a piston-operated valve for opening and closing the ports at the other end of said ducts, all arranged and operating substantially as and for the purposes set forth.

2. In a water-engine valve, the combination of a primary piston-operated valve, A, a secondary differential cylinder-port valve, B, an inclosing-chamber provided with run-around ducts *a b*, inlet C, and outlet D, substantially as and for the purposes set forth.

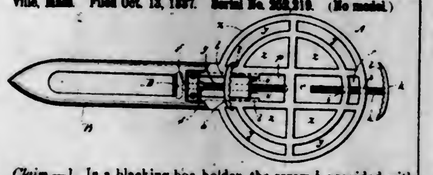
3. In a water-engine valve having a primary piston-operated valve, a secondary differential cylinder-port valve inclosed within a chamber provided with run-around ducts, the combination, with said valves, of a stem or link attached to or projecting from one of said valves and adapted to engage with the others, as and for the purposes set forth.

4. In a water-engine valve having a primary piston-operated valve, a secondary differential cylinder-port valve inclosed within a chamber provided with run-around ducts *a b*, the combination, with said ducts, of adjustable gates therein for changing and regulating their water-discharging capacity, substantially as and for the purposes set forth.

384,337. RECORDER FOR CASH-TILLS. GEORGE B. BROOKS and WILLIAM LOWEY, Hanley, and THOMAS M. FAVELL, Etruria, County of Stafford, England. Filed Aug. 10, 1887. Serial No. 246,641. (No model.)

Claim.—1. A cash-till consisting of a box or case, A, provided with hinged and locked top and containing a smaller cash-drawer, B, a striker carried upon the extended bottom of said drawer and adapted to lift cams, a double-armed cam with lever carrying a pawl adapted to be oscillated by said striker and moving a ratchet-wheel, a ratchet-wheel and a brake-wheel secured upon a shaft carrying a winding-drum, a shaft parallel to said shaft and journaled near the front of the box A, above said drawer B, and provided with a roll of paper strip passing through a friction device, over a block, and under a perforation in the top of the box, exposing a portion thereof to view to the winding-drum, said strip adapted to be wound upon the winding-drum by measured lengths determined by the movement of the ratchet-wheel, substantially as set forth.

2. In a cash-till, the combination of the box A, having hinged lockable top, a drawer, B, lower and shorter than said box, a striker, C, secured upon an extension of the bottom of said drawer, a lever, J, carrying double cam-arms *j j'* and a pawl, *k*, a shaft, E, upon which said device J *j j'* is journaled, a ratchet-wheel, *g*, fast upon said shaft and adapted to be engaged by said pawl *k*, a notched brake-wheel, H, fast upon said shaft and adapted to be engaged by the spring-detent M *m*, a winding-drum, F, fast upon said shaft, pins *l l*, adapted to restrict the movement of the cams *j j'*, a shaft, O, journaled at the



front end of the box, a bobbin, N, fast upon said shaft O and adapted to carry a roll of paper, tension-brackets *s*, a guide-block, *q*, bearing the paper near the surface of the top of the box, a plate, R, with slit *r*, covering an opening in said top and placed over the guide *q*, and a strip of paper, *p*, rolled upon the bobbin N and adapted to be uncoiled therefrom and wound upon the drum F, passing through the tension device and over the guide *q* under the slit *r*, substantially as set forth.

3. In a cash-till, the combination of the drawer B, the striker C, the lever J, having double cam-arms *j j'*, pawl *k*, ratchet-wheel E, and brake-wheel *g* with spring-detent M *m*, substantially as set forth.

4. In a cash-till, the combination of the striker C, lever J, having cam-arms *j j'*, and the limiting-pins *l l*, substantially as set forth.

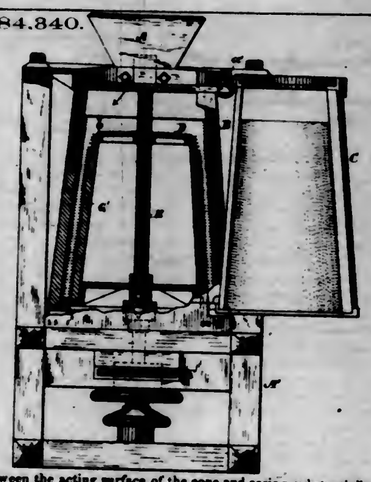
5. In a cash-till, the combination of the shaft E, carrying drum F, ratchet-wheel *g*, and brake-wheel H, shaft O, carrying drum N brackets *s*, guide *q*, and paper *p*, substantially as set forth.

384,338. **BLACKING-BOX HOLDER.** WESLEY TAYLOR, Somerville, Mass. Filed Oct. 13, 1887. Serial No. 252,219. (No model.)

Claim.—1. In a blacking-box holder, the screw *h*, provided with the serrated head *k*, in combination with the body A, screw *g*, and nut *r*, said nut being fitted to slide in said body and provided with the serrated head *b*, substantially as set forth.

2. In a blacking-box holder, the body A, provided with the curved handle B, and having the ways *l*, in combination with the nut *r*, disposed on said ways and having the serrated head *b*, the threaded rod *g*, journaled in said handle and disposed in a threaded hole in said nut, and the screw *h*, provided with the serrated head *k*, substantially as set forth.

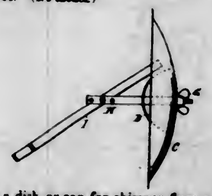
384,339. **SHOE-CLASP.** JACOB J. UEBERROD, Syracuse, N. Y., assignor to Judson L. Thomson & Co., same place. Filed Dec. 2, 1887. Serial No. 256,729. (No model.)



Claim.—1. In a spring-clasp, the combination of a base-plate having its side edges bent at right angles to the main portion of the plate and the bent parts provided with notches or indentations for the reception of the tongue-pivots with the tongue having cam-shaped pivots seated in the indentations or notches in the angular edges of the base-plate, and a supporting spring-plate connected to the base plate and retaining the tongue in the sockets on the base-plate, substantially as and for the purpose set forth.

2. In a spring-clasp, the combination of two sheet-metal plates *a b*, secured together at one end, the plate *a*, bifurcated at its opposite end and provided with sidewise extensions bent at right angles to the plate, and having notches *n n* therein forming bearings for the tongue-pivots, the other plate, *b*, having its free end terminating in extensions *e*, which are adapted to rest against the base of the tongue or holding-lever and confine the tongue-pivots in their bearings in the plate *a*, the hook-shaped tongue-lever *t*, its hook-shaped end constructed with laterally-projecting flat pivots *p*, corresponding to the notches *n* in the bent edges of the plate *a*, substantially as and for the purpose set forth.

384,340. **MACHINE FOR DELINTING COTTON-SEED.** JAMES L. WEATHERHEAD and JAMES S. COCHRAN, Philadelphia, Pa. Filed Feb. 28, 1888. Serial No. 265,637. (No model.)



Claim.—The combination, with the conical casing B, having its interior surface clothed with brushes, as described, of the cone D, having its exterior surface clothed with brushes and having its upper portion rounded off or tapered toward its axis at a greater angle than the lower portion of its height, as described, and thereby forming between the said cone and casing a downwardly-contracted or tapering seed-receiving chamber having brush-clothed opposing walls, as described providing for the separation of the seeds and facilitating their entrance

384,340.

between the acting surface of the cone and casing, substantially as described.

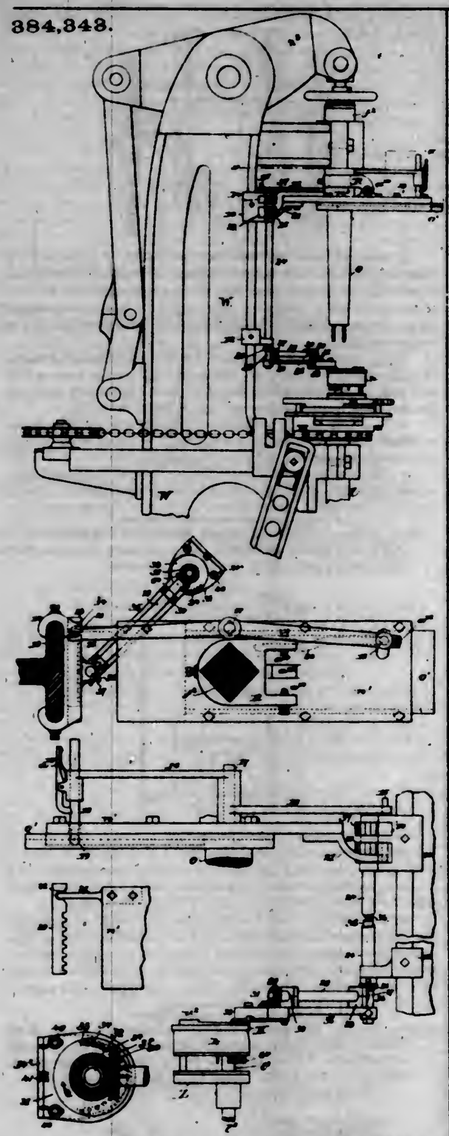
384,341. **FLUE-STOPPER.** JACOB P. WETZEL and THOMAS LEE, Cincinnati, Ohio; said Wetzel assignor to said Lee. Filed Nov. 10, 1887. Serial No. 254,810. (No model.)

Claim.—1. In a disk or cap for chimney-flues, a disk having centrally an adjustable stem provided on its inner end with an adjustable weighted lever, substantially as herein set forth.

2. A disk or cap having centrally a rearwardly-projecting stem provided with a centrally-pivoted lever having a weight at one end substantially as herein set forth.

3. In a cap or disk for chimney-flues, the combination of a disk centrally perforated, and provided on its rear side with a bridge, having an opening on a line with the disk perforation, with a stem having its forward end screw-threaded and provided with a thumb-nut, and its rear end provided with a series of perforations, and having hinged thereto a lever weighted at one end, substantially as herein set forth.

384,342. **NEW COLORING-MATTER OBTAINED BY THE ACTION OF TETRAZO-DIAMIDO BENZOLE ON PHENOLS.** RUPERT G. WILLIAMS, Albany, N. Y. Filed Nov. 17, 1887. Serial No. 255,409. (No specimens.)



Claim.—The new coloring-matters obtained by the action of tetrazo-diamido benzole (hydrochlorate) or its homologues on resorcin, the phenols, benzoic, the oxybenzoic acids, and alpha-naphthol, or their substitution products, on aniline and its homologues, beta-naphthol and the naphthylamines, or their substitution products, and on the sulpho-acids of the above amines, amides, and phenols, or their substitution products, which coloring-matters have the properties herein set forth.

384,343. **HEEL-NAILING MACHINE.** EDWARD R. ALLEN, Portland, Me., assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Sept. 27, 1887. Serial No. 250,790. (No model.)

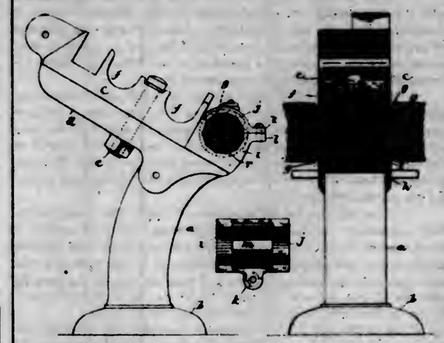
Claim.—1. In the herein-described nailing-machine, the combination, with a nail-box having a series of holes at each side for the reception of slug-nails, of the automatically-operated slug-nail-loading device to deposit slug-nails into either series of the slug-nail holes of the nail-box, substantially as described.

2. The herein-described slug-nail-loading device, consisting, essentially, of a movable bar, a perforated controlling-plate, and a movable slug-nail receptacle, the latter by its movement being adapted to cause the nails carried by it to be dropped through some or other of the holes in the said controlling-plate, according to whether a right or left heel is to be slugged, as set forth.

384,343.

3. In a nailing-machine, a head, as *n'*, a lever mounted thereon, a rack-bar, a shaft, and an arm, 35, combined with the shoe-holding spindle and its slide, and a cam to actuate the said lever, substantially as and for the purpose set forth.

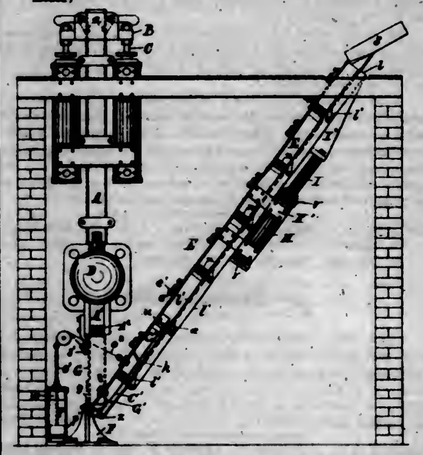
4. In a nailing-machine, a nail-box having a series of holes for the reception of slug-nails, an arm, 35, the slug-nail receptacle 33, carried by it, and a movable plate, *n'*, to serve as a support for the spindle carrying the shoe to be slugged, combined with intermediate mechanism whereby the movement of the said plate to adjust the shoe with relation to the nail-box for a right or left shoe will automatically operate the slug-nail receptacle to deposit the slug-nails into holes in the right or left side of the nail-box, substantially as described.



5. In a nailing-machine, the nail-box, the top-lift plate, and the plate 51, provided with a series of holes, 52, combined with fingers or connections 45 46, whereby the movement of the top-lift plate always moves the plate 51 in unison with it, for the purposes set forth.

6. In a nailing-machine, a nail-box having a series of holes for the reception of slug-nails, slug-nail drivers therein having shoulders, combined with the driver-plate having a series of holes, 53*, and a plate, 51, having a series of holes, 52, to operate substantially as described.

7. In a nailing-machine, the arm of the slug-nail-loading mechanism, the slide-plate 38, connected therewith having holes and having a projection, as 61, a spring for moving the said slide-plate in one direction, and a slug-nail receptacle, combined with a nail-box having a top plate against which the said lug strikes as the slug-nail-loading device is brought into operative position above the nail-box, substantially as and for the purpose described.



384,344. **BEARING FOR THE JOURNALS OF LOWER DRAWING-ROLLERS IN SPINNING-MACHINES.** JOHN DOUTH, Central Falls, R. I. Filed May 10, 1886. Serial No. 201,606. (No model.)

Brief.—The invention consists in the improved construction and arrangement of roller-bearings for the journals of the lower drawing-rollers.

Claim.—The combination, with the stand having the bearing provided with the inwardly-extending flanges, of the roller *e*, provided with the reduced bearing portion to form shoulders, a series of rollers, *r*, arranged in said bearing to surround and be in contact with said reduced portion, the shoulders of the roller being located close to said bearing, and a removable cap, *j*, for closing the bearing and maintaining the continuity of the arrangement of rollers *r*, substantially as described

384,345. **ELEVATOR FOR INGOT-CASTING MACHINES.** JAMES B. D'ARCY DOULTON, Jersey City, N. J., assignor to the Solid Ingot Company, of New Jersey. Filed Mar. 22, 1886. Serial No. 195,918. (No model.)

Claim.—1. The combination, with a vertical casting-machine adapted for receiving a series of movable mold-sections, of means for sustaining the mold-sections in the machine, means for discharging them from the lower part of the machine, a guiding-trough arranged below each casting-machine to receive the mold-sections from the

same, and means for elevating the mold-sections in the guiding-trough, substantially as herein set forth.

2. In an elevator for ingot sections or molds, the combination, with a guiding-trough, of a reciprocating frame carrying a series of pawls applied to one side of the trough, a series of detents fixed upon the trough, and a series of pressers corresponding in succession with the detents, as and for the purpose set forth.

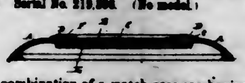
3. In an elevator for ingot sections or molds, the combination, with a guiding-trough, of a reciprocating frame carrying a series of pawls applied to one side of the trough, a series of detents fixed upon the trough, and a pivoted carrier adapted to move to and from the trough, as and for the purpose set forth.

4. In an elevator for ingot sections or molds, the combination, with a guiding-trough, of a reciprocating frame carrying a series of pawls applied to one side of the trough, arms extended from the base of the trough, and a pivoted carrier adapted to move to and from the trough between the said arms, as and for the purpose set forth.

5. In an elevator for ingot sections or molds, the combination, with a guiding-trough, of a reciprocating frame carrying a series of pawls applied to one side of the trough, arms extended from the base of the trough and sustained by a pivotal bar, and a carrier pivoted at one side upon such bar and movable to and from the trough between the arms, as and for the purpose set forth.

6. In an elevator for ingot sections or molds, the combination, with a guiding-trough, of a reciprocating frame carrying a series of pawls applied to one side of the trough, arms extended from the base of the trough and sustained by a pivotal bar, and a carrier pivoted at one side upon such bar, the carrier being movable to and from the trough between the arms and laterally upon the pivotal bar, as and for the purpose set forth.

7. In an elevator for ingot sections or molds, the combination, with a guiding-trough, of a reciprocating frame carrying a series of pawls applied to one side of the trough, arms extended from the base of the trough and sustained by a pivotal bar, a carrier pivoted at one side upon such bar and movable to and from the trough and laterally upon the pivotal bar, and a spring to hold the carrier laterally upon the bar in line with the trough, substantially as set forth.



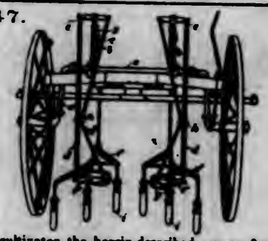
8. In an elevator for ingot sections or molds, the combination, with a guiding-trough sustained at an angle with its base adjacent to an ingot-casting machine, of a reciprocating frame carrying a series of pawls applied to one side of the trough, a pivoted carrier movable to and from the bottom of the casting-machine and the bottom of the trough, and a counter-weight to hold the carrier in line with the casting-machine when empty, as and for the purpose set forth.

9. In an elevator for ingot sections or molds, the combination, with a guiding-trough sustained at an angle with its base adjacent to an ingot-casting machine, of a reciprocating frame carrying a series of pawls applied to one side of the trough, a pivoted carrier movable to and from the bottom of the casting-machine and the bottom of the trough, and a counter-weight, combined with a dash-pot or air-cushion to hold the carrier in line with the casting-machine when empty, as and for the purpose set forth.

10. In an elevator for ingot sections or molds, the combination, with a guiding-trough and reciprocating pawls for elevating the mold, of notches in the side of the mold to engage with the pawls, as and for the purposes set forth.

11. The combination, with a casting-machine having means for sustaining the mold, pawls and means for operating them to move the molds downward, and a guiding-trough below such casting-machine provided with reciprocating pawls for moving the mold, of mold-sections having one set of notches for the application of the pawls in the casting-machine and a separate set of notches for the application of the pawls in the elevator-trough, substantially as set forth.

384,846. WATCH-CASE. EDWARD C. CHAPPATTE, Philadelphia, Pa., assignor to the Keystone Watch Case Company, same place. Filed Nov. 28, 1886. Serial No. 219,206. (No model.)

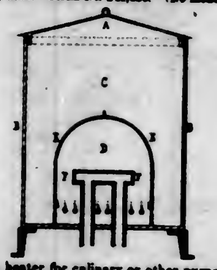


Claim.—The combination of a watch-case cap having a depressed or recessed portion adapted to receive a picture, a glass or equivalent transparent plate loosely fitting into said recessed portion to cover and protect the picture, and a retaining-ring independent of the glass and holding the glass in place by being snapped into the undercut edge of said recessed portion of the cap.

384,847. CULTIVATOR. EDWARD R. CONKLIN, Wauseon, Ohio. Filed Dec. 17, 1887. Serial No. 258,197. (No model.)

Claim.—1. In a cultivator, the combination, with the axle and plow-beam, of supporting-rods in twos or pairs, pivoted to said axle and plow-beam, whereby the plow may be swung from side to side and the horizontal position of the shovels be maintained, substantially as shown and described, for the purpose specified.

384,847.



2. In a cultivator, the herein-described means of preserving the horizontal position of the shovels, consisting of vertical supporting-rods in pairs, pivoted at their upper ends to cross-arms rigid upon the axle or axle-frame and at their lower ends pivoted to cross-arms rigid upon the plow frame or beam, substantially as shown and described, for the purpose specified.

3. In a cultivator, the combination, with the axle and plow-beam, of supporting-rods in pairs, the horizontal cross-arms at both ends of said rods, pivoted standard, spring, and chain, substantially as shown and described, for the purpose specified.

4. In a cultivator, in combination with the axle and plow-beam, a pair of equalizing supporting-rods, one of said rods being bent or curved, substantially as and for the purpose specified.

5. The combination of upper cross-arm, *c*, and its supporting mechanism, lower cross-arm, *c'*, and the plow-beam, with supporting-rods *d* and band or ferrule *h*, substantially as and for the purpose specified.

384,848. AUTOMATIC STEAM HEATER OR BOILER FOR CULINARY AND OTHER PURPOSES. ROYAL R. DEANE, New York, N. Y. Filed June 17, 1887. Serial No. 241,689. (No model.)

Claim.—1. A heater for culinary or other purposes, consisting of two chambers, one within the other, the walls of the inner provided with orifices or openings into the outer chamber, in combination with a heating apparatus located within the inner chamber above said openings, in the manner and for the purpose substantially as specified.

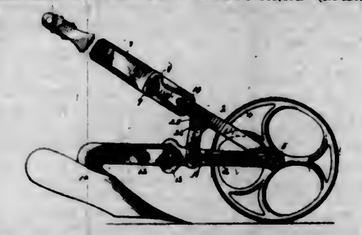
2. A heater for culinary or other purposes, divided by a partition into two compartments communicating with each other by one or more orifices or openings located near the bottom of the compartment containing the heating apparatus, in combination with said heating apparatus situated therein above said orifices or openings, in the manner and for the purpose substantially as specified.

384,849. APPARATUS FOR SEPARATING LEAD AND BASE BULLION FROM SLAG. WALTER B. DEVEREUX, Aspen, Colo. Original application filed Feb. 26, 1886, Serial No. 193,190. Divided and this application filed Nov. 2, 1887. Serial No. 254,073. (No model.)

Claim.—1. The combination, with a smelting-furnace, of a portable receiver or collecting-well into which the same discharges, a diaphragm placed in the interior of said receiver, whereby it is subdivided into two separate compartments, an opening in the base of said diaphragm connecting said compartments, a lead-well attached to the exterior of said receiver, and an opening in the wall of said receiver connecting one of said compartments with the extreme base of the lead-well, for the purposes set forth.

2. The combination, with a smelting-furnace, of a portable receiver or collecting-well into which the same discharges, a diaphragm placed in the interior of said receiver, whereby it is subdivided into two separate compartments, an opening in the base of said diaphragm connecting said compartments, a lead-well attached to the exterior of said receiver of equal depth, and an opening in the wall of said receiver connecting one of said compartments with the extreme base of the lead-well, said diaphragm and lead-well being so constructed and arranged that either or both may be removed, raised, lowered, or shifted at pleasure.

384,850. COMBINED TELEGRAPH KEY AND SOUNDER. JOHN DOCHERTY, Pleasant City, Ohio, assignor of one-half to Lemuel J. Kingsman, place. Filed Nov. 30, 1887. Serial No. 256,951. (No model.)



Claim.—1. The combination, in a telegraph-instrument, of the sounding-arm, the key-lever having a long arm and a short arm extending in opposite directions and each provided at its outer end with a press-button, and the rod connecting the sounding-arm and the key-lever, substantially as described.

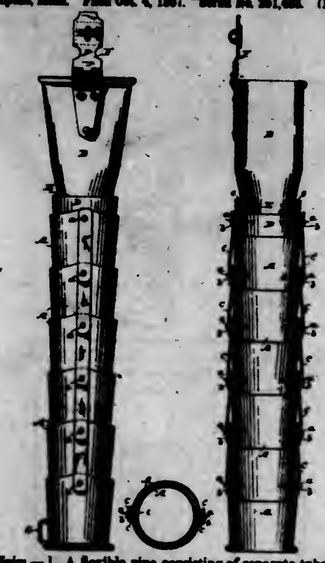
2. The combination, in a telegraph-instrument, of the sounding-arm, the key-lever adapted to be operated from either end, the rods Y and Z, attached at their upper ends to the sounding-arm on opposite sides of its pivot, and the device to attach the lower end of either of the said rods to the key-lever, substantially as described.

3. The combination, in a telegraph instrument, of the sounding-arm, the key-lever adapted to be operated from either end, the rods Y and Z, attached at their upper ends to the sounding-arm on opposite sides of the pivot, the device to attach the lower end of either of the said rods to the key-lever, and the spring bearing downward on the rod Y, substantially as described.

4. In a telegraph-sounder, the frame having the arm D and the resonant tongue or arm, the percussion-screw L at the outer end of arm D, the sounding-arm pivoted above arm D and having the percussion-screw K, adapted to strike the resonant arm, and the standard F, detachably secured to the frame and having the arm G, provided with the percussion-screws H' and I', to engage the sounding-arm on its upstroke, all in combination, substantially as described.

384,851. HAND-CULTIVATOR. EVERETT C. ELLWOOD, Grant's Farms, Conn. Filed Mar. 26, 1888. Serial No. 268,471. (No model.)

Claim.—1. The upper arm having web 24, provided with slots and lug 25, and the lower arm having bar 11, in combination with the wheel, a bolt passing through the hub thereof and through the forward ends of the arms, and braces 3, passing through the slots in the web and bolted to bar 11 and to lug 25.



2. The combination, with the upper and lower arms, the wheel, bolt 5, passing through the forward ends of the arms and the hub of the wheel, and braces connecting said arms, of platform 17, which is secured to the lower arm and adapted for the attachment of teeth or blades.

3. The combination, with the lower arm, the wheel, bolt 5, and braces 3, of the upper arm bifurcated at its rear end and having slots 8 and the bolt-holes, and a handle adjustably secured to said upper arm by bolts passing through said bolt-holes and the slots.

4. In a cultivator, the combination, with an arm, 2, having at its rear end a bar provided with bolt-holes 12 and slot 13, of platform 17, having slots 15 for the adjustment of the teeth and blades, and a standard, 17*a*, having bolt-holes corresponding with holes 12 and slot 13.

5. In combination with the cultivator-frame having arm 2, the platform 17, having a standard, 17*a*, whereby it is attached and adjusted, slots 15, ribs upon its under side and notches in said ribs, which are engaged by the edges of cultivator-teeth, and bolts passing through said teeth and said slots, whereby the teeth are held in place.

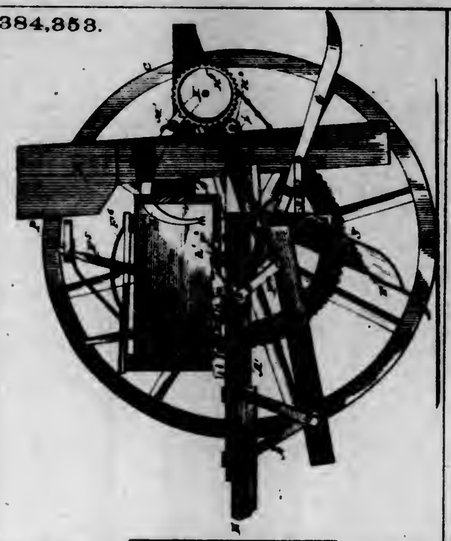
384,852. FLEXIBLE GRAIN-PIPE. THOMAS W. RUSSEY, Minneapolis, Minn. Filed Oct. 4, 1887. Serial No. 251,462. (No model.)

Claim.—1. A flexible pipe consisting of separate tubular sections pivotally connected by exterior fixed bolts or pivot-pins and straps connecting the bolts or pins of adjacent sections.

2. A flexible pipe consisting of separate tubular sections having inclined exterior bolts, in combination with straps passing over said bolts and connecting said sections.

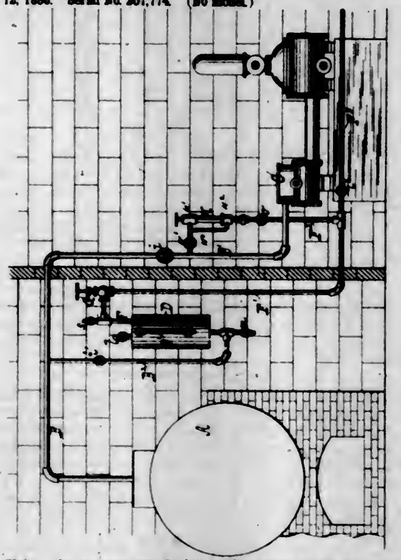
3. A flexible pipe consisting of separate tubular overlapping sections and exteriorly-extending bolts, said bolts being attached to the overlapping portion of each section, with its head located between said overlapping part and the overlapped portion of the adjacent section, in combination with the straps pivotally connected with said bolts in adjacent sections.

384,853. POTATO-PLANTER. JAMES W. BOYD, East Atchison, Mo. Filed Sept. 28, 1887. Serial No. 250,886. (No model.)



Claim.—1. In a planter, the combination, with the supporting-frame, of the beam carrying at its rear end the shovel-standard and pivotally suspended at its forward end from said frame, said beam being vertically adjustable at its rear end and carrying a rearwardly-projecting pivoted coverer, which coverer is provided with a pivoted stirrup having an adjustable connection with said shovel-standard, substantially as set forth.

2. In a planter, the combination, with the shovel-standard-carrying beam, of the pivoted covering-blade provided with a pivoted stirrup having an adjusting-screw and apertured connection with the shovel-standard, substantially as set forth.



3. In a planter, the combination, with the hopper and dropper-tube, of the vibrating fingers secured upon a shaft and passing through slots in said tube, and springs applied to said shaft and fingers, said fingers having their inner ends adapted to receive a pin placed against said tube and crosswise of said slots to effect the holding of any one or more of said fingers out of operation, substantially as set forth.

384,353.

384,354. APPARATUS FOR AUTOMATICALLY LUBRICATING STEAM-CHESTS. THOMAS FITZPATRICK, New York, N. Y. Filed July 12, 1886. Serial No. 207,774. (No model.)

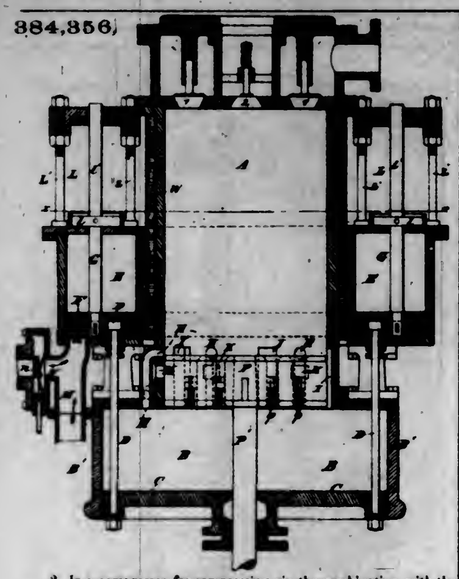
Claim.—In an apparatus for lubricating steam-chests, the combination of the pipe B B', connecting the boiler with the steam-chest, the oil-reservoir D, the pipe B^3, connecting the pipe B with the lower part of the oil-reservoir, the pipe F F' F^3, connecting the upper part of the reservoir with the pipe B', and the visible-feed tube H, the pipes being fitted with suitable cocks, all substantially as shown, for the purpose described.

384,355. LATHE FOR WOODEN HANDLES. NATHAN B. PLISE, East Hiram, Me. Filed Nov. 23, 1887. Serial No. 256,330. (No model.)

Claim.—1. In a wood-turning lathe, the combination, with a cutter-frame and standards pivoted to said frame and to a suitable support, of bar sliding in said frame and provided with pins projecting on opposite sides of the work to be turned, and the former and springs secured to the opposite sides of the said standards and to the bars, substantially as herein shown and described.

2. In a wood-turning lathe, the combination, with a sliding frame carrying a simultaneously-rotating former and the blocks to be turned, of a pivoted frame adapted to rock according to the shape of the said former, cutter-wheels mounted to rotate on the said rocking frame, yielding bars adapted to slide on the said frame, and pins projecting from said bars and engaging both sides of the said former and the said blocks, substantially as shown and described.

3. In a wood-turning lathe, the combination, with the main frame and driving-shaft O, provided with a pulley at one end, of a sliding frame, rotary dogs carried by said sliding frame, the shaft I^4, for operating said dogs, provided with a pulley at one end, idler-pulleys N^2 N^3 on the sliding frame, idler-pulleys N^4 on the main frame, and a belt passing around the pulleys on the ends of the shafts O I^4 and idlers, substantially as and for the purpose set forth.

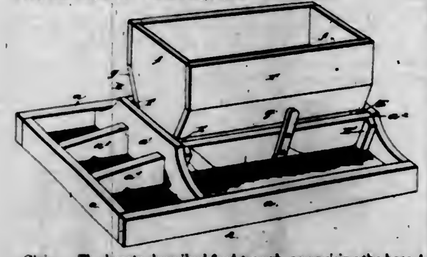


4. In a wood-turning lathe, the combination, with a main frame carrying the main driving-shaft, of a frame held to slide in the said main frame and carrying the former and the wooden blocks to be turned, dogs held on the said sliding frame and rigidly connected with one end of the said former and the blocks to be turned, said dogs being rotated from the said main driving-shaft, a rocking frame held within said sliding frame, cutter-wheels mounted to rotate on the said sliding frame and adapted to cut said wooden blocks, a set-screw held on the said rocking frame and engaging one side of the said former, and a weight for holding said set-screw in contact with the said former, substantially as shown and described.

5. In a wood-turning lathe, the combination, with a main frame carrying the main driving-shaft, of a frame held to slide in said main frame and carrying the former and the wooden blocks to be turned, dogs held on the said sliding frame and rigidly connected with one end of the said former and the blocks to be turned, said dogs being rotated upon the said main driving-shaft, a rocking frame held within said sliding frame, cutter-wheels mounted to rotate on the said sliding frame and adapted to cut said wooden blocks, a set-screw held on the said rocking frame and engaging one side of the said former, a weight for holding said set-screw in contact with the said former, and yielding bars provided with pins engaging both sides of the said former and the said wooden blocks, said bars being mounted on said rocking frame, substantially as shown and described.

384,356. AIR-COMPRESSOR. WILLIAM T. FORSTER, Erie, Pa. Filed June 3, 1887. Serial No. 240,123. (No model.)

Claim.—1. In a compressor for compressing air, an air-cylinder having at one end of the compression-chamber in which the air is compressed, and substantially opposite to the exhaust-valves, an auxiliary chamber capable of being filled with atmospheric air and situated below and opening into the compression-chamber above the piston in the latter when in its lowest position, and provided with a piston actuated by exhaust-steam from the engine, adapted and arranged to force the atmospheric air in the auxiliary chamber into the compression-chamber in front of the compression-piston in the latter, substantially as and for the purpose set forth.

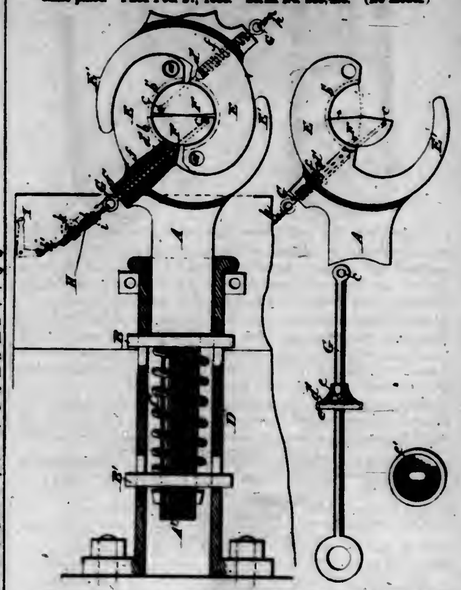


384,356.

2. In a compressor for compressing air, the combination, with the air-cylinder A, having the piston P, in which the air is compressed, of the auxiliary cylinder B, capable of being filled with atmospheric air, situated at the end of the air-cylinder substantially opposite to the exhaust-valves and opening into the air-cylinder in front of the piston P when at its lowest position, and provided with the piston C, adapted to be moved by the rods D, for the purpose of forcing the atmospheric air in the cylinder into the air-cylinder A in front of the piston P, and of the cylinder E, capable of being filled with exhaust-steam from the engine and having the piston F, connected with the rods D and so arranged as to be acted upon by the exhaust-steam to move the piston C, substantially as described, and for the purpose set forth.

3. In a compressor for compressing air, the combination, with the air-cylinder A, in which the air is compressed, provided with the openings K and tubes H, and having the piston P, containing the valves *p*, of the auxiliary cylinder B, capable of being filled with atmospheric air and opening into the cylinder A, through the tubes H and valves *p*, in front of the piston P, when in its lowest position, and provided with the piston C, arranged to be moved by the rods D, for the purpose of forcing the atmospheric air in the cylinder B into the air-cylinder A in front of the piston P, and of the cylinder E, capable of being filled with exhaust-steam from the engine and having the piston F, connected with the rods D, and so arranged as to be acted upon by the exhaust-steam to move the piston C in the cylinder B, and of the buffers L, having the screw-rods L' and the pads *o*, and containing the pistons *l*, having the rods *l'*, and connected with the piston F by the rods G, so as to move with the latter, substantially as described, and for the purpose set forth.

384,357. FEED-TROUGH. WILLIAM H. GARRETT, Geneva, Nebr. Filed Mar. 22, 1888. Serial No. 268,105. (No model.)



Claim.—The herein-described feed-trough, comprising the base A, provided with the front and sides *a*, the transverse partition *a'*, provided with the notches B, and the rear side, a^2, similar to the partition *a'*, the guide-strips E E', forming the guide-grooves *e*, the upwardly-converging boards D between the partition *a'* and the rear side, a^2, the bottomless hopper F, having the end boards, *f*, provided with downwardly-converging edges G, and notched lower ends, *f'*, to ride on the boards D, and having the side boards, *g*, to rest on the tops of the inner guide-strips, F', and the sliding removable boards H, provided with the arms A, and with their end edges resting in the grooves *e*, substantially as set forth.

384,358. PRODUCING DRIED EXTRACT OF RENNET. FREDERIK GRAEFF, Alkmaar, Holland. Filed Mar. 6, 1888. Serial No. 266,560. (No specimens.)

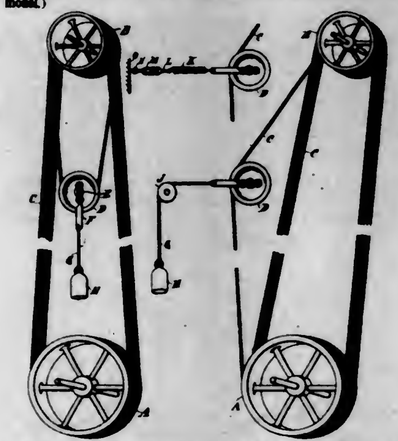
Claim.—The process of producing dry ferment of rennet, which consists in evaporating liquid extract of rennet to dryness *in vacuo* at a temperature not exceeding 40° centigrade, comminuting the product, washing the same with saturated solution of table-salt, and drying it again, substantially as and for the purpose described.

384,359. CAR-COUPLING. PETER C. GRIESHAWAR, Reading, Pa., assignor of two-thirds to Franklin S. S. Grumbrook and Jacob F. Bolter, same place. Filed Feb. 27, 1888. Serial No. 265,628. (No model.)

Claim.—1. In a car-coupling, the combination, with a draw-head having bifurcated jaws, of a locking-block occupying a semicircular recess in one of said jaws and retained therein by a system of dovetail tongues and grooves, a rod for operating the block, and a coiled spring surrounding said rod and wholly inclosed within an opening or recess in the jaw, substantially as set forth.

2. In a car-coupling, the combination of a draw-head having bifurcated jaws, one of which is provided with a semicircular recess and dovetail grooves surrounding said recess, with the locking-block adapted to fill the semicircular recess in the jaw and having tongues upon its external rounded surface, which enter the grooves in the jaw and retain the block in place, as specified.

3. In a car-coupling, the combination, with the jaw E, provided with dovetail grooves, as set forth, of the tongued locking-block F, the plane faces of which radiate from the center, so as to form a section of less than a semicircle to facilitate the engagement of said block with that of an opposing draw-head, as set forth.

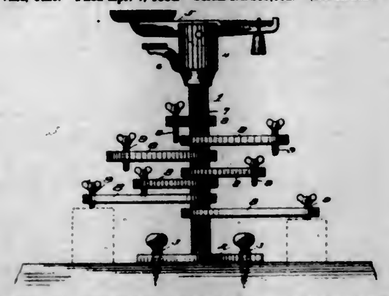


4. As an improvement in car-couplings, the circularly-recessed jaw E and the locking-block F, provided with the slot *d'*, in combination with rod G, its collar *d''*, and the spring *f*, encircling said rod between the collar and shoulder *f''* within the recess *d* of the jaw, substantially as specified.

5. The draw-head A, provided with curved jaws E and E', the inner curvature of the jaw E' being substantially the same as the outside of the jaw E, in combination with the locking-block F, secured to the jaws by dovetail tongues and grooves and forced to retain its locking position by a spring wholly inclosed by the jaw E, as set forth.

6. In a car-coupling, the draw-head having jaws E and E', the locking-block F, and its operating-rod G, surrounded by a spring in a recess of the jaw E, in combination with the bifurcated chains and

cam-levers attached to the car for the purpose of operating said locking-block from either the top or side of the car, substantially as set forth.

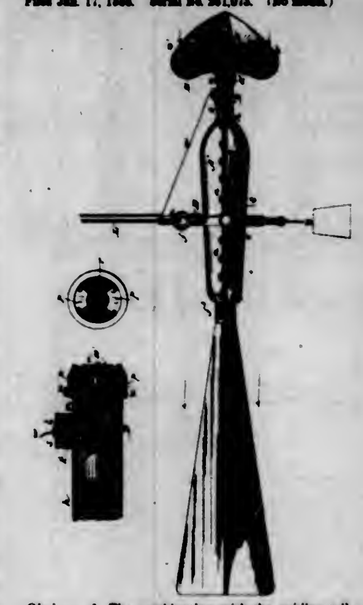


384,360. **TENSION DEVICE FOR ROPE-TRANSMISSION.** JAY E. HALL, Swanton, Ohio. Filed Aug. 29, 1887. Serial No. 248,174. (No model.)

Claim.—1. The combination, with a main driver and a driven pulley, an endless rope having multiple turns around said pulleys and wrapped with one turn thereof passed at the rear face of the driver and the opposite part around the front face of the driven pulley and forming a slack strand, of a grooved idler, journaled in a suspended hanger through which said slack strand is passed and held in tension by flexible attachments to the hanger, as and for the purpose set forth.

2. In combination with a driver and driven pulley, an endless rope passed back and forth around the pulleys and having a strand crossing from one face of the driver to the opposite face of the driven pulley an idler bearing upon the separated strand, said idler journaled in a hanger, and a spring and turn-buckle secured to said hanger for holding said strand to any desired tension, as and for the purpose set forth.

384,361. **CLAMP FOR FRUIT-CANS.** MARY J. HAMLIN, Bartramville, Ohio. Filed Apr. 7, 1888. Serial No. 269,952. (No model.)



Claim.—1. A clamp-standard for holding covers on cans containing hot fruit while being sealed, consisting of a screw-threaded upright and base and lateral arms having screw-threaded openings at their inner ends engaging the screw-threaded upright and set-screws at their outer ends, the lateral arms being vertically adjustable on the upright, substantially as shown and described.

2. A clamp-standard for holding covers on cans containing hot fruit while being sealed, consisting of an upright and base and lateral arms vertically adjustable on the upright and having set-screws at their outer ends, substantially as shown and described.

3. A clamp-standard for holding covers on cans containing hot fruit while being sealed, consisting of screw-threaded standard 1, mounted on base 2, with thumb-screws 3, and having weighing-scale 5, pivoted in head 4, having bracket-stop 6, and the lateral arms 8, engaging screw-thread 7 of upright 1, and having set-screws 9 of different lengths at their outer ends, substantially as shown and described.

4. A clamp-standard for holding covers on cans containing hot fruit while being sealed, consisting of screw-threaded standard 1, mounted on base 2, with thumb-screws 3, and having lateral arms 8, engaging screw-thread 7 of upright 1, with set-screws 9 of different lengths at the outer ends of arms 8, substantially as shown and described.

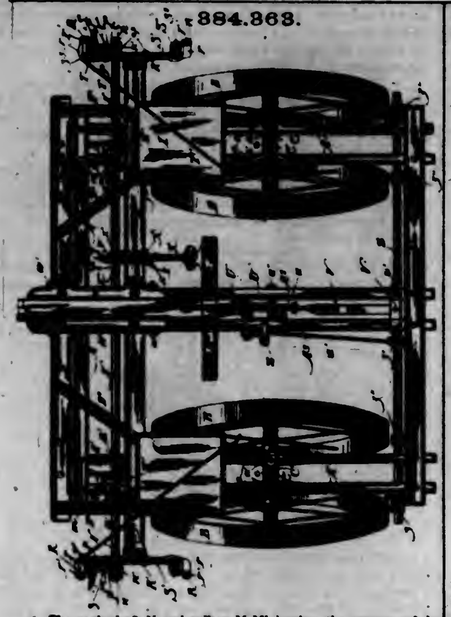
384,362. **SHIP'S LOG.** EUGENE E. HASKELL, Forestville, N. Y. Filed Jan. 17, 1888. Serial No. 261,073. (No model.)

Claim.—1. The combination, with the guiding-tail and the suspending device, of the shaft-section having a spindle, D', and the conical spiral wheel E, arranged at the extreme front end of the device, so as to form a clearing-prow, and having a hollow hub fitting with a long bearing on the spindle and inclosing the end thereof, substantially as and for the purpose described.

2. The combination, with a suspending device and guiding-tail, of the shaft-section D, having insulated bushing *k* and binding-post *l*, the insulated spring-seated bolt *n*, in electrical connection with the said post, the speed-wheel E, with contact-and insulating plates *p* and *r* in its hub opposite the spring-bolt, and the electric-current wires, substantially as and for the purpose described.

3. The combination of the speed-wheel E with hub *e*, and flange with set-screw *u*, the shaft-section D, having spindle D', with bearings *d d'*, and groove *s'* for the set-screw.

384,363. **CORN-PLANTER.** RODNEY K. HAYES, Galva, Ill. Filed Oct. 13, 1887. Serial No. 252,244. (No model.)



Claim.—1. The wheels B, in combination with the spindle C, each spindle having a plate, C', provided with a hole, *c'*, and a slot, *c²*, for adjusting the spindle to set the wheels at different inclines, substantially as specified.

2. The runner D, provided at its heel with a shelf, *d*, in combination with an oscillating tube, E', having a shelf, *e''*, at its upper end for holding the seed, substantially as specified.

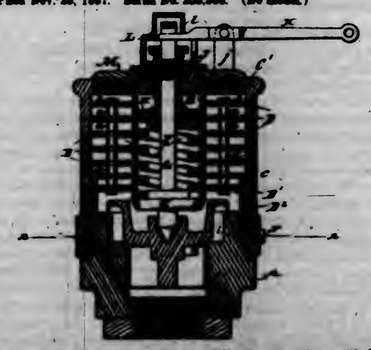
3. The runner D, provided at its heel with a shelf, *d'*, and support E, in combination with the tube E', provided at its upper end with a shelf, *e''*, bar E'', and a rock-shaft for oscillating the tube E', substantially as and for the purpose specified.

384,363.

4. The rock-shaft N and collars M M', having the arms *m m²*, in combination with the fork J, having the arm J' and carrying a pawl, K, bar E'', and tube E', for operating the seed disk and tube, substantially as and for the purpose specified.

5. The arms S S', carrying rollers S'', in combination with the fork F' and check-wire Q, substantially as and for the purpose specified.

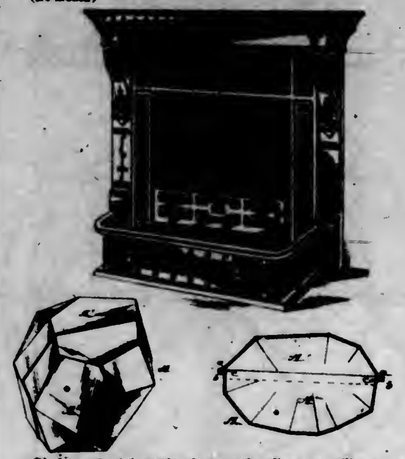
6. The arms S S', carrying the rollers S'', and arms T, in combination with the fork F' and check-wire Q, substantially as and for the purpose specified.



7. The fork F' and arm P, in combination with the collar *n*, having the extension *n'*, and rock-shaft N, for giving the rock-shaft its advance throw, substantially as and for the purpose specified.

8. The arm S, provided with the end *s*, and arm S', provided with the opening *s'*, in combination with the arm T, for operating both arms S S' simultaneously, substantially as and for the purpose specified.

9. A seed-dropping tube, E, having a fore-and-aft movement, in combination with a rock-shaft, and a connection between the shaft and tube, substantially as and for the purpose specified.

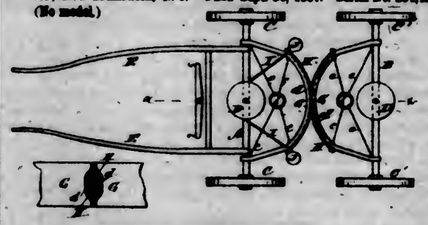


10. In a check-row planter, the combination of the herein-described device for releasing the wire, and a cord by which the operator can disengage the latch and raise the rollers and carry the wire out of the upright fork clear of the machine, substantially as specified.

384,364. **STEAM-MUFFLER.** THOMAS R. HILL, Rahway, N. J. Filed Nov. 23, 1887. Serial No. 256,266. (No model.)

Claim.—The base A, fitted with the valve B and provided with the casing C, in combination with the inner casing, E, spring F, rod G, perforated plates D, surrounding the casing E and held by rods *b* and spaced by the short intermediate tubes, *a*, placed upon the rods *b* between the said perforated plates D, substantially as described.

384,365. **HEAT DEVELOPER AND RADIATOR.** WALTER M. JACKSON, New York, N. Y. Filed Dec. 28, 1887. Serial No. 259,201. (No model.)



Claim.—1. A heat developer and radiator to utilize gaseous or other fuel, consisting, essentially, of a hollow chamber with numerous angles and a perforated wall, substantially as set forth.

2. A heat developer and radiator to be used in connection with combustible material and atmospheric air, consisting of a hollow polygonal chamber having its wall perforated, substantially as set forth.

3. A device for the economical combustion of gaseous or other fuel, consisting, essentially, of a hollow polygonal chamber that is formed of two half-shells joined at their edges, one or more perforations being made through the wall of the chamber, substantially as set forth.

4. A heat producer and radiator that is adapted to utilize economically a liquid, solid, or gaseous fuel, consisting of a hollow perforated chamber or thin shell made of metal, and provided with such an angular contour or exterior surface that interstices will be afforded for the percolation of air and gas between a mass of these polygonal chambers located in a fire-pot or open grate, substantially as set forth.

384,366. **RUNNING-GEAR FOR VEHICLES.** ALFRED W. JOHNSON, New Brunswick, N. J. Filed Sept. 30, 1887. Serial No. 251,194. (No model.)

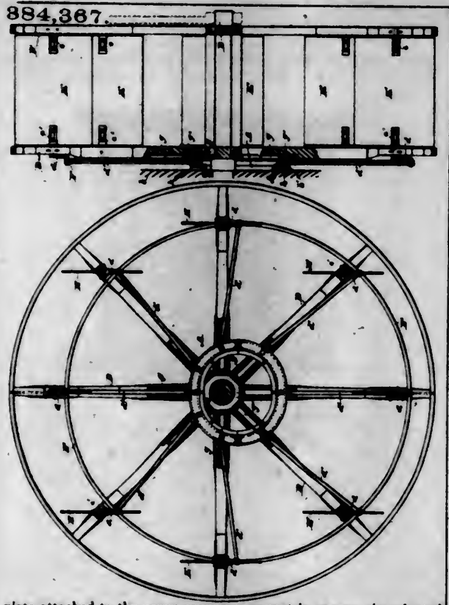
Claim.—1. In the running-gear of wagons and other vehicles having centrally-pivoted and swiveling axles united with each other by segments and attached crossing ropes or flexible connections, the segments G G, arranged to roll over and work in contact with one another, whereby said segments are mutually made to support and steady each other, substantially as specified.

2. In the running-gear of wagons and other vehicles, the combination, with the front and rear axles, A B, their fifth-wheels or swiveling-connections D D, the segments G G, and the flexible connections H H, of the stay-rods I I, connecting either swiveling-connection or fifth-wheel with the segment on the axle to which said fifth-wheel belongs, and the stop J, substantially as shown and described.

384,367. **FEATHERING PADDLE-WHEEL.** ROBERT J. JOHN, Carrollton, Wash. Filed Apr. 26, 1887. Serial No. 236,026. (Model.)

Claim.—1. In a paddle-wheel, the combination, with the arms of the wheel and buckets pivoted thereto, of an annular band of less diameter than said wheel, having a crank-connection with said paddles, a

384,367.



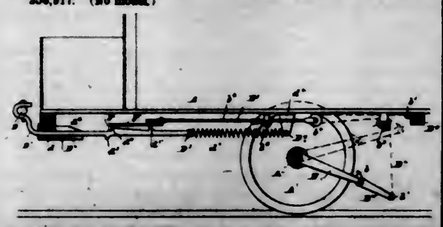


plate attached to the vessel, having an eccentric groove, pins adapted to slide in said grooves, and a crank-connection between said pin and band, substantially as shown and described.

2. In a paddle-wheel, the combination, with the arms of the wheel, the buckets pivoted therein, and an annular band having a crank-connection with said buckets, of a plate attached to the vessel's side, having an eccentric groove in its face, a plate adapted to slide in the arms of said wheel, carrying pins adapted to enter the said eccentric groove, and a pivoted connection between said plate and annular band, substantially as shown and described.

3. In a paddle-wheel, the combination, with the grooved arms of the wheel and a plate having an eccentric groove and attached to the side of a vessel, of an annular band of less diameter than the wheel, buckets pivoted between the arms and each provided with a crank-arm connected to the annular band, a plate sliding in the groove of the arms and provided with pins working in the eccentric groove of the said plate, and a rod connecting the sliding plate with the cranks of the buckets, substantially as herein shown and described.

4. The combination, with the arms D D', of a paddle-wheel provided with a longitudinal groove, *g*, at their inner ends, buckets E, pivoted near the outer ends of said arms, crank-arms *d*, attached to the inner pivots of said buckets, an annular band, F, of less diameter than the wheel, pivotally attached to said crank-arms, a plate, *f*, sliding in said grooves *g*, united at one end with said band by a connecting-rod, *d'*, and having a pin, *h*, upon the other end, of a plate, A, attached to the vessel's side, provided with groove *b'*, eccentric with the axis of said wheel, said groove adapted to receive the pin *h* of the plates *g*, substantially as shown and described, and for the purpose herein set forth.

384,368. CAR-STARTER. HENRY R. KELLER, New Orleans, La., assignor, by direct and mesne assignments, of two-thirds to William H. Belt and Oliver B. Shannon, same place. Filed Dec. 3, 1887. Serial No. 256,917. (No model.)

Claim.—1. The combination of a body having wheels and axles, a bar pivoted upon said axle, a lever fulcrumed upon the end of the bar and having its short arm opposite the periphery of the wheel and its long arm secured to a chain or cable, which in turn is secured to the body, a bar having a pulley for said chain or cable, and a draw-bar connected with said bar, substantially as described.

2. The combination of the body having wheels and axles, the clutching-lever, the draw-head and rollers on it, the draw-bar moving in said draw-head, the connecting device between the clutching-lever and the draw-bar and having a tripping-connection with said draw-bar, substantially as described.

3. The combination of the body having wheels, the clutching-lever, the draw-head having inclined faces, the draw-bar connected with the clutching-lever and having the retracting-springs, and the tripping device operated upon by the inclined faces upon the draw-head, substantially as described.

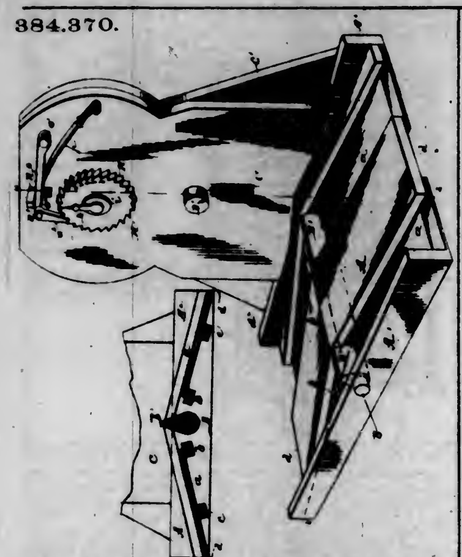
384,869. TRUCK. WILLIAM J. KENNEDY and LOUIS A. DE MATO, Jersey City, N. J. Filed Nov. 29, 1887. Serial No. 256,422. (No model.)

Claim.—1. The combination, with a truck-body, the axle thereof, a table secured upon said axle, provided with parallel and spaced slots at each end, and standards adjustably held in said slots, of a bucket pivoted in said standards, and means, substantially as shown and described, for dumping said bucket.

2. The combination, with a truck-body, the axle thereof, a table secured upon said axle, provided with parallel and spaced slots at each end, and standards having essentially U-shaped and flaring upper ends adjustably held in said slots, of a bucket pivoted in blocks, which blocks are adapted to the space intervening the members of the standards below their outer ends, a bail secured to said blocks, and a locking device attached to the bucket and engaging the bail, substantially as and for the purpose herein set forth.

3. The combination, with a truck-body provided with vertical standards over the axle between the wheels, having essentially U-shaped and flaring upper ends, of a bucket pivoted in blocks, which blocks are adapted to the space intervening the members of the standards below their outer ends, a bail secured to said blocks, and a locking device attached to the bucket and engaging the bail, substantially as and for the purpose herein set forth.

4. The combination, with a truck-body and vertical standards detachably secured to the axle between the wheels, said standards provided with a bifurcated upper end, the members whereof are oppositely and outwardly carved at their extremities, of blocks adapted to the space intervening the opposing members of the standard below their flaring extremities, a bucket pivoted in said blocks, a bail secured to the upper ends of the same, and a locking device attached to the bucket and engaging said bail, substantially as and for the purpose herein set forth.



384,870. AUTOMATIC REGISTERING GANG-BOARD. HENRY R. KIRK, Mount Pleasant, S. C. Filed Dec. 19, 1887. Serial No. 258,208. (No model.)

Claim.—1. The combination, with a floor and a registering-box secured thereto, of a rock-shaft stopped in the floor, said shaft having a pair of lugs on one end, and springs secured to the registering-box with their free ends in engagement with the lugs on the shaft, whereby the shaft is held in its normal position, substantially as set forth.

2. The combination, with a floor, a registering-box, and a rock-shaft stopped in the floor, said shaft having a cam-toe and a pair of lugs on one end, of springs secured to the box with their free ends in engagement with the lugs, a set of registering-wheels, a lever in position to be operated by the cam-toe on the rock-shaft, and a spring-actuated pawl adapted to be operated by the lever, whereby motion is communicated to the registering-wheels, substantially as set forth.

3. The combination, with a floor, a registering-box, a rock-shaft, this shaft having a cam-toe and lugs on one end, and springs secured to the box with their free ends in engagement with the lugs, whereby the shaft is retained in its normal position, of a set of registering-wheels adapted to turn in the box, said wheels receiving motion from the rock-shaft, one wheel having a cam thereon, a lever to be operated by said cam, a spring-actuated arm in position to be abutted by the lever, and a ratchet-dog pivoted to this arm with one end in engagement with the teeth on one of the registering-wheels, substantially as set forth.

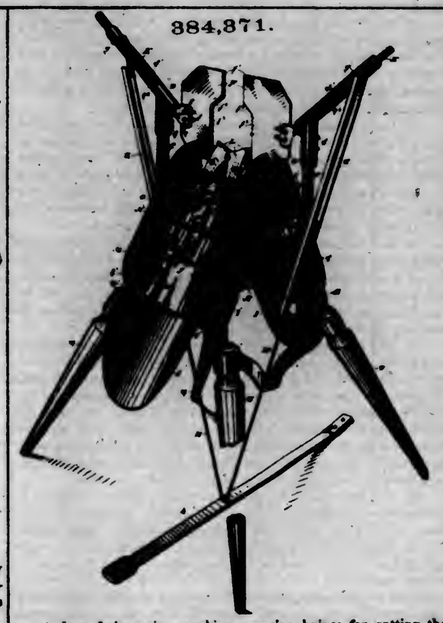
384,870.

4. The combination, with a floor, a registering-box, and a rock-shaft, the latter having lugs thereon, and springs having engagement with these lugs for holding the shaft in its proper position, of a set of registering-wheels adapted to receive motion from the motion of the shaft, one of these wheels geared to make two revolutions to a single revolution of its adjacent wheels, and a third wheel on the opposite side of the box arranged to move one notch to register every revolution of the large wheel, substantially as set forth.

5. The combination, with a floor and a rock-shaft stopped therein, of a register-box and springs in the latter exerting equal pressure at different points upon the shaft for holding the latter in its proper position, substantially as set forth.

6. The combination, with a floor and a rock-shaft stopped therein said shaft having lugs thereon, of a register-box, a pair of springs having engagement with said lugs for holding the said shaft in proper position, registering-wheels on each side of the box, and connected pawls and levers for communicating motion from the rock-shaft to the registering-wheels, substantially as set forth.

7. The combination, with a floor, a rock-shaft stopped therein, the latter having a pair of lugs thereon, and a registering-box, of a pair of springs in engagement with the lugs for holding the shaft in proper position, registering-wheels in both sides of the box loosely mounted on stationary shafts, indicating-hands secured to said shafts, and connected levers and pawls for communicating motion from the rock-shaft to the indicating-wheels, substantially as set forth.



384,871. FRUIT-STONING MACHINE. BENJAMIN A. LELLER, San Francisco, Cal. Filed Mar. 22, 1886. Serial No. 296,139. (No model.)

Claim.—1. In a fruit-stoning machine, opposing knives for cutting the fruit and gripping its pit, and having sliding shanks whereby the knives may move together to close on the pit, in combination with vertically-movable spindles carrying the shanks of the knives, whereby the latter may be driven down after gripping the pit, substantially as herein described.

2. In a fruit-stoning machine, opposing knives for cutting the fruit and gripping its pit, and sliding shanks for said knives mounted at a downwardly-converging inclination with relation to each other, whereby the knives may move together and downwardly to close on the pit, in combination with vertically-movable spindles carrying the shanks of the knives, whereby the latter may be drawn down after gripping the pit, substantially as herein described.

3. In a fruit-stoning machine, opposing knives for cutting the fruit and gripping its pit, and having sliding shanks whereby they may move together to close on the pit, and springs for returning them, in combination with vertically-movable spindles carrying the shanks of the knives, whereby the latter may be drawn down after gripping the pit, and springs for returning the spindles, substantially as herein described.

384,871.

4. In a fruit-stoning machine, opposing knives for cutting the fruit and gripping the pit, and having sliding inclined shanks whereby they may move together to close on the pit, and springs for returning them, vertically-sliding spindles carrying the shanks, whereby the knives may be drawn down after gripping the pit, and springs for returning said spindles, in combination with the treadle, the bail connected therewith, and the yokes connected with the bail and with the shanks of the knives, whereby they are operated, substantially as herein described.

5. In a fruit-stoning machine, the vertically-moving spindles, in combination with the adjustable sleeves on their tops, the socket-bearings carried by the sleeves, and the knives having sliding shanks mounted in the socket-bearings, substantially as herein described.

6. In a fruit-stoning machine, the oppositely-moving knives F, having the cutting-edges *f'* and the underlying opposite recessed portions *f*², substantially as herein described.

7. In a fruit-stoning machine, the knives F, each having a movement in a downwardly-converging plane and provided with the cutting-edges *f'*, the recessed portions *f*², and the gripping-teeth *f*³, substantially as herein described.

8. In a fruit-stoning machine, the oppositely-moving knives F, having the opposing recessed portions in their cutting-edges, whereby the fruit is cut on the sides and top in to the pit, in combination with cutters or scrapers arranged in pairs upon each side of the machine, so as to form a cup against which the base of the fruit is forced by the knives, substantially as herein described.

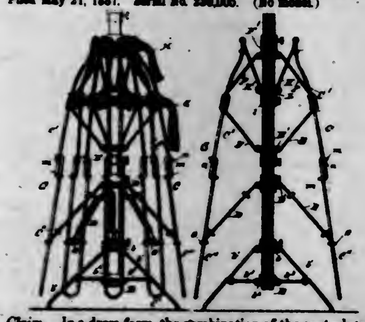
9. In a fruit-stoning machine, the cutting and gripping knives having the sliding shanks, and the vertically-sliding spindles carrying the shanks, whereby the knives may be drawn together to cut the fruit and grip its pit, and may be moved down with the fruit and pit, in combination with cutters or scrapers below upon which the fruit is forced, whereby the flesh is separated from the pit, substantially as herein described.

10. In a fruit-stoning machine, the cutting and gripping knives having the inclined sliding shanks with a spring for returning them, the vertically-sliding spindles carrying the knife-shanks and having springs for returning them, and the mechanism for operating the knives, consisting of the treadle, the yokes connected with the inclined knife-shanks, and the bail connecting the treadle with the yokes, in combination with cutters or scrapers upon which the fruit is forced by the knives, whereby the flesh is separated from the pit, substantially as herein described.

11. In a fruit-stoning machine, the cutters or scrapers upon which the fruit is forced, said scrapers having sliding stems provided with spiral extensions or twists, in combination with fixed guides in which the extensions play, whereby the scrapers have imparted to them a partial rotary movement as the pit is forced between them, substantially as herein described.

12. In a fruit-stoning machine, the cutters or scrapers upon which the fruit is forced, said scrapers having sliding stems provided with spiral extensions or twists and springs for returning the stems, in combination with fixed guides in which the extensions play, whereby the scrapers have imparted to them a partial rotary movement as the pit is forced between them, substantially as herein described.

13. In a fruit-stoning machine, the cutters or scrapers upon which the fruit is forced, said scrapers having sliding stems with springs for returning them and spiral extensions or twists on their lower ends terminating in straight portions, in combination with fixed guides in which the extensions play, and movable adjustable frames carrying said guides, whereby they may be lowered to the straight terminations of the extensions or twists, substantially as herein described.



14. In a fruit-stoning machine, the cutters or scrapers having the sliding stems with spiral extensions or twists and the fixed guide pins or lugs in which said extensions play, in combination with the adjustable bracket J, having the sockets in which the stems slide, the adjustable frame with its collars N on the stems, and the springs for returning the stems, substantially as herein described.

15. In a fruit-stoning machine, the convergent cutters or scrapers upon which the fruit is forced, arranged in pairs with meeting or overlapping edges, said cutters or scrapers having sliding stems with spiral extensions or twists projecting in line with the under surface of the stems, in combination with fulcrum-bearings in which the stems are mounted and fixed guides in which the spiral extensions play, whereby the scrapers are given a partial rotary motion and a simultaneous rocking motion to maintain the relative position of the meeting or overlapping edges of each pair, substantially as herein described.

16. In a fruit-stoning machine, the inclined cutters or scrapers, in combination with the chutes I, in which they are mounted, the main frame carrying the chutes and having slots, and the bolts passing through the slots for securing the chutes to the frame, whereby their angle and that of the scrapers they carry may be varied, substantially as herein described.

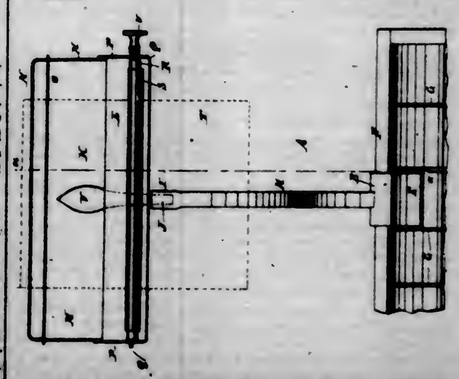
17. In a fruit-stoning machine, the inclined, yielding, and partially rotary cutters or scrapers upon which the fruit rests, in combination with the knives above for cutting the fruit and gripping its pit, said knives having inclined spring-controlled sliding shanks, the vertically-sliding spring-controlled spindles carrying the knife-shanks, and the treadle and connections with said shanks, whereby the knives are operated to force the pit down between the scrapers, substantially as herein described.

384,372. DRESS-FORM. JOHN W. LITTLEFIELD, Everett, Mass. Filed May 21, 1887. Serial No. 238,005. (No model.)

Claim.—In a dress-form, the combination of the central stationary post, the adjustable and collapsible base, the upright ribs with extensible parts, both having eyes encircling the wires of the other parts, stops a on said upright ribs, a set of single waist-braces hinged to the waist end of said ribs and to a sliding ring on said central post, and the extensible braces D, secured to the extensible parts of said ribs and to a sliding ring on said central post, all constructed and arranged substantially as shown and described.

384,373. ADDING AND WRITING MACHINE. ALBERT C. LEDLIE, Brooklyn, N. Y. Filed Mar. 26, 1887. Serial No. 232,469. (No model.)

Claim.—1. The combination, with type mechanism, of a carriage provided with an impression-surface over which paper to be printed upon may pass, feed-rollers for the paper mounted in said carriage, a number of adding-wheels mounted in an appurtenance of the said carriage, and mechanism, substantially such as described, for operating the type mechanism and adding-wheels and for moving the said carriage and the adding-wheels in unison widthwise of the machine, substantially as specified.



2. The combination of type-levers, an impression-cylinder, a carriage in which said cylinder is mounted, a number of adding-wheels, a carriage in which said wheels are mounted connected to the carriage supporting the impression-cylinder, and mechanism, substantially such as described, for moving the said carriage and operating the type-levers and adding-wheels, substantially as specified.

3. The combination of an impression-cylinder, type-levers for operating in conjunction therewith, finger-levers for operating the type-levers, adding-wheels, a motor-wheel adapted to engage with the adding-wheels one at a time, and a rock-shaft for transmitting motion to the motor-wheel and deriving motion from the operation of the levers which actuate the type-levers, substantially as specified.

4. The combination of writing mechanism consisting, essentially, of type-levers and an impression-cylinder having a rotary and longitudinal movement, a carriage in which said cylinder is supported, adding mechanism, a carriage in which said adding mechanism is supported, connected to the carriage of the impression-cylinder, an oscillating frame supporting the last-named carriage, and a cam-lever whereby this frame may be oscillated to render the adding mechanism inoperative, substantially as specified.

5. The combination of the carriage A', an impression-cylinder supported on said carriage, a rack-bar connected to said carriage, a pawl for engaging with said rack-bar for the purpose of imparting motion to the carriage, adding mechanism, a carriage supporting the adding mechanism and connected to the carriage of the impression-cylinder, an oscillating frame supporting the carriage of the adding mechanism, a cam-lever whereby this frame may be oscillated, a connection between said lever, and a device extending under the said pawl, whereby said pawl may be rendered inoperative at the same time that the adding mechanism is rendered inoperative by the oscillation of the lever, substantially as specified.

384,374. COPY-HOLDER FOR COMPOSITORS. HUGO F. MAAS, Egg Harbor City, N. J. Filed Nov. 18, 1887. Serial No. 255,502. (No model.)

Claim.—1. In a copy-holder, the combination of a double U-shaped base-clamp, an upwardly-extending arm fixed thereto having a socket at its upper end, a copy-rack secured to said socket, and a shifting-roller mounted in said copy-rack, substantially as described.

2. In a copy-holder, the combination, with a rack, K, and rack-supporting arm H, of a double U-shaped spring-clamp, B, the medial plate C of which is considerably nearer one than the other of the outer plates, D E, as and for the purpose specified.

3. In a copy-holder, the combination of a rack, K, having a smooth back plate, L, the ends of which are bent to form parallel lugs P, and a rubber-covered shifting-roller, R, journaled to said lugs P, substantially as described.

4. A rack, K, constructed of a lower back plate, L, and a rectangular skeleton frame, M, formed of a wire, N, bent into inverted-U shape and fastened to the back plate, and a longitudinal wire, O, having its ends looped over the side arms of the bent wire N, as and for the purpose specified.

384,375. ROAD-CART. WILLIAM H. MCCRACKEN, West Branch, Mich. Filed Jan. 23, 1888. Serial No. 261,927. (No model.)

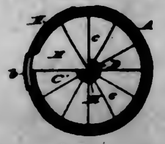
Claim.—1. The improved cart herein described, comprising the dropped axle, the rear springs secured to the dropped portion of the axle, the thills fitted loosely to the spindle-carrying arms of the axle, the barrels secured on the thills and containing springs, and the body secured at its rear end on the rear springs and having connections at their forward end provided with arms entering the spring-carrying barrels, substantially as set forth.

2. A vehicle-body having a hinged box-section, and a spring for closing and holding such section normally closed, substantially as set forth.

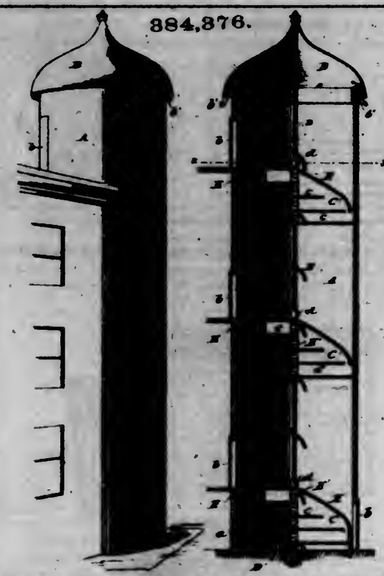
3. A vehicle-body having a hinged box-section provided with an extension in rear of such hinge, and a spring connected with such rear extension, substantially as set forth.

4. The vehicle-body herein described, having a hinged box-section, a hinged seat-section, a spring for closing such sections, and a connection therebetween, substantially as and for the purpose specified.

5. The combination of the seat having a hinged section, the seat-brace having a guide for the connecting-cord, the hinged box-section, the spring for operating the same, arranged within the brace, and the connecting-cord passed through the eye on the brace and secured at its opposite ends to the hinged seat and box sections, all substantially as and for the purposes specified.



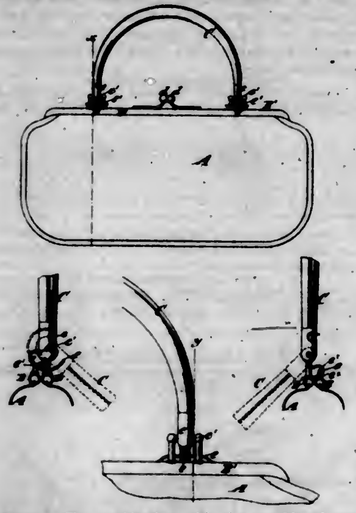
6. The combination of the body, the thills, the spring-carrying barrels secured to and depending from the thills, and braces G, extending between the thills and the lower ends of the barrels, substantially as set forth.



7. The combination of the body, the thills, the spring-barrels slotted longitudinally, the springs in said barrels, and the connections pivotally secured to the body and having arms which enter the slots of the barrels and operate between the springs thereof, substantially as set forth.

8. The improved cart herein described, consisting of the dropped axle, the rear springs and body, the thills fitted loosely at their rear ends on the axle, the barrels secured on the thills and slotted longitudinally, the front springs in said barrels, and the connecting-brackets pivotally secured at one end to the body and having arms which enter the slots of and bear between the springs in the barrels, substantially as set forth.

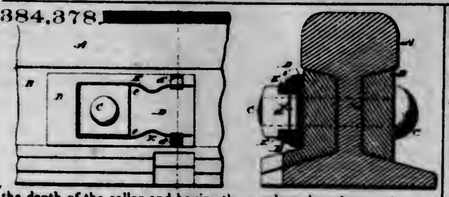
384,376. FIRE-ESCAPE. WILLIAM HOFFMANN, Chicago, Ill. Filed Dec. 12, 1887. Serial No. 257,762. (No model.)



Claim.—The combination, with the fire-proof wall A, built partly in a dwelling, having fire-proof doors *b*, a stand-pipe, D, centrally secured in said wall, provided with nozzles *d*, a hood or top, B, secured centrally to the upper end of the pipe D and resting over the upper end of the well and secured thereto, as shown, and an air-opening, *b'*, formed between said hood and top of the well, of a spiral stairway composed

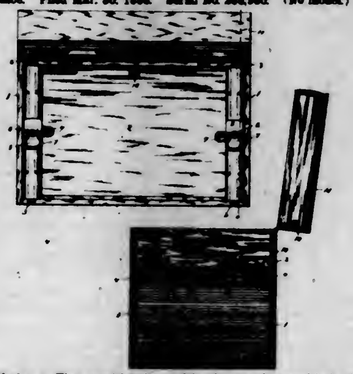
of triangular steps supported at the inner ends on said pipe D and having their outer ends project in the wall of the well, and the platforms E, secured at their inner ends to the pipe and at their outer ends in the wall of the well, substantially as shown and described.

384,377. HAND-BAG. JOHN MIHL, Jr., Jersey City, N. J. Filed Mar. 26, 1888. Serial No. 268,198. (No model.)



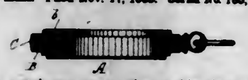
Claim.—The combination, with the two hinged externally-abutting portions of a bag-frame and a handle pivoted to one of said frame portions, of a look between the handle and the other of said frame portions, consisting of a hook on the handle and a loop or bar on the outside of said other frame portion, with which loop or bar said hook engages when the bag is closed and the handle is swung to carrying position, substantially as herein described.

384,378. NUT-LOCK. JOHN MERRIMAN and AARON S. MUNDY, Hancock, R. I. Filed Mar. 6, 1888. Serial No. 266,293. (No model.)



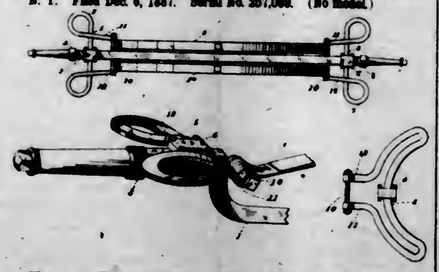
Claim.—A nut-lock consisting of an essentially rectangular plate provided with a collared aperture near one end and spaced lugs at or near the opposite ends, and an essentially U-shaped spring wider than

384,378. [illegible]



the depth of the collar and having the members slotted to receive said lugs, substantially as shown and described.

384,379. TRUNK TRAY AND FOLLOWER. GEORGE R. MILBURN, Minneapolis, Minn., assignor of one-fourth to Thomas H. Reeves, same place. Filed Mar. 30, 1888. Serial No. 268,980. (No model.)

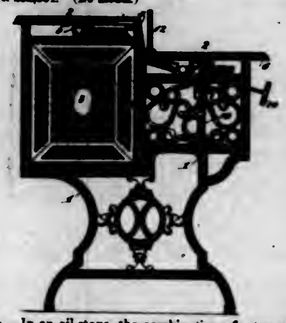


Claim.—The combination, with the trunk provided with the ratchet-bars 3, of the tray or follower 2, provided at each end with the spring-bolts adapted to engage said ratchet-bars, the rotary pins 6, connected with the bolts upon the opposite sides of the tray, and the lock bolts 9, adapted to engage said pins 6 and keep them from turning for the purpose set forth.

384,380. WATCH-CASE. CHARLES F. MORRILL and DAVID C. PERCIVAL, Boston, Mass. Filed Nov. 17, 1886. Serial No. 183,118. (Model.)

Claim.—In a watch-case center, the combination, with the relatively base-metal core or ring, of a separate external covering inclosing the front, back, and side of said core, the said core having a movement-supporting ledge or shoulder projecting inward beyond the outer covering, substantially as described.

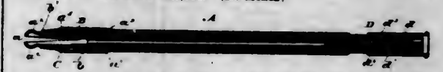
384,381. VEHICLE-SPRING. RICHARD MULHOLLAND, Dunkirk, N. Y. Filed Dec. 6, 1887. Serial No. 257,069. (No model.)



Claim.—1. The combination, with a vehicle-axle and cross-spring, of two flexible springs, each rigidly attached to the axle transversely thereto near the collars, and having two curved arms forming portions of the same projecting outward and then inward approximately parallel with the sides of the axle and yieldingly attached to the cross-spring, so as to have both vertical and horizontal action without the aid of links or swinging shackles, substantially as described.

2. In a vehicle-spring, the combination, with the axle and cross-springs, of two flexible springs having their central portions rigidly secured transversely to points near each collar of the axle, and having the two opposite portions of each spring formed into coils which curve outward and terminate in arms projecting substantially parallel with the sides of the axle, and curve upward, downward, and in toward the cross-springs, to which they are pivotally connected, substantially as and for the purposes described.

3. A vehicle-spring having its central portion adapted to be rigidly secured at right angles to an axle, and its two outer portions formed into coils which curve outward, and then terminate in arms extending inward substantially parallel with each other in a direction downward and opposite to the portion by which it is attached to the axle, and having eyes by which it is pivoted to the cross-spring, substantially as described.



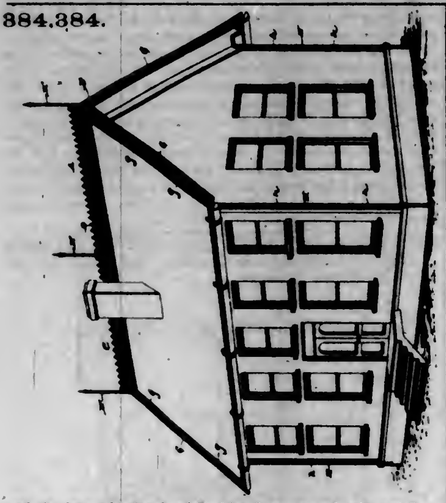
4. A vehicle-spring consisting of a central portion for rigid transverse attachment to an axle, which acts as a torsion-spring, and having two outer portions formed into coils which extend outward and act as coil-springs, the inner sides of each coil being provided with an arm extending inward approximately parallel with each other, substantially as and for the purposes described.

384,382. OIL-STOVE. GARRET MYERS, Chicago, Ill., assignor to the Adams & Westlake Company, same place. Filed Oct. 17, 1887. Serial No. 252,551. (No model.)

Claim.—In an oil-stove, the combination of a top plate having a raised rear extension, a non-generating burner located beneath said rear extension, an oven beneath said burner, a generating-burner beneath the front of said top plate, and a tube passing the truncated edge of said oven for conducting vapor from the generating to the non-generating burner.

384,383. PENCIL. LEWIS R. MYERS, Fremont, Ohio. Filed Sept. 14, 1887. Serial No. 249,690. (No model.)

Claim.—1. The tube having the longitudinal slit extending for a suitable distance of its length, with a clamping-jaw fitting on the open end and provided with an annular shoulder, in combination with a sleeve fitted on said clamping-jaw and having converging ends bearing thereon, and also provided with a shoulder and a coiled spring placed around the clamping-jaw and bearing against the shoulders of the clamping-jaw and sleeve, respectively, for the purpose set forth.



2. The combination, with the closed end of the pencil, of an open tube fitted thereon and provided with a slot, and a sliding sleeve fitted on said tube and provided with a pin working in said slot, which pin divides the stationary tube into two compartments to receive a spring and eraser, the spring bearing against the closed end of the pencil and the pin, for the purpose set forth.

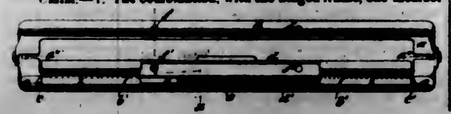
384,384. METALLIC CREST-TILE LIGHTNING-ROD. CLARK B. NELSON, Crawfordsville, Ind., assignor of one-half to James H. Watson, same place. Filed Nov. 16, 1887. Serial No. 255,341. (No model.)

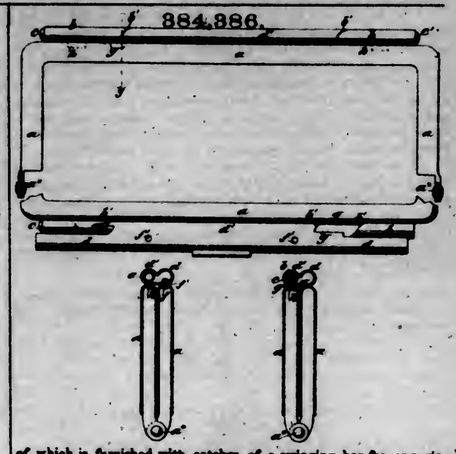
Claim.—A metallic crest-tile forming part of the electric connections of a house with the ground, serving as a part of the lightning-protective system thereof, and consisting of the diverging flanges B, forming the saddle, the vertical flange C, integral with the saddle and provided with the triangular teeth or points D to attract electricity.

384,384.

and the integral pointed rod E, rising from one end, substantially as specified.

384,385. TWINE-HOLDER. ROBERT HUNT, Jr., Chicago, Ill. Filed Dec. 27, 1887. Serial No. 258,351. (No model.)





Claim.—1. A twine-holder comprising, in combination, a hollow body formed in parts r and r', hinged together at corresponding ends, an eye on one of the said parts near the opposite end, and a suspension-cord, or the like, C, connected to the other of the said parts and passed through the said eye, whereby when the holder is suspended on the cord C it is closed by its own weight on the suspension-cord and opens by raising it to relax the suspension-cord, substantially as described.

2. A twine-holder comprising, in combination, a hollow body formed in parts r and r', hinged together at corresponding ends and provided with eyes o and n near the opposite ends, and a suspension-cord, or the like, C, extending through the said eyes, whereby when the holder is suspended on the cord C it is closed by its own weight on the suspension-cord, and opens by raising it to relax the suspension-cord, substantially as described.

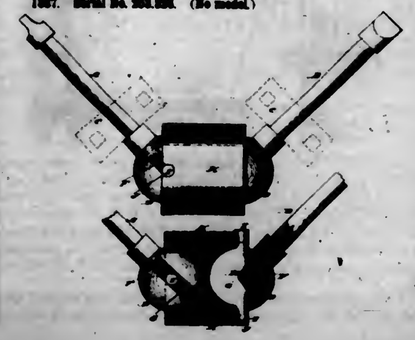
384,386. POCKET-BOOK, BAG, OR PURSE FRAME. REUBEN OLDENBURG, New York, N. Y., assignor to William Schlenger & Co., same place. Filed May 9, 1888. Serial No. 273,245. (No model.)

Claim.—1. The combination, with the hinged frame, one member

of which is furnished with catches, of a swinging bar for engaging with such catches, having a connection with the other member of the frame by a hinge-joint with spiral abutting surfaces, and a spiral spring arranged within said hinge-joint and exerting a pressure lengthwise thereof, substantially as and for the purpose herein set forth.

2. The combination, with the main frame made in two parts hinged together, and the tubes *b*, secured to one of said parts and formed with spiral or inclined end surfaces, of the swinging clasp hinged between the tubes and formed with corresponding spiral or inclined surfaces, a compression-spring bearing against the tubes and the clasp, and stop-shoulders at the ends of the inclines to limit the motion of the clasp, substantially as and for the purpose set forth.

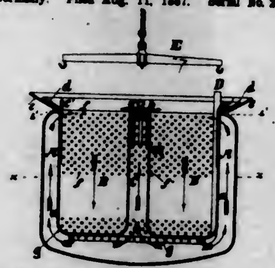
3. The combination, with the main frame *a*, the tubes *b b*, secured to one member of the frame, and formed with the inclined surfaces *b'*, and the projecting pintle *c*, secured in one of these tubes, of the clasp provided with the cylinder *d'*, having inclines to correspond with those upon the tubes, and provided with the pintle *c'*, and the compression-spring *e*, placed between the ends of the pintles, substantially as and for the purpose set forth.



384,387. BUSHING FOR BUNGS. RAFAEL PEYTLABOY, Brooklyn, N. Y. Filed Feb. 23, 1888. Serial No. 264,977. (No model.)

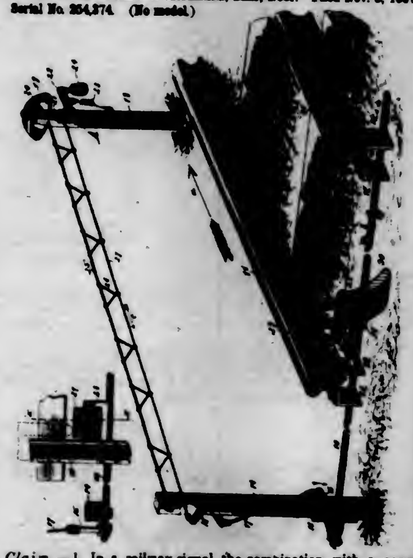
Claim.—1. The combination, in a metallic bushing for a bung, of a screw-threaded body, and a flange having a face formed at an oblique angle to the body, and cutting-teeth formed in the angular face of said flange, as and for the purposes set forth.

2. The combination, in a metallic bushing for a bung, of a screw-threaded body, and a flange having a face formed at an angle to the body, and transverse cutting-teeth in the said angular face of the flange, substantially as described.



384,388. UNIVERSAL JOINT. CHARLES PIERCE, Springfield, Ohio, assignor of one-third to Charles B. Meyer, same place. Filed Oct. 31, 1887. Serial No. 253,226. (No model.)

Claim.—1. In a universal joint, the combination, with two sections of shafting having slotted spherical heads and tapered at their ends, and journal-boxes which maintain the shafts from moving away from each other, of broad plates loosely fitted in said slots, respectively, and otherwise disconnected from the heads, notched to receive the tapered ends of the shafts, and terminating at each end in an integral journal, and a sleeve having a spherical recess at each end in which the heads are mounted, and open bearings in each end in which plate-journals are mounted and held by the shafts and their boxes.

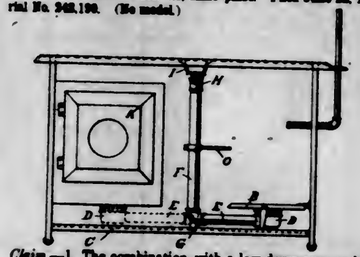


2. In a universal joint, the combination of a section of shafting having a spherical head provided with a slot extending through the greater portion thereof and a plate terminating in an integral journal at each end loosely fitted in said slot and otherwise disconnected from the head, and a sleeve having a spherical recess into which the said head is fitted and having bearings in which said plate-journals are mounted.

384,389. **DYEING APPARATUS.** RUDOLF PERSINA, Aachen, Prussia, Germany. Filed Aug. 11, 1887. Serial No. 246,656. (No model.)

Claim.—The combination of outer vessel, A, having contracted neck *c'* and flange *c*, with the inner perforated vessel, B, having flange *d*, and with the perforated tube C, cover *b*, and inlet-tube D, having perforated lower end, substantially as specified.

384,390. **RAILWAY-CROSSING ALARM-SIGNAL.** GEORGE D. RATHBURN and CHRISTIAN RATHBURN, Blair, Nebr. Filed Nov. 5, 1887. Serial No. 254,374. (No model.)

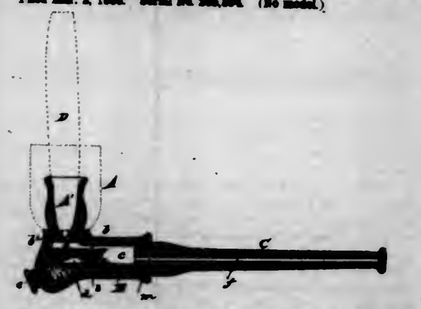


Claim.—1. In a railway-signal, the combination, with a gong supported on a post at one side of the track and a spring-actuated bell-crank lever pivoted to the post and carrying a hammer, of a rock-shaft below the rails and provided with the arm 15, the arms 26, and the stop 31, the tripping-dog 29, pivoted between the arms 26 and having the counterpoise 30, and connections, substantially as described, between the bell-crank lever and the arm 15 of the rock-shaft, as specified.

2. In a railway-signal, the combination of the rock-shaft 10, provided with the forwardly-projecting arms 26 and the stop 31, and the tripping-dog 29, pivoted between the arms 26 and having a counterpoise, 30, on one end, substantially as herein shown and described.

3. In a railway-signal, the combination, with a rock-shaft mounted beneath the bases of the rails and provided with arms 26 and a projection, 31, of a tripping-dog mounted between and supported by the arms 26, a counterpoise arranged in connection with the tripping-dog, a post, 14, an arm, 15, carried by the rock-shaft in close proximity to the post, a second post, 18, a lever, A, carried by said post and provided with a gong-hammer, a spring arranged in connection with the lever, a gong, a supporting-wire, 25, loops carried by said wire, a wire, 27, connected to the lever A and passing through said loops, a lever, 16, mounted upon the post 14, and a wire connecting the lever 16 and the arm 15, substantially as described.

884,391. **VAPOR-STOVE.** BERNARD REIH, Detroit, Mich., assignor of one-half to Jacob Haltenman, same place. Filed June 22, 1887. Serial No. 242,199. (No model.)

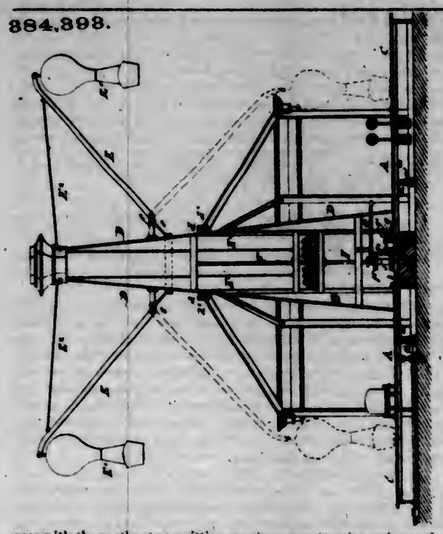


Claim.—1. The combination, with a low-down oven and cooking-shelf supported at opposite ends of the stove, of a swinging tube pivotally secured on a vertical axis between said oven and shelf and forming the means for carrying vapor from the generating-burner to a low-down burner carried by said swinging tube, substantially as described.

2. The combination, with the generating-burner, low-down oven, and cooking-shelf supported at opposite ends of the stove, of a low-down burner carried on a swinging tube between said oven and shelf, and means, substantially as described, for conducting the vapor from the generating-burner through the swinging tube into said low-down burner, all arranged to operate substantially as described.

3. The combination of the generating-burner K, and tube F, having a sleeve-joint at its upper end, with the commingling-tube and a pivot-bearing at its lower end, horizontal arm E, burner D, and handle O, all arranged to operate substantially as described.

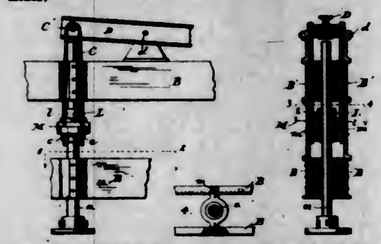
384,392. **TOBACCO-PIPE.** FREDERICK ROEHLING, Cleveland, Ohio. Filed Mar. 2, 1888. Serial No. 265,894. (No model.)



Claim.—In a pipe, the shank B, having the longitudinally-extending smoke-chamber *c* in line with its stem-opening, the bowl-opening *b'*, a passage, *b*, leading therefrom into the rear end of said chamber, the downwardly and rearwardly inclined reservoir *d*, having an inlet-passage, *l*, leading into the bottom of the chamber *c*, and an air-passage, *n*, also leading into the smoke-chamber from said reservoir above the passage *l*.

384,393. **ROUNDABOUT.** WILLIAM RAMAGE, Brooklyn, N. Y. Filed Sept. 20, 1887. Serial No. 249,173. (No model.)

Claim.—1. The combination of a stationary center block, a rotary platform, a tower supported on said platform, arms pivoted to said tower, carriers suspended from the arms, a vertically-traversing and weighted cage guided in said tower, ropes connecting the arms with said cage, a screw supported in bearings of the center block and the frame of the tower, said screw engaging fixed nuts of the cage, gearing for transmitting rotary motion from the platform to the screw, and a clutch mechanism by which said screw is thrown in or out of

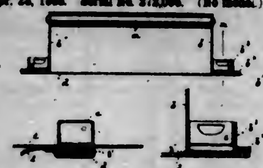


384,393.

gear with the motion-transmitting gearing, so as to raise or lower the cage and thereby lower or raise the carriers, substantially as set forth.

2. The combination of a stationary center block, a rotary platform, a fixed platform concentric to the rotary platform, a tower supported on the rotary platform, arms pivoted to said tower, carriers suspended from said arms, a vertically-traversing and weighted cage guided in said tower, ropes connecting the arms with the cage, a screw supported in bearings of the center block and of the frame of the tower, said screw engaging fixed nuts of the gage, a clutch-sleeve splined to the screw and provided with a crown-wheel at each end, gearing for transmitting rotary motion from the movable platform to the clutch-sleeve and screw, and a lever for moving the clutch-sleeve, so that either one of the crown-wheels is thrown in mesh with the gearing, according as the motion-transmitting screw is to be turned in one or the opposite direction, substantially as set forth.

384,394. **MACHINE FOR GRINDING, SMOOTHING, AND POLISHING GLASS.** FRANK SHERWIN, New Albany, Ind., assignor to H. T. De Pauw, same place. Filed Dec. 28, 1887. Serial No. 259,607. (No model.)

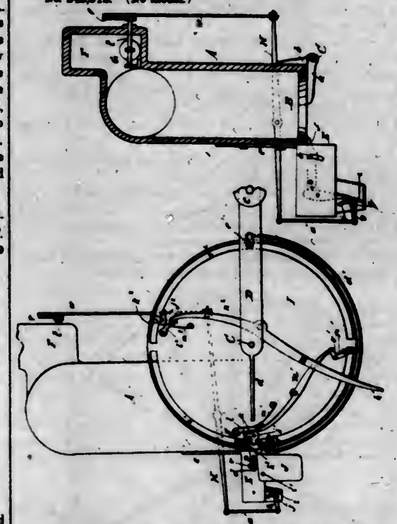


Claim.—1. In combination, a runner, a shaft connected to said runner, a cross-head within which said shaft revolves, a collar surrounding said shaft and normally resting upon the upper surface of said cross-head, a lever, and a link connecting said lever and the cross-head, whereby when said lever is operated the shaft and its runner are elevated or depressed.

2. In combination, a runner, a shaft connected to said runner, a cross-head within which said shaft revolves, a collar normally resting upon the upper surface of said cross-head, a lever, a link connecting the said lever and the cross-head, and a rod threaded at its lower end attached to the outer end of said lever, and a threaded wheel through which the lower end of said rod passes, whereby when the said wheel is revolved the shaft and its runner are elevated or depressed.

3. In combination, a runner, a shaft connected to said runner, a cross-head within which said shaft revolves, ways upon which said cross-head travels, a collar normally resting upon the upper surface of said cross-head, a lever-arm, a U-shaped link connecting said lever and the cross-head, and a rod threaded at its lower end attached to the outer end of said lever, and a threaded wheel through which the lower end of said rod passes, whereby when said wheel is revolved the shaft and its runner are elevated or depressed.

384,395. **BRAWL-STRAP.** SIMON SCHEUER, New York, N. Y. Filed Apr. 23, 1888. Serial No. 272,036. (No model.)



Claim.—1. The combination of a handle, *a*, with the bent plate *b b'*, doubled upon itself to form projection b^2 and bearing b^3, and with the clamp *c*, pivoted between parts *b* b^3, substantially as specified.

2. The combination of handle *a* with the bent plate *b b'*, doubled up to form projection b^2 and bearing b^3, and with the clamp *c*, pivoted between the bearings *b* and b^3, and with cross-bar *d*, each cross-bar being secured to the projection b^2, substantially as specified.

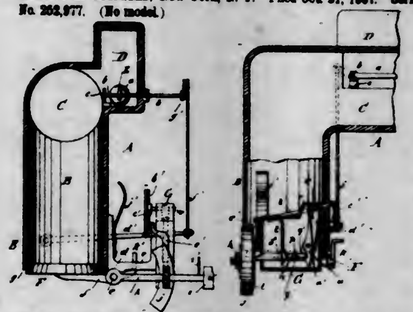
3. The combination of handle *a* with buckle-frames at the ends thereof, and with U-shaped clamps pivoted within the buckle-frames, and with the straps *c*, passing between the buckle-frames and the clamps and engaged by both shanks of the clamps, substantially as specified.

4. The combination of handle *a* with the bent plates *b*, and with the cross-bar *d*, secured to the projections b^2 of plates *b* by means of upset burrs, and with the U-shaped tongues *c*, pivoted between the bearings *b* and b^3, and having finger-pieces *c'*, and with the straps *c*, substantially as specified.

384,396. **VALVE MECHANISM FOR SEWERAGE SYSTEMS.** CHARLES H. SHEPHERD, New York, N. Y. Filed Aug. 9, 1887. Serial No. 246,512. (No model.)

Claim.—1. The combination, with the discharge-pipe provided with a float-chamber and the valve of the sewerage system, of a catch for holding the valve closed, a float placed in the float-chamber for releasing the catch, and mechanism for retarding the closing of the valve, substantially as specified.

2. The combination, in a sewerage system, of the discharge-pipe A, provided with the float-chamber F, the valve B, hinged to the open end of the said pipe and adapted to close it, the latch *f*, provided with the double-acting spring *n*, the catch-lever *i*, cam *j*, the float G, shaft *l*, arm *v*, rod *w*, lever H, rod *d'*, and arm S, intermediate between the said float and the cam-lever *j*, substantially as specified.



3. The combination, with the valve B and counterweighted arm D, secured to the pivot of the said valve, of an auxiliary retarding-weight, J, the catch k', pawl l', catch k^2, pawl l^2, and the levers n', p', and n^2, substantially as described.

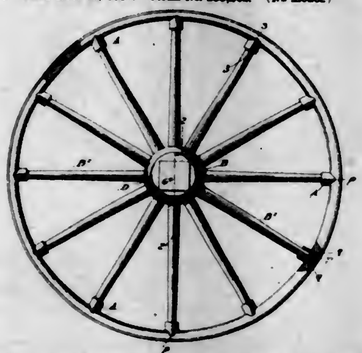
4. The combination, with the valve B and weighted lever D, connected therewith, of the slotted disk I, curved rod *d'*, carrying rollers f' f^2 in the slots of the disk I, the weight J, provided with the pin i'

and rollers k' k^2, the forked levers j' j^2, spring-pressed catch-levers l' l^2, the lever n' and trigger p', and the lever n^2, substantially as specified.

5. In a sewerage system, the combination, with the pipe A and valve B, of the latch j', provided with the stud o, the weighted lever D, attached to the pivot of the valve B and provided with the arm d, the slotted disk I, curved rod d', carried by the arm D and provided with rollers f' f^2, the auxiliary weight J, the catch k', pawl l', lever n', trigger p', catch k^2, pawl l^2, and lever n^2, substantially as specified.

384,397. VALVE MECHANISM FOR SEWERAGE SYSTEMS. CHARLES H. SHEPHERD, New York, N. Y. Filed Oct. 21, 1887. Serial No. 252,977. (No model.)

Claim.—1. In valve mechanism for sewerage systems, the combination of the valve F, hinged to the lower end of the discharge-pipe A, the arm h, connected with the valve F and carrying the spring-actuated ratchet-bar l and the counter-weight i, the latch p, adapted to engage the ratchet-bar l, the spring-actuated trigger u, arranged to engage the latch p, the cam v, the lever b', the lever d', and the float E, substantially as described.

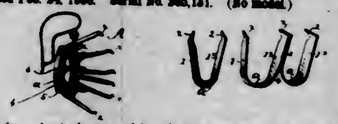


2. The combination, with the lever b', adapted to be operated by the float E, and the latch p, adapted to engage the ratchet l, of the bar c', connected with the end of the lever b', for replacing the latch p after the valve F has been operated, substantially as specified.

3. The combination, with the lever d', float E, lever b', the bar c', and latch p, of the arm k', the shaft c, and the valve F, substantially as specified.

4. The combination, with the valve F and arm h, connected therewith, of the spring f, substantially as specified.

5. The combination, with the valve F, carrying the arm h, of the spring-actuated ratchet-bar l and the spring-actuated latch p, for holding the valve closed or partly open, substantially as specified.

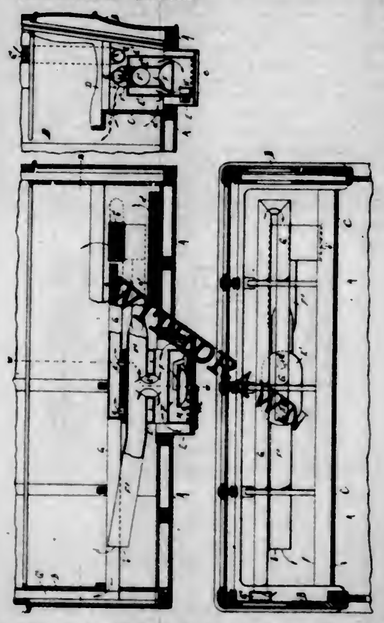


384,398. VEHICLE-WHEEL. HENRY L. SMITH, Jericho Centre, Vt. Filed Nov. 16, 1887. Serial No. 255,282. (No model.)

Claim.—1. The combination, with the spindle F and the stationary thimble G, inclosing the same and having its outer end threaded, and an annular shoulder, G^2, near its inner end, of the hub formed of two sections, C D, the inner adjacent faces of which are recessed to form spoke-sockets, the sleeve E, extending through said hub-sections, provided with external screw-threads, h, at its outer end beyond the section D, and provided with a screw-threaded offset at its rear end, as at k, to receive the shoulder G^2, the inner head-plate, C^2, abutting against the shoulder formed by the offset k, the outer plate, D^2, screwed on the outer end of sleeve E against the outer section, D, the nut G^3, screwed upon the outer end of the stationary thimble G and bearing against the plate D^2, and the offset collar H, screwed upon the offset k, and extending along the inner end of the thimble, substantially as set forth.

2. In a wheel, the combination, with the felly having a convex inner face and a spoke having a concave outer end resting against the convex face of the felly, of the tubular open-ended socket upon the concave end of the spoke and formed with lips p p, to embrace the sides of the felly, and with opposite spurs, q q, on the edge, between the lips, to enter the convex face of the felly, substantially as set forth.

384,399. GEM-SETTING. WARREN G. SMITH, Brooklyn, N. Y. Filed Feb. 24, 1888. Serial No. 265,131. (No model.)



Claim.—1. An improved jewel-setting composed of a series of independent prongs springing from an invertedly-curved base and joined together in couples at their side edges in right lines from a short distance above said base to their terminal points, substantially as described.

2. An improved jewel-setting consisting of a series of independent U-shaped members, adapted and arranged to surround the sides of a gem, the vertical arms 1 1^a of each of the series being alternately joined from their terminal points in alignment down to near their curved base a, in combination with openings 4 at the lower end of each couple of prongs, substantially as described.

3. An improved jewel-setting consisting of a series of independent pairs of prongs extending upwardly from an invertedly-arched base, each uprising prong being connected lengthwise to the next adjoining prong, said bases attached to and in combination with a lower ring, 5, substantially as described.

384,400. APPARATUS FOR HEATING CARS AND SIMILAR STRUCTURES. WILBUR F. STEELE, Steele, Dak. Filed Feb. 23, 1888. Serial No. 265,080. (No model.)

Claim.—1. In a car-heating apparatus, the combination of an outer casing having exit-openings in its upper portion, a smoke and gas pipe connected with said exit-openings, an inner casing provided with laterally-extending cold-air flues which open through the sides of said outer casing, and with laterally-extending hot-air flues which project through the upper portion of said outer casing and communicate at their inner ends with said cold-air flues, and a burner arranged below said inner casing, substantially as described.

2. In a car-heating apparatus, the combination of an outer casing having exit-openings in its upper portion, a smoke and gas pipe connected with said exit-openings, an inner casing provided with laterally-extending cold-air flues which open through the sides of said outer casing, and with laterally-extending hot-air flues which project through the upper portion of said outer casing and communicate at their inner ends with said cold-air flues, and a burner arranged below said inner casing, substantially as described.

3. The combination, in a street-car, with a seat having its front formed with elongated openings near its upper and lower edges, of a jacket, an outer casing arranged within said jacket, with a free air-space between the same and said jacket, and an inner casing provided with laterally-extending hot-air flues, and also with cold-air flues which open through the sides of said outer casing and communicate with said free air-space, whereby the cold air drawn from the interior of the car through the elongated opening near the lower edge of the seat and into said free air-space is heated within said inner casing and discharged back into the interior of the car through the elongated opening near the upper edge of said seat, substantially as described.

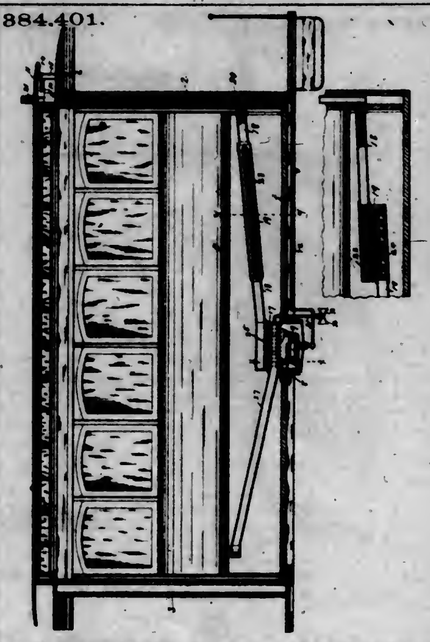
4. In a car-heating apparatus, the combination of an outer casing provided at its upper end with an enlarged box or chamber having exit-openings, a smoke-pipe passing through said enlarged chamber and communicating with said exit-openings, an inner casing provided with laterally-extending cold-air flues which open through the sides of said outer casing, and with laterally-extending hot-air flues having open ends, a car-seat formed with elongated openings near its upper and lower edges, and a burner arranged beneath said inner casing, substantially as described.

5. In a car-heating apparatus, the combination of an outer casing provided at its upper end with an enlarged box or chamber having exit-openings, a smoke-pipe passing through said enlarged chamber and communicating with said exit-openings, an inner casing provided with laterally-extending cold-air flues which open through the sides of said outer casing and with laterally-extending hot-air flues having open ends, a car-seat formed with elongated openings near its upper and lower edges, a flanged and open-top jacket supporting said outer casing, and a burner arranged between the bottoms of said chamber and casing, substantially as described.

6. In a car-heating apparatus, the combination of an inner casing provided with laterally-extending hot and cold air flues, an outer casing formed with an annular series of perforations and provided with a door near its lower end, a flanged and open-top jacket surrounding and supporting said outer casing, and provided with a door arranged in alignment with the door of said casing, and a burner arranged intermediate of the bottoms of said jacket and inner casing and adjacent to said doors, substantially as described.

7. The combination, with a street-car formed with an opening in its floor and provided with a seat having its front formed with elongated openings near its upper and lower edges, of a flanged jacket fitted within said opening, an outer casing supported within said flanged jacket and formed with apertures in its sides and with exit-openings in its upper portion, a smoke-pipe connected with said exit-openings, extended to one end of the car, doubled back to the other end of said car, and carried upward through its top, an inner casing formed with laterally-extending cold-air-inlet flues which connect with the apertures in the sides of said outer casing, and with laterally-extending hot-air flues at its upper end which project through the upper portion of said outer casing and into the space beneath the seat of the car, and a burner arranged below and within the lower end of said outer casing and upon the bottom of said flanged jacket, substantially as described.

384,401. CAR-HEATING APPARATUS. WILBUR F. STEELE, Minneapolis, Minn. Filed May 12, 1888. Serial No. 273,730. (No model.)



Claim.—1. In a car-heating apparatus, the combination of a casing and a laterally-extending smoke-pipe at or near the top of said casing, provided with a drum and an interior core, a flue extending through the sides of said casing and having one end open, and a hot-air flue secured to the other end of said flue and extending toward the end of the car, and a burner arranged in the bottom of said casing.

2. The combination, with a car, of a heater arranged in the space beneath the seat, a smoke-pipe connected with said heater and extending beneath the seat to one end of the car, an open heating-flue extending through the heater, and a hot-air flue connected with said heating-flue and extending in the space beneath the seat to the opposite end of the car, substantially as described

3. The combination, in a car-heating apparatus, with the burner 9, of the casing 17, surrounding said burner, the flue 25, extending through said casing and provided with open ends, the hot-air flue 27, connected with one end of said flue 25 and extending toward the end of the car in the space beneath the seat, and the pipe 31, provided with the open mouths 33, arranged beneath the floor of the car and having its open end extending into the end of the flue 25, substantially as described.

4. The combination, in a car-heating apparatus, with the burner 9, of the casing 17, surrounding said burner, and the heating-flue 25, extending through said casing and provided with open ends, and the

384,401.

pipe 29, projecting both from the exterior and the interior surfaces of said flue, substantially as described.

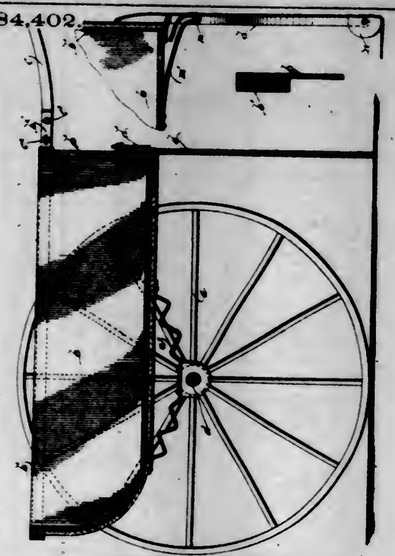
5. The combination, in a car-heating apparatus, with the burner 9, of the reservoir 10, arranged above the roof of the car and connected with said burner, the float 13, arranged within said tank, the pivoted lever 14, connected with said float, and the rod 15, connected with said lever and extending through the roof of the car and provided with the indicating-button 16, substantially as described.

6. In a car-heating apparatus, the combination of a casing, a laterally-extending hot-air pipe, and a smoke-pipe provided with a drum having an interior core, with a flue extending through the sides of said casing and having an open end, a pipe projecting into said open end and provided with funnel-shaped mouths arranged outside of the car, substantially as described.

7. The combination, with a street-car having the front of the seat provided with slots opening near its upper and lower edges, of a heater located in the space beneath said seat and consisting of a suitable casing and a burner arranged within said casing, a smoke-pipe connected with said casing and extending beneath the seat of the car toward one end of the car and connected with a pipe extending to the top of the car, an open heating-flue extending through said casing, and a hot-air flue connected with said heating-flue and extending beneath the seat of the car in opposite direction from the said smoke-pipe toward the end of the car, substantially as described.

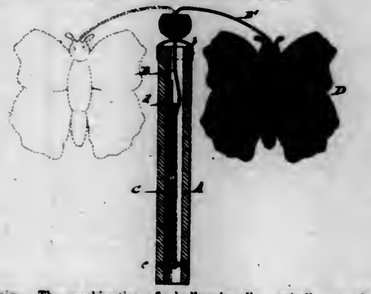
384,402. HAND-CART. DANIEL R. TRAI, Oneida Castle, N. Y. Filed Feb. 17, 1888. Serial No. 264,406. (No model.)

Claim.—1. A body for carts having a metal frame rectangular in cross-section and a sheet-metal body having its edges folded around said frame and the main body of the metal overlapping its folded edge, as shown and described.



2. In a garden-cart, the combination, with the body and the axle, of an interposed sheet-spring formed with transverse corrugations, substantially as shown and described.

3. The combination, with the body b, having its top frame extended rearward to form the arms b^3, of the handles c, secured in these arms by the bolts c' c^2, substantially as and for the purpose set forth.



4. The combination, with the body b, of the hinged standard d, extended beyond its hinge and folding beneath the body, and the button d', for securing the standard in both positions, substantially as shown and described.

5. The combination, with the body and its axle having springs interposed between them, of rigid arms pivoted on the axle for turning up under the body to take the weight off the springs, substantially as and for the purpose set forth.

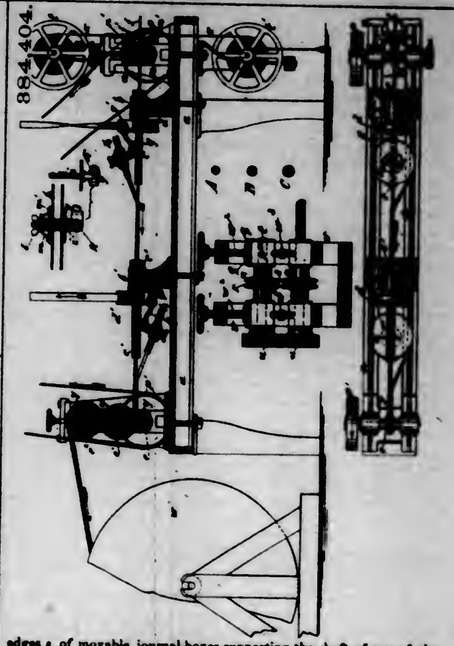
384,402.

384,403. ROTARY TOY. REINARD TEICHMANN, Brooklyn, N. Y. Filed Nov. 22, 1887. Serial No. 255,849. (No model.)

Claim.—The combination of a hollow handle, a spindle extending into said handle, a torsion-spring connecting the inner end of the spindle with the handle, and a figure or figures which are applied to the spindle and weighted at one side of the axis of the same, so as to be adapted to swing by centrifugal action around the handle, set the spring to torsional tension, and return the figure or figures in opposite direction when the handle is held stationary, substantially as set forth.

384,404. MACHINE FOR COVERING OR INSULATING WIRE. JOSEPH D. THOMAS, South Framingham, Mass. Filed Aug. 20, 1887. Serial No. 247,417. (No model.)

Claim.—1. In a wire-covering machine, feeding-rollers having their grasping-surface formed of vulcanized rubber grooved and thus adapted to grasp the covered wire with a firm elastic pressure without injuring the coatings thereof, substantially as set forth.



2. The combination, with the bobbin *h* and its supporting spindle or axis *i*, threaded at the end, of the washer *m'*, rotatively engaging the spindle, but free to slide thereon and abutting against the bobbin, with the nut *l*, screwing on the spindle, and the spring *m*, interposed between nut and washer, substantially as shown and described.

3. In a covering-machine, the combination, with the hollow spindle *c*, designed to receive the wire, pulley *d*, and bobbins *h*, of the bent arm *g*, having the bobbin mounted on one end, with the opposite end secured to the pulley and provided with clamp-nut *g'*, substantially as shown and described.

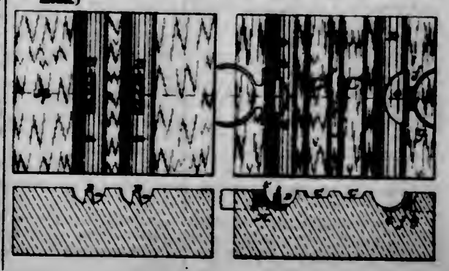
4. The combination, with the narrow rollers *n n*, having cutting-edges *s*, of movable journal-boxes in which the shafts of one or both rollers are supported, and adjustable supports for sustaining the boxes in fixed position, so as to cause the cutting-edges to approach without bearing on each other, substantially as shown and described.

5. The combination, with the narrow rollers *n n*, having cutting-

384,404.

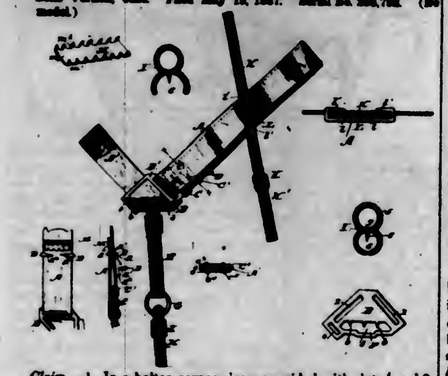
edges *s*, of movable journal-boxes supporting the shaft of one of the rollers, and the adjusting and supporting screws *w'*, engaging and supporting the boxes in both directions, substantially as herein set forth.

6. The combination, with the narrow rollers *n n* and movable journal-boxes in which the shafts of one or both rollers are mounted, of the adjusting-screws w^2, bearing on the outer boxes, and the intermediate adjustable supports, w^3, bearing between the two boxes, substantially as herein shown and described.



384,405. BENCH-STOP. ISAAC H. TERRELL, New York, N. Y. Filed Mar. 3, 1888. Serial No. 266,563. (No model.)

Claim.—1. A portable carpenter's bench-stop consisting of a plate having one end curved downward and provided with a sharp edge and formed with teeth at its other end and sharp-pointed projections adjacent thereto and perpendicular to the plate, substantially as described.



2. A portable carpenter's bench-stop consisting of steel plate 1, formed with the downwardly-curved rear end, 3, with sharp edge 4, and the forward end with teeth 2, and adjacent and perpendicular thereto the tapering sharp-pointed steel projections 6, connected to plate 1 by countersunk ends 9, substantially as described.

384,406. ATTACHING TERRETS TO HAMES. WILLIAM H. WALKER, Milford, Conn. Filed Mar. 30, 1888. Serial No. 268,944. (No model.)

Claim.—The process of securing draft-eyes, terrets, or loops to hame-bodies, herein described, which consists, first, in punching, by means of dies, holes or apertures in the hame-bodies when heated; second, inserting the tenon of a draft-eye, terret, or loop into said aperture while the hame-body is hot, and, third, securing the said draft-eye, terret, or loop to the hame-body by means of shaping-dies under pressure, as set forth, thus unifying and at the same operation shaping them when united, all substantially as herein described.

384,407. COMBINED BRIDLE AND HALTER. JOHN O. WALTON, Bells Verson, Ohio. Filed May 19, 1887. Serial No. 238,792. (No model.)

Claim.—1. In a halter, corner-pieces provided with slots 1 and 2, arranged at right angles with each other, and a diagonally-arranged slot, 3, having a bulged position, 3^x, to receive the jaw-strap, substantially as described.

2. In a halter, corner-pieces provided with slots 1 and 2, arranged at right angles with each other, a diagonal slot, 3, a bulged portion, 3^x, to receive the jaw-strap, and a slot, 4, beneath the vertical slot 2 to receive the bit, substantially as described.

3. In a halter, corner-pieces provided with slots 1 and 2, arranged at right angles with each other, and a diagonally-arranged slot, 3, having spurs *b* projecting from its inner side, substantially as described.

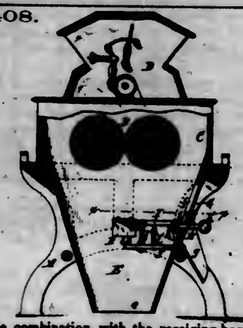
4. In a halter, the combination, with the hitching-rope, of a metal running loop, I, having a solid cylindrical portion, 5, a divided cylindrical portion, 6, a connecting-web, 7, and a spur, 8, substantially as and for the purpose described.

5. In a halter, the combination, with the strap encircling the head and nose, of the malleable-metal U-shaped fastening C, having spurs *c'* projecting inwardly from its sides, substantially as described.

6. In a halter, the combination, with the strap encircling the head and nose, made of fabric, of the leather brow and throat strap formed in a single piece and united to the head and nose strap by a metal fastening, L, having spurs *l* and folding ends *l'*, which respectively pass the one through the fabric portion and the other through the leather portion, substantially as described.

7. The combination of the plates C^3 C^3 and rivets C^4 C^5 with the folded strap A, and the corner-piece through which the said strap passes, as shown and described.

8. The combination, in a halter, with the corner-piece B, having slot 1, of the strap A, passed through the said slot and folded upon itself, the U-shaped fastenings C, embracing the sides of the strap close to the corner-piece, and the end fastening, C', substantially as described.



9. The combination, with the fabric strap A of a halter, of the fastening M, having a plate, *m*, placed upon one side of said strap, and spurs m' m^2, passing through the strap and clinched upon the opposite side of said strap, substantially as described.

10. In a halter, the combination, with the strap A, of the corner-piece B, through which the strap is passed, the fastening D, having bar *d*, spurs *d'*, and ends d^2, embracing the free end of said strap, and the metal end fastening M upon the strap to prevent the withdrawal of the same from the fastening D, substantially as described.

384,408. ROLLER-MILL. WALTER W. WHITNEY and GEORGE T. LAMPAFF, Lockport, N. Y. Filed July 12, 1887. Serial No. 244,033. (No model.)

Claim.—1. The combination, with the rollers and the receiving-hopper arranged below the same and provided with a relief-opening in its side above its discharge-opening, of a valve applied to said opening, a locking-lever arranged in the hopper, whereby the valve is held normally closed, and a releasing-plate arranged below the rollers, whereby the lever is automatically unlocked when the material accumulates in the hopper, substantially as set forth.

384,408.

2. The combination, with the receiving-hopper provided at its lower end with a discharge-opening, *e*, and at its side with an opening, *f*, of a valve, G, applied to said opening and provided with a pivoted catch, H, and a locking-lever, I, arranged within the receiving-hopper, and provided at one end with a hook adapted to engage with said catch and at its opposite end with a plate, *k*, substantially as set forth.

3. The combination, with the receiving-hopper provided at its lower end with a discharge-opening, *e*, and at its side with an opening, *f*, of a valve, G, applied to said opening and provided with a pivoted catch, H, and a locking-lever, I, arranged within the receiving-hopper and provided at one end with a hook adapted to engage with said catch and at its opposite end with a plate, *k*, and adjustable stops *l l*, whereby the movement of the locking-lever is limited, substantially as set forth.

384,409. GRATE. LEONARD M. WOODCOCK, Auburn, N. Y. Filed June 14, 1887. Serial No. 241,266. (No model.)

Claim.—1. The combination, with a supporting-frame and oscillating grate-bars connected for joint movement, of a lock for a movable part connected with said bars, the said lock being provided with stops located in the path of said movable part when unlocked, whereby the movement of said bars when unlocked is limited, substantially as described.

2. The combination, with a supporting-frame and oscillating grate-bars connected for joint movement, of a lock for a movable part connected with said bars, the said lock being provided with stops located in the path of the movable part when unlocked, said movable part and said stops being the one movable in relation to the other, whereby the movement of the bars for raking the fire when unlocked is limited and the limitation removed for dumping the grate, substantially as described.

3. The combination, with a supporting-frame and oscillating grate-bars connected for joint movement, and a lever connected with said grate-bars and moving with them, of a hinged plate provided with stops normally in the path of said lever, the pivots of said lever and plate being at right angles to each other, whereby the movement of the said lever and grate-bars is limited in the operation of raking the fire, and the stops made removable by swinging the plate outward to effect the dumping of the grate, substantially as described.

4. The combination, with a supporting-frame and oscillating grate-bars having opposing narrow lateral projections provided with curved ends, securing a uniform space between the ends of said projections, the said bars being connected for joint movement, of stops located in the path of a movable part connected with said bars and holding said bars from entirely passing each other, whereby the movement of the grate-bars for raking the fire is limited to such a movement as will preserve the uniform distance between the grate-bars, substantially as described.

5. The combination, with a supporting-frame and oscillating grate-bars having opposing lateral projections provided with curved ends, securing a uniform space between the ends of said projections, said bars being connected for joint movement, of a lever connected with said bars and moving with them, a hinged locking-plate provided with stops normally in the path of the said lever, but at a short distance from each side of the same, whereby the grate-bars are locked, when desired, and the movement of the same for raking the fire is limited

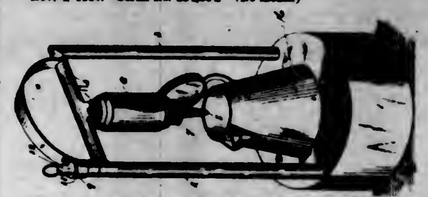
to preserve the uniform distance between the grate-bars, and the removal of the stops will permit the projections of the bars to be turned to such a position as to increase the space between the bars, substantially as described.

6. The combination, with a supporting-frame and oscillating grate-bars connected for joint movement, of a lever connected with said grate-bars and moving with them, a hinged plate provided with locking projections and stops, and an actuating bar or key with projections for engaging the lever and locking projections of the plate, whereby the movement of the lever and grate-bars is limited in raking the fire and locked when the actuating-bar is removed, substantially as described.

384,410. FURNACE-GRATE. EBENARD H. WOODCOCK, Auburn, N. Y. Filed Feb. 4, 1888. Serial No. 263,026. (No model.)

Claim.—1. The combination, with a supporting-frame and an oscillating grate-bar, of a shaft connected with said grate-bar, journaled in the supporting-frame, and extending outwardly therefrom, and a sleeve movable longitudinally on the shaft and adjacent to a stationary portion of the construction, the said stationary portion and the said sleeve being provided, the one with a lug and the other with stops, adapted to engage when the sleeve is moved toward the stationary part and rocked, substantially as described.

2. The combination, with a supporting-frame and an oscillating grate-bar, of a shaft connected with said grate-bar, mounted in suitable bearings, and extending beyond the face of the frame at one end, and a sleeve movable longitudinally on the shaft, the frame and the sleeve being provided, the one with a lug and the other with stops, adapted to engage when the sleeve is moved toward the frame and rocked, substantially as described.

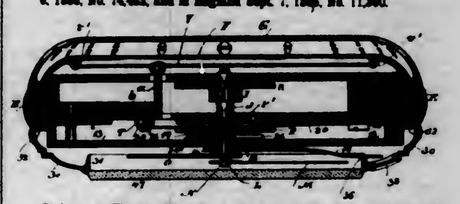


3. The combination, with a supporting-frame and an oscillating grate-bar supported in suitable bearings, of a shaft connected to said grate-bar, extending beyond the face of the frame at one end, and a sleeve movable longitudinally on the shaft, the said frame and the said sleeve being provided, the one with a lug and the other with stops, adapted to engage when the sleeve is moved inward toward the grate, the said lug having a reduced portion adjacent to the stops, whereby the sleeve and shaft are locked when the sleeve is in its inmost position, and are permitted a certain limited movement when the said sleeve is moved outward and the reduced portion only of the lug brought into position to engage the stops, substantially as described.

4. The combination, with a supporting-frame and an oscillating grate-bar supported on suitable bearings, of a shaft connected to said grate-bar, extending beyond the face of the frame at one end, a sleeve movable longitudinally on the shaft, the said frame and the said sleeve being provided, the one with lugs and the other with stops, and the said shaft having a recess the outer side of which inclines outwardly, and the sleeve being provided with a registering opening of less diameter than the outer diameter of the recess lengthwise of the shaft, and an arm for loosely engaging the opening in the sleeve and extending into the recess, whereby the sleeve may be moved longitudinally on the shaft to bring the reduced portion of the lug in line with the stops, and the shaft rocked when the parts are in position, substantially as described.

5. The combination, with a supporting-frame and oscillating grate-bars connected for joint movement, of a shaft of unequal diameters connected with said grate-bars and journaled in the supporting-frame, a sleeve fitting said shaft and capable of longitudinal movement thereon, having a projection or projections extending laterally therefrom, a portion of the inner face of said projection or projections being cut away or reduced, as shown and described, a stop located in the path of the projection or projections, and an arm for rotating said shaft and sleeve, whereby the sleeve can be moved outward to bring the reduced portion of the projection or projections against the stop to permit a lateral oscillation of said shaft, and moved inward for the projection or projections to engage said stop or lock or further limit the movement of the shaft, substantially as described.

6. The combination, with a supporting-frame and oscillating grate-bars connected for joint movement, of a shaft rigidly secured to one of the grate-bars, journaled in the frame, and having one extremity passing through and extending outwardly therefrom, the outwardly-extending portion having unequal diameters, a sleeve fitting said outwardly-extending portion, movable longitudinally therefrom, and provided with a projection or projections having a reduced portion, an arm for rotating said sleeve and shaft and moving the former longitudinally of the shaft, and a stop or stops located in the path of the projection or projections, limiting the movement of said shaft according to the position of the sleeve in respect to said stops, substantially as described.



384,411. COFFEE STRAINER OR FILTER. THEOPHILE HAMEL, Houma, La., assignor of one-half to Alexis Pisse, same place. Filed Nov. 4, 1887. Serial No. 254,304. (No model.)

Claim.—1. In a strainer or filter for coffee, the combination of the steam-escape pipe having an interiorly-threaded upper end, the removable screw-threaded cap having a central aperture and provided with an annular flange or collar, and the valve or plug suitably secured to the steam-escape pipe and adapted to be inserted in the central aperture of said removable cap.

2. The combination of the water reservoir or boiler, the steam-escape pipe having interiorly-threaded upper end, the removable screw-threaded cap having central aperture and provided with an annular flange or collar, the valve or plug suitably secured to the steam-escape pipe and adapted to be inserted in the central aperture of said removable cap, the water-pipe, the transverse connecting-pipe, the downwardly-extending discharge-chamber having the lower screw-threaded end, the funnel-shaped interiorly-threaded dripper-chamber, and the cone-shaped perforated dripper-tube.

384,412. TIME-ALARM. GERMAIN BAPST and LOUIS FALIER, Fils, Paris, France. Filed Sept. 27, 1886. Serial No. 214,080. (No model.) Patented in France Dec. 5, 1885, No. 172,730; in Belgium Sept. 6, 1886, No. 74,462, and in England Sept. 7, 1886, No. 11,360.

Claim.—1. The combination, with the watch or clock movement and case, of a sonorous metal plate held securely at its edges within the case, a finger or pin secured to and projecting from said plate, a toothed wheel contiguous to the free end of said finger, and a spring-barrel and train of gearing for rotating the toothed wheel and moving the finger to vibrate the plate, and a movable stop brought into action by the time mechanism for allowing the alarm mechanism to operate, substantially as specified.

2. The combination, with the spring-barrel S, pinion *b*, fly T, and gearing for rotating said fly, of the sonorous plate *c*, finger *a* upon said plate, the wheel P, pin 19, and tubular arbor N, the grooved disk 24, its tubular arbor 12 and hand 18, the spring 20, for pressing the wheel P toward the disk 24, a stop, 21, at the outer end of the spring 20, the wheel P' of the time-movement, and the gearing between the wheels P' and P, for rotating the latter once in every twelve hours, substantially as specified.

3. In an alarm for time-pieces, the combination, with the spring-barrel S, its train of gearing, and a fly rotated by said gearing, of the wheel P and its tubular arbor fitted to slide upon the minute-arbor L, a pin upon the face of said wheel P, the tubular arbor 12, and grooved disk 24, the hand 18, secured to said arbor 12, the spring 20, bearing upon the wheel P, and a stop, 21, at the moving end of said spring, substantially as and for the purposes specified.

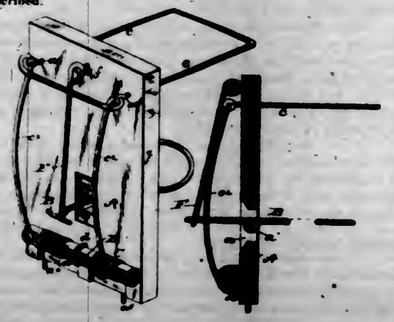
4. The combination, with the tubular arbor 12 and its hand 18 of the ring E and its circular rib 32, the bezel 30, fitted to turn upon said rib, and the flange 31 upon said bezel, having a notch to receive the outer end of said hand 18, substantially as and for the purposes specified.

384,413. DOUBLE GAGE. LOREN O. BARRETT, Brattleborough, Vt. Filed Mar. 19, 1888. Serial No. 267,788. (No model.)

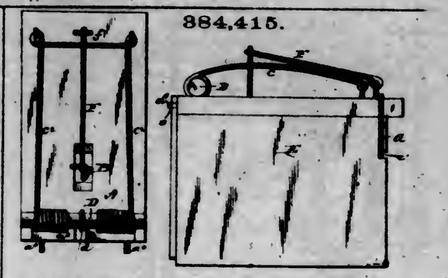
Claim.—The gage-stock having within it two holes, one of which has a countersink, and each hole having its set-screw, in combination with the gage-rods B and C, having on their ends the scribing rotary disks *b* and *c*, secured by independent screws *b'* and *c'*, substantially as and for the purpose described.

384,414. MACHINE FOR CUTTING COCOANUT-MEAT. JOEL O. BARTHOLOMEW, New Haven, Conn., assignor of one-half to Benajah H. Douglass, Jr., same place. Filed Mar. 6, 1888. Serial No. 266,562. (No model.)

Claim.—1. In a machine for cutting cocoanut-meat, the combination of a revolving cylinder constructed with one or more longitudinal grooves in its periphery, a longitudinal bar arranged in each of said grooves, with its edge projecting from the periphery of the cylinder, the said projecting edge notched to form a series of cutters, and the said bar made adjustable with relation to the periphery of the cylinder, with a hopper opening against said cylinder, the edge of the hopper around the opening conforming to the shape of the cylinder and adapted to receive the cocoanut-meat and support the meat in contact with the face of the said cylinder, substantially as described.



2. The combination of the revolving cylinder B, constructed with one or more longitudinal grooves in its periphery, the said grooves of L shape in transverse section, with longitudinal bars arranged in said grooves of corresponding L shape, the edge of said bars projecting from the periphery and notched to form a series of cutters, adjusting-screws for said bars, and a hopper of concave shape opening to said cylinder, with a follower in said hopper and corresponding to its interior shape, but of less diameter, so as to leave a space between the follower and the hopper, substantially as described.

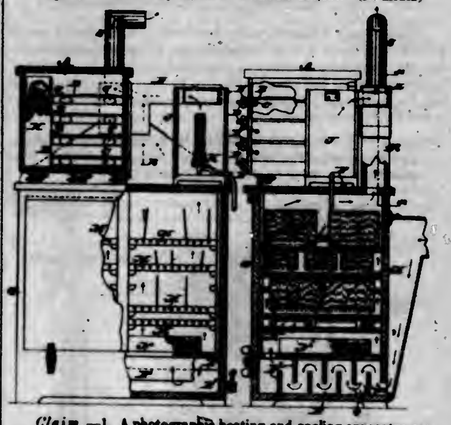


3. The combination of the revolving cylinder B, constructed with one or more longitudinal grooves in its periphery, a bar arranged in each of said grooves, the projecting edge of said bar notched to form a series of cutters on the periphery of the cylinder, and the said bars made radially adjustable, with a hopper, M, of concave shape upon its inside, opening to the periphery of said cylinder, and an adjustable follower, N, within said cylinder, its surface convex corresponding to the inner surface of the hopper, but of less diameter, the said follower provided with springs whereby it is yieldingly adjustable with relation to the inner surface of said hopper, substantially as described.

4. The combination of the cylinder B, constructed with one or more longitudinal grooves in its periphery, longitudinal bars G in said grooves made radially adjustable, the projecting edge of said bars notched to form a series of cutters, and a hopper, M, its inner surface of concave shape, opening toward the cylinder, a spring-follower, N, in said hopper and of corresponding shape, with a feed-roll in an opening through the hopper below the follower, substantially as described.

384,415. ANIMAL-TRAP. PHILEMON T. BEARD, Luling, Tex. Filed Apr. 2, 1888. Serial No. 269,612. (No model.)

Claim.—1. In a trap for gophers and the like, a platform having a rod or bar secured upon its upper face, and around which are coiled the ends of the choke-spring for increasing the tension of the same, in combination with the trigger, choker, and bait-hook, substantially as described.



384,415.

2. In an animal-trap, a platform having a rod or bar secured to its upper face, and having the ends of the choke-spring coiled thereon, pins or prongs extending from one edge of the platform for engagement with a side of a box, a box having one of its sides elevated above the others, against which the pronged end of the platform abuts for engagement therewith, and having recesses in its opposite ends for the reception of a loop, which passes thence over the free end of the platform for binding the same to the box, substantially as described.

384,416. APPARATUS FOR HEATING, COOLING, VENTILATING, AND DRYING PHOTOGRAPHIC PLATES. WILLIAM BELL, Philadelphia, Pa. Filed May 10, 1887. Serial No. 237,667. (No model.)

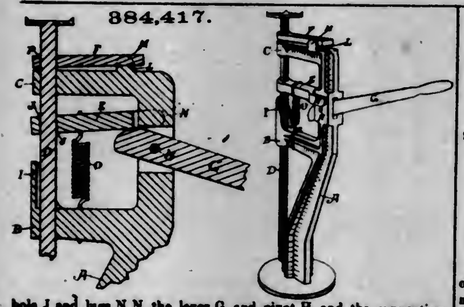
Claim.—1. A photographic heating and cooling apparatus consisting of a chest with shelves for drying the coated plates, in combination with a refrigerating-chamber, substantially as and for the purpose set forth.

2. A photographic heating and cooling apparatus consisting of an adjustable chest with shelves for drying the coated plates, in combination with a refrigerating-chamber at one side and a heating device on another side thereof, substantially as and for the purpose set forth.

3. A chest containing shelves and screws having adjusting-heads C, on which said shelves are rested, substantially as described.

4. A chest provided with leveling-screws and containing plate-supporting shelves with adjusting-screws, substantially as described.

5. A chest with plate-supporting shelves, a storage-chest, with a heating device and exit-flue connected with the storage-chest, combined and operating substantially as described.



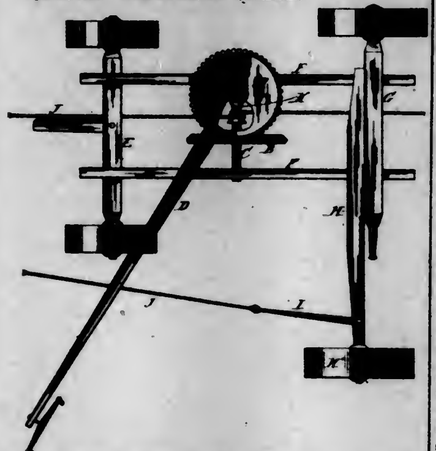
6. A photographic heating and cooling apparatus consisting of the chest G, in combination with the chest A thereon and provided with shelves, the heating-chest J, and the flue R, that portion of the top of said chest G not occupied by the said chests A and J and flue R being flat, substantially as and for the purpose set forth.

7. A photographic heating and cooling apparatus having a plate-receiving chamber with a heating-chamber having zigzag passages, and a flue with horizontal projections alternately secured to the inner wall thereof, substantially as described.

384,417. LIFTING-JACK. WILLIAM H. BIRD, Los Angeles, Cal. Filed Nov. 26, 1887. Serial No. 256,456. (No model.)

Claim.—The lifting-jack comprising the combination of the standard A, having the top arm, C, provided with the bolster L and lugs M M, the lower arm, B, provided with the projection I, the upper clutch-bar, F, provided with the hole P, the lower clutch-bar, E, having the

884,417.

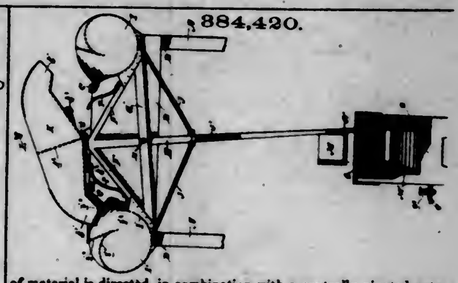


hole J and lugs N N, the lever G, and pivot H, and the supporting-rod D.

884,418. HAIR-CRIMPER. CHARLES H. RUSSELL, Chicago, Ill. Filed Dec. 3, 1886. Serial No. 184,627. (No model.)

Claim.—In a hair-crimper, the combination of the jaws *a* and *a'*, pivoted together, as at *b*, and having handles *b' b'*, provided with shoulders c^2 c^2, containing sockets *c* on their opposing faces away from and behind the pivot, and a spiral spring, *d'*, inserted at its opposite ends into the sockets *c*, and thereby removed from the pivot *b*, substantially as and for the purposes set forth.

884,419. DITCHING-MACHINE. ULRIC BLANCHENAYER, Chicago, Ill., assignor to the Blanchenayer Machine Company, same place. Filed Sept. 21, 1887. Serial No. 250,302. (No model.)



Claim.—1. The combination, with a long or extension axle of a ditching-machine, of a draw-bar, I, for overcoming the side turning or twisting of the machine in use, substantially as specified.

2. The combination, with the long or extension axle of an excavating-wheel ditching-machine, of the draw-bar I and tow-line J, for preventing side turning or swinging of the rear end of the wheel in use, substantially as set forth.

884,420. AUTOMATIC SAMPLING APPARATUS. ALLEN BRADFORD, Wardner, Idaho, assignor of one-half to Victor M. Clement, same place. Filed Feb. 23, 1888. Serial No. 265,095. (No model.)

Claim.—1. In a sampling apparatus, a centrally-pivoted swinging frame having a curved open-ended sampling-cup secured to its lower end and arranged to pass through the stream of material, whereby it receives a sample in one end and delivers it backwardly from the other end, substantially as herein described.

2. In a sampling apparatus, a sluice through which the stream of material passes and a trough in a lower plane and into which the stream

of material is directed, in combination with a centrally pivoted automatically-vibrating frame having a curved open-ended cup arranged to traverse the stream, whereby it receives a sample of the material in one end as it passes through and directs said sample backwardly from its other end, and a settling-tank into which the sample is deposited, substantially as herein described.

3. In a sampling apparatus, a sluice through which the stream of material passes and a trough into which the stream is directed, in combination with an automatically-vibrating frame having a ⊃-shaped open-ended cup passing through the stream of material, whereby it receives a sample of the material in one end and delivers it from the other, and a settling-tank provided with a slot in which the delivery end of the cup moves, substantially as herein described.

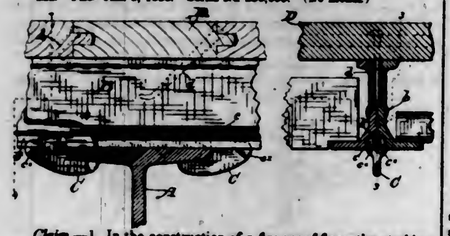
4. In a sampling apparatus, a pivoted swinging frame carrying a sample-cup arranged to traverse the stream of material whereby it is charged in passing through it, in combination with the means for automatically vibrating the swinging frame, consisting of self-discharging water-vessels upon each side of the frame and a tilting tank above receiving water and alternately discharging it into the water-vessels on each side, substantially as herein described.

5. In a sampling apparatus, a pivoted swinging frame having a cross-head and carrying on its lower end a sampling-cup arranged to traverse the stream of material, as described, in combination with the self-discharging water-vessels on each end of the cross-head of the frame, the pivoted tilting tank above having its ends arranged to discharge water into the vessels of the swinging frame, and a partition in its middle and a stationary water-supply above the central plane of the tilting tank, whereby the water is delivered to it alternately on each side of its partition, substantially as herein described.

6. In a sampling apparatus, a pivoted swinging frame having a sample-cup arranged to traverse the stream of material, as described, and a cross-head with self-discharging water-vessels on each end, in combination with the compartment tilting tank above arranged to discharge water alternately into the vessel at each end, and the stop-bars of the main frame, by which the vibration of the swinging frame is limited and defined, substantially as herein described.

7. In a sampling apparatus, a pivoted swinging frame carrying a sample-cup arranged to traverse the stream of material, as described, said frame having a cross-head with a self-discharging water-vessel at each end, in combination with the tilting compartment tank above, arranged to discharge its water alternately into the vessels of the swinging frame, the stop-bars by which the tilting of the tank is limited and defined, and the stop-bars by which the swinging of the tank is limited and defined, substantially as herein described.

8. In a sampling apparatus having a swinging frame carrying a sampling-cup traversing the stream of material, as described, the water-vessels I, through which the vibration of the frame takes place, said vessels having their rim-pieces eccentric inwardly at their tops, whereby an opening is formed to receive the water delivered to the vessels, substantially as herein described.



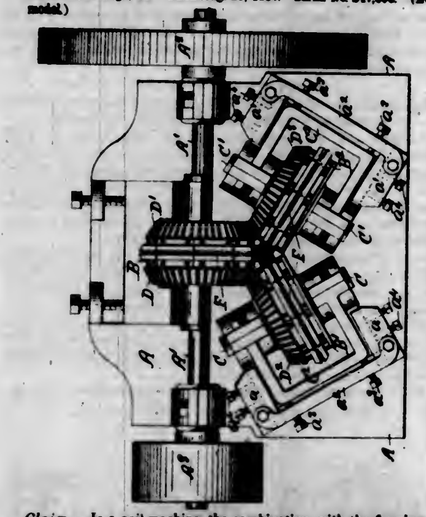
9. In a sampling-apparatus having a swinging frame carrying a sampling-cup arranged to traverse the stream of material, as described, the water-vessels I on the swinging frame, whereby it is overbalanced and its vibration effected, said vessels having their rim-pieces eccentric at their tops, their side pieces flaring, and extensions i^2, whereby a hopper-shaped opening is provided for receiving the charge of water, substantially as herein described.

10. In a sampling apparatus, a pivoted swinging frame having the curved sampling-cup, as described, in combination with the sluice through which the material passes and arranged to direct its stream across the path of the cup, the trough into which the stream is discharged, the settling-tank O, into which the charge from the sample-cup is delivered, and the overflow filter-chamber *q* in said tank, substantially as herein described.

11. In a sampling apparatus, the sluice through which the material passes and the trough into which it is discharged, in combination with the swinging frame and the sampling-cup secured to said frame and arranged to traverse the stream, said cup having an inclined collar on its lower portion, and the settling-tank into which the cup delivers its sample, substantially as herein described.

12. In a sampling apparatus, a sluice through which the material is directed and the trough for receiving it, in combination with the swinging frame, a curved sampling-cup carried by said frame and adapted to traverse the stream, whereby it receives a charge and directs it backward, said cup having a re-enforcing shoe on its back, and the settling-tank into which the cup delivers its sample, substantially as herein described.

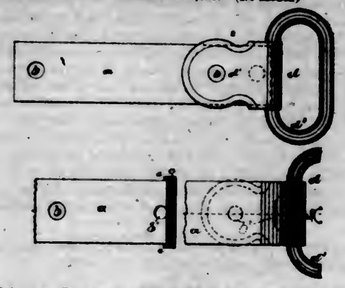
884,421. FIRE-PROOF FLOOR. WILLIAM H. BROWN, Indianapolis, Ind. Filed Jan. 3, 1888. Serial No. 259,668. (No model.)



Claim.—1. In the construction of a fire-proof floor, the combination, with the floor-beam A, of the sleeper provided with a longitudinal recess, *b'*, the device C, formed with a head, *c*, adapted to fit into said recess, the ears *c'*, arranged to bear against the under side of said sleeper, and a hooked forwardly-extended portion arranged to engage with the flange of the floor-beam, substantially as set forth.

2. The combination, with the floor-beam, of the sleeper B, formed in two parts, with a longitudinal groove at its bottom and a longitudinal recess in its top, a device engaging with said longitudinal groove in its bottom, and the flange of the floor-beam for securing them together, the flooring arranged on said sleepers and secured thereto by nails driven into the longitudinal recess in the top of said sleepers and clamped between the sides thereof, substantially as set forth.

3. In a fire-proof floor, the combination of the sleeper formed with a recess in its top extending longitudinally thereof, and formed with substantially straight sides arranged to clamp the floor-nail when driven into said recess, and the flooring laid upon said sleeper and secured thereto by nails driven through said flooring and into said recess in its top, between the sides of which they are clamped, substantially as set forth.

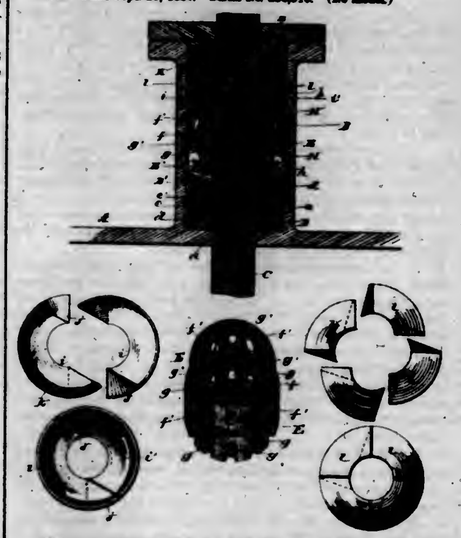


884,422. NAIL-MACHINE. GUSTAVUS H. BERDRICK and FRITZ RAUTERT, Chicago, Ill. Filed Aug. 23, 1887. Serial No. 247,606. (No model.)

Claim.—In a nail-machine, the combination, with the forming-roller B, mounted upon the main shaft, of the companion roller-dies B' B^2, set at an oblique angle relative to the roller B, and mounted upon independent shafts, said dies having a rolling contact and being provided on their peripheries with a depression equal to that of one-third the diameter of a nail, the shank whereof is triangular in cross-section,

the gear-wheels D D' D^2 D^3, the journal-blocks *a a'*, the bridge a^3, the yoke or yokes C^2, and the adjusting-screws a^4 a^5, all combined and arranged to operate substantially as and for the purposes set forth.

884,423. BACK-BAND LOOP. BROWN R. GARDNER, Howard, N. J. Filed Mar. 20, 1888. Serial No. 268,253. (No model.)



Claim.—1. The improved back-band loop for harness herein described, combining a strap, *a*, and a loop, *d*, cast around the end thereof, said parts being arranged and combined substantially as and for the purposes set forth.

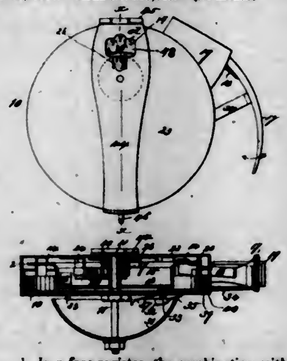
2. The improved back-band loop for harness, combining therein a strap, *a*, perforation *b'*, and a cast loop, the metal of which surrounds the end of strap and passes through the perforation thereof, substantially as and for the purposes set forth.

3. The improved back-band loop for harness herein described, combining a strap bent or turned or provided with a stop at its extremity and a loop cast on and around said bent or turned extremity, as and for the purposes set forth.

4. The improved back-band loop for harness, combining therein a strap, a loop having a flange, *d'*, and downwardly-projecting bearing d^3, formed integral with said loop, the said flange or plate being formed above said plate and away from the same, and said projecting bearing lying below said plate, substantially as and for the purposes set forth.

884,424. STUFFING-BOX. ALEXANDER H. CLARK, Fond du Lac, Wis. Filed Sept. 23, 1887. Serial No. 250,510. (No model.)

Claim.—1. The combination, with the stuffing-box and a piston-rod extending centrally through the same, of a hollow packing-cylinder located within the stuffing-box and having perforations and connecting-ducts therein and elastic packing inside and outside, and automatically-adjustable packing-rings adjacent to the opposite ends of the packing-cylinder, substantially as set forth.



2. The combination, with a stuffing-box and a piston-rod extending centrally through the same, of a hollow packing-cylinder located within the stuffing-box and provided with perforations and connect-

ing-ducts therein and flexible packing inside and outside, and automatically-adjustable packing-rings at the opposite ends of the cylinder, one set of these rings being formed in sections of lead or Babbitt metal, and a flexible ring on the outside of said metallic sectional rings, substantially as set forth.

3. The combination, with the stuffing-box and piston-rod extending centrally therein, of a removable hollow packing-cylinder constructed in a single shell with a recessed portion, and having perforations through the main and recessed portions, and ducts or chambers connecting these perforations in the interior of the cylinder, and also chambers or ducts extending around one end of the cylinder and connecting the perforations in the main portion with the opening through the middle of the cylinder, substantially as set forth.

4. A hollow recessed packing-cylinder beveled at one end, and having perforations through its main portion, and also through the recessed portion, and ducts in the interior connecting the perforations, and also ducts on the exterior connecting the perforations in the main portion of the cylinder with the piston-rod opening, substantially as set forth.

384,425. **FARE-REGISTER.** HENRY R. COFFEY, Stockton, Cal. Filed Oct. 28, 1887. Serial No. 253,613. (No model.)

Claim.—1. In a fare-register, the combination, with the casing 10, the clasp 44, hinged to one side of the casing and provided with a glazed opening, *d*, and the staple 46 at the opposite side of the casing engaged by the free end of the clasp, of the cover 23 on the casing under the clasp, and having an opening, *c*, registering with the glazed opening thereof, and the rotary registering-disks within the casing having their graduations successively brought past said openings, substantially as set forth.

2. The combination, with the case, the disk 13, journaled therein and provided with a rim, 15, and a toothed graduated flange, 14, the projection 28 on the inner face of the rim and the disk 26 in the space inclosed by the said rim, but independent thereof, and having its axis parallel with that of the disk 13, a ratchet-wheel in the path of the projection 28, and the operating-lever having a pawl engaging the teeth of the flange 14, substantially as set forth.

3. The combination, with the case, the rotary disk journaled therein and provided with a rim having a toothed graduated flange and a projection on its inner face, a cover having an opening, *c*, and provided with a bracket, 24, a registering-disk, 26, provided with an operating-ratchet and journaled on said bracket, the ratchet being in the path of the said projection when the cover is in place, and the flange and disk 26 being visible through said opening, the hood 19 on the periphery of the casing, the lever 17, pivoted therein at its inner end, and the pawl 16 on the under side of the lever and projecting through the casing into engagement with the toothed flange, substantially as set forth.

4. The combination, with the casing having a bell, a registering mechanism, hammer-arm 33, and a fixed inclined projection, 37, adjacent to the inner side of said arm, of the lever 17, operating said registering mechanism, and having an arm, 34, provided with a projection, 35, adjacent to the outer side of the said arm, whereby when the arm 34 is moved inward the hammer-arm will be moved up the fixed inclined projection until it is free to pass the engaging edge of the projection 35, substantially as set forth.

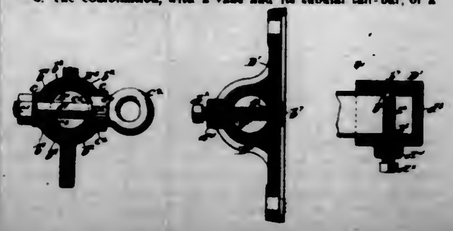
5. The combination, with the casing 10, the post 11, secured within the casing, projecting through the rear face thereof, and having a gong, 31, on said outer end, the disk 13, journaled on the inner end of the post and provided with the rim 15, having toothed flange 14 and a projection on the inner side, and the cover 23, having a bracket and the disk 26, journaled thereon, and having ratchet 27 in the path of the said projection, of the lever 17, pivoted at its inner end to the casing and having a pawl, 16, projecting through the rim of the casing into engagement with the toothed flange, and an arm, 34, also projecting into the casing, and having a projection, 35, on its inner end extending through the casing under the gong, and a second projection, 40, the spring 39 acting on said projection, the spring hammer-arm 33, secured at *c* and extending into the path of the projection 35, and the inclined releasing projection 37 in the inward path of the spring-arm 33, substantially as set forth.

6. The combination, with the casing 10, the post 11, the register-ing-disk 13, having a hub notched at 4 and mounted on the post, the disk 26, rotated from the disk 13, and the operating mechanism, of the cover 23, having a central aperture to register with the outer notched end of the hub, and the hinged clasp 44, holding the cover in place on the casing and closing the said central aperture, substantially as set forth.

384,426. **LOCKET.** JOSEPH COHN, New York, N. Y. Filed Dec. 17, 1887. Serial No. 258,181. (No model.)

Claim.—1. In a locket, the combination, with an exterior casing provided with a front and a rear plate, of a picture-casing pivoted between the said plates, a spring-catch for locking the said picture-casing in place in the exterior casing, and a spring acting on the said picture-casing for swinging it open when released by the said spring-catch, substantially as shown and described.

2. In a locket, an exterior casing consisting of front and rear plates held apart at the bottom by a circular projection and at the top by a projection with a slot and a post held between the two plates at their lower ends, in combination with a picture-casing provided with a circular offset fitting on the said circular projection, a spring secured by one end to the said post and by its other end to the said picture-casing, a wedge-shaped lug formed on the said picture-casing, and a spring-catch adapted to engage the said lug and projecting through the said slot in the top projection of the casing, substantially as shown and described.



3. In a locket, an exterior casing provided with a front and a rear plate held apart by projections at the top and bottom, a picture-casing fulcrumed between the said two plates and provided with a wedge-shaped lug, a catch fulcrumed on one of the said plates and adapted to engage the said lug on the picture-casing, a spring for pressing the said catch in contact with the said wedge-shaped lug, and a handle formed on the said spring-catch and projecting through a slot in the casing, substantially as shown and described.

384,427. **WINDMILL-VANE.** ANDREW J. CORCORAN, Jersey City, N. J. Filed Mar. 19, 1888. Serial No. 267,600. (No model.)

Claim.—1. The combination, with the tubular tail-bar on which the vane is secured, of the tail-piece having a socket, B^3, receiving the end of the tail-bar, and a bolt, as C, inserted transversely through the socket and tail-bar and having a head or shoulder entering the socket and bearing against one side of the tail-bar, and a nut applied to the bolt and bearing against the exterior of the socket at the other side of the tail-bar, substantially as herein described.

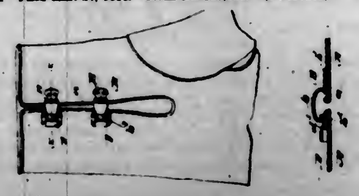
2. The combination, with the tubular tail-bar B', and a tail-piece, B^3, having a socket, B^3, receiving the tail-bar, of the bolt C, having an eye, c^3, at the head and a shoulder, c^3, bearing directly against one side of the tail-bar, and a nut, *c'*, bearing against the exterior of the socket at the other side of the tail-bar, that portion of the bore of the socket on the side of said nut being of slightly smaller curvature than the exterior of the tail-bar, so as to cramp said bar thereinto, substantially as herein described.

3. The combination, with a vane and its tubular tail-bar, of a

384,427.

clip secured to the vane and having a socket receiving the bar, and a set-screw tapped into the outer side of the socket and passing transversely through one side of the bar and impinging against the inner surface of the bar at the opposite side, substantially as herein described.

384,428. **GLOVE-FASTENER.** GEORGE H. CORNELL, Baltimore, Md. Filed Mar. 27, 1888. Serial No. 268,687. (No model.)

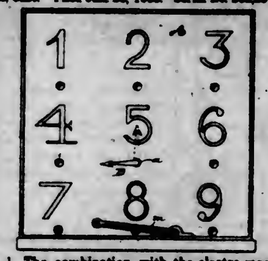


Claim.—1. The glove-fastener consisting of a cylindrical keeper provided with an engaging-tongue and a locking-bar provided with the teeth on its under surface for engaging said tongue, the said bar being held in engagement with the tongue by the inner edge of the keeper resting upon the upper surface of the said bar, substantially as described.

2. In a glove-fastening, the combination, with a cylindrical keeper having one lower outer edge struck up to form a lip, of a radial locking-bar provided with a series of teeth upon the under surface, said bar adapted to project through the keeper and engage the lip thereof, substantially as shown and described.

3. The combination, with a cylindrical keeper having one lower outer edge struck up to form a lip or tongue and an open flanged top, of a button secured to and capping the cylinder and a radial locking-bar having an under toothed surface adapted for engagement with the lip of the keeper, substantially as shown and described.

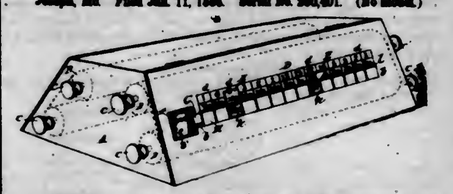
384,429. **GLOVE-FASTENER.** GEORGE H. CORNELL, Baltimore, Md. Filed Mar. 27, 1888. Serial No. 268,688. (No model.)



Claim.—1. The herein-described glove-fastener, consisting of a locking-plate provided with an arched body, and in inwardly-curved latch integral with one end having an outwardly-projecting horizontal tongue, and a keeper provided with a slot in its upper surface adapted to receive said latch and tongue, substantially as shown and described.

2. The herein-described glove-fastener, consisting of a locking-plate provided with an arched body, and an inwardly-curved latch integral with one end having an outwardly-projecting horizontal tongue, and a keeper provided with a slot in the upper surface extending from side to side and having inclined side walls, substantially as shown and described.

3. The herein-described glove-fastener, consisting of a locking-plate provided with an arched body, and an inwardly-curved latch integral with one end having an outwardly-projecting horizontal tongue, and a keeper, essentially U-shaped in cross-section, provided with a slot upon the upper face extending from side to side and having inclined side walls, substantially as shown and described.



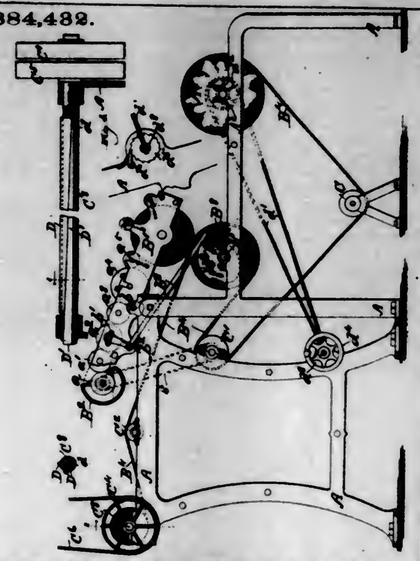
384,430. **ELECTRICAL ANNUNCIATOR.** HIRAM S. DOWNER, Zanesville, Ohio. Filed Jan. 26, 1888. Serial No. 262,267. (No model.)

Claim.—1. The combination, with the electro-magnet B, having heads *b b*, of a spindle, C, journaled in the heads below and to one side of the core, the index at the outer end of the spindle, the armature F, secured to the inner end of the spindle, normally extending upward adjacent to the core and provided on its lower end with a finger, *e*, projecting obliquely therefrom, the arms *d e*, secured to the head above the core, as at *f*, extending downwardly at opposite sides of the core and provided with stops *g h*, respectively, and the vertical rod G, having a lateral projection or arm, *j*, into the path of which the finger *e* at times extends, substantially as set forth.

2. The combination, with the electro-magnet and the spindle having an index and an armature provided with a finger or projection, of the vertical rod G, having a laterally-projecting arm or projection, *j*, into the path of which the said finger at times projects, guides *i i* for said rod, the horizontal rock-shaft *l*, having an arm, *k*, at its inner end engaging the lower end of the rod G, and an arm, *m*, at its outer end, and the spring *n*, exerting an upward strain on the arm *k* and rod, substantially as set forth.

384,431. **INTEREST-CALCULATOR.** CALVIN M. DURHAM, St. Joseph, Mo. Filed Jan. 11, 1888. Serial No. 260,401. (No model.)

Claim.—1. An interest-table consisting of a frame containing rollers, a movable principal and interest web operated by the rollers, a fixed time-indicator, and a series of flexible covers, all constructed and operated as herein shown and described.

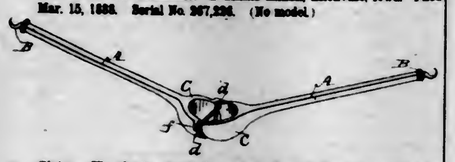


2. In an interest-table, the combination, with the frame A, indicator D, and interest-web C, of the flexible covers E.

384,432. **PRINTING-MACHINE.** JOHN H. RAHL, Chicago, Ill. Filed Apr. 23, 1887. Serial No. 236,441. (No model.)

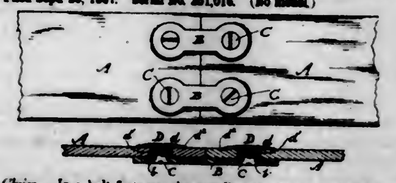
Claim.—1. In a printing-machine, the combination, with the main frame, of the auxiliary frame B', pivotally connected to said main frame and provided with the slot *b'*, the inking-roller a^2, the arm b^3, the lever b^2, the cam-piece b^4, and the shaft b^5, whereby the inking-roller a^2 is made to have alternate contact with the companion inking-rollers located on each side of the same, substantially as set forth.

2. In a printing-machine, the combination, with the inking apparatus, of the type-roller B, the printing or impression roller B^2, the roller C, and the belt b^6, said rollers B B^2 and belt b^6 being rotated by



384,432.

the passage of the web to be printed, whereby the ink-rolls have a uniform speed with the printing-rolls, as set forth.



3. In a printing-machine, the combination, with the winding and driving shaft O², of the inking and printing mechanism, the system of carrying or guide rollers, as described, and the bearings supporting the roll of paper to be printed from, whereby the web of paper passing through imparts the required motion to all the working parts of the machine alike, substantially as set forth.

384,433. DEVICE FOR SUSPENDING AND SPREADING SLAUGHTERED ANIMALS. EVERARD EEKER, Knoxville, Iowa. Filed Mar. 15, 1888. Serial No. 267,236. (No model.)

Claim.—The device consisting of the bars A, having hooks B at their outer ends, and the counterparts C of a hinge-joint at their inner ends connected by means of a bolt or pin, and a chain fixed to the center of the said pin or bolt to operate in the manner set forth, for the purposes stated.

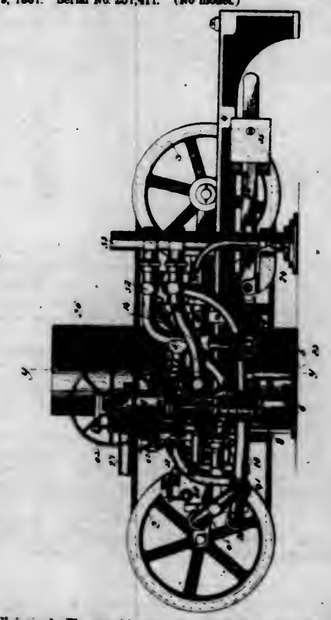
384,434. BELT-FASTENER. HJALMAR ELMBLAD, Chicago, Ill. Filed Sept. 20, 1887. Serial No. 251,016. (No model.)

Claim.—In a belt-fastener, the coupling or connecting bar B, having holes *b b*, in combination with screw-bolts C C, and the broad flat-headed nuts D D, having screw-threaded extensions or shanks *d d*, substantially as shown, and for the purposes set forth.

384,435. SAFETY-FLANGE FOR RAILROAD-RAILS. CHARLES M. IRWIN, Birmingham, Ala., assignor, by direct and mesne assignments, of one-half to J. M. Watt and Hudson Whipple, both of Washington, D. C. Filed Dec. 19, 1887. Serial No. 258,264. (No model.)

Claim.—1. The combination of a railroad-rail having a plurality of bolt-holes extending transversely through the sides thereof adjacent to the respective ends of each rail-section or length, the wheel-guard or safety-flange herein described having a curved lower portion adapted

384,435.



to fit the sides and crown of said rail, a horizontally-curved upper portion in line with the top of the crown of the rail, an upwardly-extending flange to receive the impact of the wheel and guide and retain the same in position upon the rail, and a series of bolt-holes in the side thereof corresponding in number and registering with the bolt-holes in the rail, and a series of bolts and nuts connecting said flange and rail together, substantially as set forth.

2. The wheel-guard or safety-flange herein described having a curved lower portion adapted to fit the sides and crown of a railroad-rail and a horizontally-curved upper portion in line with the top of the crown of the rail, and an upwardly-extending flange to receive the impact of the wheel and guide and retain the same in position upon the rail, substantially as set forth.

3. In combination with a railroad-rail, the safety-flange herein described having a curved lower portion adapted to fit the side and crown of the rail and an outwardly and upwardly extending top portion, the respective lengths of said flange being connected to the rail so as to break joints therewith, substantially as and for the purpose set forth.

384,436. HYDRAULIC ELEVATOR. WILLIAM T. FOX, Rochester, N. Y., assignor to The Crane Elevator Company, Chicago, Ill. Filed Dec. 9, 1887. Serial No. 257,411. (No model.)

Claim.—1. The combination of a main cylinder and an auxiliary cylinder having a piston therein which expels the water from said auxiliary cylinder as the elevator rises, with pipes connecting the auxiliary cylinder to the exhaust, and an automatic balanced valve, 16, comprising piston 19, so located upon the spindle 17 that it may close the passage between said connecting-pipes 14 and 15, or may be moved by said spindle to open said passage, and balancing-pistons 18 and 20

above and below piston 19, said valve being operated by pressure from the main cylinder through the pipe 24, whereby the said valve is opened when a predetermined pressure in the main cylinder is exceeded.

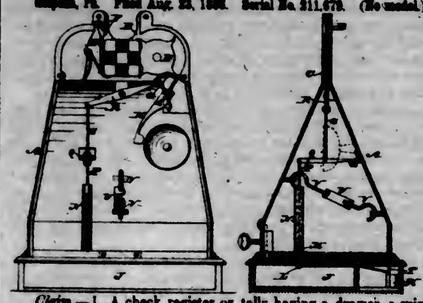
2. In a hydraulic elevator having a main and an auxiliary cylinder, the combination of a set of pipes connecting one end of the auxiliary cylinder to the water-supply, an automatic valve operated by pressure from the main cylinder and controlling the admission of water from said water-supply, a branch pipe communicating with the exhaust-tank, having an inwardly-opening check-valve and connected to the first-named set of pipes at points between the auxiliary cylinder and the automatic valve, and a passage leading from the aforesaid end of the auxiliary cylinder to the main cylinder, said passage being covered by a check-valve opening toward the main cylinder.

3. In a hydraulic elevator having a main and an interior auxiliary cylinder moving on a fixed piston secured to main cylinder, the combination of a set of pipes connecting one end of the auxiliary cylinder to the water-supply, an automatic valve operated by pressure from the main cylinder and controlling the admission of water from said water-supply, a branch pipe communicating with the exhaust-tank, having an inwardly-opening check-valve and connected to the first-named set of pipes at points between the auxiliary cylinder and the automatic valve, and a passage leading from the aforesaid end of the auxiliary cylinder to the main cylinder, said passage being covered by a check-valve opening toward the main cylinder.

4. In an elevator having a main and an auxiliary cylinder, the combination, with an automatic valve controlling the water of the auxiliary cylinder, of a pipe admitting water under the pressure of the main cylinder to operate said valve, and a valve connected to the main control-valve, admitting water to said pipe when the valve is opened to raise the elevator, and exhausting it from said pipe when the main valve is closed, as and for the purpose set forth.

5. In an elevator having a main and an auxiliary cylinder, the combination, with an automatic valve controlling the water of the auxiliary cylinder, of a pipe admitting water under the pressure of the main cylinder to operate said valve, and a valve connected to the main control-valve, admitting water to said pipe when the valve is opened to raise the elevator and exhausting it from said pipe when the main valve is closed, and a check-valve located on said pipe between the main cylinder and the valve last before mentioned, substantially as described.

384,437. BOOT OR SHOE. GEORGE S. PRAPPE, Urbana, Ohio. Filed Oct. 10, 1887. Serial No. 251,935. (No model.)



Claim.—1. A pattern for shoe-uppers, consisting of the vamp C and the two quarters A and B, one of the quarters being composed of the two pieces A′ and A², which together are of the same shape and size of the other quarter.

2. A shoe-upper formed of the vamp C, the quarters A and B, one of which, A, is composed of the two pieces A′ and A², which together are of the same shape and size as the quarter B, and a tongue-strip, I, of stiff material secured to the forward edge of the piece A′, said strip being wider than the piece A².

3. A shoe-upper formed of the vamp C, the quarters A and B, one of which, A, is composed of the two pieces A′ and A², which together are of the same shape and size as the quarter B, the facing-strips E and F, one of which is longer than the piece A′, and a top facing-strip, K.

384,438. CHECK REGISTER OR TALLY. ASHER B. GILL, Philadelphia, Pa. Filed Aug. 23, 1888. Serial No. 211,679. (No model.)

Claim.—1. A check register or tally having a drawer, a spindle for locking the same, and a lever operated by the inserted check for moving said spindle, the parts being combined and operating substantially as described.

2. In a check register or tally, a casing with throat, in combination with a spring-opened drawer, and mechanism, substantially as described, intermediate of the drawer and the throat, whereby the drawer is normally locked, but is unlocked and automatically opened when a check is inserted in the said throat, all substantially as described.

3. A casing having the throat B, in combination with toothed wheel D, pivoted lever R, a spring raised by said lever, a spindle connected to said spring and adapted to lock a drawer, and a drawer with a spring adapted to open the same, all substantially as described.

4. A check register or tally having a casing with a throat, a rotary toothed wheel, a spring-opened drawer, and mechanism intermediate of said toothed wheel and said spring-opened drawer for locking and unlocking said drawer, all substantially as described.

5. In a check register or tally, a casing having a throat, a toothed wheel operated by the inserted check, a locked drawer having a spring adapted to open the same, and mechanism intermediate of the wheel and the drawer for locking the same, all so combined and arranged that the insertion of a check operates the wheel, and thereby the intermediate mechanism, so that the drawer is automatically opened, all as described.

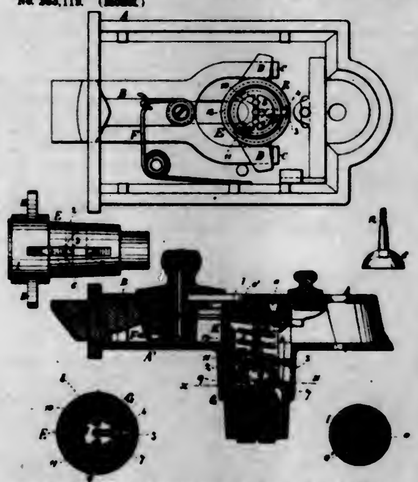
384,439. CARD-RACK. ALEXANDER R. GREENWOOD, Cleveland, Ohio. Filed Nov. 2, 1887. Serial No. 204,127. (No model.)

Claim.—The herein-described improvement in card-racks, consisting of an endless spiral coil, B, having its coil spread and flattened to overlap, and secured in the flattened manner to form the circle, heart, or diamond outline, substantially as specified.

384,440. ELECTRIC-CIRCUIT CONTROLLER. OTTO F. GRIEB, Newark, N. J. Filed Dec. 31, 1887. Serial No. 259,451. (No model.)

Claim.—1. The combination of a movable contact-piece, a coil-spring for moving the same in one direction or the opposite, according to the direction of stress exerted thereby, a pivoted support for one end of the spring, and a crank-pin coupled with said support for moving the same, substantially as described.

2. A circuit-closing device consisting of a movable contact-piece,



stationary contact-points, a coil-spring for actuating said contact-piece by throwing the same into and out of contact with said contact-points, a pivoted actuating-lever to which one end of the spring is connected for shifting the point of its support and its consequent direction of tension upon the contact-piece, a key for actuating the lever, and a connection between the key and the lever consisting of a crank-pin passing through a slot in the lever.

3. The combination of a movable contact-piece, contact-points for the same constituting the terminals of an electric circuit, a spring attached at one end to the contact-piece, a pivoted lever to the other end of which the remaining end of the spring is attached, said lever having a longitudinal slot and its point of support being intermediate between the ends of the spring, and a crank-pin passing through said slot, whereby the lever may be turned in either direction to carry the point of attachment of the spring upon one side or the other of the point of attachment of the lever.

4. In a circuit-controller, the combination of the movable piece A and its contact-points, the lever G, the spring K, attached at one end to the contact-piece and at the other end to the lever, the key E, and the crank *f*, moved thereby and engaging the lever G, substantially as described.

5. In a circuit-controlling device, the combination, with the base and the key pivoted thereon, of a movable contact-piece surrounding the axis of the key and movable independently thereof, a pivoted lever, a spring connecting the lever and the contact-piece, and a crank-pin operated by the key for moving said lever in one direction or the opposite, thereby changing the direction of pull exerted by the spring upon the contact-piece.

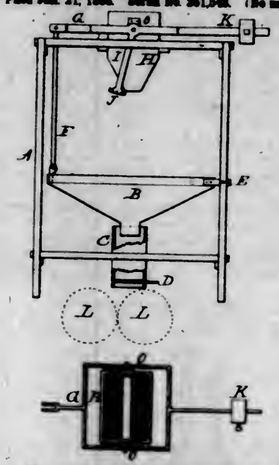
384,441. LOCK. JAMES HARTNESS, Torrington, Conn., assignor to the Union Hardware Company, same place. Filed Feb. 6, 1888. Serial No. 263,119. (Model.)

Claim.—1. The combination, with the bolt or latch and the cylinder for acting upon the same, of tumblers within the cylinder, a universal tumbler with a finger, against which universal tumbler the sliding tumblers act, a follower or support for the universal tumbler, a spring for moving the parts endwise of the cylinder, and a target having one or more openings therein for the passage of the finger, substantially as set forth.

2. The combination, with the cylinder E, of the circular case for supporting the same, a follower within the cylinder having a projection passing through the slot in the cylinder and into a slot in the case, a universal tumbler resting against the follower and having a projecting finger, 12, L-shaped tumblers sliding within the cylinder and acting upon the rim of the universal tumbler, and a perforated target for arresting the end movement of the parts, except when the finger passes into the perforation, substantially as set forth.

3. The combination, in a lock, of sliding tumblers, a universal tumbler against which the sliding tumblers act, and a finger projecting from the universal tumbler, a perforated target for arresting the movements of the parts, except when the finger passes into the perforation, substantially as set forth.

4. The combination, in a lock, of a universal tumbler having a projecting finger, sliding tumblers to act upon the same, and a target having two or more perforations, whereby the lock is adapted to two or more different keys, substantially as set forth.



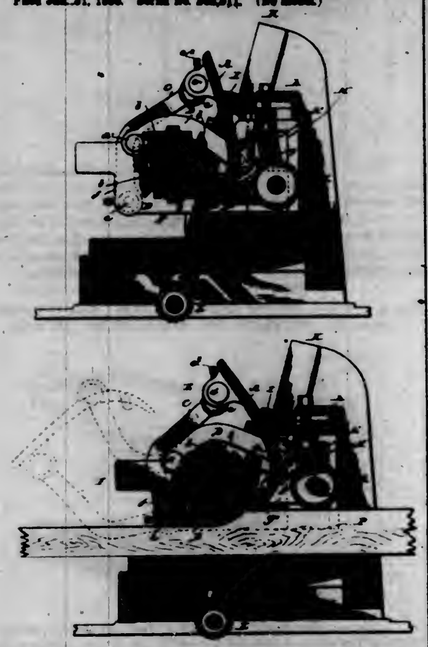
5. The combination, in a lock, with the universal tumbler, means for supporting the same, and tumblers actuated by the key for setting the universal tumbler, of the target having a roughened surface and one or more perforations in the same, substantially as set forth.

384,442. TUNING-KEY. BENJAMIN HERMANCE, Waltham, Mass. Filed Mar. 5, 1888. Serial No. 266,501. (No model.)

Claim.—The improved tuning-key hereinbefore described, made up of a support, B, having a tapered hole, *b*, a tapered peg, D, having a shoulder, *d'*, and a nut, F, support B receiving nut F and peg D, and nut F engaging the shoulder on the peg to force it home, substantially as and for the purpose set forth.

384,443. FEED-REGULATOR. ELLIS A. HOOVER, West Milton, Ohio. Filed Jan. 21, 1888. Serial No. 261,642. (No model.)

Claim.—The combination, with the supply-pipe, of the hopper having one side suspended on pivots and the opposite suspended from a pivotal lever, a valve attached to said lever to close the orifice of the supply-pipe, and a counter-weight thereon to serve as a counter-poise to the unloaded hopper, substantially as set forth.



384,444. CHALK-LINE HOLDER. BENJAMIN HOWARD, Sheep Ranch, Cal. Filed Feb. 3, 1888. Serial No. 262,827. (No model.)

Claim.—1. A chalk-line holder consisting of an oval flexible chalk-receptacle with eyelets at its ends, one of which is removable, and having ribs or flanges adjacent to its ends, as and for the purpose shown and described.

2. A hollow chalk-line holder consisting of a rubber chalk-receptacle capable of being compressed, and formed with eyelets at its ends, one of which serves as a stopper, substantially as described.

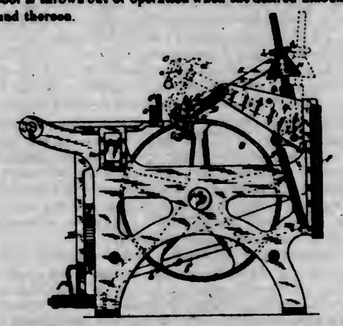
384,445. PLANING-MACHINE. LOUIS P. HOTT, Aurora, Ill. Filed Jan. 31, 1888. Serial No. 262,511. (No model.)

Claim.—1. In a planing or surfacing machine, the combination, substantially as hereinbefore set forth, with the horizontally-arranged cutter-cylinder, of the chip-breaker arranged to rise and fall in the arc of a circle substantially concentric with the cutting-circle, and the swinging arms hung at the rear of the cutter-cylinder and pivotally attached to the chip-breaker, said arms being arranged to extend forwardly over the axis of the cutter-cylinder in opposition to the thrust of the incoming lumber against the chip-breaker when the latter is in its normal working position in front of the cutter-cylinder, and being further arranged to permit the chip-breaker to be swung over and to the rear of the cutter-cylinder, for the purpose described.

2. The combination, with the cutter-cylinder, of the chip-breaker arranged to rise and fall in the arc of a circle substantially concentric with the cutting-circle, the swinging arms C and D, pivotally connected with and arranged to control the chip-breaker in its said movement, and suitable adjusting devices, such as set forth, adapted to place the toe of the chip-breaker at a greater or less distance from the cutter-cylinder, for the purpose described.

3. The combination, with the cutter-cylinder, of the chip-breaker arranged to rise and fall in the arc of a circle substantially concentric with the cutting-circle, the swinging arms C and D, pivotally connected with and arranged to control the chip-breaker in its said movement, and the adjustable eccentrics E, applied to adjust the connections between the arms C and the upper portion of the chip-breaker, substantially as and for the purpose described.

4. The combination, with the cutter-cylinder, of the chip-breaker arranged to rise and fall in the arc of a circle substantially concentric with the cutting-circle, and the presser-roll mounted in vertically-movable bearings which support and lift the chip-breaker to a height proportional to the height the presser-roll is raised by the incoming lumber, but which permit the incoming lumber upon reaching the chip-breaker to raise the same free from the support of the presser-roll bearings and in the arc of a circle substantially concentric with the cutting-circle, substantially as set forth.



5. The combination, with the chip-breaker arranged to rise and fall in a path substantially concentric with the cutting-circle of the rotary cutter-cylinder, of the presser-roll mounted in vertically-movable bearings provided with stops which engage and lift the chip-breaker to an extent proportional to the extent to which the presser-roll is raised by the incoming lumber, but which permit the lumber upon reaching the chip-breaker to engage and lift the same free from contact with the stops, substantially as described.

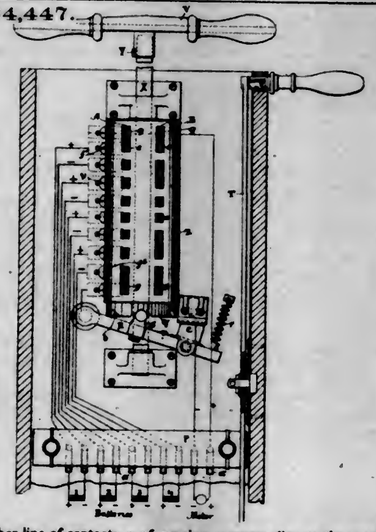
6. The combination, with the chip-breaker attached to swinging arms, for the purpose set forth, and provided with lugs *a*, of the presser-roll mounted in vertically-movable bearings provided with stops *g'*, having inclined surfaces which engage the lugs upon the chip-breaker, substantially in the manner described.

7. The combination, with the cutter-cylinder and a vertically-adjustable support therefor, of the presser-roll journaled in bearings arranged to slide in vertical guides in the support for the cutter-cylinder, the chip-breaker arranged to rise and fall in the arc of a circle substantially concentric with the cutting-circle, and the swinging arms C and D, hung upon the support for the cutter-cylinder and pivotally attached to the chip-breaker, substantially as and for the purpose described.

384,446. MACHINE FOR WINDING SPOOLS, &c. ALFRED ISHERWOOD, Philadelphia, Pa., assignor to William P. Uhlinger, same place. Filed Dec. 27, 1887. Serial No. 258,902. (No model.)

Brief.—The invention consists in the improved devices whereby the spool is thrown out of operation when the desired amount of yarn is wound thereon.

Claim.—1. In a spool or quill winding machine, in combination, a wheel having a friction-surface, a frame adapted to receive a spool or quill, a pivoted arm cast with or secured to said frame, a spring-actuated pivoted rod, an adjustable tapering cap upon said rod, and against the surface of which cap the inner end of the pivoted arm rests when the material is being wound upon the spool or quill, substantially as and for the purpose specified.



2. In a spool or quill winding machine, in combination, a wheel having a friction-surface, a frame adapted to receive a spool or quill, a pivoted arm cast with or secured to said frame, a pivoted spring-actuated rod threaded at its upper end, and a tapering cap internally threaded and surrounding said rod, and against the surface of which cap the inner end of the pivoted arm rests when the material is being wound on the spool or quill, substantially as and for the purpose specified.

3. In a spool or quill winding machine, in combination, a wheel having a friction-surface, a frame adapted to receive a spool or quill, a pivoted arm cast with or secured to said frame, a pivoted spring-actuated rod threaded at its upper end, a tapering cap internally threaded and surrounding said rod, and against the surface of which cap the inner end of the pivoted arm rests when the material is being wound on the spool or quill, and a nut or washer on said rod above said cap, substantially as and for the purpose specified.

384,447. REGULATING-COMMUTATOR FOR SECONDARY BATTERIES. EDMUND JULIEN, Brussels, Belgium, assignor to the Julien Electric Company, New York, N. Y. Original application filed Feb. 17, 1886, Serial No. 192,349. Divided and this application filed Dec. 9, 1886. Serial No. 221,113. (No model.) Patented in Belgium Feb. 15, 1884, No. 64,170; in Germany Feb. 15, 1886, Nos. 40,688 and 40,641; in England Feb. 19, 1886, No. 2,670; in Italy Mar. 20, 1886, No. 68; in France Nov. 3, 1886, No. 179,809; in Spain Nov. 27, 1886, No. 10,967, and in Portugal Dec. 20, 1886, No. 1,110.

Claim.—1. In combination with a number of independent batteries and a translating device, a current-regulator consisting of a series of brushes forming the terminals of the circuits of said batteries and translating device, and an insulating-block adapted to be moved relatively to said brushes and containing a number of lines of contact-pieces, *e g*, variously connected together in the different lines and adapted to make contact with the brushes of all the batteries and translating device and to arrange the batteries in various groups, and

384,447.

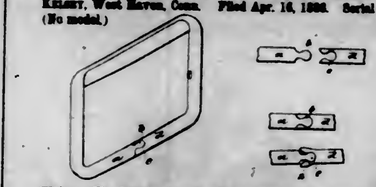
a further line of contacts, *c*, of number corresponding to the number of battery-terminals and so connected as to connect the batteries together in multiple arc at the same time that the translating device is cut out of the circuit, substantially as and for the purpose set forth.

2. In combination with a number of independent sources of electricity, a regulator having multiple couplings for coupling said sources in various orders, and a circuit-breaker operated by said regulator, substantially as and for the purpose set forth.

3. In combination with a current-regulator consisting of an insulating-support, lines of contact terminals carried thereby, and means for including any one of said lines in an electric circuit, the contact-pieces *c c* in the circuit, one fixed, the other carried by a lever operated by the movement of the current-regulator, substantially as and for the purpose set forth.

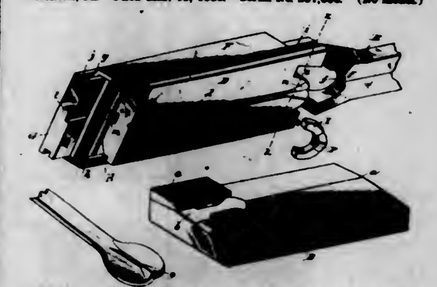
4. In combination with a current-regulator and a backing whereon the same is mounted, a line of studs on said backing electrically connected with the current-regulator, a movable insulating-bar carrying terminals electrically connected with sources of electricity and a translating device, and springs in rear of said terminals, substantially as and for the purpose set forth.

5. The combination of a number of batteries, a motor, electric circuits, a current-regulator for connecting said batteries in various groups in circuit with said motor and disconnecting the motor from the circuit, a shaft for operating said regulator, a lever for operating said shaft, and a stud and notched disk, substantially as described, whereby removal of the lever is prevented unless the regulator is placed so as to throw the motor out of circuit, substantially as set forth.



384,448. SHOE-MAKER'S LAST. GEORGE W. KELLER, Philadelphia, Pa. Filed Apr. 29, 1887. Serial No. 236,595. (No model.)

Claim.—1. The within-described flask for making a mold of the foot, said flask comprising a base portion, A, for the sole of the foot, an instep portion, B, covering the top of the foot, a portion, F, at the rear of the heel, opposite side portions, D, interposed between the heel portion and instep portion above the base, said side portions having flanges projecting inwardly toward the foot, which are adapted to separate the side portions from the other portions of the flask, and fastening devices for separably securing the various portions of the flask together in their proper relative positions, all substantially as specified.



2. A shoe-maker's last composed of cast-lead or equivalent material, as described, and forming a reproduction of an individual human foot, all substantially as specified.

384,449. MANUFACTURE OF BUCKLE-FRAMES. GEORGE B. KELSEY, West Haven, Conn. Filed Apr. 16, 1888. Serial No. 270,810. (No model.)

Claim.—The herein-described improvement in the manufacture of buckle-frames, consisting in constructing the meeting ends of the wire, the one with a dovetail-shaped tenon and the other with a corresponding recess, the tenon set within said recess and contracted in the direction of the plane of the tenon, correspondingly expanding the tenon within the recess at right angles to the plane of the tenon, then closing the recessed portion over the tenon, substantially as described.

384,450. DIE FOR MAKING EYE-BARS. JOHN P. KINSLEY, Athens, Pa. Filed Mar. 13, 1888. Serial No. 267,063. (No model.)

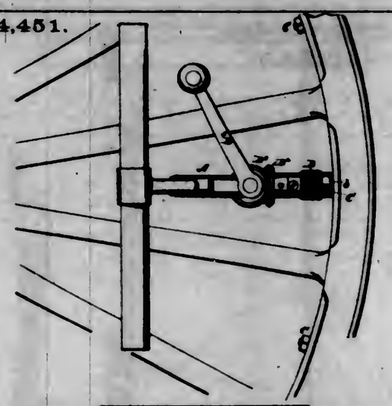
Claim.—1. The combination, with a lower die section having a recess at one end and central longitudinal rib, of the flat upper die-section having central longitudinal groove, substantially as described.

2. The combination, with the upper die-section, flat upon its under face and provided with a central longitudinal groove, of the lower die-section having a central longitudinal rib and recessed at one end and the interchangeable plates at said recessed end, substantially as set forth.

3. The combination, with the lower die-section having central longitudinal rib and a recess at one end, of the upper die-section, flat upon its under face and formed with central longitudinal groove and depression *n*, and the rammer, substantially as described.

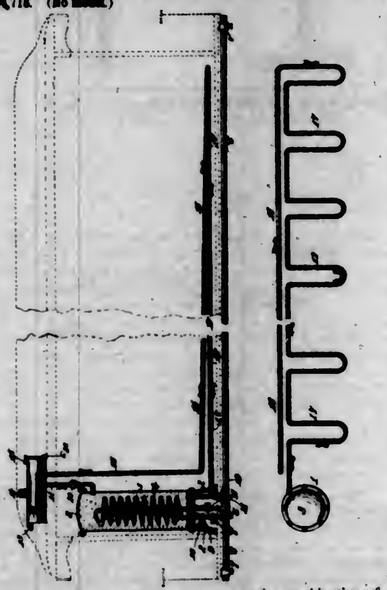
4. The combination, with the lower die-section having at one end a recess and the plates at said recessed end, of the upper die-section, the rammer, and the removable piece, all substantially as described.

5. The combination, with the lower die-section having recess at one end and the plates at said recessed end, of the upper die-section formed with depression *n*, the rammer, and the removable piece *l*, having the projection *p*, adapted to fit said depression, substantially as described.



384,451. WRENCH. JOHN S. LAPE, Ypsilanti, Mich., assignor of one-half to Alva Worden, same place. Filed Apr. 5, 1888. Serial No. 269,688. (No model.)

Claim.—1. A tire-bolt wrench consisting of a shaft provided with a wrench-head at its end, and in connection therewith gear-wheels and a crank, whereby said wrench may be operated, and a cross-arm adapted to rest upon the spokes of the wheel, substantially as and for the purpose described.

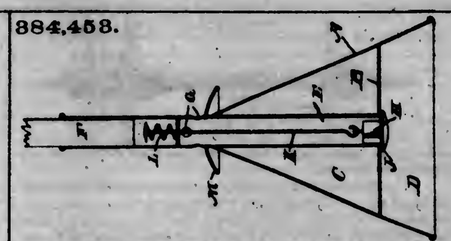


2. A tire-bolt wrench consisting of the combination, with the wrench, its shaft, and connecting-gears, of a cross-arm arranged in a plane above the level of the wrench-shaft, and adapted when resting upon the spokes to properly locate and support the wrench in position for its work, substantially as described.

3. The tire-bolt wrench consisting of a frame provided with shafts B' and B^4, engaged by gears, a crank, B^5, a cross-bar, A', and a removable wrench-head, B, substantially as and for the purposes described.

384,451.

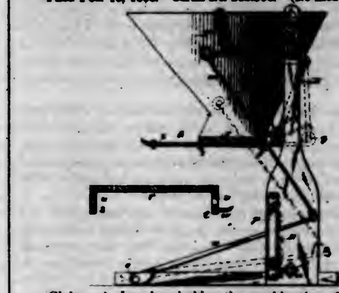
384,452. RAILWAY-CAR-HEATING APPARATUS. EDWIN A. LELAND, Meriden, Conn., assignor to Charles C. Gleek, same place, and Leonard Richardson, Brooklyn, N. Y. Filed Jan. 18, 1887. Serial No. 224,718. (No model.)



Claim.—1. In a car-heating apparatus, the combination of a water-heating tank located in a railway-car, a return-pipe coil supported in said tank, and having both of its ends extended through the tank-bottom and beneath the car-floor, a steam-pipe located beneath the car-floor and connected with one end or leg of the said pipe-coil for the purpose of conveying live steam into the coil, a blow-off cock, 8, located in the other end or leg of the pipe-coil, a cut-off valve, 21, located in the pipe-coil between the tank and steam-supply pipe, and hot-water-circulating pipes extending through the car and communicating with the water-heating tank, substantially as described.

2. In a car-heating apparatus, the combination of a water-heating tank located in a railway-car, the return-pipe coil 4, supported in said tank and having both ends or legs passed through the tank-bottom and provided with blow-off cock 8, drip-valve 10, and regulating-valve 21, the steam-supply pipe 6, communicating with one leg of said coil, the water-supply tank 12, the valved connecting-pipe 11, and the hot-water-circulating pipes 16 and 17, communicating with the water-heating tank, substantially as described.

384,453. ATMOSPHERIC CLOTHES-WASHER. SAMUEL T. LEMON, Richmond, Ind., assignor of one-third to G. Harland Lemon, same place. Filed July 23, 1887. Serial No. 245,717. (No model.)



384,453.

Claim.—1. In an atmospheric clothes-washer, the combination, substantially as set forth, of an inverted cone provided with a downwardly-open air-chamber at its bottom, an air-tube disposed axially within said cone and having its lower end in communication with said air-chamber and having its upper end prolonged beyond the top of the cone to form a handle-socket and provided with side openings above the cone and below the handle and with an inwardly-projecting flange disposed above said side openings and below the handle, a valve seating upwardly at the lower end of said tube, a rod reaching upwardly from said valve through the tube and above said flange and provided with a head at its upper end, and a spring engaging the lower side of said head on the rod and the upper side of said supporting-flange within the tube and adapted to hold said valve closed and to permit it to open upon the upstroke of the implement.

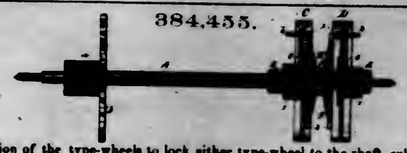
2. In an atmospheric clothes-washer, the combination, substantially as set forth, of a cone, A, having diaphragm B and bottom chamber, D, tube E, provided with openings G, valve H, rod K, having its lower end detachably hooked to said valve, and spring L, supporting said rod in its upper position and disposed above said openings G.

384,454. BAG-HOLDER. WILLIAM F. LEWIS, Washington, D. C. Filed Feb. 10, 1888. Serial No. 263,503. (No model.)

Claim.—1. In a bag-holder, the combination of fixed and reciprocating bag-supports, a spring for projecting the movable supporters and keeping the bag stretched at its mouth, and a swinging bar for releasing the bag from the fixed supports, substantially as described.

2. In a bag-holder, the combination of fixed and horizontally-reciprocating supports, a compound crank provided with bends, substantially as shown, to which the reciprocating supports are attached, a spring and a treadle connected to said crank, substantially as described.

3. In a bag-holder, the combination of a hopper, fixed and reciprocating bag-supports, a compound crank crossing and secured to the hopper and provided with an operating-arm, a spring attached to the hopper and to said arm, and a treadle also attached to said arm, substantially as described.



4. In a bag-holder, the combination of a hopper, fixed and reciprocating bag-supports, arms or ways under the hopper for supporting and guiding said supports, a compound crank, a curved swinging rod for releasing the bag from the fixed supports, a connection between said crank and rod, and a tension device for operating the crank, substantially as described.

384,455. PRINTING-TELEGRAPH RECEIVER. HENRY MANDEIN, New York, N. Y., assignor to John Anderson, same place. Filed Nov. 21, 1887. Serial No. 255,735. (No model.)

Claim.—1. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels and a clutch acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, substantially as set forth.

2. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels riding on the shaft and a clutch located between the type-wheels and acting at any point in the revo-

384,455.

lution of the type-wheels to lock either type-wheel to the shaft, substantially as set forth.

3. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels, a clutch acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, and unison-stops acting to stop at unison the wheel not clutched to the shaft, such wheel being rotated by the shaft until stopped at unison, substantially as set forth.

4. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels, a clutch acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, unison-stops acting to stop at unison the wheel not clutched to the shaft, and friction-producing devices causing the idle-wheel to be rotated by the shaft until arrested at unison, substantially as set forth.

5. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels, a clutch acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, unison-stop arms acting to arrest the type-wheels alternately, and a moving shaft or rod connected with the unison-stop arms and clutch-lever for operating them together, substantially as set forth.

6. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels riding on the shaft, a clutch located between the type-wheels and acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, a moving shaft for working the clutch-lever, and an adjustable connection between the shaft and the clutch-lever, substantially as set forth.

7. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels riding on the shaft, a clutch located between the type-wheels and acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, a rock-shaft having an adjustable rocking collar, and a pivoted clutch-lever having a horizontal arm engaging fingers on the rocking collar, substantially as set forth.

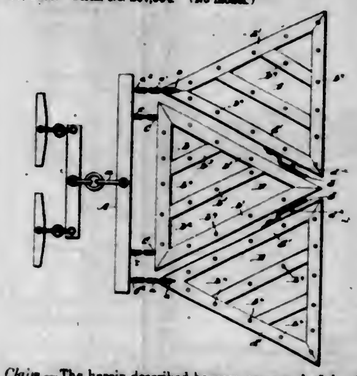
8. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels, a clutch acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, springs taking alternately in slots in the type-wheels or bearing thereon to produce friction, and arms acting to withdraw the springs alternately from such slots, substantially as set forth.

9. In a printing-telegraph receiver, the combination, with two rotating type-wheels, of separate inking-rollers bearing thereon and working parts lifting such rollers alternately from the type-wheels, whereby only the wheel that is being printed from will have an inking-roller bearing on it, substantially as set forth.

10. In a printing-telegraph receiver, the combination, with two independently-rotating type-wheels and unison-stop arms thrown alternately into the paths of rotation of working parts for stopping the type-wheels alternately at unison, of separate inking-rollers for such type-wheels and lifting-arms working with the unison-stop arms and acting to lift the inking-rollers alternately from the type-wheels, substantially as set forth.

11. In a printing-telegraph receiver, the combination, with a single driving-shaft, of two type-wheels, a clutch acting at any point in the revolution of the type-wheels to lock either type-wheel to the shaft, unison-stops acting to stop at unison the wheel not clutched to the shaft, such wheel being rotated by the shaft until stopped at unison, separate inking-rollers bearing on the type-wheels, and working parts lifting such rollers alternately from the type-wheels to reduce the friction of the idle-wheel on the shaft, substantially as set forth.

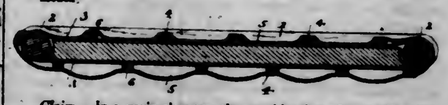
384,456. CARPET-STRETCHER. BRADLEY MANNING, Swanton, Ohio, assignor of two-thirds to Edward D. Manning, Chicago, Ill., and J. Flint Strayer, Swanton, Ohio. Filed Feb. 3, 1888. Serial No. 262,803. (No model.)



Claim.—1. The herein-described carpet-stretcher, composed of the head and foot sections, C and C', the plates B, secured to the head-section and having a series of coincident openings at different levels, the section C', having a series of horizontal openings at one end and vertical openings at its other end, the pivot-pin *e*, the stop-pin *f*, the clip *d*, and the pin d^2, for adjustably connecting the sections C and C' together, substantially as specified.

2. The combination, with the head having the section C and the foot having the section C', of the plates B, the pivot-pin *e*, and the stop-pin *f*, substantially as and for the purpose described.

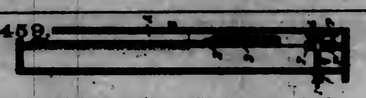
384,456.



384,457. HARROW. ASA D. MARSH, Overton, Mo. Filed Mar. 21, 1888. Serial No. 267,964. (No model.)

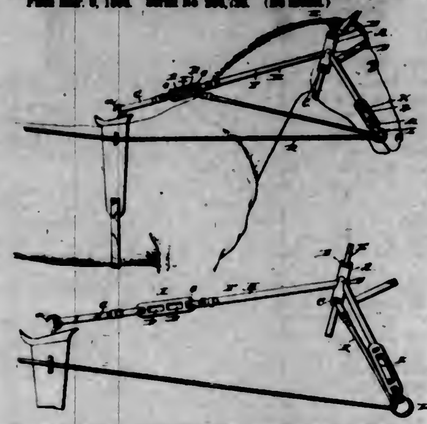
Claim.—The herein-described harrow, composed of the draw-bar A, the triangular frame B, provided with proper teeth and with the staples d^3, secured at corresponding points to its side rails near its apex, the links or chains *c*, connecting the base-rail of the frame B, at equal points from its ends, to the draw-bar A, at equal points from the ends thereof, the triangular frames D, provided with proper teeth and with the pintles *d* on the side rails engaging the corresponding staples, d^3, and having their apices front, and the chains connecting said apices to the draw-bar at equal distances from the ends thereof, substantially as specified.

384,458. ELEVATOR FOR GRAIN-BINDERS. LAWRENCE MATHEWS, Summitville, Ohio. Filed Feb. 7, 1888. Serial No. 263,206. (No model.)



Claim.—In a grain-elevator, the combination of an endless belt, the transverse slats secured thereto upon its outer surface, and a loose endless belt or apron secured to the outer surface of said slats, substantially as set forth.

384,459. SASH-BALANCE. WILLIAM C. MERRELL, New York, N. Y. Filed Mar. 3, 1888. Serial No. 266,072. (No model.)

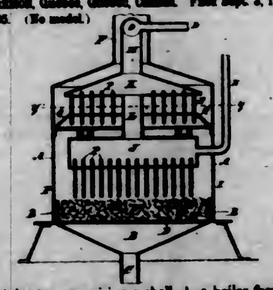


Claim.—1. The combination, with the sash, the cord, and the weight, of sleeve G, having a slot, a pulley, F, loose on the sleeve and to which the cord is connected, and a lengthwise-movable rod, H, in the sleeve, having a lug projecting through the slot to engage and disengage the pulley, substantially as described.

2. The combination, with the sash, the cord, and the weight, of the sleeve G, having a slot, and a ratchet-wheel, I, a pawl, M, a pulley, F, loose on the sleeve, a lengthwise-movable rod, H, in the sleeve, having a lug, K, to engage and disengage the pulley, a handle, I, on the rod, and a retracting-spring, J, substantially as described.

384,459.

384,460. CHECKREIN. ISAAC HILLER, West Lafayette, Ohio. Filed Mar. 9, 1888. Serial No. 266,752. (No model.)



Claim.—1. The combination, with a bridle, of the gag-hooks A, connected to the head-stall, the checkreins attached to the bit-rings adapted to be engaged by the gag-hooks and having the links I, and the lines passed through the bit-rings and adapted to be connected to the links I or to the gag-hooks, substantially as described.

2. The combination, with a bridle, of the gag-hooks A, having the ears or projections D on their outer sides and having the end slots, B C, the straps E, engaging slots B and connecting the gag-hooks to the head-stall, the checkreins attached to the bit-rings engaged by the projections of the gag-hooks and having the links I, and the lines passed through the bit-rings and adapted to be connected to the links I or to the gag-hooks, substantially as described.

3. The checkrein having its ends provided with the links K, the latter having the slots or openings M N in their ends and centers, through which the checkreins are passed, whereby the latter may be lengthened or shortened, substantially as described.

4. The checkreins having the links I, adapted for the attachment of the ends of the lines, the latter being passed through the bit-rings, substantially as described.

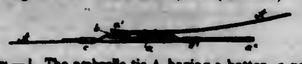
384,461. BOILER FOR HOT-WATER HEATERS. ROBERT NEIL and JOHN MORRISON, Quebec, Quebec, Canada. Filed Sept. 3, 1887. Serial No. 248,735. (No model.)

Claim.—1. A heater comprising a shell, A, a boiler formed with a lower horizontal water-section, J, the upper horizontal water-section, K, and a pipe, L, connecting the sections, and the deflectors or dampers Q, hinged to the shell and surrounding the boiler, substantially as described.

2. A heater comprising a shell, A, a boiler formed with a lower horizontal section, J, the upper horizontal section, K, having pendent bars P suspended over the lower section, and a pipe, L, connecting the sections, and the deflectors or dampers Q, surrounding the boiler, hinged to the shell, and resting against the bars, substantially as described.

3. A heater comprising a shell, A, a boiler formed with a lower horizontal section, J, having pendent bars P suspended over the furnace, the upper horizontal section, K, having pendent bars P suspended over the lower section, and a pipe, L, connecting the sections, and the deflectors or dampers Q, substantially as described.

384,462. MUG OR OTHER BRUSH. ROBERT HUNT, Jr., Chicago, Ill. Filed June 20, 1888. Serial No. 266,992. (No model.)



Claim.—1. The within-described top-knot or bristle-carrier for brushes, made in one piece, and consisting of a disk, *b*, having perforations *c* in it, and of a face flange or ring, *d*, substantially as and for the purposes specified.

2. The within-described top-knot or bristle-carrier for brushes, consisting of the disk *b*, having perforations *c* in it, the face flange or ring *d*, and the back rim, *e*, all integral with one another, essentially as and for the purposes specified.

3. The combination, with the handle B of the brush, of the independently-attached top-knot or bristle-carrier A, composed of the perforated disk *b*, face flange or ring *d*, and back rim, *e*, these latter integral with one another, substantially as described.

384,463. UMBRELLA-TIE. DAVID W. OSBORNE, Elizabeth, N. J. Filed Aug. 11, 1887. Serial No. 246,894. (No model.)

Claim.—1. The umbrella-tie A, having a button, *a*, near one end, a ring or eyelet, *b*, near the other end, and said end being folded back and the parts secured together by the eyelets *c c'*, whereby a pocket is formed for the reception of the button *a* between the parts, substantially as specified.

2. The umbrella-tie A, having a fastening, *a*, near the attached end, a ring-eyelet, *b*, secured in the tie near the outer or loose end, and said end being folded back against the opposite side of the tie to that upon which the fastening device *a* is secured, and connections through the tie at each side of the eyelet *b* to form a pocket, substantially as and for the purposes set forth.

384,464. CAN-SOLDERING MACHINE. JOHN O'FERRALL, Baltimore, Md. Filed Aug. 6, 1887. Serial No. 246,577. (No model.)

Claim.—1. In a can-soldering machine, the combination, with a solder-bath, of burners located on opposite sides of and above the point where the can-seam enters and emerges from the bath, whereby the solder is sweated into the seam from the outside, substantially as described.

2. The combination, with a reservoir having a solder-groove, *a*, of the burners E E, located on opposite sides of and above the point where the head or bottom seam of a can is made to enter and emerge from said solder-groove, whereby the solder is sweated into the seam from the outside, substantially as described.

384,465. BELT-FASTENER. WILLARD H. PACKER, Cleveland, Ohio. Filed Apr. 6, 1888. Serial No. 269,944. (No model.)

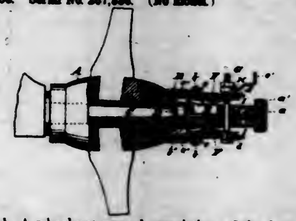
Claim.—1. A belt-fastener having a central web and a series of fingers on either side, with shoulders on the fingers corresponding to the thickness of the belt, the tips of the fingers projecting laterally from the body, substantially as set forth.

2. The belt-fastener herein described, having opposite rows of fingers, the body of each finger and the extremity thereof being in different but substantially parallel planes, with a shoulder offset between

384,465.

the body and extremity corresponding to the thickness of the belt, and a web connecting the fingers, substantially as set forth.

3. An improved article of manufacture consisting in a metallic belt-fastener formed in a single piece, with a web at its center and a series of fingers projecting oppositely from said web, each finger having a shoulder near its end at about right angles to the web and the plane of the finger above and below the shoulder, substantially as set forth.

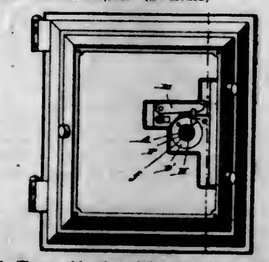


4. A belt-fastener provided with a web along its center and a series of fingers at each side of the web, having their extremities pointed and the points turned inward substantially at right angles to the plane of the fingers, substantially as set forth.

5. The belt-fastener herein described, having a series of fingers, the body and the extremity of each finger being in substantially parallel lines with a shoulder between, and the tips of the fingers extending outward from the body with the end of a belt having the extremities of the fingers directly in contact with the inside thereof, substantially as set forth.

384,466. COUGH REMEDY. GEORGE A. PATTON, Altoona, Pa. Filed Mar. 10, 1888. Serial No. 266,794. (No specimens.)

Claim.—The herein-described medical compound, consisting of elecampane, hoarhound, lovage, wild cherry, sugar, glycerine, aniseseed, and paregoric, for the purposes specified.

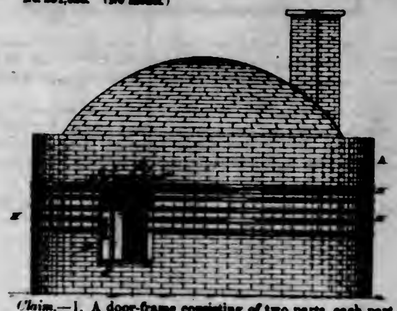


384,467. WRENCH. WILLIAM C. PERKINS, Sandy Point, Me. Filed Mar. 20, 1888. Serial No. 267,886. (No model.)

Claim.—1. A wheel-nut wrench consisting of the jaw pivoted within the rectangular collar, the fixed jaw, the respective jaws being provided in their ends with the nut-seat, the outstanding bearing-lugs, the levers fulcrumed between said lugs, the threaded bolt, the nut, and the springs, substantially as specified.

2. The combination, with jaws E, of the levers fulcrumed thereon, the threaded bolt passing through the slots in the levers and the openings in the jaws, and the nut having the crank-handle, substantially as specified.

384,468. PERMUTATION-LOCK. WILLIAM F. PETERS, Cincinnati, Ohio, assignor of one-half to the Alpine Safe Company, same place. Filed Jan. 23, 1888. Serial No. 261,572. (No model.)



Claim.—1. The combination of the arbor A, tumblers provided with tappets, the inmost tumbler being also provided on its outside face with a hub, F, and an adjustable connection between the hub and arbor, substantially as and for the purpose set forth.

2. The combination of arbor A, provided with slot *a*, tumblers provided with tappets, the inmost tumbler being also provided with hub F, having slots *f*, pin G, and means for holding pin G in place, substantially as and for the purposes specified.

3. The combination of arbor A, provided with slot *a* and socket *a'*, tumblers provided with tappets, the inmost tumbler being also provided with hub F, having radial slots *f*, pin G, and screw H, substantially as and for the purposes specified.

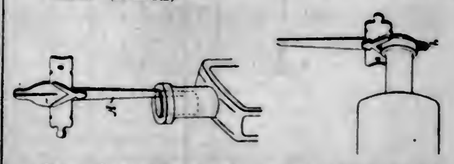
384,469. FRAME FOR BRICK-KILNS. EDWARD H. PEER, JOSEPH CASTLE, and JOSEPH B. SCRUPP, Canton, Ill. Filed Oct. 6, 1887. Serial No. 251,630. (No model.)

Claim.—1. A door-frame consisting of two parts, each part consisting of a side piece and an inwardly-turned top piece forming half of an arch, the outer end of each of said arch-pieces being provided with a flat face, each face being provided with a transverse opening and a tie-bolt in engagement with said openings, substantially as described, and for the purposes set forth.

2. A door-frame consisting of two parts, each part consisting of a side piece and an inwardly-turned top piece provided on its outer inner end with a flat surface adapted to abut the corresponding surface on the adjoining top, the outer side of each top or arch being provided with a flat-faced lug, I, the abutting ends of the two parts of the frame and the lugs aforesaid being provided with openings in alignment for the reception of a bolt, and a bolt provided with nuts for engaging said opening, substantially as specified.

3. A two-part door-frame, each part consisting in a side piece and a top piece turned inward, said top piece forming half of an arch, said side and arched pieces being provided with transverse openings, the inner sides of the arched pieces being provided with flat surfaces D around the bolt-openings, substantially as specified.

4. A two-part door-frame, each part consisting of a side piece and a top piece turned inward, said top piece forming half of an arch, each of the frame-pieces being provided with openings, in combination with the bands H, and means for engaging the ends of said bands in the openings aforesaid, substantially as described.



5. A door-frame consisting of two side pieces, each piece being provided with an inwardly-turned top piece, forming half an arch, said sides and top being provided with openings for the reception of bolts, each of said side pieces and its half-arch being provided in the rear with a flange, the outer face of said flange lying within the outer surface of the main frame-pieces and arch, whereby a recess is formed, substantially as described, and for the purposes set forth.

384,470. CRUTCH. JAMES F. PLUMER, Watertown, N. Y. Filed Feb. 15, 1888. Serial No. 264,102. (No model.)

Claim.—As an improvement in crutches, a trussed standard composed of four pieces arranged in pairs on opposite sides, the upper ends of said four pieces being inserted into the under side of the saddle in line with one another, and their lower ends being clustered together into a single column, substantially as and for the purpose shown and set forth.

384,471. COMBINED BOTTLE-OPENER AND LIQUID-DROPPER. EDWARD S. RANDALL, Dayton, Ohio. Filed May 2, 1888. Serial No. 272,555. (No model.)

Claim.—The combination of the arm A, curved in cross-section, and pointed flat end B, provided with guide C and groove B', all as and for the purpose set forth.

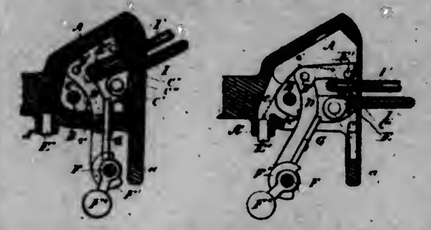
384,472. ELECTRIC WINDING ATTACHMENT FOR CLOCKS. ANDREW J. ROBIN, Augusta, Kans. Filed Oct. 20, 1887. Serial No. 252,753. (No model.)

Claim.—1. In an electric winding attachment for clocks, the combination of an electric motor having a reducing-train, a main arbor having a driving-wheel upon it provided with an inwardly-projecting pin, a spring-barrel journaled to revolve upon the main arbor and having a spring within it secured to it and to the arbor and provided with a winding-wheel meshing with the train from the motor and a reducing-pin upon its periphery, a weighted lever upon the shaft between the barrel and the driving-wheel, having an arm at one end projecting over the periphery of the barrel and engaged by the pin of the same, and a switch for opening and closing the circuit for the motor and provided with a spring-actuated lever or arm projecting inward to engage and be depressed by the weighted lever, as and for the purpose shown and set forth.

2. In an electric winding attachment for clocks, the combination of a motor having connection to the battery and to the frame, a winding-wheel and spring-barrel revolved by the motor and having a projecting pin upon the periphery of the barrel, a lever upon the arbor of the barrel, having a weighted end and an arm at the other end projecting over the periphery of the barrel and engaging the pin, a driving-wheel upon the arbor having an inwardly-projecting pin engaging the end of the lever, an insulating-block having a circular recess in its face, a disk pivoted in the recess and having segmental notches in its periphery and an inwardly-projecting insulated arm engaged by the arm of the weighted lever, a spring for raising the arm of the disk, a pin in the recess for stopping the disk projecting in one segmental notch, and strips upon one edge of the insulating-block, having their ends in contact with the portions of the periphery of the disk at the ends of the other segmental notch and having wire-connections to the battery and to the frame of the clock, as and for the purpose shown and set forth.

3. In an electric winding attachment for clocks, the combination of magnets arranged in a segment of a circle and having wire-connection at one end with a switch-plate upon the frame connected to the battery, an armature-cylinder having armature-bars in its periphery, shunt-wire coils between the magnets and having one end of their wires connected to the back of the clock-frame, a commutator upon the armature-shaft, brushes having wire-connection with the magnet-coils and the shunt-coils, a barrel upon the main arbor having the spring secured to it and winding the same by being rotated by the motor, a stop upon the main arbor for engaging a switch-lever, and a stop upon the time-train for carrying the stop of the barrel further, and a switch having a lever engaging the said stops and breaking the circuit when engaged and having wire-connection with the battery and with the frame, as and for the purpose shown and set forth.

384,473. VELOCIPEDE-SADDLE. GEORGE SALTER and JOHN WALKER, West Bromwich, England. Filed Oct. 26, 1887. Serial No. 253,023. (No model.) Patented in England Apr. 7, 1887, No. 5,173.



Claim.—1. The combination, with the bank of a velocipede-saddle, of volute springs *b*, connected at their inner ends to the square ends c^2 of a spindle, *c*, whose inner or plain middle part works within bearings or loops d^2 d^2, carried by bracket-framing *d*, secured to a framing of a machine by an adjustable clip, and with the outer end of the said springs connected to the under side of the seat by its hooked ends b^2 engaging and hooking into eyes or loops of hanging-bracket connections *g*, all substantially as set forth.

2. The combination, with a saddle-seat, *a* a^2 a^3, volute or scroll spring *b*, and bracket *d*, of an axis and arm, *e* e^2 e^3, which is operated by a screw passing through a screwed hole in the said bracket, substantially as set forth.

3. The combination, with a spring, *b*, inner end, b^2, and its axis *e* e^2 and arm e^3, of a screw, *c*, and screwed hole d^2 in bracket or framing through which it passes, as set forth.

4. The combination, with the front of the seat of a saddle-frame, *d*, and hooked connection-bracket *h* h^2, of a scroll-bracket, *i*, with its inner end surrounding a square spindle, as set forth.

384,474. CAR-COUPLING. JAMES SCOTT, Brockville, Ontario, Canada. Filed Dec. 14, 1888. Serial No. 135,847. (No model.)

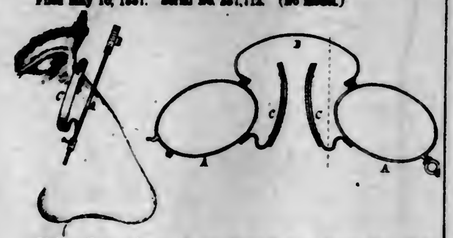
Claim.—1. The combination of the draw-head A, pivot B, lever C, stop C', pins C' C'' and *c'*, notch *c*, link I, lever D, pivot D', hub D'', latch E, pivot E', cord *e*, weight E'', guide A', finger G, shaft F, cams F', and weights F'', substantially as set forth.

2. In a car-coupler, the combination of the lever C, having removably connected to its lower forward end the coupling-link I, held thereon in a fixed position, and having at the upper edge of said end the stop C' and in its lower edge the notch *c*, the lever D, having its upper part forked and pivoted to the lever C forward of its pivot center, and having pivoted to its lower part the swivel-finger G, adapted to enter the notch *c*, and the latch E, pivoted in the upper forked forward end of the lever D and adapted to engage the stop C', substantially as set forth.

3. In a car-coupler, the combination of the lever C, having at its upper edge on the forward end the stop C', the link I, pivoted to said forward end below said stop C', pivot C', and pin *c'*, adapted to carry said link removably in a fixed position and approximately in a line with the upper edge of the forward end of said lever, substantially as set forth.

4. The combination of the lever C, having stop C', lever D, latch E, pivot E', and weight E'', substantially as set forth.

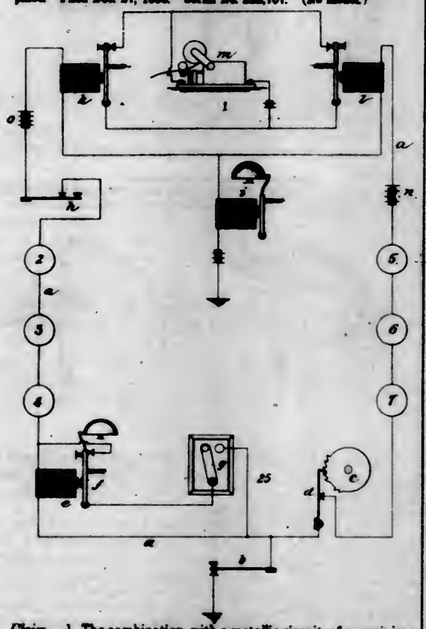
5. The combination of the lever C, lever D, latch E, stop C', and finger G, substantially as set forth.



6. The combination of the draw-head A, pivot B, lever C, and link I, substantially as set forth.

7. The combination of the lever D, shaft F, cams F', weights F", and finger G, substantially as set forth.

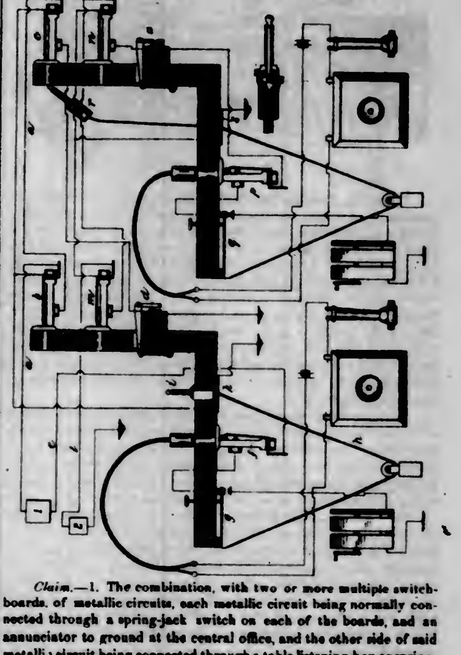
8. The combination of the lever C, having stop C', pin c', and notch c, lever D, latch E, finger G, and link I, substantially as set forth.



9. The combination of the levers C and D, latch E, stop C', link I, pin C", and finger G, substantially as set forth.

384,475. SPECTACLES. ARMINIA SCHNEIDER, New York, N. Y. Filed May 10, 1887. Serial No. 237,712. (No model.)

Claim.—In eyeglasses, the combination of a flexible bow-spring and frames for lenses, with elastic nose-pieces attached at their lower ends to said frames, the bottom part of said nose-pieces being bent inward toward the eyes, the middle part being bent parallel, or nearly so, to the plane of the lenses, and the upper ends being unattached and freely movable, all substantially as specified.



384,476. POLICE ELECTRIC SIGNAL SYSTEM. CHARLES R. SUMNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Serial No. 222,707. (No model.)

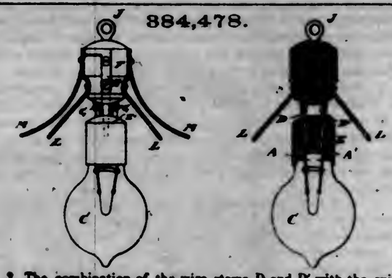
Claim.—1. The combination, with a metallic circuit, of a receiving-instrument in a local circuit and two relays, one on each side thereof, a branch circuit to ground, including battery and signal-receiving device, batteries in the metallic circuit, one on each side of said ground-branch, and a circuit-breaking device, all at the central station, and district signal-boxes included in said metallic circuit at different substations, and a normally-open ground-branch at each of said stations, including a key for closing the metallic circuit to ground, and a signal-receiving device at each station, substantially as described.

2. The combination, with a metallic circuit, including a central station and several sub-stations, of a branch circuit at the central station from said metallic circuit to ground, said branch including a battery and electro-magnet of a signal-receiving device and battery included in said metallic circuit on each side of said ground-branch at the central station, signal-transmitting instruments included in said metallic circuit at different stations, and a key at each of one or more of the stations, whereby the metallic circuit may be closed to ground at said key or keys, as desired, substantially as described.

384,477. MULTIPLE SWITCH-BOARD CIRCUIT. CHARLES R. SUMNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Serial No. 222,710. (No model.)

Claim.—1. The combination, with two or more multiple switch-boards, of metallic circuits, each metallic circuit being normally connected through a spring-jack switch on each of the boards, and an annunciator to ground at the central office, and the other side of said metallic circuit being connected through a table listening-key or spring-jack and a flexible cord and plug to ground, a loop-plug, with its cord, including a telephone at each board, and switching devices whereby two metallic circuits may be connected together by inserting the plug which forms the terminal of one line in a spring-jack switch of the other line, while the annunciator of the line whose plug is inserted is left in circuit as clearing-out annunciator.

2. The combination, with two or more multiple switch-boards, of metallic circuits, each metallic circuit being normally connected through a spring-jack switch on each of the boards and an annunciator to ground at the central office, and the other side of said metallic circuit being connected at the central office with a flexible cord and terminal plug normally resting upon a ground-connection, a loop-plug with its cord, including a telephone at each board, and switching devices whereby two metallic circuits may be connected together by inserting the plug which forms a terminal of one line in a spring-jack switch of the other line, while the annunciator of the line whose plug is inserted is left in circuit as clearing-out annunciator.

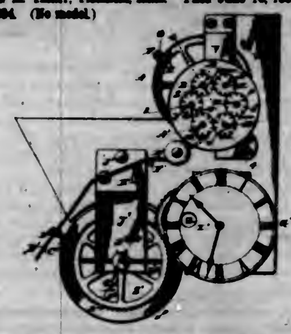


3. In a metallic-circuit telephone system, the combination, with one end of the circuit connected through a switch upon the switch-board, of the other end of the same circuit connected to a flexible cord and plug upon the same switch-board, whereby connections may be made with either or both ends of the said metallic circuit upon the same board.

4. In a telephone-exchange system, a circuit normally connected to ground at the central office and through an annunciator and switch to the subscriber's station and back to the central office, in combination with a flexible cord and plug included in said circuit and a ground-connection for said plug, said plug, when lifted and inserted in the switch of the line, completing a metallic circuit between the central office and subscriber's station and removing both ground-connections.

384,478. INCANDESCENT-LAMP SOCKET. JOHN SPINK and CHARLES GARNETT, Bradford, County of York, England. Filed Jan. 26, 1888. Serial No. 262,092. (No model.)

Claim.—1. The combination of the platinum links or lamp-terminals A and A' with the wire stems D and D' and the collar E, having the interior space E' filled with insulating material, all being arranged substantially in the manner and for the purpose described.



384,478.

2. The combination of the wire stems D and D' with the spiral springs G and terminals H and H', in the manner and for the purpose described.

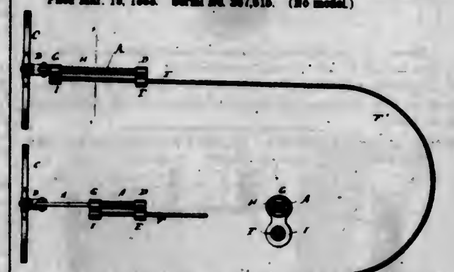
3. An electric-lamp holder having the two spiral springs G inclosed within a holder-block, and surrounding and embracing the wire stems D D', which are connected with the terminals of the lamp, substantially as described.

384,479. REGISTER AND RECORDER FOR REVOLVING SHAFTS. SILAS H. TERRY, Pittsfield, Mass. Filed June 10, 1887. Serial No. 240,894. (No model.)

Claim.—1. The combination, with the clock having the wide gear-wheel mounted on its mainspring-shaft, and the plate J', having the bearing in its lower end, of the screw having the collar, the screw-cap, the revolving record-drum having the central pillar formed with the longitudinal threaded aperture, and the gear-wheel mounted upon said pillar, substantially as set forth.

2. The combination, with the clock having the wide gear-wheel mounted on its mainspring-shaft, of the bearing-plate having the slot and the bearing at the inner end of the said slot, and the reduced slot, the screw having the collar provided with the lug, the screw-cap, and the revolving record-drum having the central pillar formed with the longitudinal threaded opening and the gear-wheel mounted upon it, substantially as set forth.

3. The combination, with the clock having the wide gear-wheel mounted on its mainspring-shaft, of the bearing-plate formed with the main slot and the bearing at the inner end of the said slot, and having the reduced slot, as described, the screw having the collar provided with the lug, the screw-cap formed with the concaved inner end, and the revolving record-drum having the central pillar formed with the longitudinal threaded opening and the gear-wheel mounted upon it, substantially as and for the purpose herein set forth.

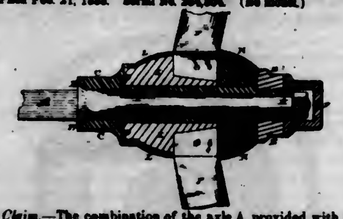


4. The combination, with the mechanism consisting of the parallel disks, the series of shafts mounted therein and having the intermeshing pinions and gear-wheels, the first shaft having the large gear-wheel on its projecting rear end, and one of the said shafts having the lug secured upon it, the dial having the circular scales marked upon it, and the indicator-hands secured upon the outer ends of the said shafts, of the centrally-pivoted spring-actuated lever having the pointed marker at its lower end, and the mechanism consisting of the clock having the wide gear-wheel mounted on its mainspring-shaft, the plate J', having the bearing in its lower end, the screw having the collar, the screw-cap, the revolving drum having the central pillar formed with the longitudinal threaded opening, the gear-wheel mounted upon said pillar, and the record band or strip of paper or other suitable material removably secured around the said drum, all substantially as set forth.

5. The combination, with the mechanism consisting of the parallel disks, the series of shafts mounted therein and having the intermeshing pinions and gear-wheels, the first shaft having the large gear-wheel on its projecting rear end, and one of the said shafts having the lug secured upon it, the dial having the circular scales marked upon it, and the indicator-hands adjustably secured upon the outer ends of the said shafts, of the centrally-pivoted spring-actuated lever having the pointed marker at its lower end, and the mechanism consisting of the clock having the wide gear-wheel mounted on its main-spring-shaft, the bearing-plate formed with the wide slot, the bearing, and the reduced slot, the screw having the collar provided with the lug, the screw-cap, the flanged drum having the central pillar formed with the longitudinal threaded opening, and the gear-wheel mounted upon said pillar, and the record-strip of paper or other suitable material removably secured around the said drum, all substantially as and for the purpose herein set forth.

384,480. PRODUCTION OF BLUE COLORING-MATTER. EDUARD ULLRICH, Hochst-on-the-Main, Prussia, Germany, assignor to the Farbwerke, vormals Meister, Lucius & Brüning, same place. Filed Dec. 14, 1887. Serial No. 257,577. (No specimens.) Patented in Germany Dec. 20, 1883, No. 28,573; in France Dec. 27, 1883, No. 173,137, and in England Jan. 1, 1884, No. 49.

Claim.—The production of methylene-blue by subjecting para-amido-dimethylaniline, hydrochlorate of dimethylaniline, and hyposulphite of sodium to the action of an oxidizing agent, as bichromate, with heat, substantially as set forth.



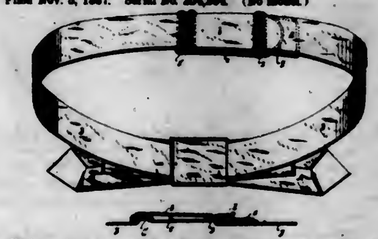
384,481. SPECTACLE-TEMPLE. MAURICE A. VANDERWAAG, Rensselaerville, assignor of one-half to Adolph Reichtold, Brooklyn, N. Y. Filed Mar. 19, 1888. Serial No. 267,615. (No model.)

Claim.—1. In spectacles, the combination, with a lens-frame or lenses, of temples hinged to the same, each temple being composed of a hinged guide-piece and a sliding ear-wire, collars provided with eyes secured on the guide-piece and ear-wire, respectively, and a spiral spring surrounding the guide-piece between said collars, substantially as herein shown and described.

2. In spectacles, the combination, with the lenses or lens-frames, of a guide-piece hinged to the outer end of each lens or lens-frame, which guide-piece is square in cross-section, a collar fixed on the swinging end of each guide-piece, an eye formed on the bottom of each of said collars, an ear-wire having its front end passed through said eye, a collar fixed on the front end of each ear-wire, an eye with square aperture on said collar, through which said square aperture the guide-piece is passed, and a spring coiled around the guide-piece between the fixed collar and movable eye on said guide-piece, substantially as herein shown and described.

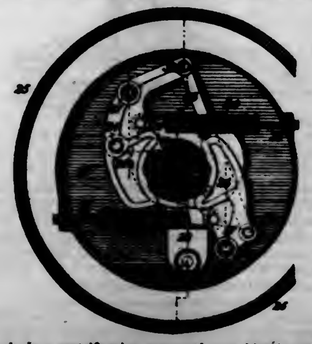
384,482. VEHICLE-WHEEL. JOHN K. VAN PELT, Hawkville, Tenn. Filed Feb. 21, 1888. Serial No. 264,994. (No model.)

Claim.—The combination of the axle A, provided with the collar B, which is beveled upon its inner side, the box C, having its inner end made to conform to the collar and provided with the shoulder D at its inner end and a screw-thread at its outer end, the wooden part I, having inclined sockets to receive the tenons O on the inner ends of the spokes P, the wooden part J, the shell N, the nuts E G, and the cap F, substantially as shown and described.



384,483. OVERSHOE. ALBERT B. WALTERS, Philadelphia, assignor of one-half to Joseph H. Black, Columbia, Pa., and David L. Oliver, Camden, N. J. Filed June 21, 1887. Serial No. 241,975. (No model.)

384,483.



Claim.—As an improved article of manufacture, a rubber boot or shoe having its sole or tread provided with one or more recesses or depressions and strips of textile material cemented in said depressions, so as to be removable therefrom when worn out, substantially as set forth.

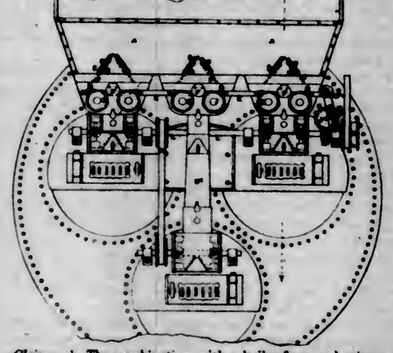
384,484. NECKSCARF. WILLIAM I. WEINBERG, New York, N. Y. Filed Nov. 3, 1887. Serial No. 254,994. (No model.)

Claim.—As a new article of manufacture, a scarf or bow having one end, *b*, of the band B turned over outwardly upon itself to form a bight, *c*; a slide, C, to one of the bars of which the end of the band is attached, the body of said band being passed through said slide and under the said bar, a loop, D, running loosely in the bight *c*, and a hook, E, composed of wire forming the parallel bars *e e* and U-shaped engaging-hook, said bars *e e* being laid upon the band and fastened thereto at the end opposite that to which the loop D is attached, substantially as described.

384,485. GOVERNOR. H. HERMAN WESTINGHOUSE and FRANCIS M. ETTER, Pittsburg, Pa., assignors to the Westinghouse Machine Company, same place. Filed Jan. 19, 1888. Serial No. 261,573. (No model.)

Claim.—1. In a centrifugal governor, the combination of a case adapted to be mounted upon and rotate with a driving-shaft, said case constituting a receptacle for lubricating material, which is closed both endwise and peripherally to prevent escape of the same, a weight pivoted to and within said case, and a movable eccentric located outside of said case and coupled to the weight, substantially as set forth.

2. In a centrifugal governor, the combination of a supporting-disk, a case connected by a tight joint at one end to the disk and having an opening adjoining its center at its opposite end, an eccentric located outside of the case and secured to a carrier pivoted on the case, a weight pivoted to and inclosed within the case, and a link inclosed within the case and connecting the weight and eccentric-carrier, substantially as set forth.



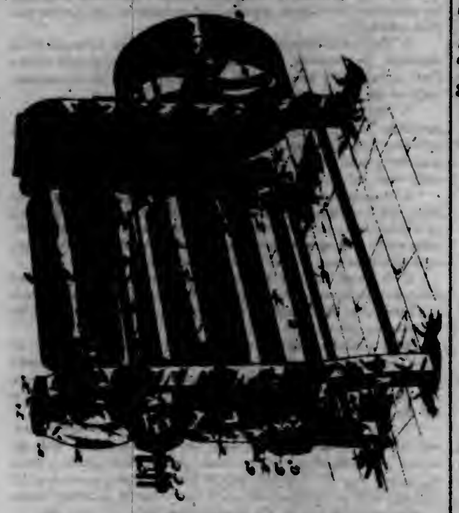
3. In a centrifugal governor, the combination of a supporting-disk, a case connected by a tight joint at one end to the disk and having an opening adjoining its center at its opposite end, a weight and an eccentric-carrier, each pivoted to and inclosed within the case, a link coupling the weight and carrier, and an eccentric secured to the carrier by connections passing through the central opening of the case, substantially as set forth.

4. In a centrifugal governor, the combination of a supporting-disk, a case connected by a tight joint at one end to the disk and having an opening adjoining its center at its opposite end, an eccentric-carrier pivoted to the inside of the case and fitting on one side against the same around the inside of its central opening and on the other side against the hub of the supporting-disk, an eccentric located on the outside of the case and secured to the carrier by connections passing through the opening of the case, a weight pivoted to the inside of the case, and a link coupling said weight to the carrier, substantially as set forth.

5. In a centrifugal governor, the combination of an inclosing-case adapted to be mounted upon a driving-shaft and having an end opening adjoining its center, an eccentric-carrier pivoted to the inside of the case and coupled to a weight also pivoted therein, and an eccentric secured to the carrier through the central opening of the case, and having an internal oil-chamber provided with a passage communicating with the interior of the case, substantially as set forth.

6. In a centrifugal governor, the combination of a supporting plate or disk, a pair of weights pivoted thereto, a connecting-link coupled at its ends to said weights in such relation to their pivots as to form lever-arms of different lengths on the respective weights, which difference of length is maintained in all positions of the weights, and an eccentric coupled to the weight having the longer connecting-link arm, substantially as set forth.

384,486. MECHANICAL STOKER. WILLIAM WHITTAKER, Burnley, County of Lancaster, England. Filed Oct. 13, 1887. Serial No. 252,726. (No model.) Patented in England Jan. 13, 1887, No. 502.



Claim.—1. The combination, with a boiler-furnace having a suitable hopper leading to said furnace, of one or more feed-rolls located in the said hopper, reciprocating pawl-carriers having pawls which engage with ratchets on the shafts of said rolls, and one or more rotary shovels arranged in said hopper below said feed-rolls, substantially as described.

2. The combination, with a boiler-furnace having a hopper leading thereto, of one or more feed-rolls located within the hopper, a reciprocating bar having pawls engaging with ratchets on the feed-rolls, one or more rotary shovels arranged in the hopper below the feed roll or rolls, and a lever pivotally connected to said bar and to a rotating disk having a crank-pin engaging with said lever, substantially as described.

3. The combination, with a boiler-furnace having hoppers leading from the exterior thereto, of feed-rolls arranged in said hoppers, inclines arranged in the hoppers above said feed-rolls, and regulating-slides mounted on said inclines, to decrease or increase the opening leading to the feed-rolls, substantially as described.

384,487. IRONING-MACHINE. THOMAS S. WEAR, Albany, N. Y. Filed Nov. 6, 1886. Serial No. 218,126. (No model.)

Claim.—1. In a machine of the class described, the standards having openings for journal-bearings, lateral flanges, and polygonal openings, in combination with tie-tubes screw-threaded and with flanged couplings having polygonal bodies and threaded to fit the tie-tubes, substantially as specified.

2. In a machine of the class described, standards having polygonal openings, flanged couplings adapted to fit said openings, tie-tubes, and a spacing-tube, these parts being constructed, combined, and arranged substantially as specified.

3. In a machine of the class described, the combination of right and left hand screw-threaded tie-tubes, similarly-threaded couplings, a spacing-tube, and standards constructed to receive the couplings and support the spacing-tube, shafts passing through the tubes and standards, and gears mounted on the ends of the shaft, substantially as specified.

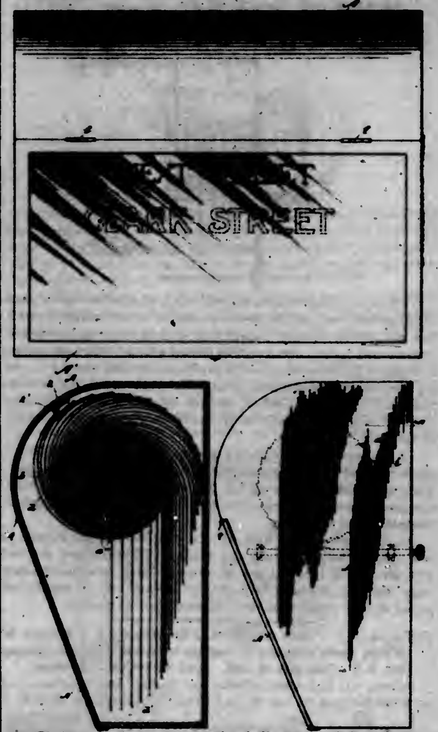
4. In a machine of the class described, the combination of an ironing and a clothed roller, suspension-links having oppositely-arranged legs, boxes arranged between said legs and upon the shaft of the clothed roller, and springs arranged between said boxes and one of the opposite legs of the suspension-links, and means, substantially as described, for raising and lowering the suspension-links and for regulating the tension of the springs, substantially as specified.

5. In a machine of the class described, the combination, with an ironing-roller, a clothed roller arranged above and a clothed roller arranged below said ironing-roller, and with the boxes of said clothed rollers, of suspension-links provided with legs, interposed springs, connecting-rods, a rock-shaft having oppositely-disposed rock-arms, a toothed sector, a pawl, and a sector-operating lever, substantially as and for the purpose set forth.

6. In a machine of the class described, a standard provided with a lateral gear, inclosing-flange, an open-sided seat for a fixed box, openings for movable boxes, and bosses for tie-tubes, substantially as specified.

7. In a machine of the class described, the combination, with a standard having a polygonal opening, of a coupling for a tie-tube, having a polygonal body to fit the opening and a flange to bear upon the wall of the standard, and a tie-tube adapted to fit the coupling, a shaft passing through the tube and taking bearing in the coupling, and a gear mounted on the shaft, substantially as specified.

8. In a machine of the class described, standards each having a bearing for a shaft projected from the wall of the standard to form a hub or boss, in combination with a tube encircling the shaft and supported upon the hubs or bosses of the bearings, and means for binding the standards and tubes together, substantially as specified.



9. The standard D, provided with the lateral flanges D^2, polygonal openings D^3, and box-openings D^4, each having the border D^5, seat D^6, the bracket D^{17}, rock-shaft bearing D^{18}, and bolt-lugs D^{19}, the whole formed as a single casting, substantially as specified.

10. The suspension-link J, perforated to embrace a shaft, and provided with the legs J^2 and J^3, substantially as specified.

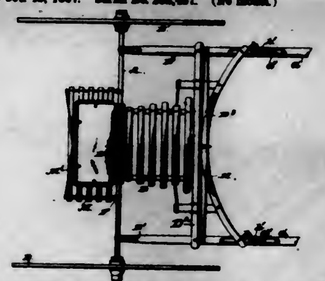
11. The combination, with the rock-shaft G, of the toothed sector G', having a socket for the lever K, the pawl G^3, the arms K' K^3, the rods K, and the movable bearings of the clothed rollers, substantially as specified.

12. The combination, with the standard D, having the opening D^4, of the flanged box A^2, the springs I, the tension-bolt I^2, and the suspension-link J, having the lugs J^2 J^3, substantially as specified.

384,488. STREET OR STATION INDICATOR FOR CARS. WILLIAM P. WILLIAMS, Chicago, Ill., assignor of two-thirds to William P. Johnson and Arthur Crandall, both of same place. Filed Jan. 26, 1888. Serial No. 262,204. (No model.)

Claim.—1. A street or station indicator consisting of a case, A, and a revolvable displaying-drum journaled within said case, and consisting of a central shaft, *b*, disks *a a'*, mounted upon said shaft and provided with seats upon their inner surfaces, rods *c*, of flexible material, having their ends sustained within said seats, whereby said rods may be readily sprung into and out of place, and display-sheets attached to said rods, substantially as described.

2. A street or station indicator consisting of an inclosing-case, A, a revolvable display-drum journaled within the upper part of said case and provided with an annular series of dependent flexible display-sheets, said sheets being loaded at their lower ends, and a spring-actuated swinging bar resting upon said sheets and connected by a pivotal joint to the inside of the case, and engaging consecutively the weighted ends of the display-sheets, substantially as described.



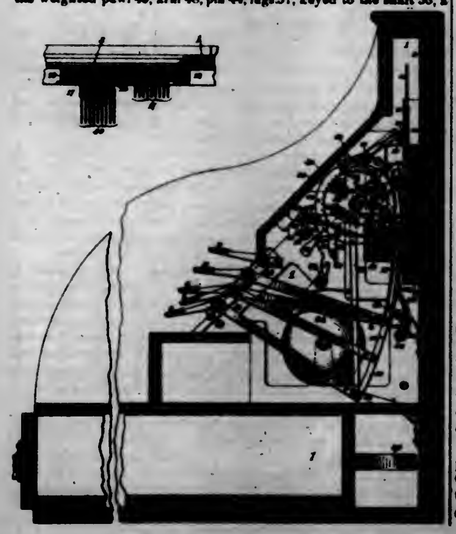
3. A street or station indicator consisting of an inclosing-case, A, having a glass door at its lower part and a revolvable display-drum journaled within its upper part, said drum consisting of a central shaft, *b*, disks *a a'*, mounted upon said shaft and provided with annular seats upon their inner surfaces, rods *c*, of flexible material, having their ends sustained within said seats, display-sheets loaded at their lower ends and attached to said rods, a swinging bar connected by a pivotal joint to the inside of the case and resting upon said sheets, and a spring, *k'*, intermediate between said bar and case, substantially as described.

4. A street or station indicator consisting of an inclosing-case, A, and a revolvable display-drum journaled within said case and composed of a central shaft, *b*, disks *a a'*, mounted upon said shaft, one of said disks having upon its periphery a series of ratchet-teeth, a sliding bar, *j*, journaled within said case and projecting therefrom, said bar being provided with a spring-pawl engaging with the ratchet-

teeth and with stops for limiting its throw, and display-sheets dependent from the drum, substantially as described.

5. A street or station indicator consisting of an inclosing-case, A, a revoluble display-drum journaled within said case and composed of a central shaft, *b*, provided with a series of longitudinal grooves or channels, disks *a a'*, secured to the ends of said cylinder and having on their inner surfaces, respectively, annular seats, and flexible rods *c*, adapted to lie within the grooves of the cylinder and have their ends secured in said seats, substantially as described.

384,489. ROAD-CART. ANDREW M. WHEEL, White Pigeon, Mich. Filed Oct. 15, 1887. Serial No. 252,467. (No model.)



Claim.—1. The combination, with the draft-bars having the plates *b* formed with ears and the circle-bar secured to and uniting the draft-bars and having an under central loop, of the pole having the angular arms secured thereto, with knuckles formed with the outer ends thereof to engage with the ear-plates on the draft-bars, the truss-braces mounted in connection with said angular arms, and the steel plate secured to the under side of the inner end of the pole, which is adapted to engage with the central loop on the under side of the circle-bar, substantially as described.

2. The combination, with the draft-bars having the ear-plates and under lugs and loops and the circle-bar having the central under loop, of the thills and pole having knuckle and under plates to be interchangeably mounted in connection with the draft-bars and circle-plate, substantially as described.

3. The combination, with the axle A, of the rack M, secured in rear thereof, the seat D', and the straps M', which connect the seat with the rack M and cross and are secured to each other immediately under the seat, whereby the motion of the seat will be equally imparted to both ends of the rack, substantially as described.

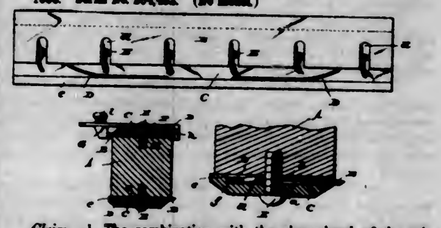
384,490. CASH REGISTER AND INDICATOR. WILLIAM W. WYTHE, Parker's Landing, Pa., assignor to William H. Wythe, Chautauqua, N. Y. Filed May 16, 1887. Serial No. 238,282. (No model.)

Claim.—1. In a cash indicator and register, the combination of the weighted pawl 49, arm 48, pin 44, lugs 57, keyed to the shaft 55, a

finger, 29, situate in the path of the cash-drawer, arms 27 and 56, and wheels 32 and 34, whereby the pawl is brought into action only when the computing mechanism is at rest, substantially as and for the purpose specified.

2. The combination of the shaft 55 and devices, substantially as described, for operating the same, lugs 57, arranged spirally on the shaft, arms 48 and pawls 49, and registering-wheels 32 36, substantially as and for the purposes specified.

3. The numbered slides arranged in series from front to back, said slides having the arms 17 projecting therefrom and arranged in the same horizontal plane, and also having slots or openings of successively greater width, so that the arms 17 shall not interfere with each other, substantially as and for the purposes described.



4. The numbered slides arranged in series expressing the different digits, the zero-slides of each series being loosely connected with the zero-slide of the series below, whereby the rise of one of the zero-slides shall carry with it the zero-slides of each of the lower series, substantially as and for the purposes described.

5. In a cash register and indicator having a series of figured slides, the combination of retaining-pawls 23, rods 16, the cash-drawer 7, pivoted arms 25, 26, and 27, and finger 29, substantially as and for the purpose specified.

6. In a cash indicator and register, the combination of two or more series of figured slides representing units, tens, &c., key-levers connected with said slides, graded arms 40, connected with said levers, arms 36, arms 36, pawls 37, and wheels 32 and 35, substantially as and for the purpose specified.

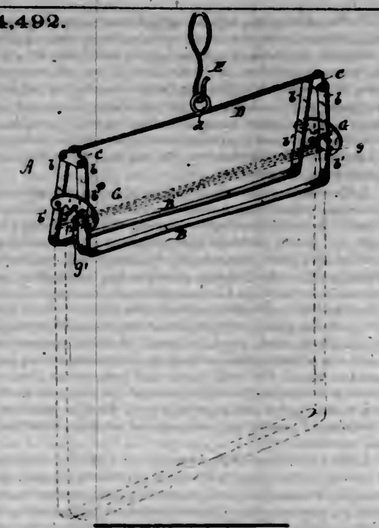
7. In a cash-register, the combination of a series of figured register-wheels representing units, tens, &c., pawls engaging with the second and succeeding register-wheels, pins 44, and lugs 48, a shaft, 55, having lugs 57 arranged spirally thereon, spring gear-wheel 53, and pinion 54, pivoted arms 56 and 27, and finger 29, and cash-drawer 7, substantially as and for the purposes specified.

384,491. CUTTER-HEAD AND MEANS FOR ADJUSTING THE CUTTERS OF THE SAME. WILLIAM R. ALLEN, Cape Vincent, N. Y., assignor of one-half to Lewis C. Martin, same place. Filed Feb. 18, 1888. Serial No. 264,462. (No model.)

Claim.—1. The combination, with the planer-head, of the rabbeted cap-plates, the cutter-blades, and the springs interposed between the cap-plates and the planer-head and adapted to engage the back edge of the cutter, substantially as specified.

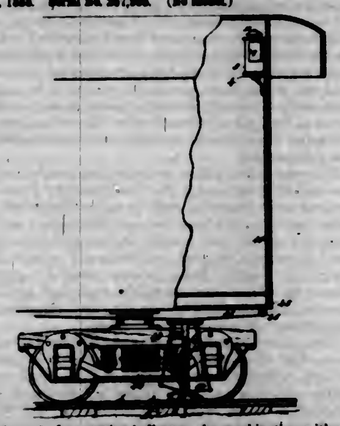
2. The combination, with a planer-head, of the cap-plates rabbeted, as described, and being deepest adjacent to the rib forming the rabbet, the springs secured within the rabbeted portion of the caps, and the cutters arranged in advance of the springs, substantially as specified.

3. The combination, with a planer-head, of the cutter-blades constructed as described, the cap rabbeted on its inner side, and the springs D, having one end secured in the said rabbeted portion and adapted to bear against the rib *c*, and their opposite ends curved forwardly to engage the rear edges of the cutters, substantially as specified.



384,492. PANTALOONS OR GARMENT STRETCHER. WILLIAM W. ATHERTON, Philadelphia, Pa., assignor to Eugene Pearson and George P. Freeman, both of New York, N. Y. Filed Sept. 20, 1887. Serial No. 250,214. (No model.)

Claim.—1. A garment holder and stretcher composed of parallel U-shaped frames made of flat or plate bars placed edge to edge and separately pivoted at their ends to links C, a bar, D, connecting said links, and clamping devices at each end of one of said frames for engagement with studs at corresponding ends of the other of said frames, substantially as set forth.



2. The combination of frames B B, having ends *b'*, link-connections C for said ends, segmental or curved notched bars on the ends of one of said frames, and pins on the ends of the remaining frame for engagement with said bars, substantially as set forth.

3. A garment holder and stretcher comprising two parallel frames placed edge to edge and having their ends separately pivoted to links C, a bar, D, connecting said links, and devices at each end of one of the frames for engagement with the other of the frames for holding or clamping them together, substantially as set forth.

384,492.

384,493. AUTOMATIC STATION-INDICATOR. RICHARD H. RADCLIFF, Jr., Savannah, and LEMUEL J. FARRIS, Barroughs, Ga. Filed Mar. 21, 1888. Serial No. 267,903. (No model.)

Claim.—1. In a station-indicator, the combination, with a name-belt and its actuating-rollers provided with gear-wheels, of a shaft carrying a spur-gear and a ratchet-wheel, a chain-wheel loosely mounted on said shaft and provided with a reversible pawl to engage the ratchet-wheel, chains attached to said chain-wheel, levers connected with the lower ends of said chains beneath a railway-car, and cams located adjacent to the track to actuate said levers for operating the chain-wheel and station-indicating mechanism and for setting the chain-wheel back after each station is passed, substantially as described.

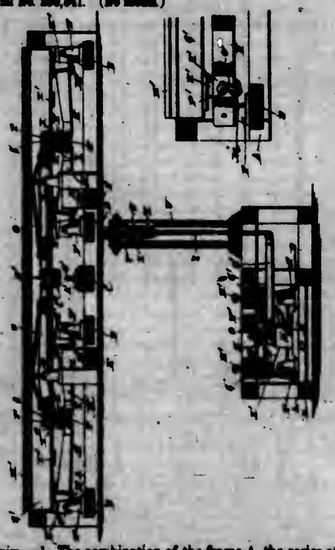
2. In a station-indicator, the combination, with a name-belt and its actuating and supporting rollers, of a horizontally-pivoted bar provided at each end with arms, tension-rollers journaled in said arms and located on opposite sides of the name-belt to bear thereon from opposite directions, a pulley on one of said arms, a spiral spring, and a cord connecting said spring with the pulley, whereby the tension of the belt is automatically regulated, substantially as described.

3. In a station-indicator, the combination of the casing 5, the name-belt 12, the rollers 13, provided with gears 14, the shaft 16, carrying a spur-gear, 15, and a ratchet-gear, 35, a chain-wheel, 37, loosely mounted on said shaft 16, a reversible pawl, 38, and its spring 40, carried by said chain-wheel, the chains 43, pulleys 46 and 47, bar 48, levers 54 and 55, supported by said bar and connected with the chains and track-cams 3 to actuate said levers, substantially as described.

4. In a station-indicator, the combination, with the chain-wheel 37 and chains 43, of the bar 48, clipped to the equalizing-beam 49, the levers 54 and 55, supported by said bar, one of said levers being connected with the chains 43 and the other provided with lateral projections or lugs 56 and 57, and the cams 3, located adjacent to the rail on one side of the track and alternately at varying distances therefrom, substantially as described.

5. In a station-indicator, the combination, with the name-belt 12, of the horizontally-pivoted bar 20, having at its ends arms 19, the tension-rollers 18, journaled in said arms, the pulley 22, spring 24, and cord 23, substantially as described.

384,494. BABY-CARRIAGE. GEORGE H. BAKER, Rome, N.Y. Filed Mar. 13, 1888. Serial No. 267,026. (No model.)



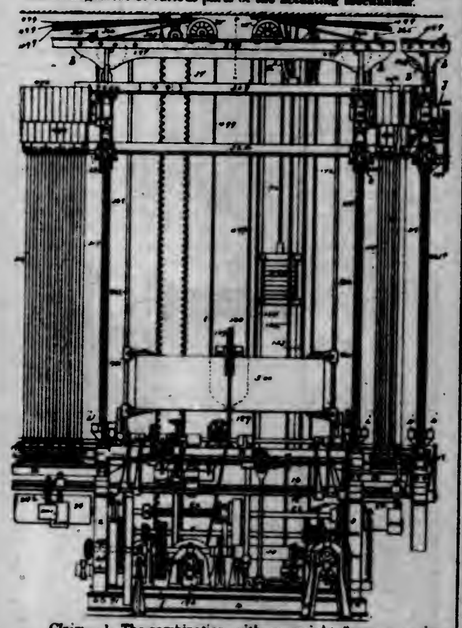
Claim.—1. The combination, with the baby-carriage, of the swinging runners hung on the under side of the carriage, and a lever connected to the runners to raise and lower the same, and having an offset adapted to engage the rear axle of the carriage to lock the runners in their lowered positions, as set forth.

2. The combination of the carriage, the swinging runners hung on the under side of the carriage, and the lever having the downwardly-diverging arms secured at their lower ends to the runners and provided with a locking-offset, as set forth.

3. The combination of the carriage, the longitudinal beams B B, secured to the bottom thereof, the rock-shaft journaled in bearings on said beams and having the integral depending arms at its ends, runners pivoted to the lower ends of said arms, and the lever secured to the runners projecting up in rear of the carriage and having a locking-offset, as set forth.

384,495. SCALES FOR WEIGHING RAILWAY-CARS. JAMES W. BALLARD and HARVEY L. PERRIN, Toledo, Iowa. Filed Jan. 5, 1888. Serial No. 259,941. (No model.)

Claim.—1. The combination of the frame A, the series of pivoted levers arranged in the ends of the frame, the levers of each series converging toward a common center, the blocks I, connected to the inner ends of the levers of each series, the longitudinal levers pivoted within the frame and having their inner ends close together and having their outer ends provided with the openings P, the pins S, inserted transversely through said openings, the bolts R, depending from said pins and passing through the blocks I, the nuts on said bolts below the blocks I, the scale-beam, and connections between the scale-beam and the longitudinal levers, as set forth.



2. The combination of the frame A, the cross-beam C within the same, the series of pivoted converging levers arranged in the ends of the frame, the longitudinal levers O, pivoted within the frame and having their outer ends connected to the ends of the converging levers and their inner ends brought close together, the scale-beam, the lever C', having its opposite ends connected, respectively, to the scale-beam and the levers O, the eye B' on the cross-beam C, and the yoke E', depending from the lever C' and pivotally connected to the eye B', as set forth.

3. The combination of the frame A, the series of converging levers pivoted in the ends of the frame, the blocks I, having the diverging ears K, the links L, having their upper ends pivoted between said ears and their lower ends connected to the inner ends of the converging levers, the longitudinal levers O, having their outer ends connected to the blocks I and their inner ends brought close together, the scale-beam, and connections between the scale-beam and the inner ends of the levers O, as set forth.

4. The combination of the frame A, the series of converging levers pivoted in the ends of the frame and having openings N' in their outer ends, the platform-beams, the hangers K', depending therefrom and composed of parallel arms passing on opposite sides of the levers, the bolts M', passed through the lower ends of said parallel arms beneath the levers, the bolt P', passed transversely through the opening N', the link O', engaging the bolts P' M', the scale-beam, and connections between the scale-beam and the converging levers, as set forth.

384,496. VERTICAL SPINNING-MULE. HERBERT T. BARNWELL, Springfield, Mass. Filed Mar. 10, 1887. Serial No. 230,491. (No model.)

Brief.—The carriage, which has mounted thereon the roving-drums, &c., is vertically reciprocated. Most of the changes are effected by a spring-actuated shipper-rod, which is released for successive movements by a series of stops, and which throws into and out of gear in succession a series of clutches. The principal features of the invention relate to the means for starting, stopping, and holding the carriage; the means for starting and stopping the spinning, backing off, and winding on; the means for regulating the winding on; the means for effecting and regulating the building; the means for regulating the draft; the construction of the carriage, and construction and arrangement of various parts of the actuating mechanism.

Claim.—1. The combination, with an upright frame, a carriage provided with a series of roving-drums and roving-delivery rollers, and means for vertically reciprocating said carriage on said frame, of a vertical rack secured to said frame and extending over a portion of the travel of said carriage, a shaft mounted on said carriage and having geared connection with said roving-drums and roving-delivery rollers, a pinion mounted on said shaft and engaging with said rack, and a pawl-and-ratchet connection between said shaft and said pinion, all constructed, arranged, and operating substantially as shown and described.

2. The combination, with an upright frame, a carriage provided with a series of roving-drums and roving-delivery rollers, and means for vertically reciprocating said carriage on said frame, of a vertical rack, means for adjusting said rack vertically on said frame over a portion of the travel of said carriage, a shaft mounted on said carriage and having geared connection with said roving-drums and roving-delivery rollers, a pinion mounted on said shaft and engaging with said vertical rack, and a pawl-and-ratchet connection between said shaft and said pinion, all constructed, arranged, and operating substantially as shown and described.

3. The combination, with a carriage of a spinning-mule capable of a vertical reciprocating movement, a counter-weight, guide-pulleys mounted in the main frame, ropes connecting said carriage and counter-weight and passing over said guide-pulleys, a shaft, winding-scrolls secured to said shaft, rope-connection between said counter-weight and said scrolls, a clutch loosely mounted, and intermediate gearing connecting said clutch and winding-scroll shaft, of a plunger, a shipper-rod, intermediate mechanism connecting the shipper-rod and plunger, a driving-shaft, a clutch, intermediate mechanism connecting said clutch with said driving-shaft, an arm secured to the shipper-rod and engaging with one of said clutches, and a projection secured to said carriage adapted to engage with said plunger and through the intermediate mechanism to operate the shipper-rod, and the arm secured thereto to throw the clutches into engagement and wind the scrolls to raise the carriage, all constructed, arranged, and operating substantially as shown and described.

4. The combination, with a carriage of a spinning-mule capable of a vertical reciprocating movement; a counter-weight, guide-pulleys mounted in the main frame, ropes connecting said carriage and counter-weight and passing over said guide-pulleys, a shaft, winding-scrolls secured to said shaft, rope-connection between said counter-weight and said scrolls, a clutch loosely mounted, intermediate gearing connecting said clutch and winding-scroll shaft, a clutch, and intermediate mechanism connecting said clutch with the driving-shaft and engaging the said loosely-mounted clutch, of a shipper-rod, a spring engaging with said shipper-rod, an arm secured to said shipper-rod and engaging with one of said clutches, a locking device holding said shipper-rod against the tension of said spring, and a rod connected with said locking device and provided with a projection adapted to be engaged by the reciprocating carriage to release the locking device and allow the shipper-rod to disengage the clutches when the carriage reaches the end of its travel, all constructed, arranged, and operating substantially as shown and described.

5. The combination, with a vertically-reciprocating carriage, a winding-scroll shaft mounted in the main frame and provided with winding-scrolls, rope-connection between said winding-scrolls and reciprocating carriage, a ratchet-wheel, and intermediate mechanism connecting said ratchet-wheel with the winding-scroll shaft, of a pawl engaging with said ratchet-wheel and holding said carriage elevated, and a shipper-rod provided with a projection adapted to engage said pawl, release the ratchet-wheel and winding-scroll shaft, and allow the carriage winding mechanism to operate, all constructed, arranged, and operating substantially as shown and described.

6. The combination, with a reciprocating carriage, winding-scrolls secured to a shaft suitably mounted in the main frame, rope-connection between said carriage and winding-scrolls, a clutch loosely mounted, intermediate gearing connecting said clutch and winding-scroll shaft, a driving-shaft, a clutch, intermediate mechanism connecting said clutch with said driving-shaft, a shipper-rod, and mechanism connecting said shipper-rod with one of said clutches, of a spring engaging with said shipper-rod, a locking device holding said shipper-rod against the tension of said spring, a cam, and intermediate gearing connecting said cam with the driving-shaft, whereby as the cam is rotated it will engage with and release the locking device, allow the spring to actuate the shipper-rod to throw the clutches into engagement, and operate the winding-scrolls to permit the carriage to descend, all constructed, arranged, and operating substantially as shown and described.

7. The combination, with a series of spindles, a shaft mounted in the main frame, a spinning-drum secured to said shaft, bands connecting said spindles with said spinning-drum, a pulley secured to said spinning-drum shaft, a main shaft, a pulley mounted loosely on said main shaft, belt-connections from said loose pulley to said spinning-drum-shaft pulley, and a clutch loosely mounted on the main shaft and secured to said loose pulley, of a clutch splined to said main shaft, a shipper-rod, mechanism connecting said shipper-rod and splined clutch, a vertical plunger, intermediate mechanism connecting said plunger and shipper-rod, a carriage carrying roving-drums and roving-delivery rollers, means for vertically reciprocating said carriage, and a projection secured to said carriage and adapted to engage with the plunger and through the intermediate mechanism to operate the shipper-rod and throw the splined clutch connected therewith into engagement with the loose clutch, and thereby start the spinning, all constructed, arranged, and operating substantially as shown and described.

8. The combination, with a main shaft, a clutch splined to said main shaft, a shipper-rod, mechanism connecting said splined clutch and shipper-rod, a spring acting against a collar on the shipper-rod, a locking device holding said shipper-rod against the tension of the spring, a retainer holding said locking device in engagement with the shipper-rod and provided with a projecting arm, and a releasing-spring engaging with said locking device, of a clutch mounted loosely on the main shaft and engaging with the splined clutch, a pulley secured to said loose clutch, a spinning-drum, intermediate mechanism connecting said pulley with the spinning-drum, and a disk having geared connection with said pulley and provided with a stop adapted to engage with the projecting arm of the retainer to release said retainer, allow the releasing-spring to disengage the locking device, and the shipper-rod spring to operate the shipper-rod, all constructed, arranged, and operating substantially as shown and described.

9. The combination, with a main shaft, a clutch splined to said main shaft, a shipper-rod, and mechanism connecting said splined clutch and shipper-rod, a spring acting against a collar on the shipper-rod, a locking device holding said shipper-rod against the tension of the spring, a retainer holding said locking device in engagement with the shipper-rod and provided with a projecting arm, and a releasing-spring engaging with said locking device, of a clutch loosely mounted on the main shaft and engaging with the splined clutch, a pulley secured to said loose clutch, a spinning-drum, intermediate mechanism connecting said pulley with the spinning-drum, a disk having geared connection with said pulley, and a stop adjustably secured to said disk and adapted to engage with the projecting arm of the retainer to release said retainer, allow the releasing-spring to disengage the locking device, and the shipper-rod spring to operate the shipper-rod, all constructed, arranged, and operating substantially as shown and described.

10. The combination, with a shipper-rod, a spring engaging with the shipper-rod, a locking device holding said shipper-rod against the tension of said spring, a retainer holding said locking device in engagement with the shipper-rod and provided with a projecting arm, a spinning-drum shaft, and a disk having intermediate geared connection with said spinning-drum shaft and provided with a stop adapted to engage with the projecting arm of the retainer to release the locking device, of a pulley loosely mounted, a spring fixed at one end and having its other end secured to said loose pulley, a pulley loosely mounted on the spinning-drum shaft, band-connection between said pulleys, a clutch adapted to connect said spinning-drum-shaft pulley with said shaft, a spring engaging with said clutch, and intermediate mechanism connecting said clutch with the shipper-rod and holding said clutch out of engagement against the tension of said spring, all constructed, arranged, and operating substantially as shown and described, whereby when the shipper-rod is released the spring-actuated clutch connects the loose pulley with the spinning-drum shaft and effects the backing off.

11. The combination, with a winding-weight, a shaft mounted in the main frame, a scroll secured to said shaft, a rope connecting said scroll and weight, intermediate mechanism connecting said shaft with the spinning-drum shaft, a ratchet-wheel secured to the winding-scroll shaft, a pawl engaging with said ratchet, a shipper-rod, and intermediate mechanism connecting said pawl and shipper-rod to disengage said pawl by the movement of said shipper-rod, of a spring engaging with said shipper-rod, a locking device holding said shipper-rod against the tension of said spring, a cam, a driving-shaft, and intermediate gearing connecting said cam with said driving-shaft, whereby as the cam is rotated it will engage with and release the locking device, allow the spring to actuate the shipper-rod to withdraw the pawl, and permit the winding-weight to operate, all constructed, arranged, and operating substantially as shown and described.

12. The combination, with a shaft mounted in the main frame, a winding-weight, mechanism connecting said shaft and winding-weight, a spinning-drum, intermediate driving mechanism connecting said shaft with the spinning-drum, and a ratchet-wheel secured to said winding-shaft, of a pawl adapted to engage with and lock said ratchet-wheel, mechanism for holding said pawl disengaged, a lever connected with and controlling said mechanism, a carriage provided with roving-drums and roving-delivery rollers, means for reciprocating said carriage, and a projection secured to said carriage adapted to engage on the descent of the carriage with said lever, release the mechanism for holding the pawl disengaged, and permit said pawl to engage with and lock said ratchet-wheel, all constructed, arranged, and operating substantially as shown and described.

13. The combination, with a scroll mounted in the main frame, a winding-weight, a rope connecting said winding weight and scroll, and a clutch connecting with said scroll, of a clutch engaging with said scroll-clutch, a main shaft, intermediate mechanism connecting said clutch with the main shaft, a shipper-rod, mechanism connecting the shipper-rod with one of said clutches, a spring engaging with the shipper-rod, a locking device holding said shipper-rod against the tension of said spring, a pivoted projecting arm, and mechanism connecting said arm and winding-scroll to effect the rotation of the arm, said arm being adapted to disengage the locking device to allow the spring to operate the shipper-rod and disengage the clutches, all constructed, arranged, and operating substantially as shown and described, whereby when the winding-weight has reached the proper height the scroll will stop winding.

14. The combination, with a scroll mounted in the main frame, a winding-weight, a rope connecting said winding weight and scroll, and a clutch connected with said scroll, of a clutch engaging with said scroll-clutch, a shipper-rod, intermediate mechanism connecting said clutch with the main shaft, mechanism connecting the shipper-rod with one of said clutches, a spring engaging with the shipper-rod, a locking device holding said shipper-rod against the tension of said spring, a wheel, mechanism connecting said wheel with said scroll, a projecting arm adapted to disengage said locking device to allow the spring to operate the shipper-rod and disengage the clutches, and an escapement-gear connecting said arm with said wheel, all constructed, arranged, and operating substantially as shown and described, whereby at each operation the winding-scrolls are disengaged and the relative position of the projecting arm and the wheel is changed.

15. The combination, with a scroll mounted in the main frame, a winding-weight, a rope connecting said winding weight and scroll, and a clutch connected with said scroll, of a clutch, a main shaft, intermediate mechanism connecting said clutch with the main shaft and engaging with said scroll-clutch, a shipper-rod, mechanism connecting the shipper-rod with one of said clutches, a spring engaging with the shipper-rod, a spring-actuated locking device holding said shipper-rod against the tension of said spring, a wheel, intermediate mechanism connecting said wheel with said winding-scroll, a ratchet-wheel secured to said wheel, an arm centrally pivoted with said wheel, a lever pivoted at the outer end of said arm and having a limited vibratory motion thereon and adapted to disengage said spring-actuated locking device and allow the shipper-rod to operate to disengage the clutches, a spring of less resistance than the locking-device spring secured to the arm and engaging with the vibratory lever, and two pawls pivoted to the arm and engaging with the ratchet-wheel and provided with projections adapted to be engaged by projections on the vibratory lever, all constructed, arranged, and operating substantially as shown and described, whereby at each operation the winding-scrolls are disengaged and the relative position of the arm and wheel is changed, for the purpose specified.

16. The combination, with a carriage carrying roving-drums and roving-delivery rollers, means for reciprocating said carriage, a shaft mounted in the main frame, a cam secured to said shaft, and intermediate mechanism connecting said reciprocating carriage and said shaft to effect the rotation of the shaft by the movement of the carriage, of a rock-shaft mounted in the main frame, having arms secured thereto carrying on their outer ends a building-wire, a rod engaging with the cam, and intermediate mechanism connecting the building-arm rock-shaft with said rod, all constructed, arranged, and operating substantially as shown and described, whereby as the cam is rotated the rock-shaft carrying the building arms and wire is rocked.

17. The combination, with a carriage, means for reciprocating said carriage, a shaft mounted on the main frame, a cam secured to said shaft, mechanism connecting said shaft and carriage to effect the rotation of said shaft by the movement of the carriage, a rock-shaft having arms secured thereto carrying at their outer ends a building-wire, a rod formed in two sections united by screw-threads and engaging with said cam, and mechanism connecting said rod and the building-arm rock-shaft, of a plunger mounted in the main frame, mechanism, including a pawl and ratchet, connecting said plunger and one section of the cam-rod, and a projection secured to the reciprocating carriage, adapted to engage with said plunger and through the intermediate pawl-and-ratchet connection to partially rotate one section of the cam-rod, thereby lengthening the same, all constructed, arranged, and operating substantially as shown and described.

18. The combination of a carriage carrying roving-drums and roving-delivery rollers, means for reciprocating said carriage, a shaft mounted on the main frame, a cam secured to said shaft, mechanism connecting said carriage and said shaft to effect the rotation of the shaft by the movement of the carriage, a rock-shaft having arms secured thereto carrying a building-wire, a rod formed in two sections having a screw-threaded connection with each other, one section of said rod engaging with the cam, mechanism connecting the other section of said rod with the building-arm rock-shaft, a ratchet-wheel, mechanism connecting said ratchet-wheel with one section of said rod, a pawl engaging with said ratchet-wheel, a plunger mounted on the main frame, a projection secured to the reciprocating carriage and adapted to engage with and operate the plunger, and means for adjusting the connection between said pawl and said plunger to regulate the throw of said pawl and amount of rotation of the ratchet-wheel, and the consequent lengthening of the connection between the cam and the building-arm rock-shaft, all constructed, arranged, and operating substantially as shown and described, as and for the purpose specified.

19. The combination, with a rock-shaft provided with arms car-

rying on their outer ends a building-wire, of a pivoted lever, intermediate mechanism connecting said lever with said rock-shaft, a carriage carrying roving-drums and roving-delivery rollers, means for reciprocating said carriage, and a projection secured to said carriage, adapted to engage with and operate said lever, and through said intermediate mechanism to rock said rock-shaft and its arms to carry the building-wire to a position for spinning, all constructed, arranged, and operating substantially as shown and described.

20. The carriage consisting of several pairs of plates, substantially as described, certain of which have thereon the arms *g*, and longitudinal angle-irons 308 and 324, secured to the opposite edges of said plates, substantially as set forth.

21. The carriage consisting of several pairs of plates, substantially as described, having laterally-projecting webs formed on their inner opposite sides, guide-rolls, substantially as described, hung to rotate between said plates, having an engagement with the edges of the post of the frame of the machine which extends between said plates, and longitudinal angle-irons 308 and 324, secured to the opposite edges of said plates, substantially as set forth.

22. The carriage having a series of ropes attached thereto, substantially as described, the frame of the machine having rollers journaled therein, over which said ropes pass, and a counterbalancing-weight, 500, hung on said ropes, of less weight than the carriage, and capable of a vertical movement in the frame of the machine coinciding inversely with the movements of the carriage, combined with two winding-scrolls, as 190 and 205, adjunctive mechanism, as described, for actuating the scrolls, and a rope having its ends attached to said scrolls and passing over and engaging with said counterbalancing-weight, substantially as set forth.

23. The combination of the machine-frame, ropes 449, and pulleys *w*, the counterbalancing-weight 500, and the carriage to which it is suspended, a winding-scroll, 190, and a like scroll, 205, a shaft to which both scrolls are attached, and a rope having its ends attached to said scrolls passing over and engaging with said weight, a clamp-connection on said scroll-shaft, whereby said scroll 205 is capable of adjustment on its shaft to cause the end of the said rope which is attached thereto to be wound onto the higher or lower parts of the scroll, substantially as set forth.

24. The main shaft 188 of the machine, having a driving-gear, 142, fixed thereon, and a loose sleeve, 113, on said shaft, having a driving-gear, 137, fixed thereon, combined with a driving-shaft, as 141, having a geared engagement, substantially as described, with said gears 137 and 142, and a driving-pulley thereon having a frictional engagement with said shaft, substantially as set forth.

25. The spindle-driving shaft 82, the pulley 410, the main shaft 188, adjunctive mechanism, as described, connecting shafts 82 and 188, the shipper-rod 34, having the arm 406 thereon and a slot therein, a clutch, 59, actuated by arm 406, and the collar 64, having an arm extending under said rod, combined with a yoke, a pin, 415, supported on the yoke, as described, and capable of a movement toward and from said rod, a shaft, i^3, having a rocking arm, 61, with which said arm 406 engages, means for moving arm 406 and rod 34 toward shaft i^3, and the spring 95, for moving them oppositely, two rocking arms, as 420 and 421, engaging with said yoke to move said pin against said rod, a spring, 425, to move said yoke and pin upward, a yoke-piece, 422, a shaft, 67, hung in bearings attached to said yoke-piece under the bed of the machine, a spring, 423, to lift said yoke-piece and shaft 67, a collar, 68, on shaft 67, having two arms, as o^3 and o^4, thereon, a worm-gear, 69, fast on said shaft 67, having pin-holes in its side, a pin, o^5, fixed in said gear, and a pin, o^3, adapted to be placed in any of said holes, a pulley, as 220, fixed on shaft 67, having a cord attached thereto, a weight, as 51, hung on said cord, a clutch, 409, loose on shaft 188 and to which clutch the pulley 410 is attached, and the worm 70 on clutch 409 on the main shaft 188, said clutch being loose on said shaft, substantially as set forth.

26. Cop-building mechanism consisting of two parallel rods, 15 and 16, capable of a rocking motion in suitable bearings on opposite sides of the machine and having wire-supporting arms thereon, and suitable weights attached to said rods, substantially as described, to swing said arms and wires toward the yarns, combined with a cam, as 340, a carriage, adjunctive mechanism, as described, for imparting rotary motion imparted to the cam by the downward motion of the carriage, substantially as described, a tube, 38, the rod 106, engaging the tube and resting on said cam, and a rock-shaft, 47, having an arm thereon connected pivotally with said tube and a second arm thereon, and means for connecting said second arm with each of said shafts 16, substantially as set forth.

27. The shaft 11, the main shaft 188, having a connection with shaft 11, as described, a scroll-pulley, 138, fixed on shaft 11, a weight, 294, and a cord, 172, connecting the scroll and weight, the drum-shaft 82, having a connection, as described, with said shaft 11, the ratchet-wheel 144, fixed on the last-named shaft, and a pawl, 143, having a bar, 178, pivotally connected therewith, having a catch-block, a^4, thereon, combined with the rock-shaft 18, having an arm, $179^{\times}$, thereon, with which said bar engages, and means for actuating said shaft 18, substantially as set forth.

28. The carriage having on one of its frame-plates the projecting cam *l*, the spring-actuated pawl 143, the spring $143^{\times}$, for engaging said pawl, the bar 178, and the elbow-lever 187, capable of engagement with said cam and having one arm engaged with said bar, combined with the shaft 11 and the ratchet-wheel 144 on said shaft, means for reciprocating the carriage, means, as described, to actuate shaft 11, and means, as described, to hold the bar 178 and the pawl against the force of the spring, substantially as set forth.

29. In combination, the rock-shaft 47, the rock-shaft 204, having a connection with said shaft 47—namely, the bar 21, as described—and the levers 219 and 256, attached to said shaft 204, the reciprocating mechanism of the carriage, as described, the carriage having the cams *r* and *r'* on the frame-plates thereof, as described, capable of engagement with said levers, the arm 23, and the rods 16, having the building-wire arms thereon and having a connection, as described, with said arm 22 on said rock-shaft 47, substantially as set forth.

30. The tube 38, having a collar, *f'*, thereon, the shipper-rod 34, a collar, 118, and an arm, 341, thereon capable of engagement with said collar *f'*, the plunger 114, the shaft 18, and an arm, 164, thereon engaging the plunger, combined with an elbow-lever, 287, having an engagement with a collar on said plunger and shipper-rod, means for elevating tube 38, and means for actuating shaft 18.

31. The lever 210, pivoted on the bed-plate 1 and having a vibratory motion in a horizontal plane, the shipper-rod 34, having a pivotal connection, as described, with one end of said lever, the longitudinal shipper-rod 358, having the spring 206 thereon, the collar 208, having a free longitudinal movement on said rod 358 and a pivotal connection with one end of the lever 210, and having a fixed hook thereon, as described, a clutch-arm, 231, fixed on said rod 358, having a hook thereon to engage with the hook on said collar, and means, as described, for releasing the hooks, combined with the shaft 11, having the winding-scroll 138 and clutch 225 fast thereon, and *x* clutch, 230, with which said arm 231 engages, and means, as described, for rotating said clutch 230, substantially as set forth.

32. The shipper-rod 358, having the spring 206 and provided with the collar 208, having a hook thereon, and the clutch-arm 231, having a spring-hook, 438, on its collar adapted to engage the hook on collar 208, combined with the gear 211, having lateral projections on its rim mechanism for rotating said gear alternately in opposite directions, a ratchet-wheel, 222, a shaft, 446, on which said gear and ratchet are mounted side by side, an elbow-lever, 224, hung to rotate freely on said shaft, a lever, 223, pivotally connected to one arm of said lever and having a limited vibratory movement capable of engaging with said spring-hook, and two independently-acting pawls carried on said elbow-lever to engage with said ratchet and the lever 223, a saddle-spring engaging with pins on said pawls, a spring attached to said elbow-lever and acting against one end of said lever 223, and mechanism for moving rod 358 against the tension of spring 206, substantially as set forth.

33. The shipper-rod 34, a spring, as described, to move said rod longitudinally, the drum-shaft 82, having the wheel 161, the spring 14, and the friction-collar 13 thereon, a collar on said rod 34, having a buster-arm, 395, thereon, a slotted hook-lever, 290, pivoted on the bed-plate by the side of the rod 34, having its open end opposite the end of said buster-arm, a vertical rocking shipper-rod, 10, having an arm, 288, thereon capable of vibratory motion in a horizontal plane, a spring-actuated pin, carried by arm 28, capable of engagement with the hook in said lever 290, a spring, 292, to hold the free end of said hook-lever upward, and a clutch-arm, 12, on said rod 10, engaging with the friction-collar 13 on said drum-shaft, combined and operating substantially as set forth.

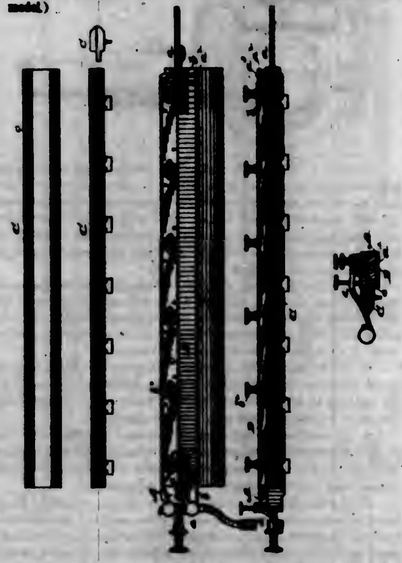
34. In combination, the shipper-rod 10, the arm 288 thereon, having the pin 396 bearing on the end of a spring under said arm, the pivoted hook-lever 290, having its end slotted to receive said arm and having a hook therein to engage said pin, and mechanism for moving arm 288 from said hook when disengaged, combined with the shipper-rod 34, having the buster-arm 395 attached thereto, and a spring to hold the free end of said lever upward, substantially as set forth.

35. The shipper-rod 34, having a slot therein provided with an offset at one end thereof, as described, and carrying the horizontal arm 120, a spring for moving said rod longitudinally, the spring-actuated pin 401, engaging with said slot and having a collar, 402, thereon, a shaft, 396, whose lower end is capable of engagement with said arm, having a rotary motion parallel with said pin and having a disk thereon provided with a cam projection to engage said collar and lift said pin, and with a stop-pin, v^6, therein, said shaft having also a pulley thereon having a cord attached thereto and carrying a crown-gear, 127, and a spring, 404, to force said shaft downward, combined with the sleeve 113, the worm 126, carried thereon, and a weight attached to said cord, substantially as set forth.

36. The shipper-rod 34, a spring for moving it longitudinally, said rod having a slot therein with one end offset, as described, and having

the arm 341 thereon, combined with the tube 38, having a collar thereon to engage with said arm, mechanism for elevating tube 38, the shaft 47, and the rods 16, connected with said tube, lever-connections, substantially as described, between said shaft 47 and the tube 38 and rods 16, the pin 401, engaging in said slot, having the collar 402 and the shaft 396, carrying the rotating disk 131, having a cam projection thereon to engage with and gradually lift said pin, and means, substantially as described, for imparting a rotary motion to said disk, combined and operating substantially as set forth.

37. The shaft 18, having the sliding clutch 167 thereon, mechanism for operating shaft 18 and the arm 186, extending from a loose clutch-sleeve on said shaft, the horizontal shipper-rods 19, having collars 168 and 169 thereon, a lever, 170, pivoted centrally on the machine and having engagement with said rods and with said clutch 167, a driving-shaft, 141, an elbow-lever pivoted under the driving-shaft 141, and a driving-wheel, a sliding friction-collar, 266, also engaging said shaft, a suitable connection, as described, between said arm 186 and said elbow-lever, and a spring, as 151, to swing the latter, combined and operating substantially as set forth.

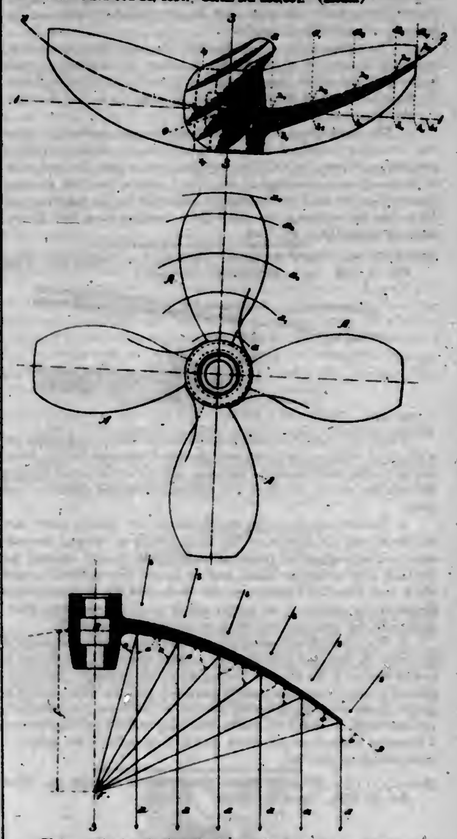


38. The drum-shaft 82, the weight 294, and an intermediate shaft, as 11, means, as described, for imparting thereto a rotary motion by said weight, and a connection, as described, with said drum-shaft and the spindle-driving bands, whereby its said rotary motion is communicated to the last-named shaft and the spindles while the carriage descends, combined and operating substantially as set forth.

39. The shaft 11, having a sleeve, 228, thereon, a clutch, 230, splined and sliding on said sleeve, a gear, 35, a clutch, 225, fast on shaft 11, and the main shaft 188, having a geared connection with said last-named gear, and mechanism for shifting clutch 229, combined and operating substantially as set forth.

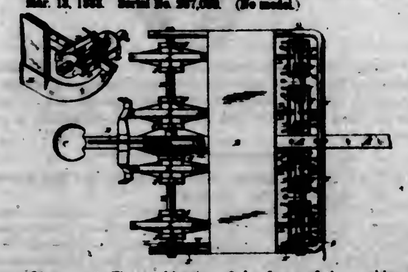
40. The main shaft 188, the clutch 25, having a free rotary motion thereon and having a gear, 35, fixed thereto, the sleeve 113, having a free rotary movement, as described, on said main shaft, means for rotating said sleeve, the sliding clutch 9, having a key-connection with said sleeve and capable of engagement with one end of said clutch 25, and the shipper-rod 34, having an arm, 394, engaging with said sliding clutch, combined and operating substantially as set forth.

41. The carriage, the ropes 499, the shaft 30, having the winding-scrolls 190 and 205 thereon, which are connected by ropes, as described, with the carriage-counterbalancing weight, said shaft 30 having a worm-and-gear connection, as described, with the gear 35, and means, as described, for supporting and operating said gear, combined and operating substantially as set forth.



384,497. RULING-MACHINE. George B. Barnard and Edward Knapp, St. Louis, Mo. Filed Aug. 16, 1886. Serial No. 211,092. (No model.)

Claim.—1. In a ruling-machine, the combination of the adjustable holder A, having seat *a'*, the detachable pen-beam B, the bar *b'*, held by nuts and bolts and grooved at *b⁴*, and clamp C, having tongue *c*, substantially as described.



2. The combination of the holder A, having the seat *a'*, the bolts a^4, and the nuts a^5, with the detachable beam B, having the hooks *b*, substantially as described.

384,498. PROPELLER-WHEEL. James R. T. Barclift, New York, N. Y. Filed Oct. 26, 1887. Serial No. 253,661. (Model.)

Claim.—The herein-described propeller-blades curved in the line of a parabolic generatrix to form a driving-surface, consisting of a helicoidal parabolic surface of revolution, and so combined with the propeller-shaft that a plane passed through the axis of the shaft will intersect the driving-surface of each blade in a parabola, substantially as described.

384,499. GRAIN-DRILL. Daniel B. Bearden, Wilson, Kans. Filed Mar. 12, 1888. Serial No. 267,092. (No model.)

Claim.—1. The combination of the frame of the machine, the axle H, journaled in suitable boxes, the ratchet-wheels rigidly secured to the axle, the covering-wheels I, provided with double hubs J, which catch upon opposite sides of the ratchet-wheels, and the spring-

actuated pawls secured to the hubs and which engage with the ratchet-wheel, substantially as set forth.

2. The combination of the shaft O, the drills or furrow-openers provided with frames at their front ends, the stops which are passed through the shaft, and the springs which are applied to the shaft and which return the furrow-openers to position after having been raised, the arm connected to the shaft, and the operating-lever and connecting-rods, substantially as specified.

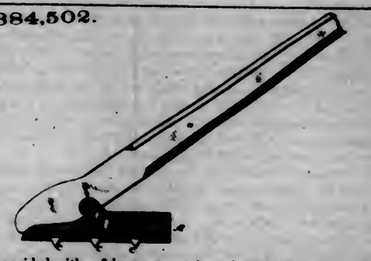
3. The combination of the clutch U, the pivoted curved lever T, connected thereto, the shaft O, the arm or lever S, which is connected to the shaft and which engages with the lever T, the operating-chain W, the wheel X, shaft H, and the operating-lever for moving the shaft O, substantially as shown and described.

4. The combination of the operating-lever, the connecting rod or rods extending therefrom, the shaft O, and arm extending therefrom and making connection with the connecting rod or rods, the seed-drills or furrow-openers connected at their front ends to the shaft O, stops connected to the shaft for moving the seed-drills in one direction, and the springs for returning the seed-drills to position when left free to move, substantially as set forth.

384,500. SAW-HANDLE. JOHN BEARDSLEE, Arcata, Cal. Filed Feb. 17, 1888. Serial No. 264,339. (No model.)

Claim.—1. The combination of the handle-loop having an eye and a sleeve at right angles to the eye, the block swiveled in said sleeve and projecting from the end of the same, and the slotted screw inserted through the end of the block and adjustably secured therein, as set forth.

2. The combination, with the saw-blade, the slotted screw, and the thumb-nut and washer, of the block having an opening for said screw and a longitudinal groove at right angles to said opening for the back edge of the saw-blade, and the handle-loop swiveled on said block and provided adjacent to the block with the circumferential flange having notches *i*, any one of which may be turned into alignment with the groove in the block, substantially as specified.



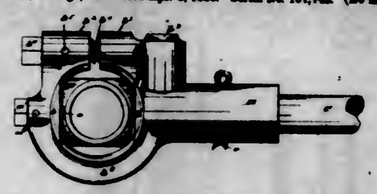
3. The herein-described saw-handle-securing device, composed of the screw B, provided with the longitudinal slot *b*, the thumb-nut D and its washer *d*, the block C, having the screw-opening *c*, the longitudinal groove *c'*, and the stem E, provided with the circumferential groove *e*, the handle-loop having the eye G, the sleeve *f*, and flange I, provided with the notches *i*, and the retaining-screw *g*, passing through a threaded opening on the sleeve, and with its point in the groove *e*, substantially as specified.

384,501. PULLEY. HENRY W. BELSHEIMER, St. Louis, Mo. Filed Nov. 21, 1887. Serial No. 255,664. (No model.)

Claim.—A composite pulley consisting of the cast-metal central portion and the wrought-metal rim, said central portion consisting of a hub, spokes, and a peripheral part channeled, and also widened, and said rim being attached to said peripheral part, substantially as described and shown.

384,502. CAR-MOVER. JOHN BIRD, Warren, Ill. Filed Mar. 23, 1888. Serial No. 268,099. (No model.)

Claim.—1. The combination of a shoe having a shoulder or bearing formed upon its top with the lever having a fulcrum which catches against the shoulder or bearing, the connecting-links, and the steel pieces which are inserted in the bottom of the shoe, substantially as shown.



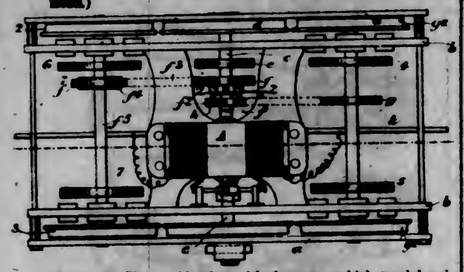
2. The combination of the shoe provided with sharp edges to bite into the rail and a shoulder or bearing upon its top with the lever which is loosely connected by means of links with the shoe, and which is provided with a fulcrum to catch against the shoulder on the shoe, substantially as set forth.

384,503. COMBINED FUR SATCHEL AND MUFF. ABRAHAM BRAHAM, Montreal, Quebec, Canada. Filed Mar. 10, 1888. Serial No. 266,913. (No model.) Patented in Canada Oct. 11, 1887, No. 27,702.

Claim.—As a new article of manufacture, the compound fur satchel-muff having in combination a satchel, a pocket, and a muff-recess situated centrally between satchel and pocket, the whole included within one outer fur-covering, and a fur cap or cover with edge of one of its sides secured to inside of said pocket, and having partially cut ends with flexible connections, for the purpose described.

384,504. PITMAN-BOX FOR HARVESTERS. ALFRED W. BRAHAM, Chicago, Ill. Filed Apr. 3, 1888. Serial No. 197,763. (No model.)

Claim.—1. The box A, having the enlargement of true spherical form flattened or reduced at its sides, in combination with the pitman-head having the transverse opening with spherical surfaces corresponding with those of the box and reduced at the sides in one direction, said members constructed, substantially as described, to admit of the box being inserted in an endwise direction and secured by a partial rotation about its own axis.



2. The box A, having the globular enlargement, the flattened surfaces, and the groove *a*, in combination with the pitman-head having the opening of greater diameter in one direction than the other to admit the box in an endwise direction, and the screw *a'*, to prevent the rotation of the box when in operative position.

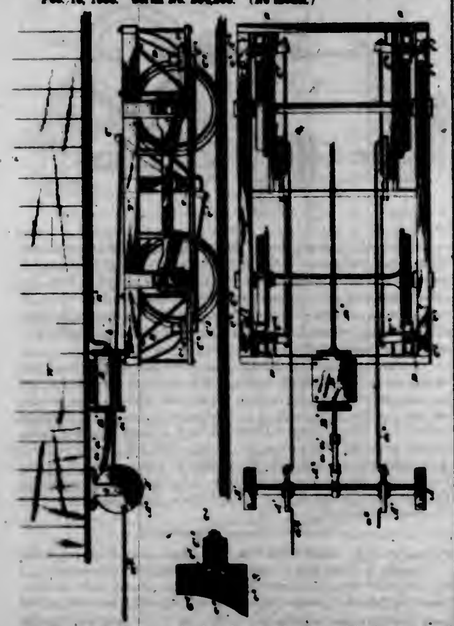
3. The box having the spherical enlargement reduced in thickness in one direction, in combination with the divided pitman-head having the opening to admit the box in one direction only, as described, and the screw *b*⁴, whereby said head may be contracted.

4. In combination with the pitman-head provided with the slot *b*³, the pitman secured therein and the fastening pin or key extended through the slot and pitman, substantially as described, whereby the pitman may be secured under different adjustments.

5. The box having the enlargement of true spherical form flattened or reduced at its sides, in combination with the pitman-head having the transverse opening with spherical surfaces corresponding with those of the box and reduced at the sides in one direction, said members constructed, substantially as described, to admit of the box being inserted in an endwise direction and secured by a partial rotation about its own axis, and means for preventing the accidental rotation of the box when in place.

384,505. CAR-TRUCK. WILLIAM J. BROWN, London, County of Middlesex, England. Filed July 30, 1887. Serial No. 245,220. (No model.)

Claim.—1. The combination, with the car or vehicle truck herein shown and described, of the bearing-blocks *m*, provided with horizontal studs, the springs *n*, encircling said studs, having their guides in the frame *b*, substantially as shown and described.



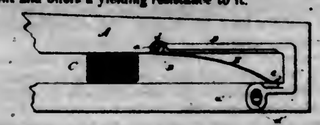
2. The combination, with a car or vehicle truck, of the segmental adjustment composed of the arm 13, carrying the anti-friction wheel 12, wheel 11, and main wheel 10, substantially as shown and described.

384,506. ANTI-FRICTION BEARING FOR SHAFTS. WILLIAM J. BROWN, London, County of Middlesex, England. Filed Oct. 11, 1887. Serial No. 252,077. (No model.)

Claim.—The combination, substantially as shown and described, consisting of the gudgeon or journal-box *a*, the adjustable plate connected therewith, the washers *d*, the anti-friction rollers arranged in said adjustable plate, the armature-shaft *f*, screw-threaded lug *g*, and set-screw A.

384,507. CAR-BRAKE. JAMES H. BROWN, Richmond, Ind. Filed Feb. 16, 1888. Serial No. 264,369. (No model.)

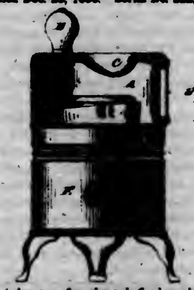
Claim.—1. In a car-brake, the combination, with the truck, of independent brake-supporting levers C', fulcrumed on the side sills of the truck-frame, shoe-heads secured to said levers, brake-operating levers C, pivoted to rigid supports at opposite sides of the frame, connecting-rods secured at their inner ends to the operating-levers at opposite sides of and equidistant from said pivot, and devices for connecting the upper ends of the operating-levers with the power, substantially as described.



2. In a car-brake, the combination, with the brake-cylinder and its piston, of a rock-shaft provided centrally with a crank-arm which is connected with the piston and at its ends with arms or disks, the trucks provided at the side with rigid supports, brake-operating levers pivoted on said supports, independent brake-supporting levers, fulcrumed in the side sills of the truck-frame and carrying shoe-heads, rods connecting the ends of the supporting-levers with the operating-levers at the opposite sides of their pivots, and rods connecting the upper ends of the operating-levers with the arms or disks on the rock-shaft.

3. In a car-brake, the combination, substantially as described, of the truck, the brake-operating lever mounted on fixed pivots, the independent brake-supporting levers fulcrumed in the side sills of the truck and each connected independently with the operating-lever, the shoe-heads secured to their supporting-levers, a spring interposed between each shoe-head and its supporting-lever, and means for connecting the brake-operating levers with the power.

4. In a car-brake, the combination, substantially as described, of the brake-supporting levers provided each with a circular recess, the shoe-heads provided each with a slot, *e*', to receive the lever, and a recess, *e*², a connecting-bolt passing centrally through the recesses of the shoe-head and its lever, a coiled spring encircling said bolt and seated at its opposite ends in said recesses, and means for connecting the supporting-levers with brake-operating mechanism.



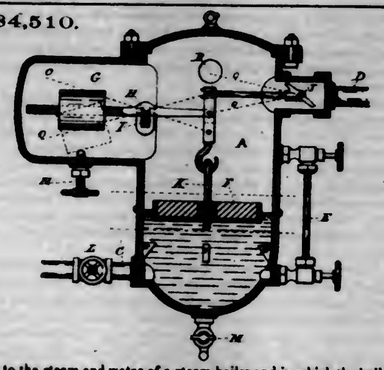
384,508. PICKER-STAFF CHECK FOR LOOMS. BENJAMIN F. CARTER, Woonsocket, R. I. Filed Sept. 22, 1887. Serial No. 250,426. (No model.)

Brief.—The check encounters the picker-staff in its backward movement and offers a yielding resistance to it.

Claim.—In combination with the lay of a loom, the plate D, having the equicircular bearing *d*, clasping the spring E, and having the short arm provided with the transverse slot *d'*, the screw *d'*, passing through said slot, the pivot *e*, and the spring having one end fitted on the pivot *e*, substantially as specified.

384,509. HEATER FOR DENTAL FLASKS. ROLLA H. CRANE, Bethel, Vt. Filed Dec. 28, 1886. Serial No. 222,412. (No model.)

Claim.—1. A heater for dental flasks adapted to inclose and cover the flask, and having at its upper side the depending offset C, corresponding in general shape to the palatal or lingual surface of the model in the lower half of the flask, substantially as described.



2. The heater for dental flasks having the offset C, for the purpose set forth.

384,510. FEED-WATER REGULATOR. FREDERIC COOK and BERNHARD THOMS, New Orleans, La. Filed Oct. 22, 1887. Serial No. 253,044. (No model.)

Claim.—1. In a feed-water regulator, the combination, with a chamber open to the steam and water of a steam-boiler and internally under its pressure, of a pipe for conveying steam from said chamber to a boiler-feed pump, a partly-immersed weight suspended in the chamber, a counterbalance-weight, a lever carrying said weights, and a balanced valve connected with said lever and located to regulate the supply of steam to the boiler-feed pump, whereby its speed is controlled by the height of the water in the boiler, substantially as described.

2. In a feed-water regulator, the combination, with a chamber

384,510.

open to the steam and water of a steam-boiler and in which the boiler-pressure is maintained, of a pipe for conveying steam from said chamber to a boiler-feed pump, a balanced valve for regulating the supply of steam delivered through said pipe to the boiler-feed pump, a partly-immersed adjustable weight, an adjustable counterbalance-weight, a lever carrying said weights, and a rod connecting said lever with the balanced valve, substantially as described.

3. In a feed-water regulator, the combination of a closed chamber open to the pressure of a steam-boiler, a balanced solid float, a counterbalance-weight, a regulating balanced valve, connecting rod and lever, and adjusting-screw N, substantially as described.

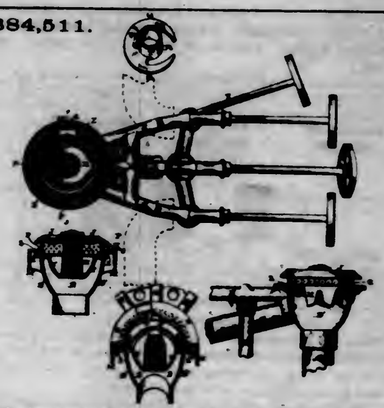
4. In a feed-water regulator, the combination, with the chamber A, float-weight F, counterbalance-weight G, lever H, and rod J^4, of the valve-chamber J^3, of a larger diameter than the steam-pipe D, and the valve J, arranged within the chamber J^3, for the purpose specified, and substantially as described.

5. A feed-water regulator consisting of a tight vessel connected with a steam-boiler above and below its water-line and containing an adjustable partly-immersed weight counterbalanced by an adjustable weight, substantially as described.

6. A feed-water regulator consisting of a tight vessel connected with a steam-boiler above and below its water-line and containing an adjustable partly-immersed weight counterbalanced by an adjustable weight, these weights connected by suitable connections or levers with a balanced regulating-valve leading to the boiler-feeder, substantially as described.

7. A feed-water regulator consisting of a tight vessel connected with a steam-boiler above and below its water-line and containing an adjustable partly-immersed weight counterbalanced by an adjustable weight, these weights connected by suitable connections or levers with a balanced regulating-valve leading to the boiler-feeder, and an adjustable stop to arrest the upward motion of the partly-immersed weight or the downward motion of the counter-weight, substantially as described.

8. A feed-water regulator consisting of a tight vessel connected with a steam-boiler above and below its water-line and containing an adjustable partly-immersed weight counterbalanced by an adjustable weight, these weights connected by suitable connections or levers with a balanced regulating-valve leading to the boiler-feeder, and an adjustable stop to arrest the upward motion of the partly-immersed weight or the downward motion of the counter-weight, a valve in the pipe which connects the regulator-vessel with the boiler below its water-line, and a blow-off valve in the regulator-vessel, substantially as described, and for the purpose set forth.



384,511. VAPOR-STOVE BURNER. SHELDON DAVIS, Cleveland, Ohio. Filed July 20, 1887. Serial No. 245,297. (No model.)

Claim.—1. The combination, with the stand-pipe, of the casting B', secured to its top and having the depressed top or portion 1 and the post or standard D cast therewith, the cap J, secured upon the post, and the ring K, which is secured upon the top of the casting by the cap, the casting having the two chambers B H formed therein, substantially as described.

2. The combination, with the stand-pipe, of the casting B', secured upon its top and having the depressed portion or top 1, so as to separate the vaporizing and commingling chambers, and the inclosing-walls M, formed as a part thereof, and the ring and cap J, suitable openings, L, being made through the top of the casting outside of the ring, so as to conduct vaporizing-flames inside of the walls M, substantially as set forth.

3. The casting B', provided with a recess in its top, so as to receive the lower edge of the ring, and provided with the horizontal projections extending inwardly from its inner edge to center the ring,

384,511.

and having openings L through its sides for the escape of the vaporizing-flames, in combination with the ring and cap, substantially as specified.

4. In a vapor-burner, the combination of the casting B', having the commingling-chamber formed in its top, with the plate Q, placed over the top of the chamber and having an opening in one side, with the ring K and cap placed above the plate, substantially as shown.

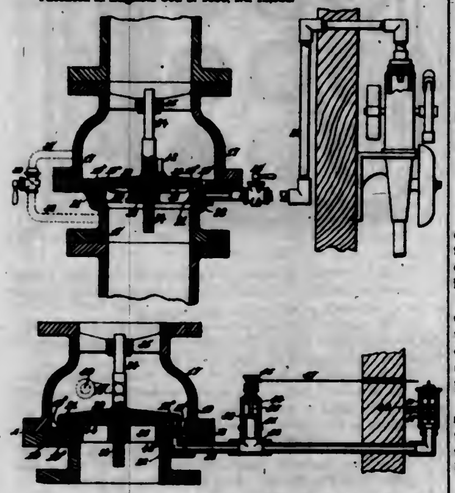
5. The combination of the casting B', having a recess in its top to receive the ring, and a horizontal flange, Z, extending around the upper edge of the recess outside of the ring, with the ring and cap, substantially as set forth.

6. The combination of the casting B', having a recess in its top to receive the lower edge of the ring, a horizontal flange, P Z, extending around the upper edge of the recess outside of the ring, and openings L through the casting for the escape of vaporizing-flames, with the ring and cap, substantially as specified.

384,512. HARNESS HOOK OR SNAP. WILLIAM S. F. DILLON, Cincinnati, assignee of one-third to George Hall, Lima, Ohio. Filed May 26, 1887. Serial No. 239,411. (No model.)

Claim.—1. In a snap-hook, the combination of two parts or sections, A and B, the outer ends of which together form the hook portion and the opposite end of each of which is provided with a loop, and one of said sections, A, is provided with a bent shank or elbow, F, and the other section, B, is provided with a notch or recess, B', in the side of its loop, adapted to receive the bent shank, which slightly pivots therein, substantially as and for the purpose set forth.

2. In a snap-hook, the combination of two parts or sections, A and B, the outer ends of which together form the hook portion, and the opposite end of one of the sections is provided with one loop and the same end of the other section is provided with a loop and a supplemental loop formed integral therewith, said supplemental loop being further provided with a cross-bar having a pin, one of said sections, A, is provided with a bent shank, F, and the other section, B, is provided with a notch or recess, B', inside of its loop, adapted to receive the bent shank which slightly pivots therein, substantially as and for the purpose set forth.



384,513. CHIN-REST FOR THE DEAD. CARL B. DEGEN, Brooklyn, N. Y. Filed Mar. 3, 1888. Serial No. 266,074. (No model.)

Claim.—In a chin-rest for the dead, the elastic frame A, composed of arms B C, bent transversely and laterally, and adapted to have its ends under the chin and on the top of the head and its sides to converge from the points H H, so as to pass around toward the back of the head, substantially as shown and described.

384,513.

384,514. ALARM-VALVE FOR AUTOMATIC FIRE-EXTINGUISHERS. RALPH DOWSON and JOHN TAYLOR, Bolton, County of Lancaster, England. Filed Dec. 23, 1887. Serial No. 258,316. (No model.) Patented in England Oct. 2, 1886, No. 12,888.

Claim.—1. In an automatic fire-extinguisher, the combination, with a valve-casing through which the water passes to the sprinkler, said casing having a passage leading to a pipe communicating with an alarm and being provided with a valve-seat having an opening communicating with said passage, of a valve closing the water-passage through said casing and covering and uncovering said opening in the valve-seat as the valve closes and opens, substantially as described.

2. In combination with the valve 20, provided with the double facing 19^{a}, the annular chamber or cavity 21 between the same, the seating 19, and the slot or opening 45 through same to allow of the annular chamber or cavity 21 being open to the pressure of the atmosphere when the valve 20 is closed, and through which water flows to operate an alarm when the valve 20 opens, substantially as and for the purpose herein set forth.

3. The combination, with the casing, of a main valve, 20, and by-pass consisting of a valve-seat, 40, and valve 37, inclosed by a casing, 42, having discharge-openings, said by-pass being mounted on the main valve, which is provided with a passage communicating with the passage closed by the valve 37, substantially as described.

4. The combination, with the casing 17 18, of the main valve 20, having an annular space or channel, 21, the valve-seat 19, having a slot, 45, communicating with annular chamber 21 and with a pipe, 23, the valve-box 51, valve 53, having stem 55, and the detachable button 56, having a cord or wire connected to the alarm, substantially as described.

5. The combination, with the valve-casing 17 18, having the passage 22, of the main valve 20, having an annular space, 21, valve-seat 19, having a slot, 45, communicating with annular chamber 21 and with a pipe, 23, the valve-box 51, valve 53, having stem 55, and the detachable button 56, having a cord or wire 57, substantially as described.

384,515. MACHINE FOR MAKING WIRE NAILS. HENRY REED, Meadville, Pa. Filed July 27, 1887. Serial No. 245,091. (No model.)

Claim.—1. In combination, two plates, one movable and the other fixed, cutting-dies supported from one of the said plates, and forcing-faces carried upon the other plate for causing the operation of said dies in the changing of the position of the two plates, and driving mechanism for the moving plate, all substantially as described.

2. In combination, two plates, one movable and the other fixed, cutting-dies supported from one of said plates, forcing-faces carried upon the other plate for causing the operation of said dies in the changing of position of the two plates, driving mechanism for the moving plate, and a feeding mechanism carried upon the movable plate, substantially as described.

3. In combination, substantially as described, a bed-plate and a supporting-plate in sliding connection therewith, driving mechanism for the sliding plate, gripping-jaws and cutting-dies supported therefrom, and forcing-faces on the bed-plate for causing the operation of both jaws and cutters, substantially as described.

4. The combination, in a machine for making nails from wire, of a gripper for the wire, dies having longitudinal and lateral movement, a plate carrying the said gripper and dies, and a bed-plate having forcing or contact faces for causing the longitudinal movement of the dies, and an abutment to come in contact with the dies, with a driving-shaft and its connections, all substantially as described.

5. In combination, in a machine for making nails from wire, a gripper, dies arranged to move therewith and to swing inward, forcing-faces for causing the longitudinal movement, and an abutment arranged to press the dies against the gripper, with driving mechanism whereby the wire is held, severed, and the gripped end upset to form the head, all substantially as described.

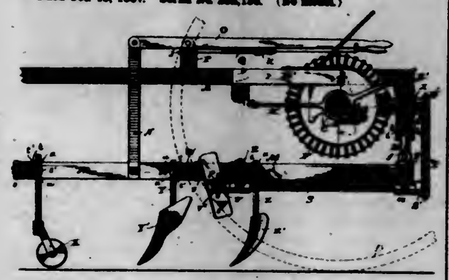
6. In combination, a plate, B, having an abutment, a plate A, in sliding connection with the plate B, a gripper to hold the wire, and dies arranged to move with the gripper to sever the wire, said movement being caused by forcing-faces on the plate B, said dies being hinged and normally held outward from the gripper, the gripper-face and dies being in line with the abutment, and mechanism for changing the position relatively of the plates, substantially as described.

7. The combination, substantially as described, of a bed-plate and a plate in sliding connection therewith, gripping-jaws, forcing-faces on the bed-plate for causing the gripping-jaws to operate, a pair of dies moving with the gripping-jaws and hinged to swing inward thereto, but held normally outward, and an abutment on the bed-plate arranged to press the dies against the face of the jaws.

8. In combination, the slides carried on the plate A, the gripping-jaws operated thereby, the dies hinged to the slide, with adjustable connections, the abutment to force the dies against the jaws, and the

forcing-faces for causing the slides to operate, substantially as described.

9. In combination with the plates A and B, one movable longitudinally in relation to the other, laterally-movable gripping-jaws and dies carried on one plate, movable pawls carried on one plate, and the holding-grip for retaining the wire while the movable pawls retreat, substantially as described.



10. In combination, substantially as described, a fixed and movable plate, one carrying gripping-dies connected to slides moving across the line of movement of the plate and rollers on the other plate arranged to press the slides inward.

11. In combination with the base and moving plate, a pair of slides, gripping-jaws operated thereby, dies having beveled ends carried by the slides, springs to hold the dies away from the slides, and an abutment arranged to bear on the dies after they have severed the wire and force them against the end held in the grip, all substantially as described.

12. In combination with the plates A and B, one movable longitudinally in relation to the other, laterally-movable gripping-jaws and dies carried on one plate, feeding-pawls carried on the movable plate, and holding-pawls supported independently of said movable plate for retaining the wire while the feeding-pawls retreat.

13. In combination, the plates A and B, one movable in relation to the other, laterally-movable gripping-jaws and dies carried on one plate, feeding-pawls carried on the movable plate, and holding-pawls supported independently of said movable plate and upon a movable support.

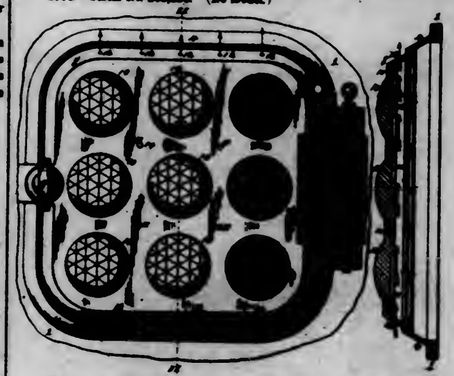
384,516. COTTON-CHOPPER. STEPHEN FREEMAN, Racine, Wis. Filed Oct. 13, 1887. Serial No. 252,193. (No model.)

Claim.—1. In a cotton-chopper, the combination of a carriage, a frame suspended beneath the carriage, a chopping mechanism carried on the frame, and casters and plows secured to said frame by laterally-adjustable couplings that permit a pivotal and vertical adjustment of said casters and plows, substantially as set forth.

2. In a cotton-chopper, the combination of a carriage, a frame suspended beneath the carriage to have a positive horizontal movement and an automatic vertical movement, a chopping mechanism carried by the frame, and casters secured to said frame to have a pivotal, vertical, and lateral adjustment, substantially as set forth.

3. In a cotton-chopper, the combination of a carriage, a sprocket-wheel and pinion carried by a shaft that has its bearing on the carriage, a gear-wheel loose on the carriage-axle and in mesh with the pinion, a clutch feathered on said axle for engagement with the hub of the gear-wheel, a frame suspended beneath said carriage, a knife-shaft having its bearings on the frame and provided with a sprocket-wheel, and a drive-chain arranged on said sprocket-wheels, substantially as set forth.

4. In a cotton-chopper, the combination of a suitable carriage, a vertically-depending thimble secured to the carriage and having suitable transverse openings, a stem arranged in the thimble, and a pin passed through this stem and the openings in said thimble, a frame pivotally connected at its rear to said stem and suspended at its front by a suitable hanger depending from said carriage, and a chopping apparatus carried by said frame, substantially as set forth.



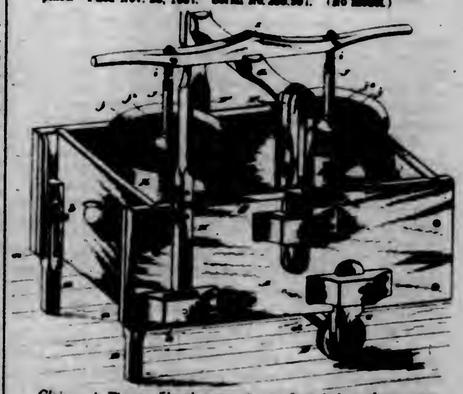
5. In a cotton-chopper, the combination of a carriage, a bearing secured to the carriage, a vertically-depending thimble integral with the bearing and provided with suitable transverse openings, a stem arranged in the thimble and a pin passed through this stem and the openings in said thimble, a frame pivotally connected at its rear to said stem and suspended at its front by a suitable hanger depending from the carriage, a shaft arranged in said bearing, a knife-shaft having its bearings on the frame, and suitable means for imparting motion to said shafts, substantially as set forth.

6. In a cotton-chopper, the combination of a carriage, a rectangular frame carrying the chopping mechanism and swiveled at its rear to the rear of the carriage, a lever swiveled to said carriage, a hanger connecting the lever and forward portion of the frame, a pivoted segmental rack, and a spring-catch arranged on the lever to engage the rack, substantially as set forth.

7. In a cotton-chopper, the combination of a carriage, a frame suspended beneath the carriage to have a positive horizontal adjustment and an automatic vertical movement, a rotary chopper having its bearings on the frame, and casters, plows, and cultivator-teeth secured to said frame by laterally-adjustable couplings that permit a pivotal and vertical adjustment, substantially as set forth.

8. In a cotton-chopper, the combination of a carriage and its axle, a frame suspended beneath the carriage to have a positive horizontal adjustment and an automatic vertical movement, a chopper-shaft having its bearing on the frame, casters, plows, and cultivator-teeth secured to said frame by laterally-adjustable couplings that permit a pivotal and vertical adjustment, a sprocket-wheel upon the chopper-shaft, a sprocket-wheel and shaft upon said carriage driven from the axle, and a drive-chain arranged on said sprocket-wheels, substantially as set forth.

384,517. STOVE. MARY S. GAGE, St. Louis, Mo. Filed Feb. 7, 1888. Serial No. 263,333. (No model.)



Claim.—1. The combination, in a stove, of the mica plate 5, glass 10, and an air-chamber, 11, between, having orifices 12 for the passage of air, substantially as and for the purpose set forth.

2. The combination of the mica, the glass bull's-eye having fluots, and the air-chamber between them, with provision for the passage of air through the chamber, for the purpose set forth.

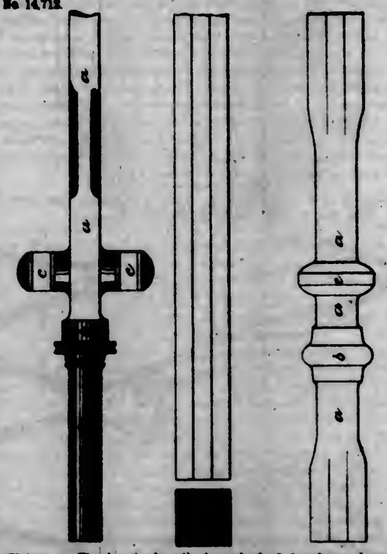
3. The combination, in a stove, of the two doors carrying, respectively, the mica 5 and glass 10, and an air-chamber between them, with orifices in the edges or walls of the chamber for the passage of air, substantially as and for the purpose set forth.

384,518. CHURN. CHARLES E. GALE, Plattsburg, N. Y., assignor of one-half to Charles W. Vaughn and Edward H. Wood, both of same place. Filed Nov. 22, 1887. Serial No. 256,267. (No model.)

Claim.—1. The combination, in a churn, of two independent cream-receptacles having independent dashers and perforated inwardly-depressed tops, the bar connecting said dashers, the rock-shaft to which said bar is centrally attached, provided with an operating-lever whereby the dashers are reciprocated, and a containing-box or receptacle for the cream-receptacles having a centrally-arranged trough with which outlets from said receptacles engage, one of the cream-receptacles having side flanges which fit over the said trough, substantially as described.

2. The combination, with a receptacle, A, provided with a longitudinal centrally-arranged trough, L, having an end opening, of independent churn-bodies K K, having independent dashers mounted in said receptacle A, and having outlet-openings communicating with the said trough, one of said churn-bodies K having side flanges cut away to snugly fit over the said trough, substantially as described.

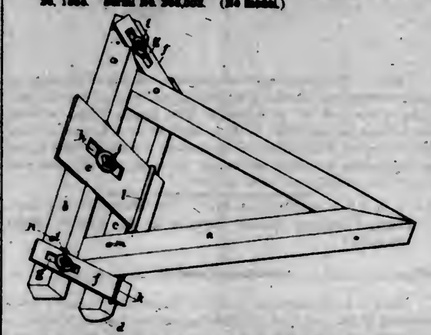
3. In a churn, the combination, with the receptacle or box A, adapted to receive churns having independent dashers, of the slotted blocks E, secured to the upper part of the side of the said receptacle or box A, the slotted block A, secured adjacent to the lower edge and one end of one of the sides of the receptacle or box, the standards F, removably secured in the blocks E, having a rock-shaft, G, mounted in their upper ends, to which an operating-bar, I, is centrally attached and connected to the dasher-rods of the churns, the depending arm or bar *f*, secured at its upper end to the rock-shaft G and having its lower end slotted and provided with a series of apertures, the slotted operating-lever H, pivotally secured at its lower end in the block A, and a link-bar, *g*, connecting the lower end of the arm or bar *f* with the lever H, whereby the churn-dashers may be operated either by the rod I or from one side of the box or receptacle by the lever H, substantially as described.



384,519. WITHDRAWN.

384,520. BOLTING-REEL. DAVID L. HANAKER, Chambersburg, Pa. Filed Aug. 30, 1887. Serial No. 247,894. (No model.)

Claim.—The combination, in a polygonal bolting-reel, of the longitudinal ribs of the reel located at the angles of the latter and having recesses formed in their outer edges, with wings projecting from the inner ends of the ribs toward the bolting-cloth at an angle less than a right angle, so as to form V-shaped lifting-pockets, all substantially as specified.

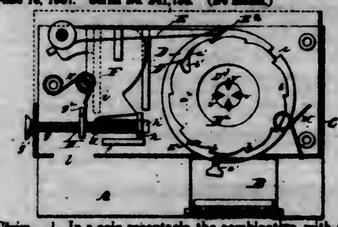


384,521. MANUFACTURE OF AXLES FOR VEHICLES. JOHN G. HARRISON, 11 Heol Road, Blghausen, England. Filed Mar. 8, 1887. Serial No. 230,189. (No model.) Patented in England Dec. 1, 1886, No. 14,712.

Claim.—1. The herein-described method of forming axle-trees, which consists in first subjecting the fagot to the action of dies having ball-shaped recesses for the formation of circular "collar-balls" upon the blank, the blank or fagot being constantly turned during the stamping operation, and then submitting the blank having such collars to the action of dies having laterally-extended recesses, which receive and shape the metal of one of said collars and form the flaps or side wings.

2. The method or process of forming axle-trees from fagots, which consists in first pressing or stamping the fagot in one set of dies, and thereby forming circular rounded beads or balls, and then in a second set of dies pressing said balls into the forms of the side wings or flaps and the collar, respectively, of an axle-tree, substantially as set forth.

384,522. SNOW-PLOW. JOHN B. HAYES, Detroit, Mich. Filed Mar. 26, 1888. Serial No. 268,202. (No model.)



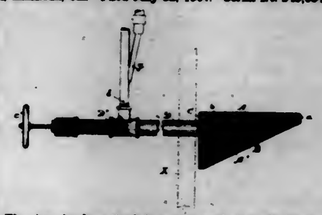
Claim.—1. In a snow-plow, the combination of the tongue *a* with the bar *c*, attached to the tongue, as described, and having its lower edges rounded or beveled, substantially as and for the purposes hereinbefore set forth.

2. In a snow-plow, the combination, with the bars *b* and *c* and the V-shaped tongue, arranged as described, of the plates *f*, having slots *g*, bolts *i*, and staples *k*, all substantially as and for the purposes hereinbefore set forth.

3. In a snow-plow, the combination, with the bars *b* and *c* and the V-shaped tongue, arranged as described, of the plate *e*, having slot *h*, the bolt *j*, and the staple *l*, all substantially as and for the purposes hereinbefore set forth.

384,523. COIN RECEPTACLE AND REGISTER. EDWARD BRADLEY, Jersey City, N. J., and WILLIAM G. HOOPER, Brooklyn, N. Y. Filed June 13, 1887. Serial No. 241,726. (No model.)

Claim.—1. In a coin-receptacle, the combination, with a series of concentric disks representing different values, of the dogs E E', engaging with said disks, the pivotal plates or guards F F', and the slide H, substantially as described.



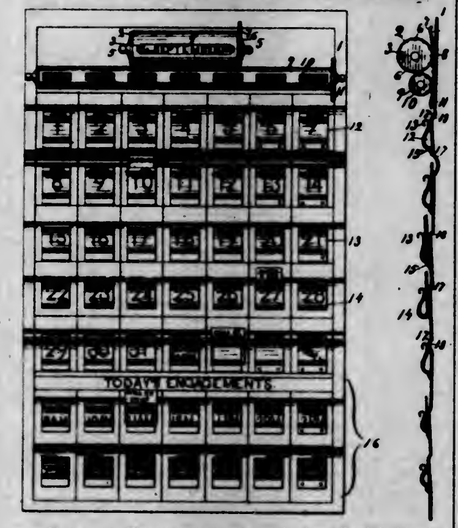
2. The combination, with the concentric disks representing different values and having notched flanges, of the dogs E E', the pivotal plates or disks having tail-pieces, and the slide H, having head *h* and notched cross-bar g^3, substantially as described.

3. In a coin-receptacle, the combination, with the registering-disk and the dogs E E', engaging therewith, of the plates or disks formed with the flanges *i* and tail-pieces *d*, and the slide H, having the head *h* and notched bar g^3, said parts being so arranged as to be conjointly operative only when the space between the head *h* and flange *i* is occupied by an independent body, such as a coin of given diameter, substantially as described.

4. In a coin registering or counting apparatus, the combination of a registering-dial, a dog, E, whereby the same is moved step by step, a pivotal plate or disk to which said dog is attached, having a flange, *i*, on its face and a tail-piece, *d*, and a slide, H, having a head, *h*, and notched cross-piece g^3, to control the movement of the parts when a coin is placed between the head of the slide and the flange on the disk, substantially as described.

5. In a registering apparatus, the combination of the dials comprising the plate D, having the bent lugs, and the interiorly and exteriorly flanged rings D' D^2, substantially as described.

384,524. HYDROCARBON-BURNER FOR FURNACES. ADAM HEBBER, Alameda, Cal. Filed July 22, 1887. Serial No. 245,084. (No model.)



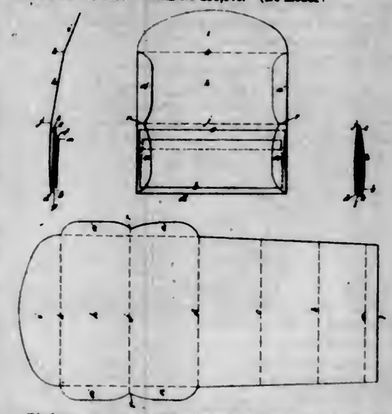
Claim.—The herein-described burner, consisting of the body A, having vertical and parallel sides, flat top, and inclined bottom, producing a chamber, A^x, of triangular form longitudinally, provided with a broad narrow outlet, *a*, the plate B, set to slide upon the bottom of chamber A^x, with beveled front edges, the setting-shaft C, and the supply-tube D, having connection for steam and oil pipes, constructed for operation as herein set forth.

384,525. CATAMENIAL SACK. JOHN HOTHERSALL, Manchester, County of Lancaster, England. Filed Jan. 5, 1888. Serial No. 259,823. (No model.)

Claim.—As an improved article of manufacture, a lady's towel consisting of the pad *a*, of soft fabric—such as Turkish toweling—having the extensions *d d*, of the same material, and the superposed strip *b*, of like material, under which the said extensions are folded for use, and attaching-strips *c c*, connected with the pad, substantially as described.

384,526. MEMORANDUM-CALENDAR. ARISTA H. ISBELL, Asheville, N. C. Filed Sept. 20, 1887. Serial No. 250,294. (No model.)

Claim.—1. The combination, in a calendar-roll, of the board 1, the receptacles 12, secured thereto, seven in a line and numbered from 1 to 31, the cylindrical case 2, having an aperture in its front, the cylinder 3, journaled in the case and having names of months upon it to register with the said apertures, and, further, having the notches 6 around it, the spring 7, provided with a nib, 8, to engage the said notches, the case 9, secured to the board 1 and having seven apertures in a line in its front, the cylinder 10, journaled in the case 9 and having the days of a week in seven zones upon it to register with the said seven apertures, and each aperture to head a column of the said numbered receptacles, the cylinder 10 being notched circumferentially, and a spring, 11, adapted to engage the said notches, substantially as shown and described.

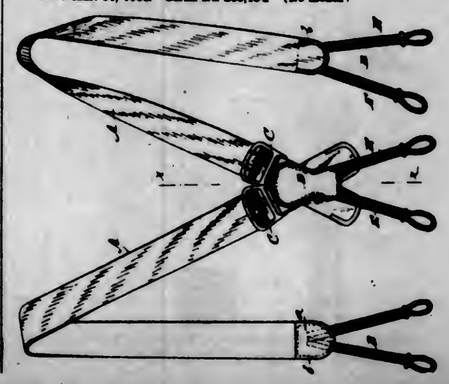


2. The combination, in a calendar, of a board, 1, a cylindrical case secured thereon and having an aperture in its front, a cylinder having the names of divisions of time marked on it in circumferential spaces, and, further, having notches in it to register with the said spaces, and the spring 7, secured at one end to the board 1 and having a nib, 8, to engage the said notches, and a projecting handle portion, substantially as shown and described.

3. The combination, in a calendar, of a back or board, 1, and a series of springs secured thereto and forming receptacles therewith, the receptacles having marks upon their faces outside of the said springs indicating dates, substantially as shown and described.

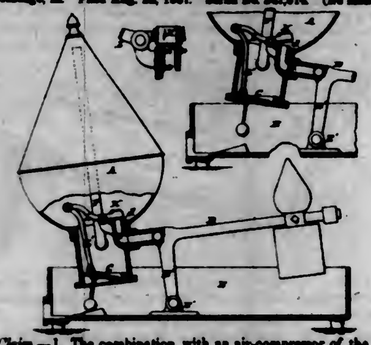
4. The combination, in a calendar, of a board or back having depressions 17 and card-receptacles secured to the said back below the said depressions, substantially as shown and described.

5. The combination, in a calendar, of a board having depressions 17 and receptacles having fronts adapted to press upon the said board at the projection below the said depressions, substantially as shown and described.



384,527. POCKET-BOOK. ALBERT H. JOCELYN, Montclair, N. J., assignor of one-half to William A. Armstrong, Mount Vernon, N. Y. Filed Jan. 6, 1888. Serial No. 259,970. (No model.)

Claim.—1. A pocket-book made of a strip of fabric, provided with side flaps, *a*, one on each side, and folded in alternately-reversed directions in transverse lines *b c d*, and having the said side flaps each lapped over and cemented upon the several alternately-reversed folds, substantially as herein described, whereby the two flaps combine with the parts between the folds to form several pockets, as herein set forth.



2. A pocket-book made of a strip having transverse folds *b c d* in alternately-reversed directions to form several pockets and a transverse fold, *j*, to form a loose side or back, A, and having side flaps, *a a'*, which are lapped over and cemented over the parts between the folds *b c d* to complete the ends of the several pockets, and also lapped over the ends of the loose side or back A to re-enforce the latter and form double corners *r r* in the fold between the said loose side or back and the pockets, substantially as herein described.

384,528. SUSPENDERS. JACOB KATZENBERG, New York, N. Y. Filed Mar. 31, 1888. Serial No. 269,134. (No model.)

Claim.—The back piece, D, the suspender-ends E E, secured to the lower end of the said back piece, and the buckles C C, secured to the upper end of said back piece, in combination with the webs A A, held by the buckles C C, and provided at the front ends with the permanently-attached suspender-ends B B, substantially as described.

384,529. AUTOMATIC AIR-COMPRESSOR. GEORGE J. KEEHAN, Chicago, Ill. Filed Aug. 29, 1887. Serial No. 247,814. (No model.)

Claim.—1. The combination, with an air-compressor of the type herein described, of a rocking lever, E, having a T form, the vertical member of which extends down in close proximity to the bottom of the supporting-tray and carries the journal-pivot at its lower end, in manner and for the purpose set forth.

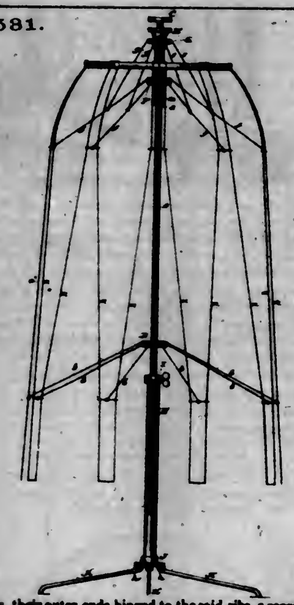
2. In an air-compressor of the type herein described, the combination of the water-inlet D, valve K, lever L, one end of which is connected to the link L', while the other end carries the valve K, link L', and foot or outlet valve C, the parts being connected together and operating in the manner and for the purpose set forth.

3. In an air-compressor of the type herein described, the combination, with the chamber A, of the air-pipe F, valved branches G G', valve I, bell-crank I', and link I^2, connected to the tray, the parts being arranged and operating in the manner and for the purpose set forth.

4. In an air-compressor of the type herein described, the water or air inlet valve heads, consisting of a tapering rubber cork or plug inserted in a counterpart hole or opening in its carrying-lever, as described, and for the purpose set forth.

384,530. DUST-GUARD FOR CAR-AXLE BOXES. PETER M. KLINE, St. Louis, Mo. Filed Feb. 13, 1888. Serial No. 263,810. (No model.)

Claim.—1. The combination of the axle-box provided with a flange, 5, disk 7, ring 8, disk 10, and ring 11, having flange 12, substantially as and for the purpose set forth.



2. The combination of the axle-box, disks 7 and 10, and rings 8 and 11, substantially as and for the purpose set forth.

384,531. DRESS-FORM. WILLIAM H. KNAPP, Brooklyn, N. Y. Filed Jan. 30, 1888. Serial No. 262,669. (No model.)

Claim.—1. In a garment-stand consisting of a central spindle, and a series of ribs surrounding it radially expansible, the combination therewith of a vertically-adjustable collar, F, a stationary collar, G, both supported on said spindle, a series of diagonal braces corresponding to the respective ribs, and a corresponding series of links, the outer end of said braces hinged to the respective ribs, the inner end of said braces and links hung, the one series to the stationary collar G and the other series to the adjustable collar F, the outer ends of the said links hinged to the said braces midway of their length, both the links and braces inclined in the same direction, substantially as described.

2. In a garment-stand, the combination of a central vertical spindle, a series of ribs surrounding said spindle and radially expansible, a collar, B, vertically adjustable on said spindle, a series of braces, *b*, hinged by their inner ends to the said collar B and inclining downward

884,581.

therefrom, their outer ends hinged to the said ribs, a second adjustable collar, F, on said spindle, and a stationary collar, G, above said collar F, a second series of braces inclined in the same direction as the lower series of braces, and a corresponding series of links, the outer ends of the said second series of braces hinged to the respective ribs, the inner ends of the said links and braces, the one hung to the stationary collar and the other to the adjustable collar, the outer ends of the links hung to the said second series of braces midway of their length, substantially as described.

3. In a garment-stand, the combination of the central spindle, A, a series of ribs arranged around said spindle and radially adjustable, an adjustable collar, B, on said spindle, a series of braces, *b*, hung by their inner ends to the said collar B and extending diagonally downward, their outer ends hung to the respective ribs, the tubular sleeve D on said spindle above said collar B, free for independent rotation on said spindle, but held against vertical movement, said sleeve screw-threaded upon its outer surface, a correspondingly screw-threaded collar, F, on said sleeve, a stationary collar, G, above said collar F, a second series of braces, and a corresponding series of links inclined in the same direction as the series of braces below, the said second series of braces hinged by their outer ends to the said ribs, the inner ends of said series of ribs and series of links hinged, the one to the adjustable collar F and the other to the stationary collar G, and the outer ends of the links hung to the respective braces midway of their length, substantially as described.

4. A support for garment-stands and like purposes, consisting of a base, J, having a central opening through it, a standard, H, vertically adjustable in said opening through the base, the said base constructed with radial recesses, the said recesses extending into the central opening, and legs K, hinged in said recesses upon an axis at right angles to the axis of said standard, the said hinging axes being outside the said opening, and the said legs each constructed with an extension from their respective hinged ends, the said extensions being adapted to bear against the central standard within the opening in the base when the legs are extended, substantially as described, and whereby when the standard is withdrawn the legs are free to be folded against the standard.

384,532. PUNCH. HARK D. KNOWLTON, Chicago, Ill. Filed Aug. 10, 1887. Serial No. 247,242. (No model.)

Claim.—1. The combination, with a punch and a die or matrix, of an auxiliary cutter extending outwardly from the punch, said auxiliary cutter having its cutting-edge set back from the cutting-edge of the punch and arranged to act against an opposing flat surface of the die or matrix, substantially as described.

2. The combination, with a punch and a die or matrix, of an auxiliary cutter attached to and extending outwardly from the punch, the cutting-edge of said auxiliary cutter being set back from the cutting-edge of the punch and arranged to act against an opposing flat sur-

384,532.

face of the matrix, and means adjustably connecting said cutter with the punch, whereby the edge of the cutter may be adjusted with relation to the opposing face of the matrix, substantially as described.

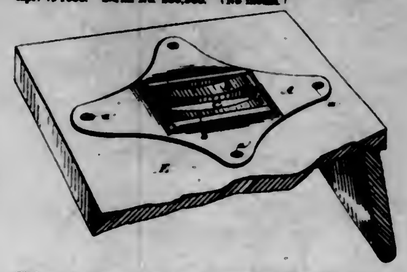
3. The combination, with a punch and a die or matrix, of an auxiliary cutter extending outwardly from the cutting-edge of the punch and arranged to act against an opposing flat surface of the matrix, and a holder for the said punch and auxiliary cutter, said cutter being adjustably sustained in the holder by means affording both an endwise and lateral adjustment of the cutter, substantially as described.

4. The combination, with a punch, of a holder for the same provided with a shank for attachment to a punching-machine, and with a plate supporting the punch and provided with a recess in its lower face, an auxiliary cutter, movable clamp-plates located within the said recess, and opposing set-screws inserted through said plate and bearing against the clamp-plates, substantially as described.

384,533. TOY PARACHUTE. WILLIAM J. KUHNEN, Syracuse, N. Y., assignor of one-half to Frederick A. Kuntzsch, same place. Filed Feb. 14, 1888. Serial No. 263,956. (No model.)

Claim.—1. In a toy parachute, a ring suspended from the umbrella portion provided with a suspension-bar having suspended therefrom and integral therewith a weight of desired configuration, substantially as described.

2. In a toy parachute, a horizontal suspension-bar provided at its ends with a neck portion and a head, and a weight configurated as desired, connected therewith, said parts being integral and formed of cast metal, essentially as shown and described.



3. In a toy parachute, a horizontal suspension-bar formed at its ends with a neck portion provided with a head, and a weight of preferred configuration connected to the suspension-bar by one or more arms or hangers, said parts being integral and formed of cast metal, for the purpose set forth and described.

4. In a toy parachute, a horizontal suspension or cross bar suitably journaled in the ring portion, a weight suitably configurated depending from said bar by a pair of arms or hangers, said suspension-bar, end portions, weight, and connecting-arms thereof being formed of one integral piece of cast metal, substantially as and for the purpose set forth.

5. In a toy parachute, an umbrella or sustaining portion, cords attached thereto and connected to loops on a ring, said ring portion and its loops being formed from a single piece of wire, a horizontal bar journaled in said ring and maintained centrally therein, and a weight of desired configuration suspended from said bar, said bar and weight being integral and formed of cast metal, all combined substantially as described, and for the purposes specified.

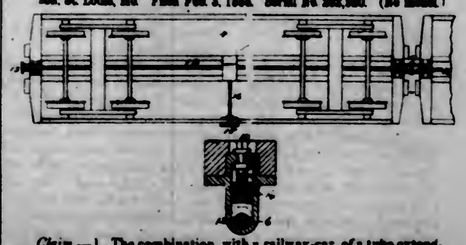
6. The combination, in a toy parachute, of the umbrella portion A, provided with cords 1, connected to the loops 2, formed integral with the ring B, the bar C, provided with the neck portions *a* and heads *b* and extending diametrically across said ring and journaled in loops thereon, and a weight, D, of desired configuration suspended from the bar C by arms or hangers *c c*, said bar and connected weight being integral and formed of cast metal, substantially as described, and for the purposes specified.

384,534. WAGON-SEAT. WILLIAM A. LAPO, Colfax, Wash. Filed Apr. 7, 1888. Serial No. 269,969. (No model.)

Claim.—A wagon-seat support consisting of a plate having end perforations and a central concavity provided with a slot, substantially as set forth.

384,535. SASH-FASTENER. EDWIN W. LOCE, Bolivar, N. Y. Filed Jan. 9, 1888. Serial No. 260,209. (No model.)

Claim.—1. In a window, the frame thereof, in combination with the sash, rods or strips at the rear of the said sash, and springs at the rear of the said rods or strips.



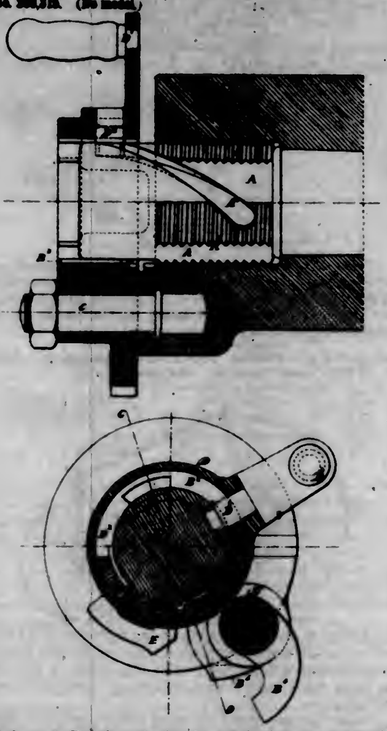
2. The combination, in a window, of the frame A, sashes B and B', rod C, and spring E at the rear of sash B, and springs G and blocks G' at the rear of sash B', all arranged in the manner and for the purposes substantially as shown and set forth.

3. The combination, in a window, of the frame A, sashes B and B', situated therein and having inclined notches deepest at their uppermost extremities, lugs or projections secured to the frame, rods or strips C at the rear of the sash B and on either end thereof, having their uppermost extremities pivotally secured to the frame and their lowermost extremities left free, springs at the rear of said rods, thimbles or sockets within the sash B', springs situated therein, and blocks upon the said springs, all arranged substantially as and for the purposes herein set forth.

4. The combination, with the window-frame and the sash, of rods at the rear of said sash, having their upper extremities pivoted to the window-frame, and springs at the rear of said rods or strips, having their upper extremities secured thereto and their lower extremities abutting against the window-frame, substantially as shown and described.

5. A window-sash having notches at its outer edges, and lugs or projections set in the window-frame, adapted to engage with the said notches, in combination with rods or strips at the rear of said sash and abutting thereagainst, and springs at the rear of said rods for holding the same in contact with the said sash.

384,536. DEVICE FOR COUPLING CARS. WILLIAM H. HOBBS, sen., St. Louis, Mo. Filed Feb. 3, 1888. Serial No. 262,980. (No model.)



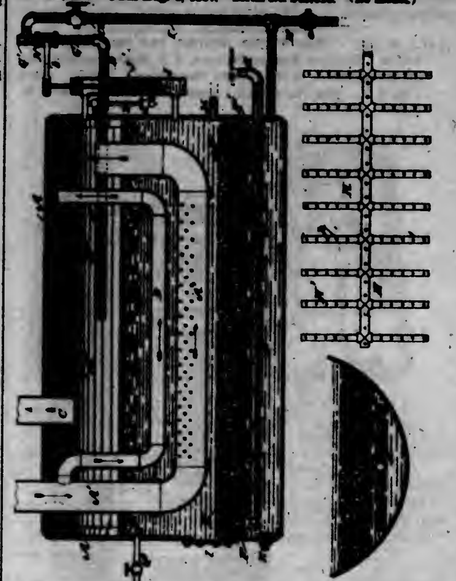
Claim.—1. The combination, with a railway-car, of a tube extending from end to end of the car, and a draft-cable passing through and guided and protected by said tube, by which the cars are coupled together.

2. The combination, with a railway-car, of the tube 12 beneath the same, having flaring ends 13, for guiding the coupling-cable 6, substantially as and for the purpose set forth.

3. The combination, in a railway-train, of the cable-tubes beneath the cars, a cable secured to the locomotive and extending through the tubes, and gripping devices on the cars, for the purpose set forth.

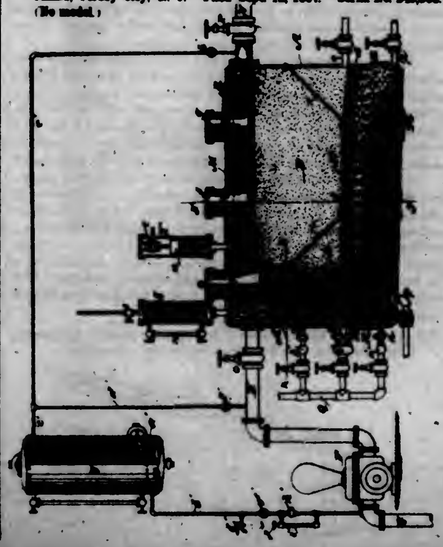
4. The combination, in a cable, of a suitable device upon the locomotive or tender for winding and unwinding the cable, and guide-tubes and gripping devices upon the cars, substantially as and for the purpose set forth.

384,537. BREECH MECHANISM FOR GUNS. THOMAS HEBERT, Westminster, England, assignor to the Hotchkiss Guns and Ammunition Company, (Limited,) same place. Filed Apr. 2, 1888. Serial No. 269,316. (No model.)



Claim.—1. Breech mechanism for guns having a screw breech-piece with divided segments of screw-threads upon it, corresponding segments in the gun for these segments to lock into, a ring capable of being turned around the rear end of such breech-piece, a lever-handle extending from the ring by which it can be turned, a pin or pins carried by the ring to enter inclined grooves, so disposed that when the ring is turned by its lever-handle it first gives a partial turn to the breech-piece to unlock it, and then draws the breech-piece back clear of the rear end of the gun, and a pin projecting from the rear end of the gun, around which the ring is then turned by the continued movement of its lever-handle, and the breech-piece thereby carried to one side and out of line with the bore of the gun.

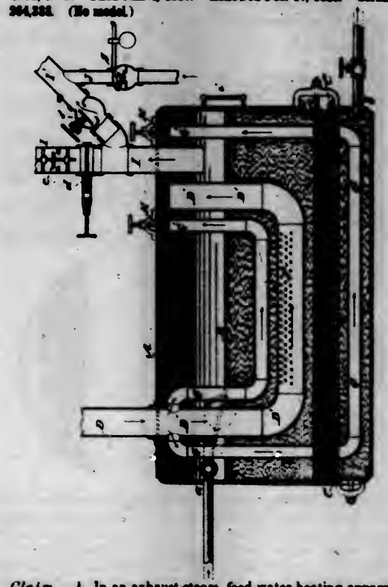
2. The combination of a gun having divided segments of screw-threads within its breech end, a breech-piece having corresponding segments to lock into them, and also having an inclined groove passing partly around it, a carrier-ring into which the rear end of the breech-piece extends, a short arm extending from the ring and capable of being turned around a pin projecting rearward from the breech end of the gun, a ring with lever-handle extending from it capable of being turned around the carrier-ring, and a pin projecting inward from the ring and entering the inclined groove in the breech-piece, the whole so disposed that on the ring being turned in one direction the breech-piece has first a partial turn given to it, is then drawn back, and then by the continued movement of its lever-handle carried to one side of the gun.



3. The combination of a gun having divided screw-segments within its breech, a breech-piece with corresponding screw-segments, a carrier-ring into which the rear end of the breech-piece extends, a short arm extending from the ring, a pin projecting rearward from the breech end of the gun, around which the arm can be turned, an extractor sliding in a longitudinal groove in the gun and having teeth upon it to engage with the screw-threads on the breech-piece, and a longitudinal groove in the carrier-ring, into which the extractor is drawn when the breech-piece is drawn back from the gun.

384,538. FEED-WATER HEATER. WILLIAM CLEVELAND, Paterson, N. J. Filed Aug. 1, 1887. Serial No. 245,515. (No model.)

Claim.—A feed-water heating and filtering vessel constructed with main and exhaust steam and water chambers having a feed-water supply-pipe with a regulating cock or valve, an exhaust-steam induction-pipe, an exhaust-steam eduction-pipe, a filter-diaphragm, and a terminally-closed branched and perforated blowing-out pipe, the latter being located beneath said diaphragm and the steam-eduction pipe above, substantially as shown.



384,539. METHOD OF LIQUID PURIFICATION. WILLIAM CLEVELAND, Jersey City, N. J. Filed Sept. 12, 1887. Serial No. 249,808. (No model.)

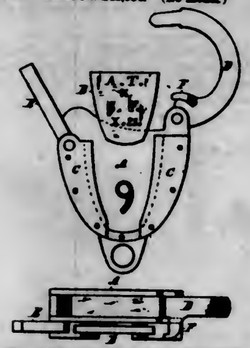
Claim.—1. The herein-described method of purifying liquid, consisting in subjecting the same to filtration through a bed of one grade of material, and subsequently through another bed of a different grade of material, said material being subjected to cross cleansing-currents, substantially as described.

2. The method described of discharging and renewing the fouled portion of an up-current filter-bed, the same consisting in forcing a hydraulic counter-current horizontally through the lower portion thereof and replacing the portion so discharged by gravitation of the remaining portion, substantially as and for the purposes set forth.

384,540. FEED-WATER HEATING AND FILTERING APPARATUS. WILLIAM OLIPHANT, Paterson, N. J., assignor, by direct and mesne assignments, to the Oliphant Manufacturing Company, of New York, N. Y. Filed Jan. 4, 1887. Renewed Feb. 17, 1888. Serial No. 264,326. (No model.)

Claim.—1. In an exhaust-steam feed-water-heating apparatus, the combination, substantially as shown, with an exterior shell, of an interior exhaust-steam-conducting pipe having perforations at that portion which is immersed beneath the feed-water, and having its ends connected, respectively, to the exterior source of exhaust-steam and to the interior steam-chamber of said shell, and a separate steam-eduction pipe located relatively thereto, as shown.

2. In an exhaust-steam feed-water-heating apparatus, the combination, substantially as shown, with an exterior shell and interior exhaust-steam-conducting pipe having perforations located as shown, of auxiliary relief exhaust-steam pipes connected with said exhaust-pipe at its point of entrance to said shell and immersed in the feed-water for the purpose of conducting through the same a portion of said steam and delivering the latter to the steam-chamber of said shell.



3. In an exhaust-steam feed-water heating and filtering apparatus, the combination of an exterior shell comprising a water-reservoir and steam-chamber, a main steam-exhaust pipe having perforations and steam-chamber communication, as shown, auxiliary exhaust-steam relief-pipes, separate steam-eduction pipe provided with an atmospheric check-valve, a filtering-diaphragm located substantially as shown and described, and means for automatically supplying feed-water above said diaphragm and withdrawing the same from beneath said diaphragm.

384,541. BUILDING-BLOCK. HARRIS S. PALMER, Chattanooga, Tenn. Filed Feb. 15, 1887. Serial No. 227,686. (No model.)

Claim.—As a new article of manufacture, a hollow rectangular concrete building-block having the projecting tongue D on its top and the groove C in its lower side, the tongue of one block fitting in the groove of the superimposed block, and the ends of the block being provided with a series of scallops or vertical corrugations extending entirely across the end thereof, substantially as described and shown.

384,542. SEAL-LOCK. OMAR C. PRATT, San Rafael, Cal. Filed Sept. 6, 1887. Serial No. 248,981. (No model.)

Claim.—The within-described seal-lock A, having secured on one side the grooved jaws C, the seal B, fitting in the said jaws, the locking-lever E, pivoted between one of the grooved jaws and the lock-plate proper, and the shackle D, having near its heel the spur F, all combined in the manner and for the purposes set forth.

384,543. BICYCLE ARM. F. PEIRCE, Philadelphia, Pa. Filed Oct. 15, 1887. Serial No. 252,641. (No model.)

Claim.—1. In a bicycle, a treadle, in combination with a lever or arm having a wrist-pin or stud, and a gear-wheel meshing with a pinion on the shaft of the driving-wheel of the bicycle, the said treadle bearing on said wrist-pin or stud, substantially as and for the purpose set forth.

2. In a bicycle, the fork D, having slotted arms E, in combination with link F, the treadle G, pivoted to said link, the wheel J, having the arm H, and the pinion K, mounted on the axle of the driving-wheel B, the said treadle bearing on and operating the said arm H, substantially as and for the purpose set forth.

3. In a bicycle, a slotted lever or treadle engaging with the crank thereof, in combination with a friction-roller of conical form mounted on said crank, substantially as described.

4. In a bicycle, a slotted lever engaging with the crank thereof and vertically adjustable on the frame of the bicycle, substantially as described.

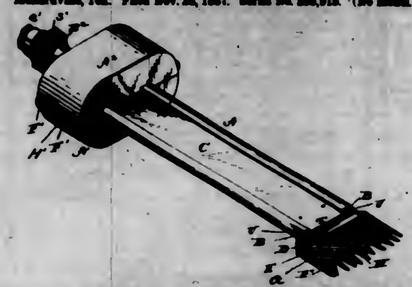
5. In a bicycle, the fork having a slotted arm, in combination with a link vertically adjustable in said slotted arm and a treadle pivoted to said link, substantially as and for the purpose set forth.

6. In a bicycle, a roller having beveled ends, in combination with a treadle and an arm connected to gearing meshing with and operating a pinion on the driving-wheel, substantially as and for the purpose described.

384,544. RUBY-PIN SETTER. PAUL RAMBER, Dubuque, Iowa. Filed Aug. 27, 1887. Serial No. 248,033. (No model.)

Claim.—1. In a ruby-pin setter for watch-makers, the combination of the chank A, having the head B, and the projecting arm C, for the purpose set forth, with a sliding clamping-jaw arranged on the shank, and the combined tweezers and gage secured to the clamping-jaw and movable thereon, substantially as described.

2. The combination, in a ruby-pin setter for watch-makers, of the shank A, having the head B, and the extended arm D, the sliding jaw



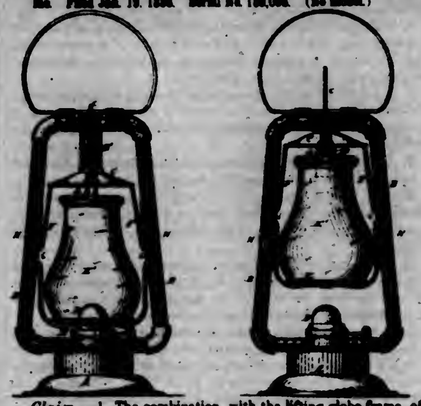
384,544.

secured to the shank, the spring to force the said jaw normally forward toward the head B, for the purpose set forth, and the combined tweezers and gage fitted on one side of the sliding jaw and provided with the longitudinal slot L, and the set-screw S, working in the said slot and secured to the sliding jaw, substantially as described.

3. The combination, with a ruby-pin setter having the rigid head B and the sliding clamping-jaw E, of the tweezers and gage secured to the said sliding jaw and adjustable thereon, said tweezers and gage having the tweezer-arms N and O, the former being provided at its outer end with the curved guide P, adapted to direct the slit between the tweezer-arms onto the ruby-pin, substantially as described.

384,545. SHEEP-SHEARING MACHINE. GEORGE RICHARDSON, Mooresville, Tex. Filed Nov. 22, 1887. Serial No. 255,915. (No model.)

Claim.—1. The combination, with the handle having the casing at its rear end, of the stationary blade having the series of teeth beveled on their lower edges, the pivoted movable blade having the teeth beveled on their upper edges and having the longitudinal slot in its rear end, the centrally-pivoted lever having the pin at its forward end and having at its rear end the projecting arms, the thick rearward portions of which are rounded on their inner sides, the shaft mounted in the end casing, the eccentric disk mounted upon the said shaft, and suitable means for revolving the said shaft.

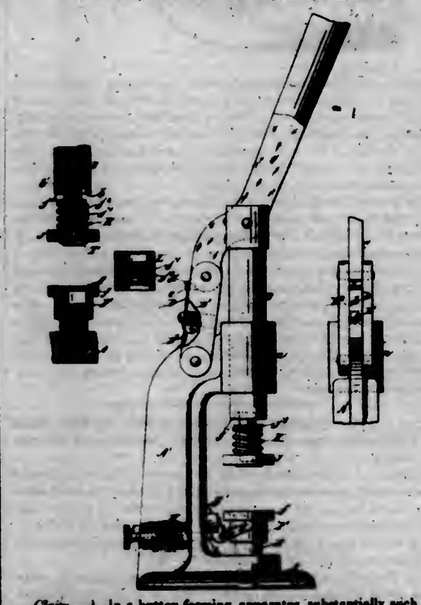


2. The combination, with the handle having the casing at its rear end and formed with the recessed forward end, of the stationary steel blade having the recessed rear end and the series of teeth beveled on their lower edges and rounded on the lower sides of their points, the said teeth increasing in thickness from their base to their points, the pivoted movable steel blade having the teeth beveled on their upper edges and increasing in thickness from their base to their points and formed with the longitudinal slot in its rear end, the centrally-pivoted lever having the pin at its forward end and having at its rear end the projecting arms, the thick rearward portions of which are rounded on their inner sides, the shaft mounted in the end casing, the eccentric disk mounted on the said shaft, and suitable means for revolving the said shaft.

3. The combination, with the shears, substantially as described, the centrally-pivoted lever for operating the lower shear-blade, having at its rear end projecting arms, the thick rearward portions of which are rounded on their inner sides, and the shaft provided with the eccentric disk which engages the said arms, of the flexible shaft secured at its lower end to the rear end of the disk-shaft and mounted at its upper end in a supporting-bracket, the rubber wheel adjustably secured upon the upper end of said flexible shaft, and the large drive-wheel.

4. The combination of the shears, the centrally-pivoted lever operating the upper shear-blade and formed with arms at its rear end, and the shaft having the eccentric disk secured thereon and engaging the said arms of the centrally-pivoted lever, with the flexible shaft, the rope-sockets formed with the ridges on their inner sides and the toothed threaded outer surfaces and the clamping-nuts, the supporting-bracket, the rubber wheel having the grooved sleeve fitting on the upper rope-socket, which is formed with a longitudinal key, the shifting-lever, and the main drive-wheel.

5. The combination, with the handle formed with the cap-pieces at the corners of its forward end, and the recessed forward end, and the casing formed in two halves, as described, of the removable top plate for the cover having the downwardly-bent forward end, the stationary steel blade having the recessed rear end and the series of teeth beveled on their lower edges and increasing in thickness from their base to their points, the pivoted movable steel blade having the teeth beveled on their upper edges and increasing in thickness from their base to their points and formed with the longitudinal slot in its rear end, the centrally-pivoted lever having the pin at its forward end, and suitable means for reciprocating it, substantially as set forth.



384,546. TUBULAR LANTERN. JOSEPH B. STIMSON, Lincoln, Me. Filed Jan. 19, 1888. Serial No. 260,696. (No model.)

Claim.—1. The combination, with the lifting globe-frame, of a side tube provided with an upright opening, *j*, and a grooved plate, H, secured to the tube over said opening, substantially as set forth.

2. The combination, with the lifting globe-frame having lateral projections *i*, of side tubes provided with upright grooves *h*, having recesses *l* of greater depth than said grooves, in which recesses said projections engage, thereby locking the globe-frame in position, substantially as set forth.

384,547. BUTTON-MAKING DEVICE. JOHN STEWART, Newark, N. J. Filed July 14, 1887. Serial No. 244,351. (No model.)

Claim.—1. In a button-forming apparatus, substantially such as described, the combination, with the lower die or sleeve and its anvil or post, of a spring tension-lever, substantially such as described, ar-

ranged to sustain the said lower die in its normal position by an elastic pressure, substantially in the manner and for the purpose described.

2. In a button-forming apparatus, substantially such as described, the combination, with the die F, anvil E, and lever G, of means, substantially such as described, for sustaining the said lever and die in their normal position by an elastic pressure, for the purpose and substantially in the manner described.

3. In a button-forming apparatus, substantially such as designated, the tension-lever G, formed with the stop or bearing-arm *g*, in combination with the die F and with means for holding the said lever G and die F in their normal positions, substantially in the manner and for the purpose described.

4. In a button-forming apparatus, substantially such as described, the combination, with the die F and tension-lever G, of means for adjusting the tension or pressure exerted by the latter, for the purpose and substantially in the manner described.

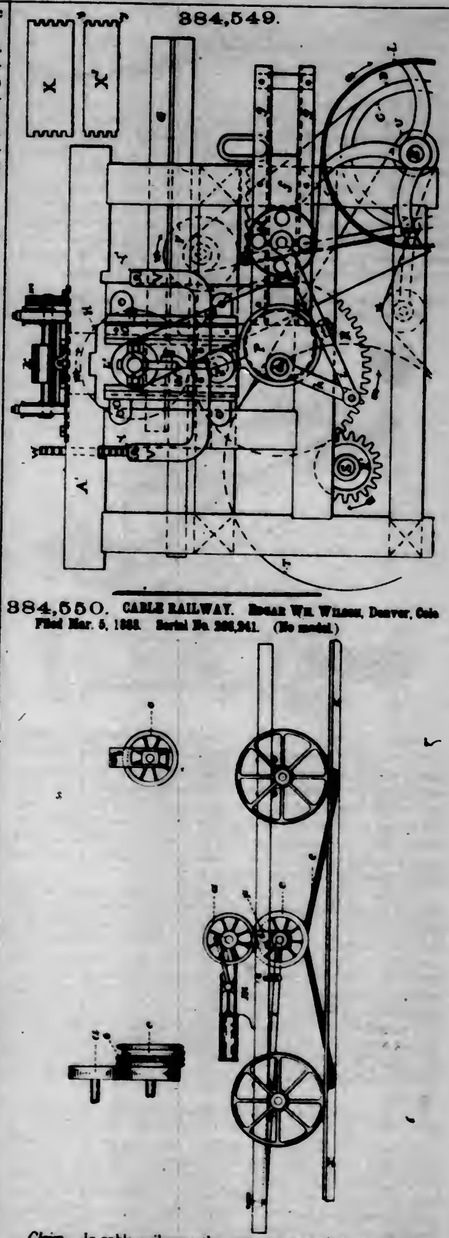
5. In a button-forming apparatus, substantially such as described, the combination, with the die F and lever G, of the bolt A, spring H, and adjusting-screw I, substantially in the manner and for the purpose described.

6. In a button-forming apparatus, substantially such as described, the combination, with the plunger B, formed with a spring-compressing shoulder, *b*, of the die J, provided with the compressed spring K, confined thereon by means which admit of its further compression by the said plunger, substantially in the manner and for the purpose described.

7. In a button-forming apparatus, substantially such as described, the combination, with the plunger B and plunger-lever C and the link D, of a spring-latch for holding the said parts in a prescribed position, substantially in the manner and for the purpose described.

8. In a button-forming apparatus, substantially such as described, the combination, with a plunger and with an opposed die, of a die having a spiral spring compressed and confined upon its cylindrical portion between two flanges, one of which latter is formed of less width than the thickness of the said spring, for the purpose and substantially in the manner described.

884,548. SLED-BRAKE. ISAAC C. THOMPSON, Andrew, Iowa. Filed Mar. 15, 1888. Serial No. 267,267. (No model.)



Claim.—1. The combination, with a sled having runners whose rear ends are provided with oblique slots, of the rock bar or shaft secured thereto having integral slotted arms and operated by a lever, the brake-dogs attached to the said arms and working in the oblique slots in the ends of the runners when depressed, and the metallic clips surrounding the ends of the sled-runners and forming retention-guides for the dogs, substantially as described.

2. The combination, with a sled having runners whose rear ends are provided with oblique slots, of the rock bar or shaft secured to the rear end of the sled and provided with integral slotted arms, the brake-dogs pivotally mounted in said arms of the rock-shaft and working in the oblique slots in the ends of the sled-runners, the metallic clips surrounding the ends of the sled-runners and forming retention-guides for the dogs, the arm secured to one end of the rock-shaft at right angles thereto and having a slot in its end, the bell-crank lever fulcrumed to the sled and having a stud or pin projecting from one arm thereof engaging with and moving in the slot in the arm on the one end of the rock-shaft, and a handle attached to the other arm of said lever, substantially as described.

884,549. MACHINE FOR MAKING HONEY-FRAMES. JAMES WARR, Modesto, Cal. Filed Dec. 27, 1887. Serial No. 259,162. (No model.)

Claim.—1. The vertically-reciprocating saw-frame N, having the circular saw H mounted thereon and arranged to cut at top and bottom in its movements up and down, in combination with two pairs of feed-rolls, and means consisting of ratchet W W', spring-pawls Z, bars Y Y', and U-shaped arm V, for operating the feed-rolls from the reciprocating frame, substantially as described.

2. The automatic saw-belt take-up or tightener-pulley M, guides *g g* in which it slides, a shaft, Q, links *i*, and crank *h*, mounted adjustably on the shaft, in combination with the saw-arbor and its movable frame connected by means of an eccentric to said shaft, substantially as described.

884,550. CABLE RAILWAY. EDGAR WM. WILSON, Denver, Colo. Filed Mar. 5, 1888. Serial No. 266,941. (No model.)

Claim.—In cable railways, the motor *m*, provided with the friction driving-pulley *a*, in combination with the friction drum-pulley *c*, carrying the dormant cable *c*, and provided with the lever *i*, all operated as set forth, and for the purpose indicated.

884,551. UMBRELLA. HARRY ALPHAN and LEOPOLD SHARPP, Mobile, Ala. Filed July 16, 1887. Serial No. 244,482. (No model.)

Claim.—1. In an umbrella, the combination, with the stick having a handle at one end and a detachable cap at the other and surrounded by a series of ribs, of a covering having straps sewed thereto provided with hooks and eyes, said straps being constructed and adapted to encircle and hold the covering to the ribs.

884,551.

2. In an umbrella, the combination, with the stick having a handle at one end and a detachable cap at the other and surrounded by a series of ribs, of a covering having metallic fasteners secured to it near the outer ends of the seams, and being provided at a point above the fasteners with straps sewed thereto, said straps having hooks and eyes and being constructed and adapted to encircle and hold the covering to the ribs.

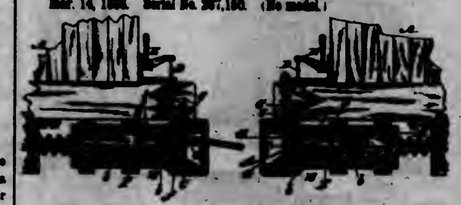
3. In an umbrella, the combination, with the stick having a handle at one end and a detachable cap at the other and surrounded by a series of ribs, of a covering consisting of pieces of material sewed together and terminating at one end in a ring, and having metallic fasteners secured thereto near the outer ends of the seams, and being provided at a point above the fasteners with straps having hooks and eyes, said straps being constructed and adapted to encircle and hold the covering to the ribs.

884,552. GATE. GEORGE H. AYLWORTH, Brighton, Ill. Filed Mar. 30, 1888. Serial No. 268,970. (No model.)

Claim.—1. The combination, with a hinged or swinging gate, of a lever fulcrumed on the top of the post to which the gate is hinged and capable of moving back and forth on its fulcrum, one end of said lever being connected to the top of the gate forward of the hinges and the other end projecting back beyond the said post, substantially as shown and described.

2. The combination, with a hinged or swinging gate, of a lever fulcrumed on the top of the post to which the gate is hinged and capable of moving back and forth on its fulcrum, one end of said lever being connected to the gate forward of the hinges and the other end projecting back beyond the post, and a cord attached to the latch and passing thence through a guide or keeper at the free end of the lever, substantially as shown and described.

3. The combination, with a hinged or swinging gate, of a plate, *c'*, pivoted on the top of the post to which the gate is hinged and carrying guide-rollers c^2 c^2, and a lever passing between said guide-rollers and connected at one of its ends to the top of the gate forward of the hinges and the other end projecting back beyond the said post, the said guide-rollers forming fulcra for said lever, substantially as shown and described.

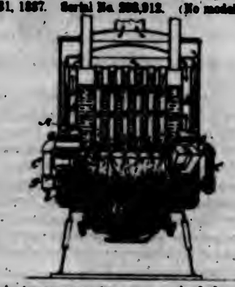


884,553. SASH-FASTENER. GEORGE H. AYLWORTH, Brighton, Ill. Filed Apr. 23, 1888. Serial No. 271,907. (No model.)

Claim.—1. In a sash-lock of the character described, the combination of a curved circularly-movable gravity-bolt, and a stop outside the line of movement with which the forward end of the bolt is adapted to engage to hold the same in retracted and inoperative position, substantially as shown and described.

2. In a sash-lock of the character described, the combination of a base plate or case, a curved circularly-movable gravity-bolt, a link-connection between the base-plate and the inner or upper end of the bolt, and a stop with which the forward end of the bolt is adapted to engage to hold the same in retracted and inoperative position, substantially as shown and described.

884,554. CAR-COUPLING. CHARLES L. BATTINGER, Philadelphia, Pa., assignor of one-half to J. Harry Battinger, Camden, N. J. Filed Mar. 14, 1888. Serial No. 267,160. (No model.)



Claim.—1. In a car-coupling, a draw-head with the recess *a* in the upper wall, and the groove *b'*, in combination with a link-retainer having pins at its inner end, substantially as and for the purpose set forth.

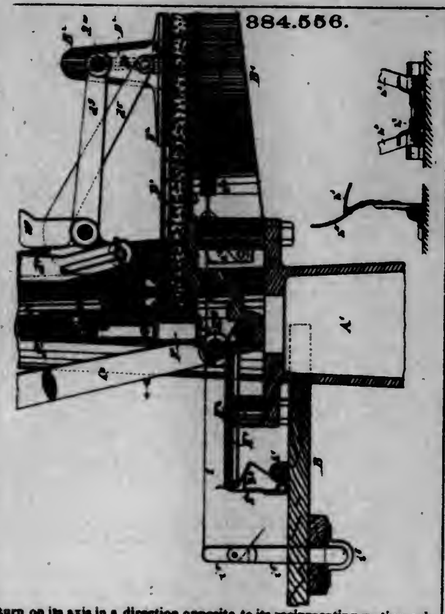
2. In a car-coupling, the combination, with the draw-head having the spring-follower, of the pivoted plate adapted to rest on said follower to hold and guide the link, substantially as described.

3. In a car-coupling, a draw-head having the grooves or ways *b'*, and the link-retainer G with pins *g*, and a connecting-link, said parts being combined, substantially as and for the purpose set forth.

4. A car-coupling device consisting of a draw-head with a recess in its upper wall adapted to receive the end of the link, and grooves or ways in the said draw-head, a link-retainer with pins working in said ways, and a spring-actuated coupling-pin, said parts being combined, substantially as described.

884,555. STEAM-GENERATOR. JOHN V. BERRIMAN, Brooklyn, assignor to the Ledgerwood Manufacturing Company, New York, N. Y. Filed Oct. 31, 1887. Serial No. 253,912. (No model.)

Claim.—A steam-generator composed of the sections A and B, the said section B constructed in two parts, having their junction immediately below the fuel-pockets, the lower part consisting of the cast-iron walls *b' b'' b'''*, inclosing the water-space *b*, and the flanges *k* and *j*, the said walls *b'* and *b''* being respectively provided with the openings *k* and *l*, substantially as described.



884,556. CIGAR-BUNCHING MACHINE. DAVID J. BOMER and CHARLES P. REED, New York, N. Y., assignors, by direct and mesne assignments, to the North American Cigar Machinery Company of the City of New York. Filed Nov. 1, 1887. Serial No. 254,023. (No model.)

Claim.—1. The combination of a detachable feed-box, means for locking the same in position upon the machine-frame, a vertically and longitudinally reciprocating feed-gripper operating in said box, a vertically-reciprocating cutting-knife, a retaining-chamber having a hinged bottom gate or gates, a vertically-reciprocating plunger operating in said chamber, and a rolling device for rolling the binder around the filler delivered by the plunger, substantially as set forth.

2. The combination of a detachable feed-box, means for locking it in position upon the machine-frame, a vertically and longitudinally reciprocating feed-gripper operating in said box, a vertically-reciprocating cutting-knife, a retaining-chamber having a hinged bottom gate or gates, a vertically-reciprocating plunger operating in said chamber, a rolling-table having a pocket vertically below the plunger, and a rolling-apron attached at one end to a stationary point of support and at the other end to a horizontally-reciprocating roller that is adapted to

884,556.

turn on its axis in a direction opposite to its reciprocating motion, substantially as set forth.

3. The combination of a detachable feed-box having a longitudinally-slotted top plate or cover, a vertically and longitudinally reciprocating feed-gripper operating in said box and having teeth passing through said slotted top plate, a vertically-reciprocating cutting-knife at the front end of the feed-box, a retaining-chamber having a hinged bottom gate or gates, a vertically-reciprocating plunger operating in said chamber, a rolling-table having a pocket vertically below said plunger, a reciprocating roller, and a rolling-apron attached at the front end to a fixed point of support and at the rear end to the roller, said roller having an axial motion in a direction opposite to its reciprocating motion, substantially as set forth.

4. The combination of a detachable feed-box having laterally-adjustable side rails and a slotted top plate, a vertically and longitudinally reciprocating feed-gripper operating in said box and having central stationary teeth and laterally and vertically adjustable side teeth, a vertically-reciprocating cutting-knife, a retaining-chamber having a hinged bottom gate or gates, a vertically-reciprocating plunger operating in said chamber, a rolling-table having a pocket vertically below said plunger, a reciprocating and axially-turning roller, and a rolling-apron attached at the front end to a stationary point or support and at the rear end to the roller, substantially as set forth.

5. The combination of a supporting-frame having a horizontal and longitudinally-grooved bracket, a detachable feed-box provided with a longitudinal bottom tongue located in the grooved bracket, a fulcrumed locking-hook engaging said tongue, a vertically and longitudinally reciprocating feed-gripper operating in said box, a vertically-reciprocating cutting-knife, a retaining-chamber having a bottom gate or gates, and a vertically-reciprocating plunger operating in said chamber, substantially as set forth.

6. The combination of a supporting-standard having a horizontal longitudinally-grooved bracket, a detachable feed-box located therein and having a longitudinal bottom tongue fitting into the groove of said bracket, a longitudinally-slotted top plate and laterally-adjustable side rails, a pivoted and weighted locking-hook for engaging the feed-box, and a vertically and longitudinally reciprocating feed-gripper operating in said box having a central fixed row of teeth and laterally and vertically adjustable side rows of teeth, substantially as set forth.

7. The combination of a detachable feed-box having laterally-adjustable side rails and a longitudinally-slotted top plate, and a vertically and longitudinally reciprocating feed-gripper operating in said box, having a row of fixed center teeth and rows of adjustable side teeth, a vertically-reciprocating cutting-knife, a retaining-chamber having a hinged bottom gate or gates, and a vertically-reciprocating plunger operating in said chamber, the horizontal section of said retaining-chamber and plunger corresponding to the vertical cross-section of the feed-box formed by the bottom, side rails, and top plate of the feed-box, substantially as set forth.

8. The combination of a detachable feed-box having laterally-adjustable and tapering side rails, a vertically and longitudinally reciprocating feed-gripper operating in said box, a vertically-reciprocating cutting-knife, a retaining-chamber having a removable side wall and a hinged bottom gate or gates, and a detachable plunger operating in said chamber, the horizontal cross-section of the retaining-chamber and plunger corresponding with the vertical transverse section of the feed-box, substantially as set forth.

9. The combination of a detachable feed-box, a vertically and longitudinally reciprocating feed-gripper operating therein, a vertically-reciprocating cutting-knife, a retaining-chamber having a hinged bottom gate or gates, a vertically-reciprocating plunger operating in said chamber, a rolling-table having a pocket vertically below the plunger, a horizontally-reciprocating roller, a rolling-apron attached at the front end to a stationary point below the table and at its rear end to the roller, and tension-belts applied in opposite directions to the axle of the roller, whereby an axially-rotary motion is imparted to the roller in a direction opposite to the direction of its reciprocating motion, substantially as set forth.

10. The combination of a detachable feed-box, a vertically and longitudinally reciprocating feed-gripper operating therein, a vertically-reciprocating cutting-knife, a retaining-chamber having a hinged bottom gate or gates, a vertically-reciprocating plunger operating in said chamber, a rolling-table having a pocket vertically below said plunger, spring-actuated retaining-fingers at the front of said rolling-table, a horizontally-reciprocating roller, a rolling-apron attached at its front end to a fixed point of support below the table and at its rear end to said roller, and spring-actuated tension-belts applied in opposite directions to the axle of the roller, so as to impart to the same an axially-rotary motion in a direction opposite to the direction of its reciprocating motion, substantially as set forth.

11. The combination of a supporting-standard having a horizontal bracket provided with grooved upright arms, a detachable feed-box locked to said bracket, longitudinally-grooved guide-pieces guided vertically in said arms, a reciprocating feed-gripper guided by said guide-pieces, cams on the driving-shaft having cam-grooves, and intermediate levers connecting the feed-gripper and the guide-pieces of the same with said cams, so as to impart a vertically and longitudinally reciprocating motion to said feed-gripper, substantially as set forth.

12. The combination of a roller, a rolling-table, a rolling-apron, a forked oscillating lever, a rotary driving-shaft, a cam having a cam-groove engaging the upper end of said lever, and pivot-links connecting the forked lever with fixed points in the supporting-standard, said points being respectively above and below the connection of the forked lever with the cam-groove for imparting horizontally-reciprocating motion to the said roller over the rolling-table, substantially as set forth.

13. The combination of a rolling-table, a rolling-apron, a roller attached to the rear end of said apron, hinged spring-fingers at the front end of said table, tension-belts applied in opposite direction to the axis of the roller, spring-arms attached to opposite ends of said belts, a forked oscillating lever applied to the roller, a rotary driving-shaft, and a cam having a cam-groove engaging the upper end of said lever, so as to impart reciprocating motion to the roller simultaneously with an axially-rotary motion in a direction opposite to the reciprocating motion, substantially as set forth.

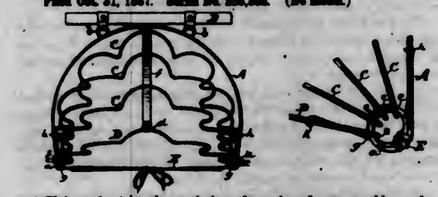
14. In a cigar-bunching machine, the combination of the table and apron with an apron-winding bunching-roller and rotating and reciprocating mechanism, whereby the effective bearing-surface of the roller is increased and the bunch is rolled in a gradually-tightening bight, substantially as and for the purposes set forth.

15. In a cigar-bunching machine, the combination of the table and apron, the table having a pocket at its rear end, with an apron-winding bunching-roller and rotating and reciprocating mechanism, the rear end of the apron being secured, as shown, on the circumference of the roller, whereby the apron is first unwound from and then wound upon the roller, substantially as and for the purposes set forth.

16. In a cigar-bunching machine, the combination of the table and apron with an apron-winding bunching-roller having a removable slotted sleeve at its apron-winding part, and rotating and reciprocating mechanism, substantially as and for the purposes set forth.

17. In a cigar-bunching machine, the combination of the table and apron with an apron-winding bunching-roller and reciprocating mechanism, the roller having two drums or pulleys, and with two roller-rotating straps or bands secured, as shown, to the upper periphery of the two drums or pulleys, substantially as and for the purposes set forth.

18. In a cigar-bunching machine, the combination of the table and apron with an apron-winding bunching-roller and reciprocating mechanism, the roller having two drums or pulleys, and with two roller-rotating straps or bands secured at their outer ends to spring devices and at their inner ends to the inner periphery of two drums or pulleys, substantially as and for the purposes set forth.

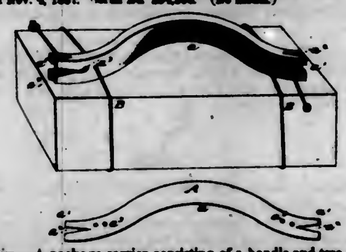


19. In a cigar-bunching machine, the combination of the four-motion toothed feed-gripper, having mechanism to give it the four right-lined motions described, with the stationary closed feed-box having longitudinal slots opposite the teeth of the feed-gripper, whereby the filling is fed bodily forward through the feed-box longitudinally of the same without disturbing its distribution, substantially as and for the purposes set forth.

20. In a cigar-bunching machine, the combination of the four-motion toothed feed-gripper, having mechanism to give it the four right-lined motions described, with the stationary closed feed-box cigar-shaped in transverse section and having slots opposite the teeth of the feed-gripper, whereby the filling is primarily distributed in the feed-box and is fed bodily forward without disturbing that distribution, substantially as and for the purposes set forth.

21. In a cigar-bunching machine, the combination of the four-motion toothed feed-gripper, having mechanism to give it the four right-lined motions described, with the stationary closed feed-box having longitudinal side rails or shaping-strips, and having slots opposite the teeth of the feed-gripper, whereby the filling is primarily distributed in the feed-box and is fed bodily forward without disturbing that distribution, substantially as and for the purposes set forth.

22. In a cigar-bunching machine, the combination of the four-motion toothed feed-gripper with the stationary closed feed-box increasing in depth toward the delivery end and having slots opposite the teeth of the feed-gripper, whereby the filling is fed bodily forward and is loosened up without disturbing its distribution, substantially as and for the purposes set forth.

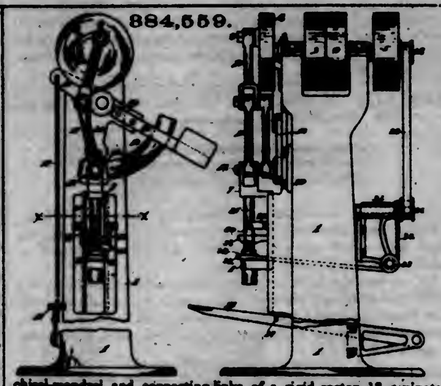


884,557. BUSTLE. FREDERICK J. BEARD, New Britain, Conn. Filed Oct. 31, 1887. Serial No. 253,202. (No model.)

Claim.—1. A bustle consisting of a series of connected bows, having the bows which give form to the clothing corrugated by a series of opposing bends of long and short curves, and forming the series of rounded projections with intervening spaces, substantially as described, and for the purpose specified.

2. In a bustle, the combination of a series of wire bows connected at their ends by coils and the separately-formed springs *g*, having the loops or coils A of their arms encircling the wire of which the bows A D are formed, substantially as described, and for the purpose specified.

884,558. PACKAGE-CARRIER. JAMES W. BRIDWELL, Hillsborough, Ohio, assignor to the Star Manufacturing Company, of Ohio. Filed Nov. 4, 1887. Serial No. 254,260. (No model.)



Claim.—A package-carrier consisting of a handle and two cords, said handle having horizontal ends to lie flat on the package, V-shaped end grooves, and pairs of cord-holes adjacent to the latter, substantially as shown and described.

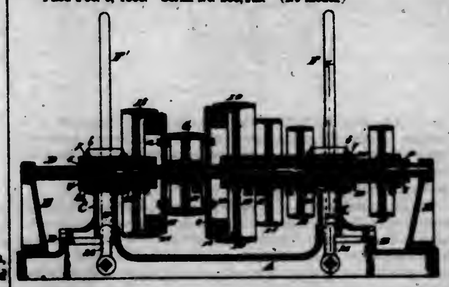
884,559. MORTISING-MACHINE. GEORGE W. DOBBS, Delhi, and FREDERICK DARRIN, Reno City, assignors to the Egan Company, Cincinnati, Ohio. Filed Jan. 3, 1888. Serial No. 259,576. (No model.)

Claim.—1. In a mortising-machine, the combination, with the crank 6, links 10 and 11, and the chisel-mandrel, of the rigid sector 13, the pivoted arm 21, the arm 22, sliding on the sector and loosely engaging the pivoted arm, the crank-arm 15, connected with the said pivoted arm, and a foot-lever and connecting-rod to operate the crank-arm for adjusting the sliding arm on the sector, substantially as and for the purpose described.

2. In a mortising-machine, the combination, with the crank 6,

884,559.

chisel-mandrel, and connecting-links, of a rigid sector, 13, a pivoted arm, 21, an arm, 22, sliding on the sector and loosely engaging the pivoted arm, and means, substantially as described, for operating the pivoted arm to adjust the sliding arm on the sector.



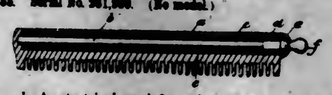
3. The combination, with the chisel-mandrel 25 and drive-shaft of a mortising-machine, of the crank 6, connecting-links 10 and 11, rigid sector 13, a pivoted arm, 21, an arm, 22, sliding on the sector and loosely engaging the pivoted arm, means, substantially as described, for operating the pivoted arm to adjust the sliding arm on the sector, and chisel-reversing devices composed of a pulley on the drive-shaft, a pulley rigid on the chisel-mandrel, endless bands operating the parts, a finger, 36, pivoted on a part of the chisel-mandrel, the pendent arms 40 and 41, to trip said finger, and the notched forked yoke 37 38, substantially as described.

4. The combination, with the chisel-mandrel of a mortising-machine, of a lock-finger, 36, pivoted on a part of the chisel-mandrel, the rigid yoke 37 38, notched at each end, pendent arms 40 and 41, for tripping the lock-finger to release the mandrel, and endless bands for turning the chisel-mandrel when said finger releases the same, substantially as described.

5. The combination, with the chisel-mandrel 25 of a mortising-machine, of the finger 36, pivoted to a part of the mandrel, the rigid yoke having its free ends notched to engage the finger, and finger-tripping arms 40 and 41, substantially as described.

6. In combination with the rotating mandrel 25 of a mortising-machine, the yoke 37 38, provided with the notches 26 and 39, and the finger 36, laterally engaging with one of said notches for locking and holding the mandrel from revolving, substantially as specified.

884,560. COUNTER-SHAFT. GEORGE W. DOBBS and FREDERICK DARRIN, Cincinnati, Ohio, assignors to the Egan Company, same place. Filed Feb. 9, 1888. Serial No. 263,443. (No model.)

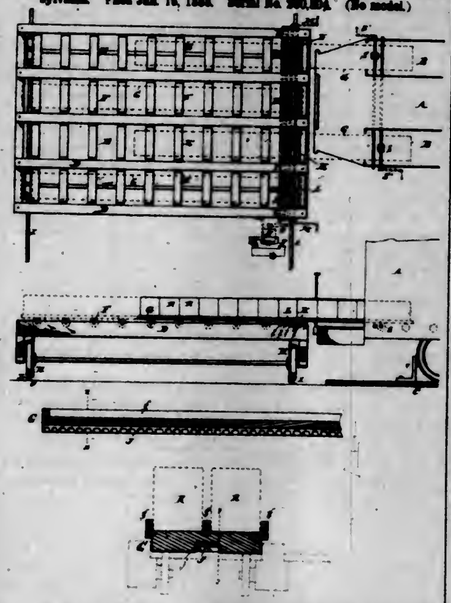


Claim.—1. The combination of the single continuous shaft D, the pulley G, fixed to the shaft and carrying a friction-cone, laterally-movable pillar-block C, the sleeve 4, mounted in the pillar-block, and the driving-pulley on the sleeve, substantially as described.

2. The combination of the counter-shaft D, the pulley G, carrying a friction-cone rigidly secured thereto, the laterally-moving pillar-block C, the sleeve 4, journaling within the said pillar-block C and provided with the collar 20, the crank-shaft 24, having the crank-arm 26 engaging with said pillar-block C, and the lever on the crank-shaft, substantially as described.

3. The combination of the bed-plate A, the counter-shaft D, the laterally-adjustable pillar-blocks C, the sleeves 4 5, journaled in said pillar-blocks C and adjustable therein, the driving-pulley G, having

friction-cones 9 and 11, the friction-pulleys 14 and 18, mounted on the sleeves and moving laterally therewith, the lever and connections between the levers, and the pillar-blocks for moving said pillar-blocks, substantially as specified.



384,561. ELECTRIC COMB. CARL DUBOIS, Chicago, Ill. Filed Jan. 26, 1888. Serial No. 261,800. (No model.)

Claim.—1. An electrical comb formed of a hollow metal cylinder, *a*, having metal comb-teeth, and provided with a core, *b*, having plug *d* and cover *c*, said core provided with a jacket, *e*, charged with an exciting-fluid, substantially as specified.

2. An electrical comb formed of a hollow metal cylinder, *a*, having metal comb-teeth, and provided with a core, *b*, having enlarged plug *d*, to which is attached a shouldered cover, *c*, and knob *f*, said core provided with a jacket, *e*, charged with an exciting-fluid, substantially as specified.

384,562. ELECTRIC RAILWAY. G. HERBERT CONBOY, Philadelphia, Pa., assignor to the Electric Car Company of America, of Pennsylvania. Filed Jan. 16, 1888. Serial No. 260,804. (No model.)

Claim.—1. The combination of a car-track with battery-slide carriage movable transversely across the line of said track, a battery-supporting slide having a rack, a pinion on said battery-slide carriage, and suitable means to rotate the pinion to propel the slide from the carriage into the car, or vice versa.

2. The combination of a car-track with battery-slide carriage movable transversely across the line of said track, a battery-supporting slide having a rack, a pinion on said battery-slide carriage, and suitable means to rotate the pinion to propel the slide from the carriage into the car, or vice versa, and a car adapted to receive the battery-slide, provided with a pinion to assist the pinion on the slide-carriage and to start the battery-slide from the car onto the slide-carriage.

3. The combination of a car-track with battery-slide carriage movable transversely across the line of said track and provided with rollers, a battery-supporting slide having a rack and adapted to run upon said rollers, a pinion on said battery-slide carriage, and suitable means to rotate the pinion to propel the slide from the carriage into the car, or vice versa.

4. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track, a series of rollers on said carriage arranged parallel with each other to form a line parallel with the track, a pinion arranged on said carriage at or near the end adjacent to the car-track, and a battery-slide having a rack, with which the pinion meshes, and adapted to run upon said rollers.

5. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track, a series of rollers on said carriage arranged parallel with each other to form a line parallel with the track, a pinion arranged on said carriage at or near the end adjacent to the car-track, a battery-slide having a rack, with which the pinion meshes, and adapted to run upon said rollers, and a shaft secured to said pinion and extending to opposite sides of the carriage, whereby power may be applied at both ends.

6. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track and having supports for four battery-slides, and having a pinion for each of said supports to propel the four slides, and four battery-slides having racks adapted to be supported upon said carriage and propelled to or from it by the pinions.

7. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track and having roller-supports for four battery-slides, and having a pinion for each of said supports to propel the four slides, and independent shafts extending across the carriage for operating each of said pinions, and four battery-slides having racks adapted to be supported upon said carriage and propelled to or from it by the pinions.

8. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track and having roller-supports for four battery-slides, and having a pinion for each of said supports to propel the four slides, and four battery-slides having racks adapted to be supported upon said carriage and propelled to or from it by the pinions.

9. The frame D, supported on wheels H, in combination with supporting-rollers E F, arranged in parallel rows, and a pinion, K, at one end of each of said rows of rollers.

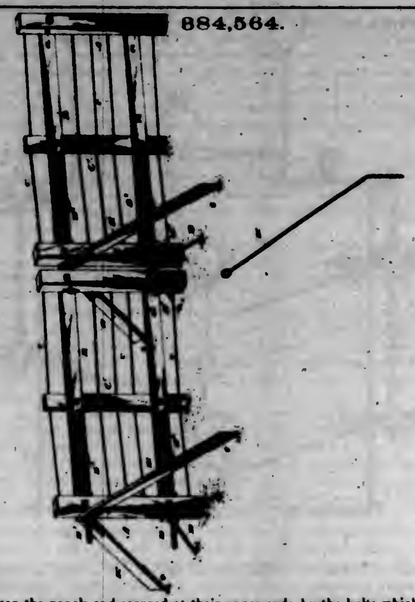
10. The frame D, supported on wheels H, in combination with supporting-rollers E F, arranged in parallel rows, a pinion, K, at one end of each of said rows of rollers, and independent shafts I, extending across the frame D.

11. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track, a battery-supporting slide having a rack, a pinion on said battery-slide carriage, suitable means to rotate the pinion to propel the slide from the carriage into the car, or vice versa, an electric motor to rotate the pinion, a motor-circuit, and a switch to control the motor.

12. The combination of a car-track with a battery-slide carriage movable transversely across the line of said track and having supports for four battery-slides, and having a pinion for each of said supports to propel the four slides, and a separate battery-slide for each of said supports.

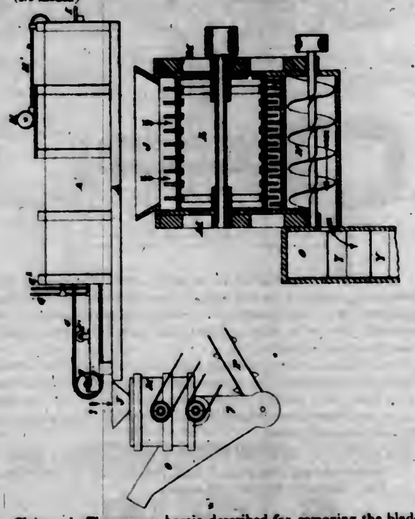
13. The combination of a car having one or more battery-slide supports and an opening thereto, a movable battery-slide carriage movable with respect to said car, so as to pass the openings to said slide-supports, and in which the battery-slide carriage has two or more parallel battery-slide supports and twice as many battery-slides as the car has battery-slide supports, whereby the slides on the car having expended batteries may be run out on the carriage and then the carriage shifted and other slides having charged batteries run into the same openings from the same carriage which received the slides from the car.

384,563. RUBBER-TIP ATTACHMENT FOR PENCILS AND THE LIKE. FREDERICK R. GROSS, Waterbury, Conn., assignor to the Eagle Pencil Company, New York, N. Y. Filed Mar. 31, 1888. Serial No. 269,096. (No model.)



Claim.—1. A rubber-tip attachment for pencils and the like, consisting of a tube, sleeve, or ring open from end to end and adapted to fit upon the pencil, and a rubber or eraser holding socket secured thereto and laterally projecting therefrom and located to one side of the bore of the said tube or sleeve, so that the pencil can project through and beyond both ends of the tube without interfering with or meeting the eraser, as and for the purposes hereinbefore set forth.

2. The rubber-tip attachment consisting of the sleeve or ring B, the inwardly-set spring-arm or friction-pad C, and the laterally-projecting socket or rubber-holder A, these parts being constructed and arranged substantially as and for the purposes hereinbefore set forth.

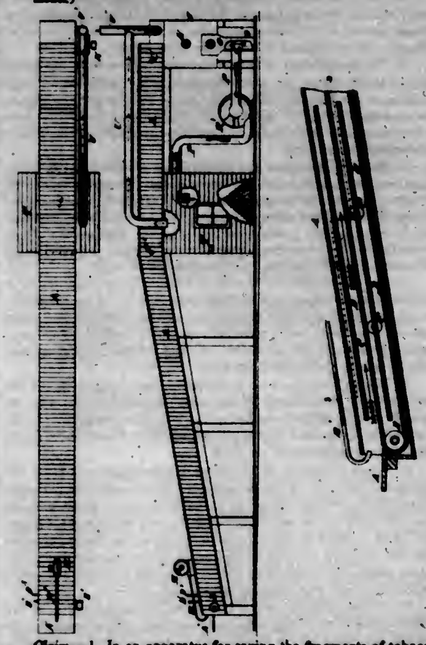


384,564. FENCE. ALPHA B. GELP, Wabarum, Ind. Filed Jan. 12, 1888. Serial No. 260,821. (No model.)

Claim.—A portable fence composed, substantially as before set forth, of a series of panels consisting of horizontal boards, vertical end posts, A A', having horizontal bolt-holes opposite said boards, sliding headed bolts seated in holes of posts A, stops secured to the boards at a distance from post A less than the length of the bolts to prevent the removal thereof, and upper and lower brace-rods interposed between the panels and secured at their upper ends by the bolts which connect adjacent panels.

884,564.

384,565. PROCESS OF UTILIZING TOBACCO WASTE. JAMES T. DUNNAGAN, St. Louis, Mo. Filed Feb. 23, 1884. Serial No. 121,821. (No model.)



Claim.—1. The process herein described for removing the blade portions from the stem portions in the utilization of tobacco-leaf waste, which consists in thoroughly drying the material to be treated, beating the material for causing the blade portions to become detached from the stem portions, and, finally, subjecting the material to a current of air for separating the blade portions from the stem portions, substantially as described.

2. The process herein described for removing the blade portions from the stem portions in the utilization of tobacco-leaf waste, which consists in thoroughly drying the material to be treated, beating the material for breaking up the stem portions and causing the blade portions to become detached from the stem portions, and, finally, subjecting the material to a current of air for separating the blade portions from the stem portions, substantially as described.

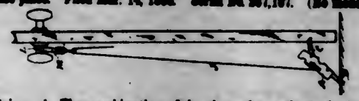
3. The process herein described of removing scraps of tobacco from the stem portion, which consists in first drying the tobacco, then exposing it to the atmosphere to render it brittle, then beating it so as to detach the fragments of leaf from the stems, and, finally, separating the said fragments from the heavier stem portions by air-currents, substantially as set forth.

384,566. APPARATUS FOR STEMMING TOBACCO. JAMES T. DUNNAGAN, St. Louis, Mo. Filed Aug. 3, 1886. Serial No. 159,973. (No model.)

Claim.—1. In an apparatus for saving the fragments of tobacco, the combination of a drier having means for automatically carrying stems of tobacco having particles of leaves attached therethrough, a breaker or separator arranged to receive the discharge of material from the drier, and means for collecting the leaf-fragments from the stem portion, substantially as set forth.

2. The combination, with a case having heating-pipes, of an endless apron passing through the case and supported by drums or rollers and a separator.

3. The combination, with a traveling apron and casing, of a separator located at the end of the traveling apron, a flue which receives the material from the separator, and a fan for inducing air-currents in said flue.



4. The combination of the traveling apron, the case, the heating-pipes therein, the cylinder and concave located at the end of the apron, the conveyer, the flue into which the conveyer discharges, and a fan for inducing air-currents in said flue.

5. The combination, with the drying apparatus consisting of a box or case, of an endless apron supported by drums or rollers within the box or case, power being applied to one of the drums to move the said apron, pipes located within the box through which hot air or steam is circulated, and a separator, substantially as and for the purpose set forth.

6. In combination with a drier, a carrier, and mechanism for creating a draft, the separator consisting of a cylinder and concave, a screw conveyer, and a chamber or shaft through which air is circulated to separate the valuable part from the stems and discharge it into a room, substantially as set forth.

7. The combination of a suitable box, drums located within the box, endless apron supported and operated by the drums, heating or drying pipes located within the box, a feed-table at one end of the box, the cylinder and concave located within a suitable chamber, the screw conveyer at the bottom of said chamber, the shaft into which the conveyer discharges, the collecting-room, the pipe connecting the room with said shaft, fan located in the pipe to separate the valuable part from the stems, and pipes forming vents to the room and cylinder-chamber, substantially as and for the purpose set forth.

384,567. DOOR-FASTENER. ROBERT C. ELLIOTT, Prairie Creek, Ind., assignor of one-half to William K. Elliott and Joseph H. Harper, same place. Filed Mar. 14, 1888. Serial No. 267,167. (No model.)

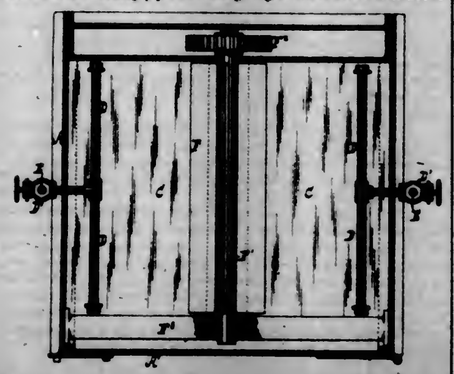
Claim.—1. The combination of the clasp, the cord attached to the clasp, and the spring-gun alarm, provided with spring-clasp fastening-prongs pivoted to the ends of its frame, and with a trigger to which the said cord is attached, substantially as set forth.

2. The combination of the alarm-frame, the two fastening-prongs pivoted to the frame, the spring-chamber in the frame, the plunger working in the chamber, the spring behind the plunger, the trigger, the cartridge-chamber in line with the plunger, and the thumb-piece for drawing back the plunger so that it may be held by the trigger, substantially as set forth.

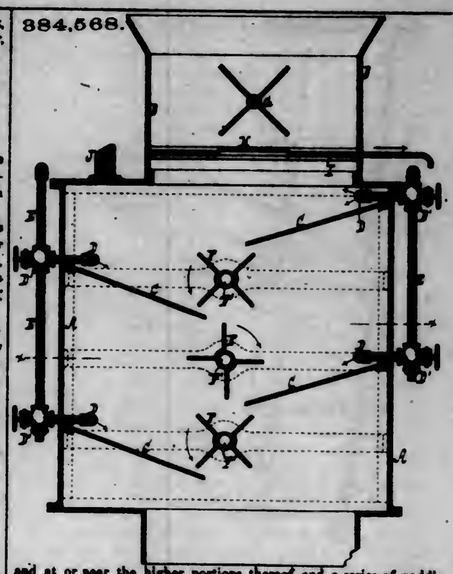
3. The combination of the alarm-frame provided with a spring-chamber, the plunger working in the chamber, the spring behind the plunger, the two fastening-prongs pivoted to the frame, the screw closing the end of the spring-chamber, the screws projecting through slots in the frame for guiding and operating the plunger, the trigger pivoted in the frame and engaging with the plunger, and the slot for the insertion of the cartridge, substantially as set forth.

4. The combination of the alarm-frame having a groove in its under side, a flat spring secured in the said groove, the two fastening-prongs pivoted within the said groove so that they may be closed flush with the frame, and a spring-gun formed in the said frame above the said prongs and provided with a trigger for operating it, substantially as and for the purposes set forth.

5. The combination, with a detonating spring-gun alarm, of the clasp-jaws, the guide having sloping sides for operating the jaws, the screwed stem pivotally connected to the jaws, the tube provided with a collar, and the union-nut for tightening up the jaws and retaining the alarm-cord, substantially as set forth.



6. The combination, with a detonating spring-gun alarm, of the clasp-jaws, the guide having sloping sides for operating the jaws, the screwed stem pivotally connected to the jaws, and provided with the shoe upon its end, the tube fitting over the end of the stem and provided with a collar at the top, and slots in its sides for engagement with the said shoe, the plug in the bottom of the tube, and the union-nut for tightening up the jaws and retaining the alarm-cord between the said shoe and plug, substantially as set forth.

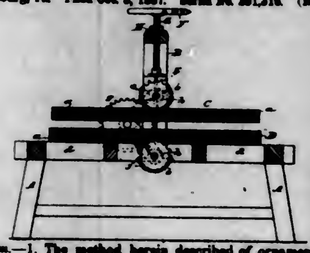


7. The combination, with a detonating spring-gun alarm, of the serrated clasp-jaws having projections on their outside surfaces, the serrated jaw-guide having sloping sides bearing against the said projections, the screwed stem pivotally connected to the jaws, the tube provided with a collar and sliding on the end of the said stem, and the union-nut for tightening up the jaws and retaining the alarm-cord, substantially as set forth.

384,568. MALT-MASHING MACHINE. THOMAS EVANS, New York, N. Y. Filed Oct. 19, 1886. Serial No. 216,635. (No model.)

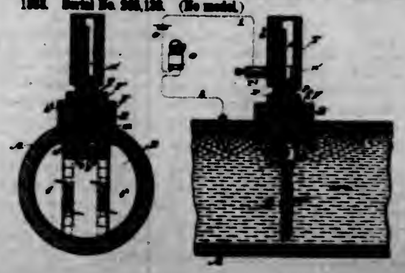
Claim.—1. In a mashing-machine, a series of inclined chutes on opposite sides of the mashing-chamber, alternately one below the other, a water-supply, and a series of paddle-wheels intermediate of said chutes, the whole combined substantially as and for the purpose herein described.

2. In a mashing-machine, a series of inclined chutes on opposite sides of the mashing-chamber, alternately one below the other, a series of water-distributing pipes extending lengthwise to said chutes above



and at or near the higher portions thereof, and a series of paddle-wheels intermediate of said chutes, the whole combined substantially as and for the purpose herein described.

3. In a mashing-machine, a series of inclined chutes, a series of water-distributing pipes, each provided with a valve, and water-supply pipes connected to said valves, the whole combined substantially as and for the purpose herein described.



384,569. METHOD OF ORNAMENTING GLASS. MARX FINK, Pittsburg, Pa. Filed Oct. 3, 1887. Serial No. 251,316. (No model.)

Claim.—1. The method herein described of ornamenting glass, metal, &c., consisting in first applying to a plate any suitable design with paint in a rough manner, then placing another plate upon it, next applying pressure to them, and finally affixing the ornamentation to the plates, as specified.

2. The mode of ornamenting glass, &c., herein described, consisting in first applying to the plate a suitable design in a rough manner with paint, then placing another plate upon it, and then applying pressure to them by reciprocating platens or rollers, in the manner and for the purpose set forth.

384,570. ELECTRIC CIRCUIT-CLOSING DEVICE. MILTON W. GROVENSTEIN and FERDINAND G. JAHR, New York, N. Y. Filed Feb. 24, 1888. Serial No. 265,128. (No model.)

Claim.—1. The combination of a movable vane, an arm actuated thereby, a chamber or conduit containing the vane, said arm extending without the chamber, and a flexible tubular packing intervening between the arm and the chamber through which said arm extends.

2. The combination of a movable arm, a vane for giving a lateral movement to the arm, a support for the vane through which the arm extends, and a flexible tubular packing intervening between the arm and the support.

3. A circuit-closing device consisting of a pivoted vane or wing adapted to be placed in a chamber or conduit, a circuit-closing point mechanically coupled therewith and actuated thereby, a contact-point therefor, and a flexible packing between the circuit-closing point and the support of the vane.

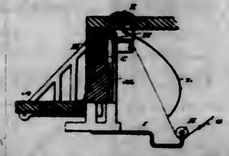
4. A circuit-closing device consisting of a pivoted vane, a circuit-closing point mechanically coupled therewith and actuated thereby, a contact-point therefor, and a support for the circuit-closing point consisting of a flexible tube.

5. A circuit-closing device consisting of a pivoted vane, a circuit-closing point mechanically coupled therewith and actuated thereby, a contact-point therefor, a flexible packing between the circuit-closing point and the support of the vane, consisting of a flexible tube one end of which is sealed to the circuit-closing arm and the other to the support of the vane.

6. The combination of a movable vane, an arm or lever one end of which is engaged by or connected with said vane, a hollow post through which said lever extends, a lug upon the lever at the end of the hollow post affording a fulcrum, and a flexible tubular packing intervening between said arm and said post, substantially as described.

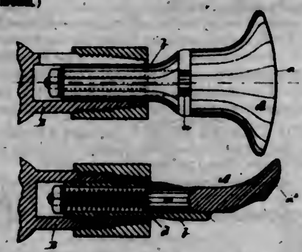
7. A circuit-closing attachment which consists of a vane, B, contained in the tube A, the spring normally holding the vane in a given direction, the stop opposed to the spring, the movable circuit-closing arm A, the cap a', through which it extends, the flexible coupling or packing between the arm and cap, and a contact-point applied to the circuit-closing arm, substantially as described.

8. In a circuit-closing device, a vane or valve having wings folding in a given direction, and a circuit-closing arm or points actuated by means of the vane.



9. The combination, with an electrical attachment for a chamber or conduit, of a circuit-closing point outside of the chamber or conduit, a device within the chamber or conduit for actuating the same, and a flexible tubular packing through which a movable mechanical connection is formed with the circuit-closing device.

384,571. MANUFACTURE OF HARNESS-MOUNTINGS. ROBERT S. GREENING, Newark, N. J., assignor to the Sargent Manufacturing Company, same place. Filed Mar. 24, 1888. Serial No. 268,281. (No model.)



Claim.—The method of making harness-mountings which consists in first casting or roughly forming metallic bodies for the mountings having portions of full size and other portions of smaller size, then covering the smaller portions with a plastic material substantially even with the larger portions and hardening the same, and finally finishing the metallic and hardened plastic surfaces, substantially as herein specified.

384,572. PASSENGER-REGISTER. THOMAS F. HARLY, New Orleans, La., assignor to Frank A. Behan, same place. Filed Mar. 14, 1887. Serial No. 230,812. (No model.)

Claim.—In a passenger-register, the step A, rod F, rod or cord G, pedal-rod and foot-piece I K, spring L, angular guide N, thimp or button O, and pulley H, in combination with the frame S, having bars s s', provided with the spring-pawl 1 and spring-detent 11, the spring 4, the toothed wheel 2, dial T, the link-frame R, and the rod F, connecting the step A with the link-frame R, substantially as specified.

384,573. SHANK-BURNISHING DEVICE. ALBERT HARDEN, East Bridgewater, Mass., assignor of one-half to Hillman A. West, St. Louis, Mo. Filed Oct. 28, 1886. Renewed May 19, 1888. Serial No. 274,373. (No model.)

Claim.—1. The tool A, with its curved edge a' and its long narrow convex face a^2, substantially as and for the purposes specified.

2. In combination, the tool A, with its long narrow convex face a^2, curved at its edge a', the spring d, and the tool-carrier B, substantially as described.

384,574. PROJECTILE. JOSEPH B. HAWLEY, Hartford, Conn. Filed Apr. 26, 1887. Serial No. 236,203. (No model.)

Claim.—1. The combination, with a projectile having a rear extension and slots in its base, of a centrally-perforated leather washer mounted on the projection, the front face of the washer toward the base of the projectile, so that the slots furnish apertures for the entrance of air between the projectile and washer to throw off the washer during the flight of the projectile, substantially as described.

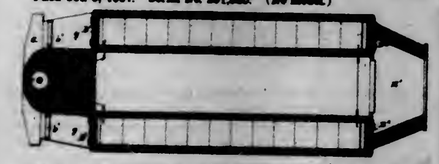
2. The combination, with a projectile and its sabot, of an interposed spring to detach the sabot after the projectile is fired.

3. A projectile having a rear projection and a series of washers thereon, and a spring between the washers and projectile, all arranged and combined substantially as set forth.

4. A projectile having a tapering rearward extension from its base, a series of washers on said projection, slots and pins connecting the washers and projectile to cause the washers and projectile to rotate together, and a spring interposed between the washers and base of the projectile to throw off the sabot after the projectile is fired, all in combination substantially as described.

5. The combination, with a projectile having air-passages in its base, of a series of washers mounted on a projection at the rear of the projectile, the front washer resting against the base, with its outer edge in proximity to the air-passages, substantially as described.

384,575. CAR-COUPLING. EDWARD HOWE, Blunt, Dak., assignor of one-half to Josh F. Williams, same place. Filed Mar. 21, 1888. Serial No. 267,949. (No model.)



Claim.—1. In a car-coupler, the combination, with the draw-head, of a spring secured within the recess of the draw-head in the path of the link, the rear upwardly-extended free end of which spring extends through a slot in the draw-head, the double-armed lever pivoted on a support on the top of the draw-head, with its lower arm resting on the extended end of the spring and short enough to fall off said end when raised to the proper height, and the pin hanging from the upper arm of said lever in the pin-holes of the draw-head, and a slot in the spring registering with said holes, substantially as specified.

2. In a car-coupler, the combination of the link G with the recessed draw-head A, having the pin-holes a a', the slot a^2 in its roof in rear of the pin-holes, and the recess a^3 in its floor within, the spring

B, having the curved portion *b*, the vertically-extended rear end, *b'*, and the slot *b²*, the double-armed lever C, pivoted on a bracket on top of the draw-head, and the hanging pin pivoted to the upper arm of said lever, substantially as specified.

3. The combination of the link with the recessed draw-head having the slot a^2, the slotted spring B, having the upwardly-extended rear end, *b'*, the double-armed pivoted lever, the pin hanging from the upper arm of said lever, and the spring F, having its outer or front end secured to the upper arm of the double-armed lever and its free rear end bearing on the top of the draw-head, substantially as specified.

384,576. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Electric Car Company of America, same place. Filed Oct. 5, 1887. Serial No. 251,825. (No model.)

Claim.—1. An electric car having its front or operator's platform of a width equal to or substantially equal to the distance between the seats, and having the front ends of the compartments under the seats made open for the insertion of batteries within said compartments from the front end of the car.

2. An electric car having its front or operator's platform of a width equal to or substantially equal to the distance between the seats, having the front ends of the compartments under the seats made open for the insertion of batteries within said compartments from the front end of the car, and doors to cover the said openings.

3. An electric car having its front or operator's platform of a width equal to or substantially equal to the distance between the seats, having the front ends of the compartments under the seats made open for the insertion of batteries within said compartments from the front end of the car, and a supporting-platform upon each side of said operator's platform, over which the batteries are pushed.

4. An electric car having its front or operator's platform of a width equal to or substantially equal to the distance between the seats, and having the front ends of the compartments under the seats made open for the insertion of batteries within said compartments from the front end of the car, and a supporting-platform provided with an anti-friction roller upon each side of said operator's platform, over which the batteries are pushed.

5. The combination, in a car, of the seat-compartments B, for the batteries having open ends, and a platform arranged between the openings in the ends, and long battery-supporting slides adapted to run into the seat-compartments.

6. An electric car having its front or operator's platform of a width equal to or substantially equal to the distance between the seats, having the front ends of the compartments under the seats made open for the insertion of batteries within said compartments from the front end of the car, in combination with long slides to run into said compartments, and cells of batteries on each of said slides.

7. An electric car having its front or operator's platform of a width equal to or substantially equal to the distance between the seats, and having the front ends of the compartments under the seats made open for the insertion of batteries within said compartments from the front end of the car, in combination with long slides to run into said compartments, rollers upon which said slides rest, and cells of batteries on each of said slides.

8. In an electric car, a compartment for the battery under the seat and open at one end and a platform-guard cut away or reduced in width at the open end of said compartment, in combination with batteries arranged in said compartment.

9. In an electric car, a compartment for the battery under the seat and open at one end, a platform-guard cut away or reduced in width at the open end of said compartment, in combination with batteries arranged in said compartment and a slide or carriage upon which said batteries rest and by which they are pushed into the compartment.

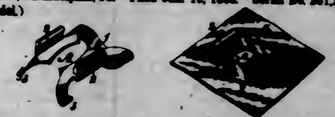
10. The combination of a car having a compartment under the seat running lengthwise with the car and having an opening at one end, a supporting or operating platform arranged immediately below said opening, and a passenger or operator's platform of a width sufficiently small as to not obstruct said opening, with a long slide to enter said compartment, and batteries arranged upon said slide.

11. The combination, in a car, of a seat-compartment running lengthwise of the car, an opening on the end of said compartment, a door for said opening supported within said compartment, and a removable battery-slide adapted to be moved into or out of said compartment through said opening and resting upon said supports.

12. The combination, in a car, of a seat-compartment running lengthwise of the car, an opening on each end of said compartment, a door for each of said opening-supports within said compartment, and a removable battery-slide adapted to be moved into or out of said compartment through said openings and resting upon said supports.

13. An electric car having a compartment exterior to the passenger-compartment, a removable door or cover to said compartment, two or more battery-cells, and a removable slide or support for said batteries, whereby said slide or support, with its batteries, may be simultaneously inserted or removed from the compartment through the door.

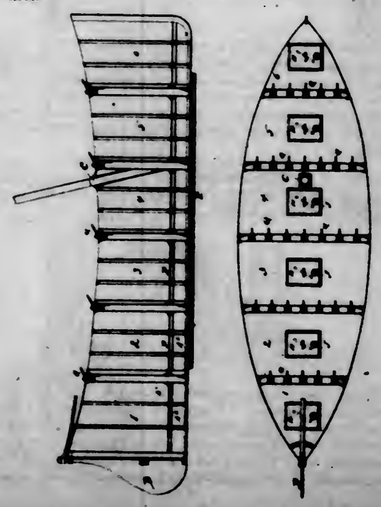
14. An electric car having a compartment exterior to the passenger-compartment, and having an opening extending to the outside of the car, a removable door or cover to the opening to said compartment, two or more battery-cells, and a removable slide or support for said batteries, whereby said slide or support, with its batteries, may be simultaneously inserted or removed from the compartment through the doorway to the outside of the car.



384,577. COMBINED RUBBER-DAM CLAMP AND NAPKIN-HOLDER. JAMES W. IVORY, Philadelphia, Pa. Filed Nov. 21, 1887. Serial No. 255,709. (No model.)

Claim.—1. A combined dental rubber-dam clamp and napkin-holder, consisting of a clamp having the lips B for the engagement of a napkin, substantially as described.

2. A combined dental rubber-dam clamp and napkin-holder, having the clamp portion A and provided with lips B and legs C, substantially as and for the purpose set forth.



384,578. RUBBER-DAM ADJUSTER AND CLAMP. JAMES W. IVORY, Philadelphia, Pa. Filed Jan. 19, 1888. Serial No. 261,216. (No model.)

Claim.—1. A dental rubber-dam adjuster and clamp having jaws and arms projecting upwardly or downwardly from the frontal ends thereof, so as to pass on the sides of the anterior tooth, substantially as described.

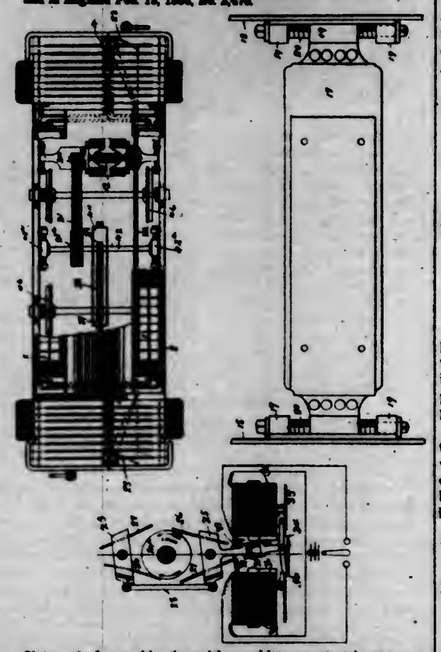
2. A dental rubber-dam adjuster and clamp having jaws with arms on the sides thereof and arms on the frontal ends thereof, the two sets of arms projecting upwardly and downwardly, as the case may be, in opposite directions, or approximately so, substantially as and for the purpose set forth.

384,579. COMBINED WATER-TANK AND LIFE-BOAT. SIMON J. R. JOHANNESEN, Langset, near Risoe, Norway. Filed Feb. 20, 1888. Serial No. 265,742. (No model.) Patented in England Feb. 15, 1888, No. 2,200.

Claim.—1. A life-boat formed of a series of separate sections locked together end to end, each section having two sides, two ends, and a top and bottom, substantially as set forth.

2. A life-boat composed of a series of independent sections locked together, each section having two sides, two ends, and a top and bottom, the sides and bottom projecting some distance beyond one of the end plates, substantially as set forth.

3. A ship's tank having a false bottom a short distance above the actual bottom, a hand-hole in said false bottom, and a cover for closing the hand-hole, substantially as set forth.



4. A ship's tank having a false bottom subdividing it in two compartments, and an outlet pipe or cock for the upper compartment, substantially as set forth.

5. A ship's tank having a U-iron secured along the sides and bottom at one end and a clip-plate along the sides and bottom of the opposite end, said clip being adapted to pass into the angle-iron on the end of an adjacent tank, substantially as set forth.

6. The combination of two ship's tanks, of a U-iron secured along the sides and bottom of the corresponding end of each tank, a clip-plate along the side and bottom of each tank at the opposite end, and bolts and nuts along the top edges of the tank, substantially as set forth.

7. The combination, with a ship's tank, of a U-iron secured along the sides and bottom at one end, a transverse U-iron secured on the same end a short distance below the top edge, a clip-plate secured along the sides and bottom of the opposite end, a transverse clip-plate secured on the same end a short distance below the top edge, and bolts and nuts at the top edge, substantially as set forth.

384,580. APPARATUS FOR ELECTRIC TRACTION. EDMOND JULIEN, Brussels, Belgium. Filed Feb. 17, 1888. Serial No. 263,949. (No model.) Patented in Belgium Sept. 7, 1883, No. 62,681, Mar. 7, 1884, No. 64,412, Feb. 5, 1886, No. 71,888, and Nov. 19, 1886, No. 78,988, and in England Feb. 19, 1886, No. 2,470.

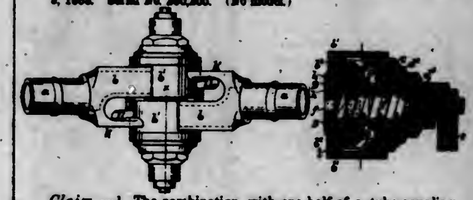
Claim.—1. In combination with a vehicle, an electric motor, a supporting bar or plate therefor hung from the vehicle, and adjusting-screws at both ends of said support for moving said motor in the plane of its support, substantially as set forth.

2. In combination with a motor, a movable carriage or support, an insulating-block between said motor and support, supporting-lugs on a vehicle and the support, respectively, and adjusting-screw connecting such lugs, substantially as and for the purpose set forth.

3. In an electrically-propelled vehicle, in combination with a casing protecting the power-transmitting mechanism, brooms on said casing, substantially as and for the purpose set forth.

4. In an electrically-propelled vehicle, in combination with the motor and its commutator, a current-reversing device consisting of two pairs of commutator-brushes and their carriers, an armature on one of the brush-carriers, electro-magnets controlling said armature, an electric circuit including a source of electricity and the said magnets, a switch whereby current may be directed into either magnet, and a locking device for holding either of the pairs of brushes in contact with the commutator of the motor, substantially as and for the purpose set forth.

5. In an electrically-propelled vehicle, the combination of an electric battery divided into several independent series, each of said series being placed in a drawer or box carrying exposed terminals, a current-regulator having multiple couplings and connected with the terminals of the said batteries, an electric motor fixed on a movable support and bearing on its field-magnets two distinct exciting-circuits independently controlled, a current-reversing device, flexible transmitting mechanism between motor-shaft and axle, and a protecting casing around such mechanism carrying brooms, all substantially as and for the purpose set forth.



384,581. ELECTRIC RAILWAY-CAR. EDMOND JULIEN, Brussels, Belgium. Filed Mar. 16, 1887. Serial No. 231,164. (No model.) Patented in Belgium Nov. 19, 1886, No. 78,988.

Claim.—1. The combination of the motor A, having armature-shaft *a*, worms *e*, jointed to said shaft, axles having pinions *p*, and rods for elevating one or other of said worms, substantially as and for the purpose set forth.

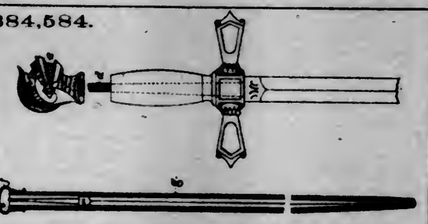
2. The combination of a car carrying a number of batteries, and a motor in circuit therewith, a regulating-commutator in the circuit for arranging said batteries in various groups, a shaft extending from end to end of the car, and hand-shafts connected therewith for operating said commutator, substantially as and for the purpose set forth.

384,582. TUBE-COUPLING. ANDREW C. KIMBALL, Providence, R. I., assignor of one-half to James D. Anthony, same place. Filed Jan. 9, 1888. Serial No. 260,305. (No model.)

Claim.—1. The combination, with one half of a tube-coupling provided with means for spearing the same to another similar half, of the valve-case *c*, provided with the steam-ports *c' c'*, the valve *d*, having the ports *d'* and operating-handle *e*, and the packing-cylinder *f*, provided with the joint-ring *g* and packing-ring *i*, surrounding the packing-cylinder, substantially as and for the purpose set forth.

2. In a tube-coupling, the combination, with the chamber *b*, of the valve-case *c*, having the ports *c' c'*, the packing-cylinder *f*, provided with the joint-ring *g* and packing-ring *i*, surrounding said packing-cylinder, the valve *d*, provided with the ports *d' d'* and operating-handle *e*, and the spring *f'* for holding the packing-cylinder and valve in operative position, substantially as and for the purpose set forth.

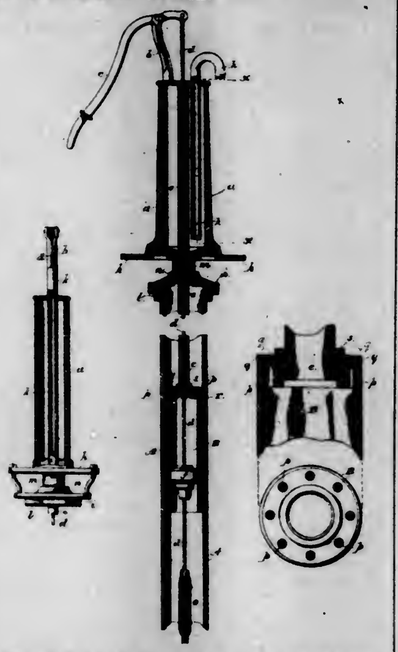
384,583. CHANGE-RECEIVER. JOSEPH A. KIMBALL, New York, N. Y. Filed Nov. 18, 1887. Serial No. 255,473. (No model.)



Claim.—1. A change-receiver consisting of a fixed table, A, having a hole, *a*, in combination with a horizontally-moving gate, B, and closing-spring D, arranged to receive change in the aperture *a*, and to deliver it to the hand below by a movement of the gate, substantially as herein specified.

2. The gate B, having the aperture *b* and rim or tube B', in combination with the table A, having the aperture *a*, spring J), stops A^1 A^2, and keeper G, arranged for joint operation, as herein specified.

384,584. SWORD. LA FAYETTE LITTLE, Toledo, Ohio. Filed June 27, 1887. Serial No. 242,612. (No model.)



Claim.—1. A sword having a detachable hilt and handle and a sectional scabbard, in combination with a blade-case in the form of a case, substantially as shown and described, for the purposes specified.

384,584.

2. A sword having a detachable hilt and handle, in combination with a blade-case made in the form of a cane, substantially as shown and described, for the purpose specified.

384,585. DEEP-WELL PUMP. PHILIP A. MYERS, Ashland, Ohio, assignor of one-half to Francis H. Myers, same place. Filed Jan. 23, 1888. Serial No. 262,244. (No model.)

Claim.—1. In a pump, the combination, with the main barrel forming a passage for the column of water in its upward movement to the point of discharge, and a discharge-pipe in connection with the upper end thereof, of a submerged cylinder within the same provided with a piston, and an opening in said submerged cylinder into the barrel above its piston, whereby the water which accumulates above the piston of the submerged cylinder is discharged directly into the column of discharging water, substantially as described.

2. The combination, in a pump, of a main barrel forming a discharge-passage to the surface and in connection at its upper end with the discharge, a cylinder within the same, a piston-rod and pistons, and a valved opening in the submerged cylinder between the cylinder and the main barrel, substantially as described.

3. A pump consisting of a main barrel forming a discharge-passage to the surface, a submerged cylinder within the same, a piston-rod carrying pistons of unequal diameter, a guide-pipe for the piston-rod connected to and supporting the submerged cylinder, and valved openings to the main discharge in the head of the submerged cylinder, substantially as described.

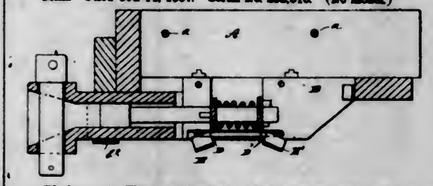
4. A pump consisting of a pump-stock, a main barrel, a submerged cylinder within the barrel, and a piston-rod and piston, combined with a flange, *h*, on the pump-stock, a flanged ring, *i*, suspended from the flange *h*, a collar, *n*, seated in a recess in the upper part of the ring *i*, and a pipe, *m*, connecting the stock and collar *n*, substantially as described.

884,586. BLOCK FOR ENGRAVING OR ETCHING UPON. WILLIAM C. NORMAN, Sydney, New South Wales. Filed Dec. 11, 1885. Serial No. 185,344. (No model.) Patented in England Sept. 16, 1884, No. 12,026; in New South Wales Feb. 24, 1885, and in Victoria Oct. 9, 1885, Nos. 4,367 and 4,368.

Claim.—1. An improved block or surface for engraving or etching upon, consisting of an etching-surface and an acid-resisting stippled film submerged below the upper etching film or surface, substantially as set forth.

2. An improved block or surface for engraving or etching upon, consisting of a surface sheet or mass of material in which are embedded separately-arranged quantities (such as dots, strips, &c.) of another material offering more stubborn resistance to the action of a third material that will etch said surface or first material, substantially as herein described and explained.

3. An engraving block or surface comprising a plate or film constituting the etching-surface, having a design indented, engraved, or otherwise sunk in its under face and coated with a stippled acid-resisting film, substantially as and for the purpose set forth.



4. The herein-described method of mounting engraving blocks or surfaces of the character described upon a smooth sheet of metal or alloy, consisting in first coating the two surfaces which are to adhere with a film of tin or solder, and then pressing them together at a temperature which will melt and affect only the solder, substantially as herein described and explained.

884,587. CUSPIDOR. JAMES L. O'CONNOR, New York, N. Y., assignor to the New York In Floor Cuspidor Company, same place. Filed Jan. 23, 1888. Serial No. 261,618. (No model.) Patented in England Oct. 15, 1887, No. 13,988.

Claim.—In a cuspidor, a combination of the sink A, let into a floor, the top being flush with the upper surface and provided with a plug, D, for stopping its lower aperture, said plug being provided with a pivot-rod, E, for removing the same, the handle of which is normally covered by the funnel C, the shallow funnel C, located inside the sink A and resting upon a rabbet on the interior of the edge of said sink, and the grating B, resting upon the edge of the funnel C and closing the mouth of the sink A, substantially as described.

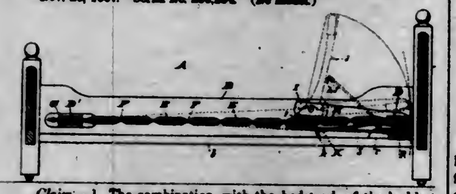
884,588. DRAFT-TIMBER FOR CARS. JOHN R. OWEN, Jackson, Tenn. Filed Oct. 11, 1887. Serial No. 252,010. (No model.)

Claim.—1. The combination, with the central sill of a car, and rods projected transversely through the same near the ends, of draft-timbers provided with aligning recesses in their under edge at each side of the center, apertured transverse straps engaging the walls of said recesses, and inclined side bars connecting the said straps and sill-bars, substantially as and for the purpose herein set forth.

2. The combination, with the sill of a car, and rods projected transversely through the same near the ends, of draft-timbers provided with aligning recesses in their under edge at each side of the center and inclined in direction of said center, apertured transverse straps engaging the walls of said recesses, detachable inclined side bars connecting the said straps and sill-rods, and means, substantially as shown and described, for securing the side rods to the straps and sill-rods.

3. The combination, with the center sill of a car, and rods projected transversely through the same near each end, provided with apertured extremities and keys in said apertures, of draft-timbers provided with aligning recesses in their under edge at each side of the center and inclined in direction of said center, apertured transverse straps engaging the walls of said recesses, and detachable inclined side rods connecting said sill-rods and straps, and provided with a thread at one end adapted to receive a nut and an eye at the opposite end, all arranged to operate substantially as set forth.

884,589. INHALER. ROBERT PALMER, Swanton, Ill. Filed July 8, 1887. Serial No. 243,732. (No model.)

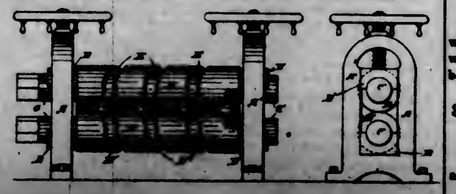


Claim.—1. The flexible tube *b*, formed as described, in combination with the perforated end plates, *c*, and the stop *f*, substantially as set forth.

2. The combination of the tube *b*, formed of coiled wire and adapted to contain medicament, the perforated plates *c*, secured in the ends of the coiled-wire tube, and an exterior cylinder, *a*, substantially as specified.

3. The combination of the tube *b*, formed as described, having the perforated plates *c* and stop *f*, with the outer casing, *a*, and an air-space between the tube and case, substantially as described.

884,590. SPRING MID-BOTTOM. WILLIAM H. PHENNEY, Mermaid, Del., assignor of one-half to Joseph W. Derrickson, same place. Filed Nov. 30, 1887. Serial No. 256,284. (No model.)



Claim.—1. The combination, with the bedstead, of the bed-bottom composed of the head and foot rails and intervening slats, the longitudinal connecting-wires secured in pairs to the head and foot rails and alternately passing over and under adjacent slats and crossing between the slats, the anchor-bar removably secured to the side bars, the retaining-blocks, the tension-wires extending from said anchor-bar and engaging the wires F, and the lever-arms pivoted near their inner ends to the inner surface of the side rails of the bedstead and at their outer ends to the head-rail, substantially as specified.

2. The combination, with the bedstead and the transversely flexible bed-bottom having its foot-rail removably secured to the bedstead near the foot thereof, and having the anchor-bar removably secured to the side bars near the head thereof, of the pivoted lever-arms having the segmental plate thereon, and the eyebolts set transversely on said lever-arms, and the supporting-bars pivoted at their lower ends to the inner surface of the side rails, B, and having the hook ends to engage the transverse eyebolts, substantially as specified.

3. The combination of the bedstead, the flexible bed-bottom having the foot-rail D', removably secured to the side rails, B, the anchor-bar removably attached to the side bars near the head thereof, and the tension-wires extending therefrom and engaging the wires F, the lever-arms pivoted near their inner ends to the inner surface of the side rails, B, and at the outer ends to the head-rail D, the semicircular plate secured in the recess and flush with the outer surface of the lever-arms I, the said plate being provided with a series of openings in a line concentric with the pivotal point of the lever-arm, the detent M, pivoted in the recess in the side rail, B, having the engaging point, and the arm D, having the button flush with the outer surface of the side rail of the bedstead, and the spring *p* in the recess, substantially as specified.

884,591. ROLLING APPARATUS. WILLIAM L. PENN, Philadelphia, Pa. Filed Oct. 17, 1887. Serial No. 252,513. (No model.)

Claim.—1. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, and the pivoted arm, substantially as specified.

2. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, and the adjustable guide-plate, substantially as specified.

3. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, and the pivoted arm, substantially as specified.

4. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, and the adjustable guide-plate, substantially as specified.

5. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, and the pivoted arm, substantially as specified.

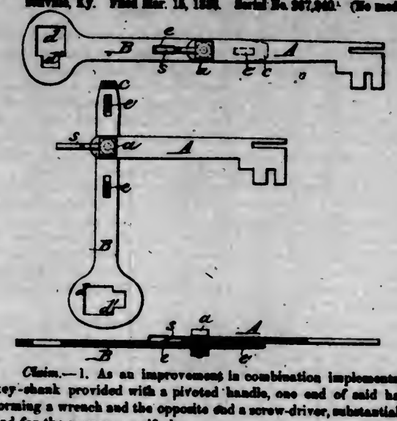
6. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, and the adjustable guide-plate, substantially as specified.

7. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, and the pivoted arm, substantially as specified.

8. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, and the adjustable guide-plate, substantially as specified.

9. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, and the pivoted arm, substantially as specified.

10. The combination, with the rolling-mill, of the guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, the adjustable guide-plate, the pivoted arm, and the adjustable guide-plate, substantially as specified.

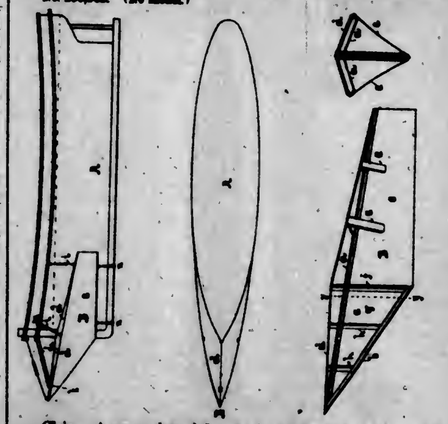


Claim.—1. The improved method of swage-rolling metallic shapes by passing such articles between rolls diagonally to the plane of their axes into helical swages formed in said rolls, substantially as set forth.

2. The improved rolling-swages, consisting of rolls fitted in pairs, with opposing helical swages formed therein, substantially as set forth.

3. The improved swaging-rolls, consisting of a pair of opposing rolls provided with helical opposing recesses formed therein, and cavities at the terminations of said helical recesses adapted to receive removable and adjustable dies, substantially as set forth.

4. Helical swaging-rolls, consisting of a central body or shaft, and removable noses having helical dies or grooves formed therein and arranged to form when assembled dies for varying lengths of work, substantially as set forth.

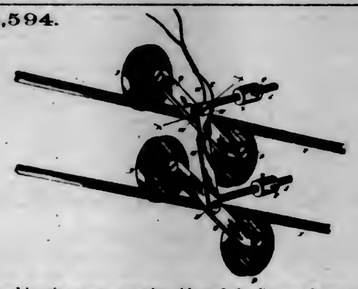


884,592. COMBINATION IMPLEMENT. WILLIAM S. ROSS, Madisonville, Ky. Filed Mar. 15, 1888. Serial No. 267,040. (No model.)

Claim.—1. As an improvement in combination implements, the key-shank provided with a pivoted handle, one end of said handle forming a wrench and the opposite end a screw-driver, substantially as and for the purpose specified.

2. In a combination implement, the key-shank, handle provided with screw-driver and wrench pivoted to said shank, and the spring secured to said shank with its free end entering recesses in the handle, all arranged and operating as set forth.

884,593. ICE-BREAKER FOR VESSELS. FREDERICK W. SMILLIE, Baltimore, Md., assignor of two-thirds to H. Hermann Peine and George W. Umbach, both of same place. Filed May 26, 1887. Serial No. 239,262. (No model.)



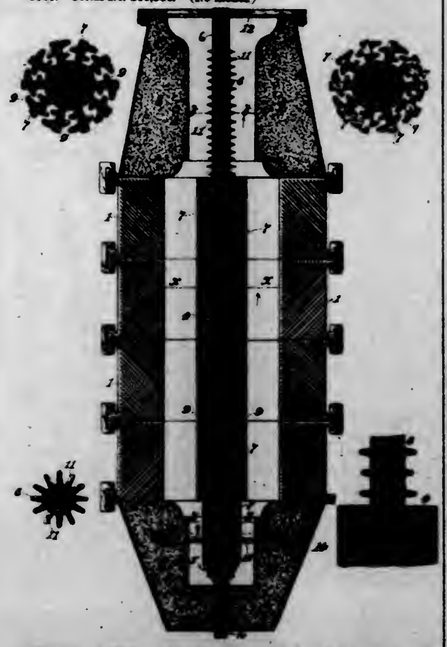
Claim.—A prow adapted for attachment to the bow of a vessel, which consists in a stem-iron, side bars, side and deck sheets, and a water-tight bulk-head placed transversely of the prow, the whole being fastened together, substantially as and for the purpose specified.

884,594. SYSTEM OF ELECTRIC LOCOMOTION. HENRY A. SUTTON, Washington, D. C., assignor to the Brush Electric Company, Cleveland, Ohio. Filed June 7, 1887. Serial No. 240,522. (No model.)

Claim.—1. In an electric railway system, the combination, with a line-conductor, of a rigid frame, contact-rollers journaled on said

384,594.

frame and bearing upon opposite sides of the line-conductor, and a single weight carried by the frame and adapted to hold both rollers in contact with the line-conductor, substantially as set forth.



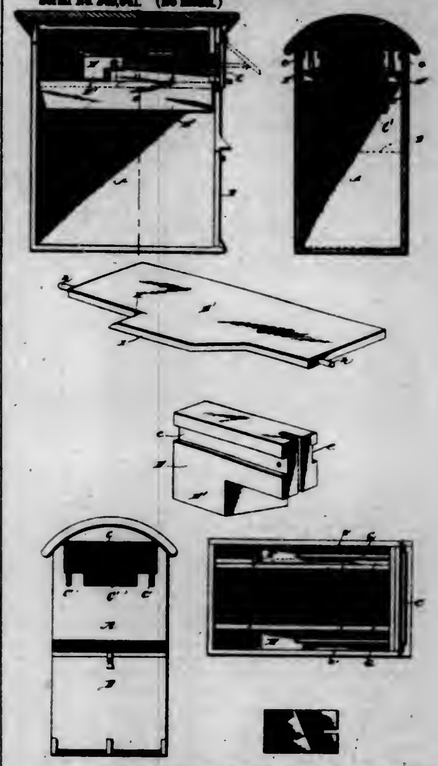
2. In an electric railway system, the combination, with a line-conductor, of a frame carrying at one end a roller adapted to rest against one side of the line-conductor and at its opposite end a roller to rest against the opposite side of the line-conductor, and a weight attached to said frame for turning said frame to establish and maintain contact of the rollers with the line-conductor, substantially as set forth.

3. A contact-truck composed of grooved rollers engaging the opposite sides of the line conductor, a frame for supporting said rollers, and a weight tending to turn said frame about its middle, and the rollers in contact with the conductors, substantially as described.

4. An electrical contact-truck composed of a frame, rollers mounted thereon and engaging opposite sides of a line-conductor, and an adjustable weight tending to turn said frame about its middle, substantially as described.

5. In an electric railway system, two line-conductors parallel to each other and one vertically above the other, in combination with a contact-truck for each conductor, a device tending to hold the contact-points of each truck in contact with its respective conductor, a link loosely connecting the two trucks mechanically, but insulated from one of them electrically, and flexible conductors extending from the trucks to a traveling motor, substantially as set forth.

384,595. MOLD. ROBERT SLESTH, Pittsburg, Pa. Filed Apr. 2, 1888. Serial No. 269,336. (No model.)

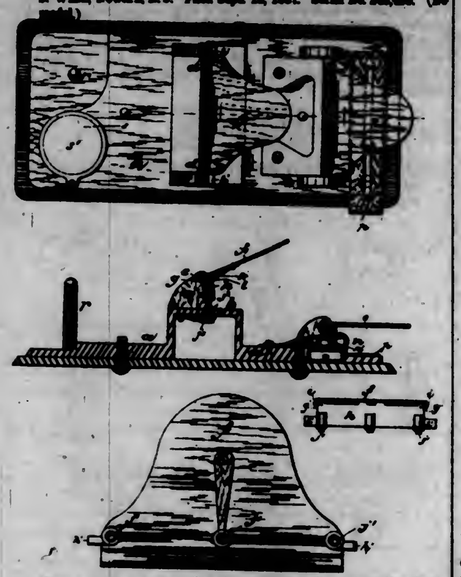


Claim.—1. The combination of a mold for rolls or other analogous articles and an internal chill or cooler provided with a series of wings or projections, substantially as set forth.

2. The combination of a mold for rolls or other analogous articles and an internal chill or cooler provided with a series of radiating wings having nodules or horns formed thereon, substantially as set forth.

3. The combination of a mold for rolls or other analogous articles and an internal chill or cooler provided with a series of wings or projections, and having one of its ends secured as against movement and its opposite end free to move when the chill or cooler is heated by the molten metal, substantially as set forth.

384,596. LETTER-BOX. JAMES R. SMITH, New York, N. Y., assignor of one-half to Walter I. Averill, same place. Filed June 8, 1887. Serial No. 240,641. (No model.)



Claim.—1. In a letter-box, the combination of the trap H, arranged across the box, the sliding blocks E, and the door C, connected to the blocks, whereby when the door is opened the trap will be closed by the blocks, substantially as specified.

2. In a letter-box, the combination, with the door C, of the drop-doors H', pivoted near the sides of the box and having tongues I on the outer edges, and the sliding blocks E, connected, substantially as described, to the door C, whereby when the said door is opened the blocks will slide and operate the said tongues to raise the doors H', substantially as and for the purpose set forth.

3. In a letter-box, the combination of the door C, leaves or drop-doors H', pivoted near the sides of the box, and having the tongues I, provided with beveled shoulders thereon, the sliding blocks having the depending legs E', provided with beveled front ends, to impinge against the said beveled shoulders when the blocks are moved forward, and the rods connected at opposite ends to the door C and the blocks E, substantially as and for the purpose set forth.

4. The herein-described letter-box, comprising the box A, door B at the lower end, opening C, having the slots on each side thereof, door C, to cover the said opening and the slots, partitions D D, arranged along each side of the box at the upper end to form the ways D' D', ribs *d d*, disposed in the said ways, leaves or drop-doors H', pivoted at the outer edges under the said partitions D, tongues I, having beveled shoulders K on the outer edges of the said leaves, sliding blocks E, having grooves *e* in the sides to receive and slide on the ribs *d*, depending beveled legs E' on the said blocks, and rods G G, pivoted at the outer ends to the door C and at the other ends to the said sliding blocks, and operating through the said slots on each side of the opening C, all constructed, arranged, and operated substantially as and for the purpose hereinbefore set forth.

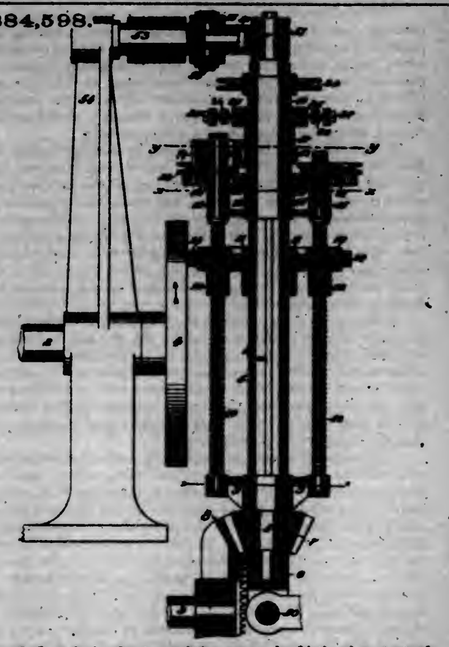
384,597. PERFORATING AND EYELETING MACHINE. GEORGE R. WEBB, Newark, N. J. Filed Sept. 12, 1887. Serial No. 249,488. (No model.)

Claim.—1. A perforating-machine substantially such as described, combining therein arms or supports for holding the ends of a lever, a spring-plate for carrying the perforators, perforators arranged on said spring-plate and adapted to be operated by said lever, a bed-plate supporting said lever, spring-plate, and perforators, and provided with openings arranged to receive said perforators, and a drawer arranged under said perforators and adapted to slide in and out of the bed-plate, substantially as and for the purposes set forth.

2. An eyeleting-machine substantially such as herein described, having a bed with lower dies, a plate-like lever, and a gate having dies for forming a second flange on an eyelet, said gate being pivotally connected with and operated by said lever, as and for the purposes set forth.

3. The combination, in an eyeleting-machine, with a bed having reprunible pins, of a lever having a pivoted gate with male dies or formers corresponding in position with said pins and adapted to enter the eyelet and turn the same to form the second flange, all arranged and operating substantially as described.

4. In an eyeleting-machine, the combination, with a bed having reprunible pins adapted to receive eyelets, of a plate-like lever provided with a gate-guides *c*, and a spring for holding said gate against said guides, said gate being provided with dies or formers for turning a flange on said eyelets, substantially as set forth.



5. The combination, in an eyeleting-machine, with a bed having reprunible pins and lower dies, of a plate-like lever, a gate pivotally connected with and operated by said lever, and dies on said gate, all arranged and operating substantially as described.

6. In an eyeleting-machine, the combination, with a bed having reprunible pins and lower dies, of a plate-like lever, a gate pivotally connected with and operated by said lever, dies or formers on said gate, guides formed on the supporting-arms, and against which the ends of the gate slide, and a spring secured to said lever for holding said gate against said guides, substantially as set forth.

384,598. DEVICE FOR TRANSMITTING POWER. CARL T. A. H. WINKHAUS, New York, N. Y., assignor to John S. Connolly, Philadelphia, Pa., and Thomas R. Connolly, Brooklyn, N. Y. Filed Jan. 3, 1888. Serial No. 259,603. (No model.)

Claim.—1. In a device for transmitting power by means of frictional contact, the combination, with friction-disks, one of which is movable to vary the speed of the transmitted motion, of a screw-connection which engages the movable disk, and gearing which is movable to cause the action of the screw-connection on the friction-disk, whereby it is moved, substantially as and for the purposes described.

384,598.

2. In a device for transmitting power by frictional contact of disks, the combination of the said disks, one being movable toward and from the center of the other to vary the speed of the transmitted motion, and one being movable to and from the surface of the other to vary the contact-pressure, said disks having actuating mechanisms by which said motions are effected, said actuating mechanisms being mechanically connected, whereby on the motion of the one disk toward or from the center of the other the contact-pressure of the disks shall be varied, substantially as and for the purposes set forth.

3. In a device for transmitting motion by means of frictional contact, the combination, with disks and their bearings, one of the disks being movable toward and from the center of the other to vary the speed of transmitted motion, and the bearings of one of the disks being movable to move said disk to and from the surface of the other, of a screw which is connected with and moves said bearings, whereby the pressure of contact of the disks is variable conformably with the position of one disk relatively to the other, substantially as and for the purposes described.

4. In a device for transmitting motion by frictional contact, the combination of the contact elements, one of which is a rotary disk or wheel having an encircling friction-ring, which is fitted loosely to its seat on the disk and bears against the other contact element, whereby on the application of excessive resistance it shall slip on its seat, substantially as and for the purposes described.

5. In a device for transmitting power by means of frictional contact of friction-disks, one of which is movable to vary the speed of the transmitted motion, the combination of a gear-wheel, 22, which rotates on the axis of the friction-disk, other gearing connected therewith, and also connected with the mechanism which moves the movable friction-disk, and a friction-ring, 23, which is in mechanical connection with said gearing, and which normally revolves on the axis of the disk, whereby on retardation of the said ring the mechanism of the movable disk will be driven independently and will effect the motion thereof, substantially as and for the purpose set forth.

6. In a device for transmitting power by means of frictional contact of friction-disks, one of which is movable to vary the speed of the transmitted motion, the combination of a gear-wheel, 22, which rotates on the axis of the friction-disk, other gearing connected therewith, and also connected with the mechanism which moves the movable friction-disk, a friction-ring, 23, which is in mechanical connection with said gearing, and which normally revolves on the axis of the disk, whereby on retardation of the said ring the mechanism of the movable disk will be driven independently and will effect the motion thereof, and means for retardation of the gear-wheel 22 to effect the reverse action of the parts, substantially as and for the purpose set forth.

7. In a device for transmitting power by frictional contact of disks the combination of the said disks, one of which is movable toward and from the center of the other to vary the speed of the transmitted motion, and which is provided with mechanism for producing such movement, and a lever operated in harmony with the movement of said movable disk, which lever automatically causes the cessation of said movement when the disk is moved through a predetermined distance, substantially as and for the purpose set forth.

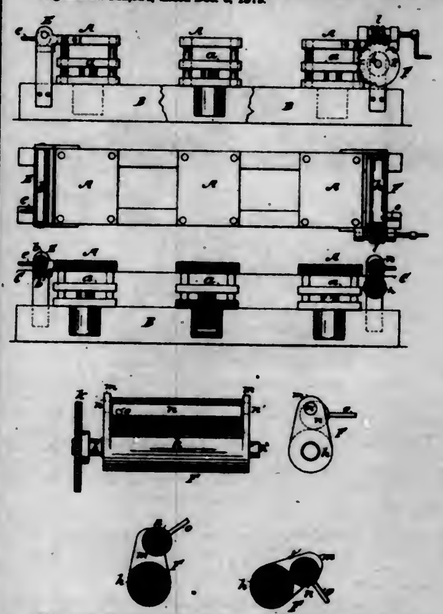
8. In a device for transmitting power by frictional contact of disks, the combination of the said disks, one of which is movable toward and from the center of the other to vary the speed of the transmitted motion, and which is provided with mechanism for producing such movement, and a cam which through suitable mechanism acts on the mechanism of said movable disk to cause it to operate, and a lever operated in harmony with the said movement of the movable disk, which lever stops the motion of the disk after it has moved to an extent corresponding to the degree of motion of the cam, substantially as and for the purpose set forth.

9. In a device for transmitting power by means of frictional contact, the combination, with friction-disks, one of which is provided with mechanism by which it is movable to vary the speed of the transmitted motion, of differential gearing driven by the power connections which cause the motion of the movable friction-disk, said differential gearing acting automatically to cause the cessation of the motion of the disk when it has moved through a predetermined distance, substantially as and for the purpose set forth.

10. In a device for transmitting power by means of frictional contact of friction-disks, one of which is movable to vary the speed of the transmitted motion, the combination of a gear-wheel, 22, which rotates on the axis of the friction-disk, other gearing connected therewith, and also connected with the mechanism which moves the movable friction-disk, a friction-ring, 23, which is in mechanical connection with said gearing, and which normally revolves on the axis of the disk, whereby on retardation of the said ring the mechanism of the movable disk will be driven independently and will effect the motion thereof, and means for retardation of the gear-wheel 22 to effect the reverse action of the parts, a threaded sleeve, 16, forming part of and rotating with the gear-wheel 22, a threaded sleeve, 17, working thereon, gearing connected with the sleeve 17 and which drives it at a different rate of speed from that of the sleeve 16, whereby the one sleeve is caused to move on the other, and a lever operated by motion of the sleeve, which automatically causes cessation of motion of the gearing when it has moved through a predetermined distance, substantially as and for the purpose set forth.

11. In a device for transmitting power by means of frictional contact, the combination, with frictional disks one of which is movable toward and from the center of the other to vary the speed of transmitted motion, of an epicyclic train of gearing which is connected with the said movable disk and acts thereon to cause its said motion toward and from the center of the other disk, substantially as and for the purposes described.

12. As a device for transmitting power by means of the frictional contact of disks and varying the same, mechanism for moving one of the disks, and retarding devices whereby said mechanism is caused to operate, a lever, 38, by motion of which pressure is caused to be exerted on the retarding devices, and a bar, 30, connected with the moving mechanism of said disk and moved thereby to relieve the pressure exerted on the retarding devices, substantially as and for the purposes described.



13. As a device for transmitting power by means of frictional contact of disks and varying the same, mechanism for moving one of the disks, in combination with the friction-bars 31 and 32, by motion of which said mechanism is caused to operate, a lever, 34, a movable bar, 30, interposed between this lever and the said friction-bars and connected with the moving mechanism of said disk, a spring connecting the levers 38 and 34, and a stop, 46, substantially as and for the purposes described.

14. As a device for transmitting power by means of frictional contact of disks and varying the same, mechanism for moving one of the disks, in combination with the friction-bar 31, by motion of which said mechanism is caused to operate, a lever, 36, by motion of which pressure is caused to be exerted on the friction-bar, a bar, 30, connected with the moving mechanism of said disk and moved thereby to relieve the pressure exerted by said lever on the friction-bar, and a cam and lever whereby the lever 36 is operated, substantially as and for the purposes described.

15. In a device for transmitting power by frictional contact of disks, the combination, with said disks, one of which is movable to and from the other to effect variation in contact-pressure, of a lever, 39, which effects the motion of one of said disks to vary the speed of the transmitted motion, and a lever, 57, also operated by motion of the lever 39, and connected with the movable bearing of the axis of said disk, whereby a corresponding and simultaneous change of speed and variation of contact-pressure is effected, substantially as and for the purposes described.

REISSUES.

10,988. MACHINE FOR MANUFACTURING RUBBER BELTING. JOHN MURPHY, Brooklyn, N. Y. Filed Apr. 12, 1880. Serial No. 270,403. Original No. 232,894, dated Oct. 5, 1880.

Claim.—1. In a machine for manufacturing rubber belting, a series of presses arranged in line with each other, with intermediate spaces, in combination with suitable end clamp and stretching devices, said presses being operated by any suitable means, substantially as set forth.

2. The combination of the cam-rollers *b n*, fixed cross-bar *b'*, and roller *h*, provided with the projecting arms *m m*, substantially as described.

3. The improvement in machines for manufacturing rubber belting in which the prepared belt is subjected to hot plates, which consists in the adaptation of a fixed clamping device at one end of the machine and a combined clamping and stretching device at its opposite end, whereby the belt is stretched to produce a permanent set that will be practically maintained in use, the said fixed clamping device consisting of a stationary holding-clamp, and the said combined clamping and stretching device consisting of a vibrating stretching-clamp composed of a stationary roller, *h*, having vibrating arms *m m*, carrying a cam-roller, *n*, and suitable devices for operating the same, substantially as set forth.

NORRIS PETERS

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE STOUGHTON.

Decided May 28, 1888.

USE OF TECHNICAL TERMS.

The words "means," "mechanism," and "connections" are proper terms when applied to devices forming no part of the invention, but which are in common use in various kinds of machinery—for instance, when the operation of rollers is governed by gearing, belting, cranks, or other appliances which in themselves are simple and have little or nothing to do with the real invention. Or, as in the present case, the term "means," when applied to the operation or shaking of certain movable screens, is proper, because evidently the same movement of the screens can be effected by an infinite variety of mechanism which would produce the same result and be simply the equivalent of that employed by applicant.

ON petition.

ORE-PULVERIZING MACHINE.

Application of Eli T. Stoughton filed March 7, 1887, No. 230,052.

Messrs. Munn & Co. for the applicant.

HALL, *Commissioner:*

This application comes before the Commissioner on appeal from the action of the Primary Examiner making formal objections to the claims. In his answer to the appeal the examiner says:

> Wishing, however, to have the terms "means," "mechanism," "connections," &c., eliminated from the claims, or to have your honor decide whether they were or were not objectionable, the examiner, in the letter of January 13, refused to give further action until this question had been settled, under *ex parte Mill*, (40 O. G., 919.)

In *ex parte Paige* (40 O. G., 807) the Commissioner attempted to point out as clearly as possible the instances in which these terms were admissible and when they were inadmissible. It was there stated that such terms—

> might be employed * * * to refer to mere adjunctive devices which connect or give co-operation to the various elements or features of the invention, but are in themselves no actual or controlling part of it. It is because any means or mechanism may be used to carry out such adjunctive functions, and need not be defined, that those terms can be thus employed.

With that explanation it seems that the matter must necessarily rest largely with the examiner. In the case of a combination between two elements, A and B, there may be connections or mechanism by means of which the two elements co-operate or unite in their operation, such connection or mechanism being really no part of the invention and being in common use in many other relations and with many other kinds of machinery or apparatus. An invention may consist in the co-operation of two rollers held together by certain devices; but the movements of the two rollers may be governed by gearing, belting, cranks, or other devices which in themselves are simple and common and have little or nothing to do with the real invention. In cases of this kind it requires no skill or knowledge of patent law to understand that such devices can properly be described by the terms "connections" or "mechanism," qualified by proper words.

In the present case, in claim 1, the term "means" is applied to the operation or shaking of certain movable screens. The examiner, I understand, concedes that the invention in no way consists in the particular appliance which is used to produce these movements of the screens, and there seems to be nothing in the invention itself. There is a cam and a connecting-rod attached to the screen, and the movements of this cam give an upward and downward motion to the rod which lifts the screens and causes them to vibrate or oscillate.

In my judgment, it is proper to use the word "means" in referring to these devices, because, evidently, the same movement of the screens can be effected by an infinite variety of mechanism which would produce the same result and be simply the equivalent of that employed and shown in this case.

The terms "mechanism" and "connections," in the second, third, fourth, and fifth claims, are used in precisely the same sense, as I understand the invention, and I am not able to see why they are not properly used, in view of the distinction made in *ex parte Paige*.

In reversing the action of the examiner in this particular I do not intend in any sense to depart from the principle announced in *ex parte Paige*, for it is evident that every case must stand by itself and its own construction, and it will be impossible to apply the decision in this particular application to any other application which is not exactly similar to it in form and construction. This is only an instance in which I apply the decision from which the above quotation has been taken.

EX PARTE STANBRIDGE.

Decided May 24, 1888.

1. The term "mechanism" is not permissible when applied to various and different devices in the several claims which are not adjunctive devices.
2. In a given specific invention which embraces adjunctive devices the adjunctive devices referred to in all the claims must be the same and bear the same relation to the different elements.

APPARATUS FOR AUTOMATICALLY DELIVERING GOODS, &c.

ON petition.

Application of Samuel Stanbridge filed January 30, 1888, No. 262,417.

Mr. M. Bailey for the applicant.

HALL, *Commissioner:*

This petition is taken to vacate and reverse the action of the examiner in objecting to the terms "actuating mechanism," "mechanism for rotating said crank," "mechanism for automatically operating the same," and "automatic actuating mechanism," contained in four separate claims. The objection is that in consequence of the use of those terms the claims are vague and indefinite.

The examiner supports his objections by citing *ex parte Paige*, (40 O. G., 807;) *ex parte Nicholson*, (36 MS. Dec., 406;) *ex parte Deming*, (26 O. G., 1207;) *ex parte Wilkin*, (29 O. G., 950;) *ex parte Holt*, (39 O. G., 171,) and *Rapid Store Service Company* v. *Taylor*, (42 O. G., 721.) Applicant contends that the objections are not supported by these authorities, because the objectionable terms apply in the present case to

adjunctive devices which connect or give co-operation to the various elements or features of the invention, but are in themselves no actual or controlling part of it.

In a given specific invention which embraces adjunctive devices, such devices must be the same and bear the same relation to the different elements or parts which they connect or aid to co-operate, whatever may be the form of the claims or however many claims may be introduced. In the present case there are four claims, and an examination of the specification and drawings shows that the term "mechanism," as used in each, does not comprehend the same devices or parts of devices—that is, it comprehends more and different devices in one claim than in the others. Thus, in claim 2 it covers or comprehends the weighted lever U, spring U', ratchet-wheel W, pawl V, shaft Q, gears O P, and shaft M; while in claim 3 it comprehends the retaining-lever R R', weighted lever U, spring U', shaft Q, ratchet-wheel W, pawl V, wheel S, having stops S' and "surfaces" S², gears O P, and crank-shaft M L. It is evident that if the term "mechanism" can be thus applied in the different combinations claimed to all the devices that operate them, because such devices happen to be somewhat unimportant or immaterial in comparison with others, its use might be indefinitely extended, and it might be ultimately applied to almost every feature of the invention. If the weighted lever U had no other function than to rotate the retaining-wheel W and gearing P O, it might be that the term "mechanism for operating the crank L" could be properly employed, for undoubtedly this might be effected by a mainspring, clock-work, or a weight and pulley, while a belt might be substituted for the gearing O P. But the weighted lever U has other and very important functions: First, it enables the forward movement of the wheels W and P to be arrested synchronously with the restoration of the detent R' to the slot S', so as to prevent violent jar. Second, it enables the movement to be controlled by the lever Z X, on which it rests, by means of the pulley or wheel at the end of the latter. Third, so, also, after the movement of P and W has produced a single revolution of O, and the crank L has driven the pusher I forward and back, the weighted lever U is necessary, because by it alone can the lever Z X be employed to restore the power—the weight—to its normal position, so that the "automatic" operation of the "mechanism" can be repeated. This is clearly shown in both forms of this mechanism, Figures 2 and 4.

It is undoubtedly true that this invention consists of the relation between the element controlling the retaining-lever R R' by means of the coin and the lever Z X, and the element controlling and operating the pusher I, so that the latter can move back and forth only as the retaining-lever R R' is disengaged by the passage of the coin; but evidently the mechanism which controls this relation is the most important part of the device. I see no reason why the case is not fairly within *ex parte Paige*. It is to be noted that the examiner, in his letters of April 18 and 24, 1888, calls attention to the state of the art. This, I think, furnishes additional reason against the use of the term "mechanism" as employed in the present claims. This was shown in *ex parte Nicholson*. For instance, if in the alleged invention all the elements or combinations were old, except the features described by the term "mechanism," which consisted merely in improvements, evidently the term could not be allowed.

The action of the examiner is affirmed.

EX PARTE MILLER.

Decided May 31, 1888.

Applicant claims, broadly, "automatically-operating mechanism to impart alternate fast and slow movements to the driving-shaft" in his needle-grooving machine, but concedes that the principle involved is old and that this varying movement or motion has been accomplished by an infinite variety of means to an infinite variety of kinds and classes of machinery; but he insists that he is the first in this particular kind of machinery to apply *means* for varying the movement. *Held* that applicant has only invented improvements upon mechanism already used to accomplish the same result, and that he must limit his claims to the specific construction by which he obtains this variableness of movement. The courts would undoubtedly construe his patent to cover his specific construction, and to permit such vague and indefinite language in claims would result in misleading the public or in deterring others from entering this particular field of invention, and thus by a species of intimidation applicant would secure a protection to which he is not entitled.

ON petition.

NEEDLE-GROOVING MACHINES.

Application of Lebbeus B. Miller, filed January 24, 1888, No. 261,753.

Mr. S. A. Bennett and *Mr. Henry Calver* for the applicant.

HALL, *Commissioner:*

This application was recently before me upon a petition presenting the question as to whether an appeal from the action of the examiner should go to the Examiners-in-Chief or to the Commissioner. Applicant now comes before me and asks me to review the action of the examiner with reference to some formal objections to claims 8 and 9. The examiner objects to the expression "automatically-operating mechanism to rotate the said cam-shaft," in the eighth claim, and "automatically-operating mechanism to impart alternate fast and slow movements to the driving-shaft," in the ninth claim. Applicant frankly states that he puts his claims in this form and employs these terms because he believes himself to be the first person who has ever applied to this specific class of machinery means for varying the movement so as to cause the same parts of the machinery to move slowly at one period of their operation and more rapidly at another. It is conceded by him that the principle involved is old, and that this varying movement or motion has been applied by practically an infinite variety of means to an infinite variety of kinds and classes of machinery, so that he cannot be said to be the first inventor who has applied the principle or the idea. But he finds existing in this particular art mechanism which he thinks can be improved by the introduction of a device which will cause certain parts of such mechanism to move variably, faster at one time and slower at another, and he invents an improvement upon that mechanism which accomplishes the result sought, and he says, in effect:

Instead of being limited to the particular improvement or construction which I have embodied, I claim that I am entitled to be protected as against any other form or construction of improvement which may accomplish this same result of variableness in the movements of these different parts of the original mechanism.

In my judgment, the applicant is not entitled to such a broad claim, and he must be required to limit his claims to the specific construction by which he accomplishes this variableness of movement. Undoubtedly the courts would hold him to the construction shown in his application should a patent issue, and the only effect of permitting these vague and indefinite terms to remain would be to mislead the public or to deter other inventors from entering upon this field of art, so that by a species of intimidation the applicant would secure in a certain indefinite sense a protection to which he is not justly entitled.

I think, therefore, the action of the examiner was correct, under *ex parte Paige*, (40 O. G., 807,) and that the applicant should be required to set forth a more distinct and specific statement of the construction which he claims to have invented.

EX PARTE LOMBARD *et al.*

Decided May 28, 1888.

STATEMENT OF THE CASE.

Applicants present broad and generic claims and claims for specific constructions. The former have been rejected for lack of novelty, and the latter found to conflict with claims in other pending applications. They insist that they have two years in which to appeal from the rejection, and by refusing to act successfully tie up other applications and prevent the issue of patents, or place the Office in the position of issuing patents which may hereafter be adjudged to interfere with an application pending at the time the patents were granted.

1. *Held* that if applicants refuse to avail themselves for an unreasonable time of their right of appeal, or are unreasonably dilatory in making the protection which the rules offer them, for the purpose of delaying the issue of patents to other parties for their inventions which have been found patentable, the Commissioner would not be justified in permitting such dilatory and unjust action of applicants to work hardship to other applicants who are entitled to the specific constructions, but will issue the patents.

2. In such cases the applicants should be notified that in order to secure an interference they must act with reasonable promptness; but the Office and not the applicants must be the judge of what constitutes reasonable promptness.

REFERENCE by Examiner.

BRAIDING-MACHINES.

Application of Levi W. and Nathaniel Lombard filed December 21, 1887, No. 258,602.

Mr. F. Curtis and *Mr. W. H. Babcock* for the applicants.

HALL, *Commissioner:*

Applicants present broad and generic claims and claims for specific constructions. The former embrace, generically, the subject-matter of more definitely-restricted claims found in other applications pending in the Office. There is no conflict between the specific claims of the respective applications. Two of these other pending applications were months ago found allowable; but they have been withheld from issue to determine whether an interference should be declared between their specific claims and the broad and dominating claims of the applicants Lombard and Lombard.

The broad claims of applicants Lombard have been rejected for want of patentable novelty, and applicants have been repeatedly urged to amend or appeal; but they refuse to act, and insist that they have two years within which to take such action as seems to them best. They thus successfully tie up and delay the issue of other applications, or the Office is put in the position of issuing patents which may possibly hereafter be adjudged to interfere with an application at such time pending in the Office. The examiner has asked the Commissioner for instructions.

Section 4904 requires an interference to be declared whenever an application is made for a patent which, in the opinion of the Commissioner, would interfere with any other pending application. When, in his opinion, no such interference exists, such declaration is not required. Undoubtedly the interference may, *prima facie*, appear upon the face of the two applications; but an interference is not declared upon the *prima facie* appearance of the applications. The patentability of the invention is first ascertained, and the statute has always been construed as referring to applications whose inventions were recognized and held by the Office to be patentable, and interferences are only declared after such determination. It is also true that when an application has been rejected which would otherwise bring about an interference and an appeal has been taken the other interfering case has been suspended until the appeal has been finally determined. This is done in justice to the rejected applicant, in order that he may take the opinion of the higher tribunals as to the patentability of his invention, and may avoid contest with a patent issued while he was in the Office. But if the application of one of the applicants has been rejected and he refuses to appeal, and knowingly delays other applications ready for allowance, I know of no rule of

practice or reason why the Office should wait and delay in order to afford him that justice and protection which he refuses to accept.

In the case referred by the examiner I am advised that the broad claims of the applicants are not patentable. The Commissioner, then, is not in the situation of having in the Office an application which, in his opinion, would interfere with another pending application. His opinion, as now advised, is that there is no such patentable application pending. What is his duty? Must he await the dilatory and unjust action of the applicants until they can convince him that the Office is in error in its opinion, or shall the public business be dispatched with promptitude and justice? I think there can be but one answer to the proposition. I hereby direct the examiner to proceed in accordance with these views.

I do not intend that there shall be any undue haste in cases of this kind, nor that applications shall go to issue until applicants in other cases are reasonably and fairly notified that to secure interference they must act with reasonable promptness. But it must be understood that the Office, and not the applicants, must determine what constitutes such reasonable promptness.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

FLOWER *et al. v.* THE CITY OF DETROIT.

Decided May 14, 1888.

1. BAILEY—HYDRANTS.

Reissued Letters Patent No. 6,990, granted March 14, 1876, to Thomas R. Bailey, Jr., for an improvement in hydrants, adjudged invalid as to the first claim and not infringed as to the third claim thereof.

2. REISSUE—MODEL ALONE NOT SUFFICIENT BASIS.

The rule in *Parker & Whipple Co.* v. *Yale Lock Co.* (123 U. S., 87; 25 O. G., 290) affirmed that the Patent Office model alone is not to be considered the basis for a reissue in which a change of the invention of the original patent is sought.

APPEAL from the Circuit Court of the United States for the Eastern District of Michigan.

Mr. E. J. Hill for the appellant.
Mr. George L. Roberts for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Eastern District of Michigan by James Flower, Thomas Flower, and George Flower against the City of Detroit, the Fire Commission of the City of Detroit, Benjamin Vernon, president thereof, and the Board of Water Commissioners of the City of Detroit, for the infringement of Reissued Letters Patent No. 6,990, granted March 14, 1876, on an application filed February 17, 1876, to Thomas R. Bailey, Jr., for an improvement in hydrants, the original patent, No. 75,344, having been granted to said Bailey, March 10, 1868.

Among the defenses set up in the answer it was alleged that new matter, not constituting any substantial part of the alleged invention upon which the original patent was granted, was introduced into the specification of the reissue, and that the reissue is not for the same invention as the original patent, and is void.

The specifications and claims of the original and of the reissue are here placed side by side in parallel columns, the parts in each which are not found in the other being in italic.

Original.

To all whom it may concern:

Be it known that I, T. R. BAILEY, Jr., of Lockport, in the county of Niagara and State of New York, have invented a new and Improved Hydrant Fire-Plug; and I do hereby declare that the following is a full, clear, and exact description thereof, which will enable those skilled in the art to make and use the same, reference being had to the accompanying *drawings, forming* part of this specification.

This invention relates to a *new and improved method of constructing* fire-plugs or hydrants; *and the invention consists in operating a cylinder-valve in a suitable case, and in the arrangement and combination of parts connected therewith, as hereinafter described.*

Figure 1 represents a longitudinal central section of *the* hydrant, *showing the parts of which it is composed and the manner of their arrangement. Fig. 2 is* a cross-section of *Fig. 1* through *the line x x.*

Similar letters of reference indicate corresponding parts.

A represents the hydrant-tube, from which *the* water is discharged. B is the horizontal section which is connected with the "water-main," and which *forms* the valve-chamber.

C is a loose casing around the hydrant-tube, *for protecting the tube from dirt, &c.* D is the cylinder-valve, *which has* its seat at its lower end, *on* elastic *or leather* packing, secured in a groove, as seen in *the drawing* at *a*. E is a rod, having a screw-thread on its upper end, by which the valve is operated. F is a sleeve-nut, *which engages* with the screw on the rod, *raising* and lowering *it* as the nut is turned. This nut is turned by a wrench on the head G.

The sleeve-nut is secured in the cap of the hydrant by a collar, and packing under the hollow cylinder stuffing-box H, *as seen in the drawing.* J is a yoke, which is attached to the rod E by a set-screw, and *which is secured* in the tube A, and prevented from turning, as it moves up and down, by projecting lugs, *as seen in Fig. 2; and* it will be *seen* that the arrangement is such that the rod and valve may be raised and lowered without being rotated. *This secures* a uniform and perfect bearing of the valve on its seat, the packing *a* remaining undisturbed.

Provision is made for the discharge of the waste water by an orifice beneath the valve D, *marked f*, which orifice is opened and closed by a valve

Reissue.

To all whom it may concern:

Be it known that I, T. R. BAILEY, Jr., of Lockport, in the county of Niagara and State of New York, have invented a new and Improved Hydrant Fire-Plug; and I do hereby declare the following *to be* a full, clear, and exact description thereof, which will enable *others* skilled in the art *to which my invention relates* to make and use the same, reference being had to the accompanying *drawing, which forms* a part of this specification.

This invention relates to *improvements in the construction of* fire-plugs or hydrants.

In the drawing, Figure 1 represents a longitudinal central section of *a* hydrant *according to my invention;* Fig. 2, a cross-section of *the same* through *lines x x of Fig. 1.*

My invention consists in the following parts and combinations, as hereinafter specified and claimed, wherein—

A represents the hydrant-tube from which water is discharged. B is the horizontal section which is connected with the water-main, and which *may form* the valve-chamber.

C is a loose *movable* casing around the hydrant-tube. D is the cylinder-valve, *having* its seat at its lower end, *upon suitable* elastic packing secured in a groove, as *shown* at *a*. E is a rod having a screw-thread on its upper end, by which the valve is operated. F is a sleeve-nut *engaged* with the screw-*nut* on the rod *E, lifting* and lowering *said* rod as the nut is turned *one way or another.* This nut is turned by a wrench *or crank or other suitable device* on the head G.

The sleeve-nut is screwed in the cap of the hydrant by a collar and packing, under the hollow-cylinder stuffing-box H. J is a yoke which is attached to the rod E by a set-screw or *its equivalent,* and *it* is screwed in the tube A, and prevented from turning as it moves up and down by projecting lugs, as *shown in detail at* Fig. 2.

It will be *noticed* that the arrangement is such that the rod and valve may be raised and lowered without being rotated, *thus securing* a uniform and perfect bearing of the valve on its seat, the packing *a* remaining undisturbed.

Provision is made for the discharge of the waste water by an orifice, *f*, beneath the valve D, which orifice is opened and closed by a valve, *g*. A wing, *h*,

marked g, as seen in the drawings. *h is* a wing on the top of this valve.

As the cylinder-valve D descends the angular flange *i* on its inside *strikes* the wing A and raises the valve, as seen in the drawing, *thus allowing* any water which may remain in the hydrant to escape through the orifice *f* and aperture *k*. *It will be thus seen that no water will be left in the hydrant to freeze in cold weather.*

The tube *A* is secured to the horizontal section B by a ring-nut *n*, which contains recesses for packing-rings around the valve, as seen at *o o*. Packing around the valve is secured by another ring-nut *o*, and also under the end of the tube A, as seen in the *drawing.*

P represents the discharge-pipe, with a screw for the attachment of the hose, and a cap-piece for covering the pipe when the hydrant is not in use.

Having thus described my invention, I claim *as new and desire to secure by Letters Patent—*

1. A hydrant or *water* plug, *constructed substantially as shown and described—that is to say, with the parts* A and B *connected together, as shown,*

and with a cylinder-valve and *a waste-water* valve connected and operated *in combination* substantially *as herein specified.*

2. The *arrangement of the* parts A B, valve D, case C, and [illegible] *for the purposes specified.*

to provided upon the top of this valve.

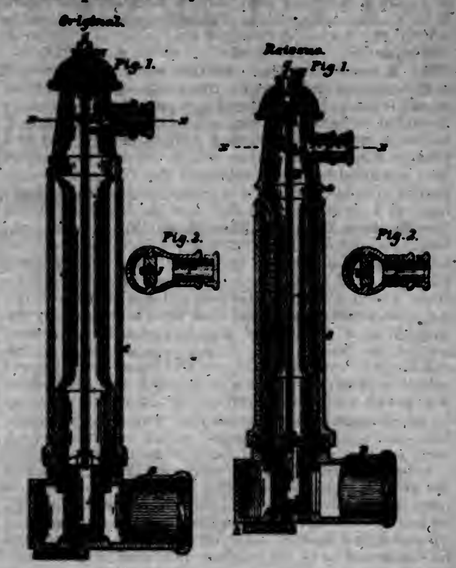
As the cylinder-valve D descends the angular flange *i* on its inside *striking* the wing A, raises the valve, as shown in the drawings, *and allows* any water which may remain in the hydrant to escape down through the orifice *f* and aperture *k*, *thus preventing* any retention *of water above the freezing level.*

The tube *A'* is secured to the horizontal section B by a ring-nut, *n*, which contains recesses for packing-rings around the valve, as shown at *n*. Packing about the valve is also secured by another ring-nut, *o*, and also under the end of the tube A, as *shown* in the drawings.

P represents the discharge-pipe, with a screw for the attachment of the base, and a cap-piece for covering the pipe when the hydrant is not in use.

It will be observed that the casing C loosely rests upon the main B, or upon a branch projecting upward from the same. This casing extends upward, enveloping the main portion of the water-pipe A, at least that portion which is subterraneous. Said casing extends upward and fits loosely about the plug or hydrant at the portion A'. Above the upper terminus of the casing C is provided the bead a upon the hydrant proper. Sufficient space is left between the bead a and the upper terminus of the casing C to permit of sufficient up-and-down play of the said casing C, for the purpose which will hereafter more fully appear. This distance between the bead and casing may be adjusted to any desired distance, thus lengthening or shortening it by means of its screw attachment at its base.

The main function of the casing C is to prevent derangement of parts during cold weather by the ground alternately freezing and thawing around the hydrant or plug. This process of freezing causes the surrounding earth, by its expansion, to lift or upheave, and thus be liable to derange the hydrant or plug. This upheaval or movement is received by the casing C, which, by its capability of sliding loosely up and down, will accommodate the upheaval of the earth above mentioned, without any liability to derange the plug or hydrant. This is the chief function of the casing C, although it likewise serves the purpose of protection to the water-pipe A.



What I claim is—

1. *In combination with a hydrant or fire-plug, a detached and surrounding casing, C, said casing adapted to have an independent up-and-down motion sufficient to receive the entire movement imparted by the upheaval of the surrounding earth by freezing, without derangement or disturbance of the hydrant or plug proper, substantially as shown.*

2. *In combination with a hydrant or fire-plug pipe, A, the supply-pipe B, and cylinder-valve and waste-valve, connected and operated substantially as herein shown and described.*

3. *The combination of the hydrant or fire-plug pipe A, supply-pipe B, casing C, and [illegible]*

The drawings of the original and of the reissue are also here placed side by side.

The material difference between the descriptive parts of the two specifications is that in the reissue it is stated that the casing C is movable, and that sufficient space is left between the bead *a* upon the hydrant proper and the upper terminus of the casing C to permit of sufficient up-and-down play of the casing C to allow it to slide loosely up and down, to accommodate the upward and downward movement of the earth during the process of freezing and thawing, without any liability to derange the plug or hydrant. The casing could not thus slide loosely up and down unless sufficient space were left between the bead *a* and the upper terminus of the casing. No suggestion of such arrangement is found in the specification of the original patent, and the drawing of that patent shows no space between the upper terminus of the casing and the bead or flange above it. This is new matter introduced into the specification of the reissue contrary to the express inhibition of section 4916 of the Revised Statutes.

Claim 1 of the reissue is for an invention not indicated or suggested in the original patent—namely, the independent up-and-down motion of the casing. In addition to this, the drawing of the original patent shows a close contact between the top of the casing and the bead or flange above it, so as absolutely to forbid any such independent up-and-down motion of the casing as is covered by the first claim of the reissue, while the drawing, Figure 1, of the reissue shows a sufficent space between the top of the casing and the bead or flange above it to admit of such independent up-and-down motion.

Issue having been joined, proofs were taken on both sides, and the circuit court entered a decree dismissing the bill, from which the plaintiffs have appealed. Its opinion accompanies the record, and is reported in 23 *Fed. Rep.*, 202. It held that the reissued patent was invalid, as matter of law, upon a comparison of the original with the reissue. We concur in this view.

It is [illegible]

Office with the original application exhibited the invention covered by the first claim of the reissue. It is doubtful whether that fact is satisfactorily established. But, irrespective of this, the case falls directly within the recent decision of this court in *Parker & Whipple Co.* v. *Yale Clock Co.*, (123 U. S., 87; 25 O. G., 290.) It was held in that case that what was suggested in the original specification, drawings, or Patent Office model is not to be considered as a part of the invention intended to have been covered by the original patent, unless it can be seen from a comparison of the two patents that the invention which the original patent was intended to cover embraced the things thus suggested or indicated in the original specification, drawings, or Patent Office model, and unless the original specification indicated that those things were embraced in the invention intended to have been secured by the original patent. (See, also, *Hoskin* v. *Fisher*, 125 U. S., 217.) In the present case it cannot be seen from a comparison of the two patents that the original specification indicated that what is covered by the first claim of the reissue was intended to have been secured by the orignal. In the present case, also, the reissue was not applied for until nearly eight years after the original patent was granted, and the reissue was taken with the manifest intention of covering, by an enlarged claim, structures which in the meantime had gone into extensive public use, and which were not covered by any claim of the original patent.

Infringement is alleged only of claims 1 and 3 of the reissue. As to the casing C of the third claim, it cannot, any more than the casing C of the first claim, be held to cover a casing which has the independent up-and-down motion referred to. Such casing must be construed to be the casing exhibited in the drawing annexed to the original patent—that is, one in which the up-and-down play is restricted by the overlapping bead or flange. On any other construction claim 3 is an unlawful expansion in regard to the casing of what is found in the original patent. In addition to this, if the casing of claim 3 is only a casing which has no end-play, it is anticipated by what is shown in Letters Patent No. 19,206, granted to Race and Mathews, January 26, 1858, which patent was the subject of the decision of this court in *Matheus* v. *Machine Co.*, (105 U. S., 54.)

The decree of the circuit court is affirmed.

Supreme Court of the United States.

THE ST. PAUL PLOW WORKS *v.* STARLING.

Decided May 14, 1888.

JURISDICTION WITHOUT REGARD TO AMOUNT.

In the suit at bar, which was for patent license-fees under a contract, where both the validity of the patent and infringement were put in issue and decided by the circuit court, there is no doubt that this was "a case touching patent rights" and came within the jurisdiction of this Court under section 699 Revised Statutes, without regard to the sum or value in dispute.

MOTION to dismiss for want of jurisdiction.

IN ERROR to the Circuit Court of the United States for the District of Minnesota.

Messrs. J. B. & W. H. Sanborn for the plaintiff.
Messrs. Frackelton & Carenis for the defendant.

Mr. Justice GRAY delivered the opinion of the Court.

The original action was brought in the Circuit Court of the United States for the District of Minnesota by a citizen of Nebraska against a corporation of Minnesota for breach of an agreement in writing, dated December 17, 1877, by which the plaintiff granted to the defendant the right to make and sell within a defined territory a certain kind of plow, under Letters Patent granted August 18, 1874, to the plaintiff for an improvement in plows, (of which he alleged in his complaint that he was the first and original inventor,) and the defendant agreed to make such plows in a good and workmanlike manner, and to advertise and sell them at a price not exceeding the price of similar implements sold by other manufacturers, and to render accounts semi-annually and pay the plaintiff a royalty of $2.50 for each plow sold. The defendant in its answer admitted the agreement sued on, but denied any breach; denied that the plaintiff was the original and first inventor of any improvement in plows, and averred that his alleged improvement had been described in six earlier patents specified; admitted that the defendant had made and sold plows according to the method described in Letters Patent granted March 9, 1880, to one Berthiaume, and averred that those plows were constructed upon an entirely different principle from the plaintiff's. The plaintiff filed a general replication, denying the allegations of the answer.

A jury trial having been duly waived in writing, the case was tried by the court, which, upon facts set forth in detail, found that the defendant had made 960 plows under the Berthiaume patent and 350 other plows; that all those plows infringed the plaintiff's patent, and that the plaintiff's invention was not anticipated by either of the six other patents set up in the answer, and concluded that the plaintiff was entitled to a royalty of $2.50 on each plow sold by the defendant, amounting to $3,275, overruled a motion for a new trial, and gave judgment for the plaintiff accordingly. (29 Fed. Rep., 790; 32 Fed. Rep., 290.)

The defendant sued out this writ of error, which the original plaintiff now moves to dismiss for want of jurisdiction, because the judgment below was for less than $5,000.

The decision of this motion depends upon section 699 of the Revised Statutes, by which a writ of error or appeal may be allowed from any final judgment or decree of the circuit court, without regard to the sum or value in dispute, "in any case touching patent rights." This section substantially re-enacts the corresponding provision of the patent act of 1870, in which the words were—

in any action, suit, controversy, or case at law or in equity touching patent rights. (Act of July 8, 1870, chap. 230, sec. 56, 16 stat., 207.)

The language applied to this subject in the patent act of 1836, under which the cases of *Wilson* v. *Sandford* (10 How., 99) and *Brown* v. *Shannon* (20 How., 55) were decided, was that used in that act in defining the jurisdiction of the circuit court in patent cases, namely:

Actions, suits, controversies, and cases arising under any law of the United States granting or confirming to inventors the exclusive rights to their inventions or discoveries. (Act of July 4, 1836, chap. 357, sec. 17, 5 stat., 124.)

Similar words were used in the patent act of 1861 in defining the jurisdiction of this Court. (Act of February 18, 1861, chap. 37, 12 stat., 130.) But in the act of 1870, as in the Revised Statutes, Congress, while using similar language in defining the jurisdiction of the circuit court, substituted (it must be supposed purposely) the new phrase "touching patent rights" in defining the jurisdiction of this Court.

The present case was an action upon a contract by which the plaintiff licensed the defendant to make and sell a patented article, and not a suit for infringing the plaintiff's patent. But the questions whether that patent was valid and whether it had been infringed were put in issue by the pleadings and decided by the circuit court. Whether, within the meaning of other statutes and in the light of previous decisions, this case should be considered as "arising under" the patent laws of the United States, is a question not before us. (See *Dale Tile Manufacturing Co.* v. *Hyatt*, 125 U. S., 46, and cases there cited.) It is sufficient for the decision of this motion that we have no doubt that a case in which the validity and the infringement of a patent are controverted is a "case touching patent rights," and therefore within the appellate jurisdiction of this Court under section 699 of the Revised Statutes, without regard to the sum or value in dispute.

Motion to dismiss for want of jurisdiction [illegible]

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 13, 1888.

With the approval of the Secretary of the Interior, Alexander Melhado, of New York, N. Y., is hereby disbarred from practice before this Office, pursuant to section 487 of the Revised Statutes.

BENTON J. HALL,
Commissioner.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *James S. McGlehon*, No. 135 *Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado*.

DESIGNS.

18,286.—SPOOL-CABINET.—*Edwin R. Bullock*, Pawtucket, R. I. Application filed April 27, 1888. Serial No. 272,076. Term of patent 7 years.

18,289.—BADGE.—*Henrietta F. Duke*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited)*, same place. Application filed May 18, 1888. Serial No. 274,814. Term of patent 3½ years.

18,290.—BOTTLE.—*William M. Garton*, Baltimore, Md., assignor to *William Swindell, Walter B. Swindell, Charles J. B. Swindell, and Joseph R. Swindell*, all of same place. Application filed May 10, 1888. Serial No. 273,505. Term of patent 14 years.

18,391.—ORNAMENTATION OF SHEET METAL.—*A. Irving Griggs*, New York, N. Y. Application filed May 7, 1888. Serial No. 273,127. Term of patent 14 years.

18,392.—CARPET.—*Otto Heinigke*, New Utrecht, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed January 26, 1888. Serial No. 262,084. Term of patent 3½ years.

18,393.—BADGE.—*Peter D. Keyser*, Philadelphia, Pa., assignor to *P. H. Sheridan*, U. S. A., trustee, Washington, D. C. Application filed December 20, 1887. Serial No. 258,547. Term of patent 14 years.

18,394.—FONT OF PRINTING-TYPE.—*Ernst Lowenhe*, Chicago, Ill., assignor to *Barnhart Bros. & Spindler*, same place. Application filed April 28, 1888. Serial No. 272,212. Term of patent 14 years.

18,395.—FABRIC.—*Bettie H. Miller*, Philadelphia, Pa., assignor to *The Cheney Brothers*, South Manchester, Conn. Application filed May 15, 1888. Serial No. 273,711. Term of patent 3½ years.

18,396.—TEA-GOWN.—*Ellen Moran*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed May 16, 1888. Serial No. 274,216. Term of patent 3½ years.

18,397 to 18,399, inclusive.—RUG.—*Adolph Petzold*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Applications filed May 24, 1888. Serial Nos. 274,934 to 274,936, inclusive. Term of patents 3½ years.

18,400.—LANTERN-BODY.—*Francis L. Pisch*, New York, N. Y. Application filed May 7, 1888. Serial No. 273,126. Term of patent 7 years.

18,401.—QUILTING.—*Charles T. Wagner*, College Point, N. Y. Application filed January 27, 1888. Serial No. 262,162. Term of patent 7 years.

18,402.—QUILTING.—*Charles T. Wagner*, College Point, N. Y. Application filed January 26, 1888. Serial No. 262,301. Term of patent 7 years.

18,403.—QUILTING.—*Charles T. Wagner*, College Point, N. Y. Application filed January 31, 1888. Serial No. 262,591. Term of patent 7 years.

18,404.—QUILTING.—*Charles T. Wagner*, College Point, N. Y. Application filed February 16, 1888. Serial No. 264,273. Term of patent 7 years.

18,405.—THERMOMETER-BASE.—*Henry L. Weiland*, Rochester, N. Y. Application filed February 8, 1888. Serial No. 263,427. Term of patent 3½ years.

18,406.—BOTTLE-STOPPER.—*Samuel P. Weld*, Bond's Village, Mass. Application filed May 5, 1888. Serial No. 272,730. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 6,191 and upward are registered under the act of March 3, 1881.]

15,608.—WHISKY.—*The Aurora Distilling Company*, Aurora, Ind., and Cincinnatti, Ohio. Application filed May 14, 1888. Used since June 18, 1879.
"The word 'SUNNYSIDE.'"

15,609.—FLAVORING-SYRUP FOR EFFERVESCING AND OTHER DRINKS.—*J. H. Barber & Co.*, New York, N. Y. Application filed April 14, 1888. Used since April 1, 1888.
"The words 'MEXICAN SARSAPARILLA.'"

15,610.—DRESS-SHIELDS.—*August H. Brinkmann*, Baltimore, Md. Application filed May 8, 1888. Used since April 24, 1888.
"The word 'LANGTRY.'"

15,611.—WHISKY.—*Henry Corby*, Belleville, Ontario, Canada. Application filed March 10, 1888. Used since 1864.
"The letters 'I. X. L.'"

15,612.—LEATHER FLY-NETS.—*D. Fischbeck & Son*, Milwaukee, Wis. Application filed May 15, 1888. Used since February, 1887.
"The word 'Boss.'"

15,613.—EMBALMING-FLUID.—*Edwin F. Hill*, Springfield, Ohio. Application filed May 9, 1888. Used since April 30, 1879.
"The word 'CHAMPION.'"

15,614.—USEFUL OR ORNAMENTAL ARTICLES MADE OF SOLID SILVER.—*Howard & Son*, Providence, R. I. Application filed April 9, 1888. Used since July 1, 1886.
"The representation of a four-leafed clover."

15,615.—RIBBONS.—*Johnson, Cousins & Co.*, New York, N. Y. Application filed April 20, 1888. Used since February 1, 1884.
"A monogram of the letters and character 'J C & Co.' and the word 'RIVERSIDE.'"

15,616.—SOAP.—*The Mexican Amollin Soap Company*, Peoria, Ill. Application filed June 10, 1887. Used since February, 1886.
"The words 'AMOLIN DIAMOND KING' and the figure of a rhombold or diamond."

15,617.—REFINED COPPER.—*Orford Copper Company*, New York, N. Y. Application filed May 12, 1888. Used since January 1, 1881.
"The letters 'O. C.'"

15,618.—REFINED COPPER.—*Orford Copper Company*, New York, N. Y. Application filed May 12, 1888. Used since January 1, 1887.
"The letters 'O. R. C.'"

15,619.—CORSETS.—*Shepard, Norwell & Co.*, Boston, Mass. Application filed May 12, 1888. Used since April 1, 1888.
"The word 'BARONESS.'"

15,620.—HOUSEHOLD-NAILS.—*Simmons Hardware Company*, St. Louis, Mo. Application filed May 1, 1888. Used since April 20, 1888.
"The words 'DRIVE WELL' and the letters 'D. W.'"

15,621.—SOAP-POWDERS.—*Strawbridge & Jaeger*, Chicago, Ill. Application filed April 6, 1888. Used since February 1, 1888.
"The words 'CHAMPION AMERICAN.'"

15,622.—BRAND, ALE AND PORTER.—*J. L. Straus & Bro.*, Baltimore, Md. Application filed May 14, 1888. Used since November, 1885.
"The monogram 'J L S & Bro' above the representation of a spread-eagle standing on a shield."

15,623.—SAFETY FUSIBLE PLUGS FOR BOILERS.—*George Van Wagenen*, New York, N. Y. Application filed May 5, 1888. Used since April 10, 1888.
"The figure of a triangle."

15,624.—CHEMICALS, CHEARS, AND CHEARSETTES.—*Philip Whitlock*, Richmond, Va. Application filed May 10, 1888. Used since 1868.
"The picture of a bald-headed old man with spectacles on forehead and hair extending around his chin up each side of his head."

15,625.—EGGS-TONIA.—*A. W. Wills & Son*, Birmingham, county of Warwick, England. Application filed May 22, 1888. Used since March 15, 1888.
"The name 'WILLS.'"

LABELS.

5,624.—Title: "RANO'S DANDELION LIVER PILLS."—*Frederick Seiser* and *Charles O. Rano*, Buffalo, N. Y. Application filed May 28, 1888.

DISCLAIMERS.

8,168, (Reissue.)—*Charles F. Tenny* and *Thomas J. Hobbs*, Baldwinsville, Mass. IMPROVEMENT IN COMBINED CARRIAGE AND CHAIR. Patent dated April 9, 1878. Disclaimer filed June 9, 1888, by the present assignee, *Gilman Wells*, Templeton, Mass.

Enters his disclaimer to the first nine claims, which are in the following words:

"1. As an improved article of manufacture, a child's chair convertible into a high chair or carriage, it being provided with a pair of hinged legs, and rollers carried by and movable with the legs, the rollers being adapted to bear upon the floor when the seat is lowered, to thereby form a carriage, substantially as described.

"2. A child's-chair seat, combined with rollers and seat-supporting legs, connected with such seat and with each other, and a foot-rest so attached as to permit the legs to be extended more or less at the front and rear of the seat, to convert the chair into a high chair or carriage, substantially as described.

"3. In a child's chair convertible into a high chair or carriage at will, the combination of a seat and a pair of hinged roller-carrying legs, connected with the frame of the seat, the legs, by their change of position with reference to the seat, enabling the seat to be elevated to form a high chair for use with a dining-table of usual height, and to lower the seat for a carriage, the same set of legs serving to sustain the seat in both its elevated and lowered position.

"4. The combination, with a chair seat and legs hinged to the seat-frame, of rollers placed near the ends of the legs to permit the ends of the legs to rest upon the floor when the seat is elevated, and the rollers to bear upon the floor when the seat is lowered, by changing the position of the legs with relation to the horizontal portion of the seat.

"5. The combination, with the seat and arms of a child's chair, of a table connected therewith, and adapted to be turned backward over the back of the seat when not in use as a table.

"6. In a child's high chair and carriage, the combination of a seat-frame, hinged legs and rollers, and a holding device, to hold the upper ends of the legs fixed with relation to the seat when in its elevated position as a high chair, the disengagement of the holding devices permitting the legs to turn on the connection joining them with the seat, to thereby permit the high chair to be used as a carriage.

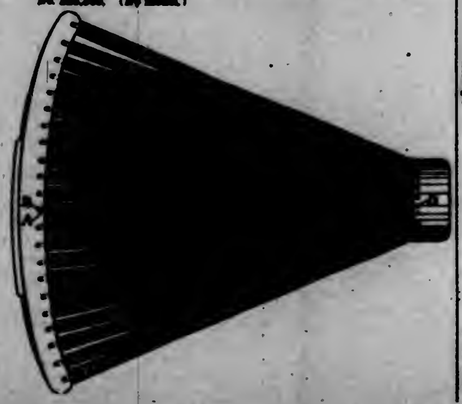
"7. In a combined child's high chair and carriage, rigidly-connected seat, arms, and back, combined with hinged legs and rollers, and a foot-rest and table, adapted to be placed in front of the seat when in use, and to be suspended at the back of the seat when not in use, substantially as described.

"8. A combined child's high chair and carriage, provided with pivoted roller-carrying legs, adapted to be extended in front and behind the seat as the same is lowered to form a carriage, and with a stop to check the outward spreading of the legs, to thereby retain the lowered seat at the desired level to form a carriage, substantially as described.

"9. In a child's high chair and carriage, the combination of legs hinged to the seat-frame at one side of a line drawn laterally through the center of the seat-frame, such legs supporting the seat in its high and low positions, and a holding device to connect such hinged legs with the seat-frame at a point at the opposite side of such central line, to hold such hinged legs in proper position to firmly support the seat each side such central line."

PATENTS

GRANTED JUNE 19, 1888.



384,599. CAR-HEATER. EDWARD ASHCROFT, Pottsville, assignor of one-half to Alfred S. Seaman, Frackville, Pa. Filed Oct. 26, 1887. Serial No. 253,414. (No model.)

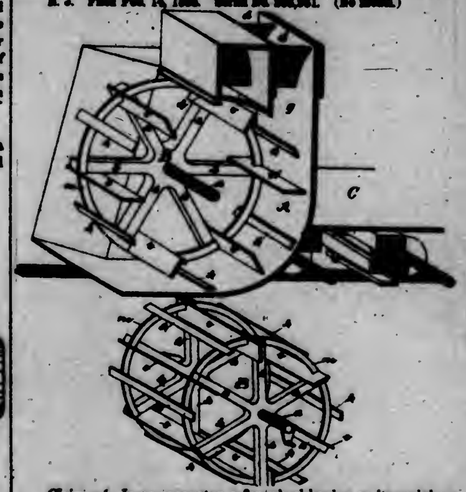
Claim.—1. A car-heater provided with an upper and lower water-chamber and a side passage connecting said chambers, in combination with an intermediate chamber communicating with the upper part of the upper chamber, and with a system of heating-pipes provided with a series of hollow connected flat seats or foot-warmers arranged on the floor of a car, substantially as described.

2. A car-heater provided with upper and lower connected water-chambers, a fire flue or flues passing through the upper chamber, and a furnace in the lower chamber communicating with the flues in the upper chamber, in combination with an intermediate water-chamber connected with the upper part of the upper chamber, and a system of heating-pipes provided with a series of hollow connected foot-warmers arranged on both sides of a car, and a return-pipe communicating with the lower section of the reservoir, substantially as described.

384,600. SADDLE. WILLIAM ASHCROFT, Victoria Works, Victoria Road, Aston, County of Warwick, England. Filed Jan. 3, 1887. Serial No. 223,203. (No model.)

Claim.—A saddle for a bicycle or tricycle having its seat made entirely of springs or equivalent elastic material, as described and illustrated.

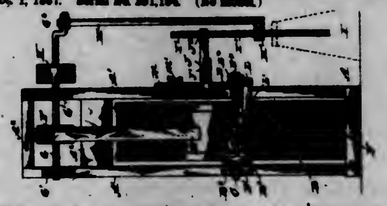
384,601. LETTER-FILE. MARY H. BARNARD, Canton, Ill., administratrix of William S. Barnard, deceased. Filed Mar. 31, 1888. Serial No. 268,172. (No model.)



Claim.—1. In a file-box, the two sides hinged together after the manner of a box, provided with overlapping flanges at the edge, and cut away at the corners to expose the contents.

2. In a file-box, two complementary sides hinged together book-like and provided with hinged outwardly-turning supports, substantially as described, whereby they may be sustained when opened, in inclined positions.

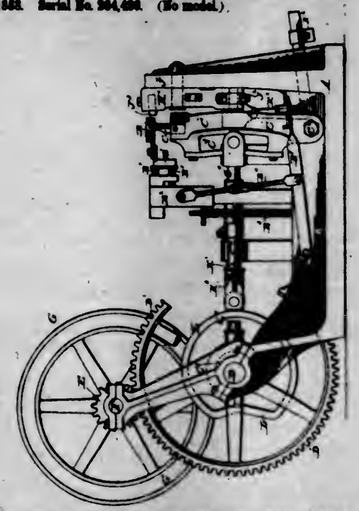
3. A file-box consisting of the two flanged sides hinged together book-wise, and each having one corner hinged to turn outward, substantially as described.



384,602. SNOW-EXCAVATOR. WILLIAM G. BARNES, Paterson, N. J. Filed Feb. 14, 1888. Serial No. 263,861. (No model.)

Claim.—1. In an excavator, a fan-wheel having on its periphery a series of longitudinal knives, each knife being placed a sufficient distance in advance of a vane so as to leave room between the back of the knife and the front of the vane for the escape of the snow or other material, substantially as shown and described.

2. In an excavator fan-wheel, the combination of spokes *b b*, vanes *v v*, rings *m m*, and knives *k k*, substantially as shown and described.



384,603. ANIMAL OR OTHER POWER. JOHN BENTOLA, Henryville, Ind., assignor of one-half to Mathew H. Dunlevy, same place. Filed Oct. 1, 1887. Serial No. 251,184. (No model.)

Claim.—1. The combination of the wheel B, uprights A', bearings D D', the latter extended to form the bracket d^3, the countershaft G, connecting-rod H, guide-rod J, mounted in the bracket, and the rod I', substantially as specified.

2. The combination of the bearing D, having the tubular extensions D^4, forming a long bearing for the shaft C, the leading-bar L, mounted on the extension, and the adjusting-arm M, pivotally connected with the leading-bar, substantially as specified.

384,604. MACHINE FOR SECURING SPOKES IN METAL WHEELS. WILLIAM P. BETTENDORF, Davenport, Iowa. Filed Feb. 17, 1888. Serial No. 264,499. (No model.)

Claim.—1. In a spoke-fastening machine, a spoke-holding clamp, in combination with the pivoted header-carrying arm, the eccentric, the rod connecting the eccentric and arm, and the yielding hub-support.

2. In a spoke-fastening mechanism, the pivoted arm provided with a heading-tool to enter a hub, in combination with an eccentric and a connecting-rod mounted at one end around the eccentric and pivoted at the other end to the header-carrying arm, as shown.

3. In a spoke-fastening machine, in combination with a heading-tool to enter the hub, the hub-sustaining device, in combination with a supporting-spring and a depressing-lever.

4. In combination with the vibratory heading-tool, the hub-support, the vertically-sliding head having a horizontal sliding connection with the support, the spring to retract the support, the spring to lift the head, and the lever to depress the same.

5. In combination with the connected clamp-levers, their operating-pitman, the reciprocating rod connected to the latter, its actuating-cam, and the retracting-spring.

6. In a spoke-fastening machine, the clamping-levers, their actuating-pitman, the reciprocating rod, the lever for starting said rod, its actuating-cam, the cam-driving clutch, and the clutch-controlling lever operated by the rod, as shown, whereby the initial closing of the jaws is caused to set the cam in motion.

7. In combination with the connected clamp-levers, their actuating-pitman, the reciprocating rod connected to the pitman and provided with a stud, the rod-retracting spring, the rod-operating cam, its driving-clutch, and the clutch-operating lever provided with the opening having oblique edges, as described, to move the lever in both directions.

8. In a machine for seating metallic spokes, the combination of a heading-tool and its operating mechanism, a spoke-clamp, and a clamp-operating cam of irregular form timed to release the spoke as soon as the heading-tool completes its action.

384,605. WHIP-SOCKET. JOHN F. BOWER, Chicago, Ill. Filed Feb. 1, 1888. Serial No. [illegible]. (No model.)

Claim.—1. In a whip-socket, a locking-eccentric movable by hand into locking position with the whip and provided with a spring tending to prevent accidental locking, substantially as set forth.

2. The whip-socket provided with a lock for securing the whip, consisting of a clamping-eccentric, a pawl and ratchet for securing the eccentric, a key for disengaging the pawl, and a spring for throwing back the eccentric, substantially as set forth.

3. The combination, with a whip-socket, of the housing, the eccentric borne in the housing and provided with a handle extending to the outside of such housing, the locking-pawl, the ratchet upon the axis of the eccentric, a spring for returning the eccentric, and a key for throwing out the pawl, substantially as set forth.

4. The combination, with the socket, of a lock for holding the whip, a key for releasing the lock and having one or more wards, and a tumbler having its inner end in the path of the key and provided with one or more projections adapted to enter the wards of the key, substantially as set forth.

5. The combination, with the whip-socket and the whip-clamping eccentric, of a key, *o*, and its attached chain, the socket being provided with a horizontal opening, P *p*, adapted to admit said key, substantially as set forth.

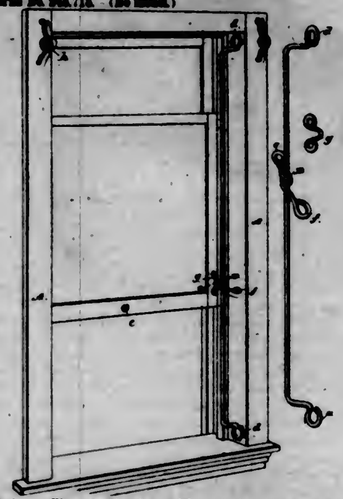
384,606. CAR-COUPLING. WARREN I. BRADDOCK, Boston, Mass., assignor of one-half to T. B. Sargeant, Detroit, Mich. Filed Nov. 24, 1886. Renewed Mar. 2, 1888. Serial No. 266,003. (No model.)

Claim.—1. The draw-bar having the chamber *h*, and the pin-receiving orifices *d d'*, communicating with said chamber, combined with the curved lever *f*, pivoted to the lower portion of the draw-bar, and having an arm extending upwardly from the pivot and adapted to support the coupling-pin, and another arm extending forward from the first and adapted to support the link, as set forth.

2. The combination of the draw-bar, the pivoted lever *f*, formed as described, the coupling-pin *e*, the yoke *k*, engaged with said pin, and the rod *h*, having arms *j j*, engaged with the ends of said yoke, as set forth.

3. The combination of the draw-bar, the pivoted lever *f*, the yoke *k*, the longitudinally-movable rod *h*, having the arms *j j*, engaged with the yoke, and the stud *o*, and the fixed bearing *i*, having a notch or groove, *p*, adapted to receive said stud and hold the rod with the pin in a raised position, as set forth.

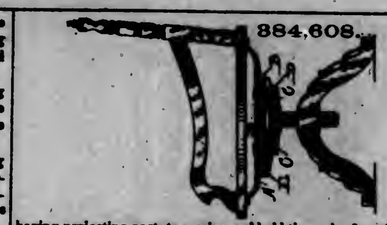
4. The combination of the draw-bar, the pivoted lever *f*, the pin *e*, the yoke *k*, engaged with the pin, the rod *h*, having the arms *j j*, engaged with the yoke, and the vertical rod *l*, having the loop *m*, engaged with one of the arms *j*, as set forth.



5. The combination of the draw-bar, the pivoted lever, the pin and the operating devices therefor, the arm *q*, pivoted below the draw-bar and having the link-supporting arm *u*, and the rod *r*, having the crank *t*, adapted to operate the arms *q u*, as set forth.

6. The combination of the draw-bar having the lever *f*, the pin *e*, the longitudinally-movable rod *h*, connected, as described, to said pin and provided with the stud *o*, the bearing having a groove to receive said stud and lock the pin in a raised position, and the vertical sliding rod *l*, having a fulcrum upon which it may be turned to move the rod *h* endwise, as set forth.

7. The combination of the draw-bar having the slot, the sliding bearing-block therein, the beams or supports, and the cylindrical axle journaled and movable lengthwise in said beams and block, and the strap supporting the forward end of the draw bar, as set forth.



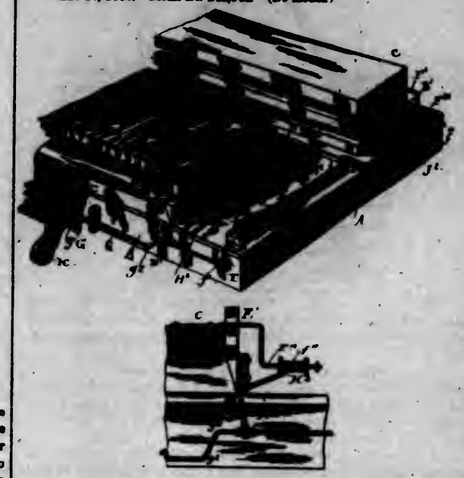
8. The combination of the draw-bar having the slot, the sliding bearing-block therein, the beams or supports, the cylindrical axle journaled and movable lengthwise in said beams and block, the strap supporting the forward end of the draw-bar, and the removable stops bearing against the ends of the axle, as set forth.

384,607. SASH-HOLDER. ISAAC BERGAW, Litchfield, Ill., assignor of one-half to August F. Warnsbe, same place. Filed Sept. 3, 1887. Serial No. 248,713. (No model.)

Claim.—The combination, with a window frame and sash, the latter having a loop secured thereto, of a guide-rod secured to the frame in close proximity to the loop, and a friction-clutch, the latter consisting of a wire coiled loose around the guide-rod and adapted to slide thereon, this clutch having one end bent around the loop on the sash and the opposite end bent to form a thumb-piece, substantially as set forth.

384,608. CHAIR. WILLIAM I. BUSHEE, Chicago, Ill., assignor to the Rocker Spring Company, same place. Filed Mar. 28, 1887. Serial No. 232,559. (No model.)

Claim.—1. The combination, in a tilting or rocking chair, of a seat part, a base part, connectors for securing and holding said parts together, and a movable portion forming the rockers interposed between the seat and base parts for changing the center of oscillation of the chair-seat, substantially as described.



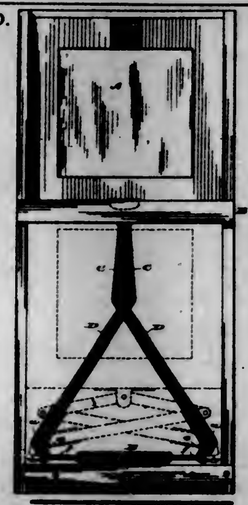
2. The combination, in a tilting or rocking chair, of a seat part, a base part, connectors for securing and holding said parts together, movable rockers interposed between the seat and base parts, and means for moving such rockers back and forth to change the center of oscillation of the chair-seat, substantially as described.

3. The combination, in a tilting or rocking chair, of a seat part

having projecting parts to receive and hold the ends of a coiled spring, a base part having base rails or supports and projecting parts to receive and hold the ends of a coiled spring, connectors for securing and holding said parts together, movable rockers interposed between the seat part and the base-rails, and means for moving said rockers back and forth on the base-rails to change the center of oscillation of the chair-seat, substantially as described.

384,609. REED-ORGAN. MELVILLE CLARK, Chicago, Ill. Filed June 17, 1887. Serial No. 241,944. (No model.)

Claim.—1. In combination with the knee-swell lever K, the slide-bar G, rock-shaft H, journaled transversely to the direction of the length of said bar and having a crank-arm pivoted to said bar, the said rock-shaft having the crank-wrist H^2 and the swell C hinged at one edge to the reed-box, and having the crank-arm F secured to it and bent to form the crank-wrist F^{20}, and the anti-friction roller f^{10}, loosely journaled on said wrist and shorter than the same and flanged, as described, whereby it travels over the wrist H^2 and is by said wrist moved lengthwise on the wrist F^{20}, substantially as set forth.



2. In a reed-organ, in combination with the knee-swell lever, the two reed-boxes C and C', one in the rear of the other, their swells respectively hinged thereto and provided with rigid cranked arms, flanged rollers loosely journaled and adapted to slide lengthwise on the cranked wrists of said cranked arms, rock-shafts extending from front to rear, and having crank-wrists in position to contact with the said rollers and further provided with crank-arms at their forward ends, and a slide-bar, as G, pivoted to said crank-arms and adapted to be longitudinally actuated by the knee-swell lever, substantially as and for the purpose set forth.

3. In a reed-organ, the combination, with the swells, of a slide-bar, G, and mechanism which connects it with the swells, said slide-bar being bent to form the vertical portion G', and provided with an anti-friction roller on said portion, and the knee-swell lever contacting with said roller, substantially as set forth.

384,610. COMPENSATING SPRING-LEVER. REUBEN CLARKE, Toronto, Ontario, Canada, assignor of one-half to Daniel McFarlane and John Graham Bowling, both of same place. Filed Feb. 6, 1888. Serial No. 263,662. (No model.) Patented in Canada Feb. 15, 1888, No. 28,482.

Claim.—The combination, with the arms C, pivoted at one end to the movable body, and the levers D, pivoted at one end to said arms and at the other on fixed pivots, as at *a*, of the short arms *c* on said levers, and the spring E, connecting the free ends of said short arms, substantially as and for the purpose specified.

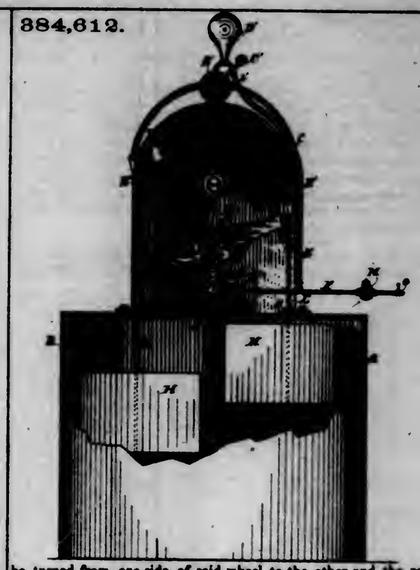
384,610.

384,611. TRUSS. CHARLES CLOVER, Toronto, Ontario, Canada. Filed Oct. 20, 1887. Serial No. 252,915. (No model.)

Claim.—1. A spindle, A, connected directly to the center of the spiral spring C, in combination with a socket, E, connected to said spring at the opposite end, substantially as and for the purpose specified.

2. A spindle, A, connected directly to the center of the spiral spring C, and having a head, *a*, formed on it, in combination with a socket, E, connected to said spring at the end opposite to the end at which the spindle is connected, and having a cap, *b*, substantially as and for the purpose specified.

3. A spindle, A, adjustably connected directly to the center of the spiral spring C, in combination with a socket, E, connected to said spring at the end opposite to that at which the spindle A is connected, and the pad connected to said spindle and spring, substantially as and for the purpose specified.



384,612. MOTOR. JAMES B. ERWIN, Milwaukee, Wis. Filed Mar. 31, 1887. Serial No. 233,109. (No model.)

Claim.—1. In a hydropneumatic motor, the combination of a motor-wheel, a wheel-inclosing case, into which case water is forced by the expansive force of compressed air alternately from one and then the other of two separate air-tight water-receivers, two air-tight water-receivers, from one and then the other of which the same water is alternately forced by the direct expansive force of compressed air within such receivers into said wheel-inclosing case, water-ducts provided with checks communicating from said water-receivers into said wheel-inclosing case and from said wheel-inclosing case back to said water-receivers, an air-pipe communicating from a supply with both of said water-receivers, and mechanism for controlling the course of the air alternately to and from each of said water-receivers, substantially as set forth.

2. In a hydropneumatic motor, the combination of two separate liquid-receivers communicating with each other through a third receiver or wheel-inclosing case, a wheel-inclosing case, two branch pipes having return-checks communicating from said liquid-receiver through a single pipe with said wheel-inclosing case, and a single pipe communicating from said wheel-inclosing case through two separate branch pipes having return-checks with each of said liquid-receivers, substantially as and for the purpose specified.

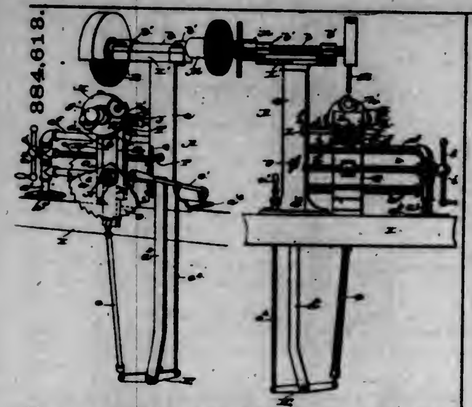
3. In a hydropneumatic motor, the combination of two liquid receivers, A and B, two branch pipes, *a* and *b*, communicating from the respective receiver A and B with the single pipe or duct E, pipe or duct E, water-controlling cock F, and branch pipes or nozzles F′ and F″, communicating between said cock and the wheel-inclosing case D upon the respective sides of the wheel, whereby the course of the water may

384,612.

be turned from one side of said wheel to the other and the rotary movement of the wheel reversed, substantially as set forth.

4. In a hydropneumatic motor, the combination of the wheel-inclosing case D, provided with a motor-wheel, two liquid-receivers, A and B, from one and then the other of which water is alternately forced into said wheel-inclosing case D, valve-chamber I, communicating through ports with the respective receivers B and C, reciprocating slide-valve *c*′, two counterbalanced oscillating floats, H H, located, respectively, in the respective receivers B and C, and suspended by rods from the same supporting-lever, and mechanism for communicating motion from said oscillating floats to said reciprocating valve, whereby, as said floats oscillate in said water-receivers, the same water is forced alternately from one and then the other of said floats containing water-receivers upon a wheel in said wheel-inclosing case, substantially as and for the purpose specified.

5. In a hydropneumatic motor, the combination of the liquid-receivers A and B, valve-chamber I″, communicating from a single air-pipe, F, with the respective liquid-receivers A and B, past the air-controlling valve *c*″, lever R, pivotal support S, valve-rods L L, communicating between said lever R and the interior of said receivers A and B through the stuffing-nuts *a*′, floats H H, counterbalanced in their respective chambers upon the same pivotal support or lever R, located upon the exterior of said chambers, two-armed lever A″, mounted upon the same pivotal support S with the lever R, pivotal support S, stops *g*′ *g*″, projecting from said lever R upon the respective sides of said lever A″, stops D″ D‴, projecting from the side of the short arm C′ of said lever A″, upon the respective side of the lever F″, lever F‴, affixed at one end of the pivotal shaft G″ upon the exterior of the valve-chamber I″, pivotal shaft G″, extending across the interior of the valve-chamber I″, stuffing-nut I, surrounding the protruding end of said shaft G″, lever H‴, affixed to the inner end of said shaft G″, and air-controlling valve *c*′, adapted to be operated by contact with said lever H‴, all substantially as and for the purpose specified.



384,613. MACHINE FOR SHARPENING SAWS, &c. CYRUS S. FARRAR, East Saginaw, Mich., assignor of one-half to Fred B. Wiggins, same place. Filed Jan. 28, 1886. Serial No. 191,051. (No model.)

Claim.—1. In a grinding-machine, the combination of the main frame, grinding-wheel shaft journaled in the main frame of the carriage, the actuating means causing the carriage to travel, the slide moving in a groove or way in the carriage, the head-block pivoted to the slide, and means, substantially as described, whereby the slide can be raised and lowered, substantially as described.

2. The combination, with the main frame and the grinding-wheel shaft, of the carriage-actuating screw, the slide-lever E, the pitmen *c*, and link-rod *d*′, substantially as specified.

3. The combination, with the main frame, emery-wheel, and emery-wheel shaft, of the carriage, actuating means therefor, the slide moved up and down by means substantially as described, the pivotal block secured on the slide, the spring-arm K, extending rearward from said block, the retaining-plate *h*, the pivoted head-block being provided

384,613.

with an arm, *g*′, for the attachment of the cutter-head, the spring-arm I, having the detent-edge *i*, and extending from said head-block, and the templet provided with notches on its edge, substantially as specified.

4. In a grinding-machine, the combination, with the reciprocating slide, the pivotal block secured thereto, the spring-arm extending from said block, the retaining-plate secured to the end of said arm, and the templet J, having the notches *j* on its upper edge, of the pivoted head-block G, provided with the pivotal pin *g* and retaining-arm *g*′, and the spring-arm I, provided with the detent-edge *i*, substantially as specified.

5. In a grinding-machine, the combination, with the carriage, the slide moving in a vertical groove or way in the carriage, the pivotal block secured to the top of the slide, the spring-arm K, the curved plate *h*, having the bent ends *h*′, and the curved templet J, provided with the notches *j* and P, respectively, on its upper edge and rear side, of the pivoted head-block G, provided with the pivot-pin *g* and retaining-arm *g*′, the spring-arm I, having the detent-edge *i*, and the spring-detent arm *l*, provided with the detent-plate *l*′, substantially as specified.

6. In a grinding-machine, the combination, with the grinder-shaft journaled to the main frame, and the grinding-wheel secured to said shaft, of the carriage, the slide moving in a vertical groove in the carriage and provided with the vertical series of openings *d*′, the rod N, nut *n*, the supporting-arm P, attached to the standard *a*, and the file Q, attached to said arm, substantially as specified.

7. In a grinding-machine, the main frame carrying the grinding-wheel shaft, the internally-movable carriage, and the slide vertically movable in the carriage, as set forth.

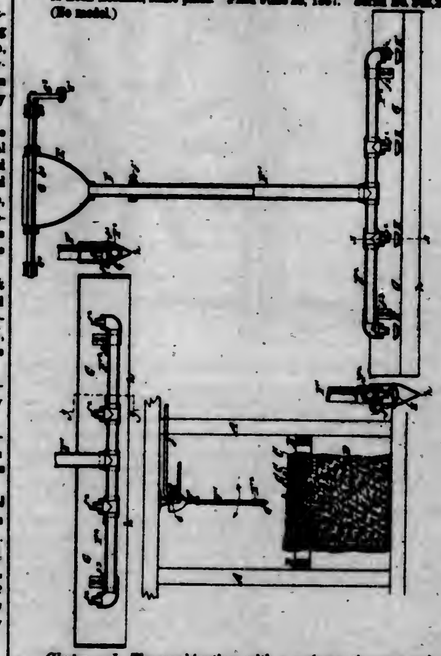
8. In a grinding-machine, the main frame carrying the grinding-wheel shaft, the guide-bars *a*″, the standard *a*′, the screw working in the standard *a*′, and the carriage working laterally on the guide-bars and engaged by the screw, as set forth.

9. In a grinding-machine, the main frame, the grinding-wheel shaft, the laterally-movable carriage, the slide movable vertically in the carriage and carrying the head-block at the upper end, as set forth.

10. In a grinding-machine, the combination of the emery-wheel, the pivotal block, the head-block for the attachment of the cutter-head, and the operative mechanism, substantially as described, whereby the knives may be ground without removal from the cutter-head, and may thereby be made harder than when sharpened by the file, so that they will remain sharp longer, substantially as specified.

384,614. BILLIARD-CUE. WILLIAM H. FIELDS, Columbiana, Ohio. Filed Feb. 20, 1888. Serial No. 264,644. (No model.)

Claim.—1. A billiard-cue having a ferrule provided with a protruding elastic cushion at its outer end, in combination with a surrounding sleeve having a flexible tip at its outer end, the sleeve being secured upon the ferrule to produce contact or tension of the cushion upon the tip, substantially as described.



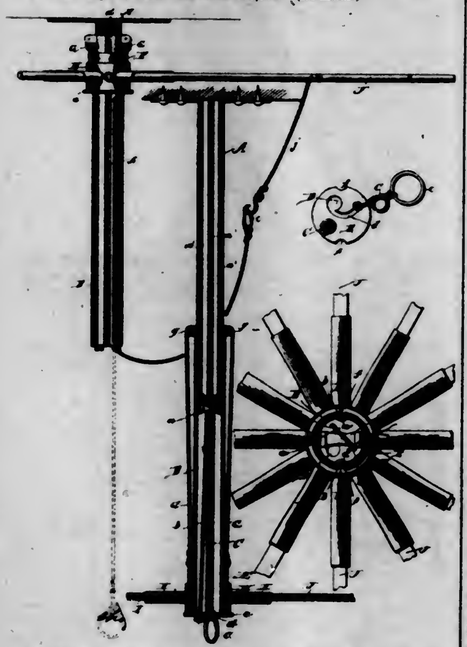
2. A billiard-cue having a ferrule, an elastic cushion on the outer end of the ferrule, and a pin projecting through its wall, in combination with a sleeve rounded at its outer end and supporting a flexible tip, and having slots in its wall for engagement with said pin, substantially as described.

384,614.

384,615. SAND AND WATER DISTRIBUTOR FOR STONE-SAWING MACHINES. JOHN H. FRANCIS, Rutland, Vt., assignor of one-half to Louis Lehman, same place. Filed June 23, 1887. Serial No. 242,304. (No model.)

Claim.—1. The combination, with a reciprocating saw-sash or frame and a gang of saws therein, of a sand and water distributer pivoted parallel with the line of movement of the saws, and a rod or connection for imparting to the distributer an oscillating or swinging movement transverse to such line of movement of the saws, substantially as herein described.

2. The combination, with a reciprocating saw-sash and a gang of saws therein, of a water and sand receiver supported on a pivot above the saws, a pipe depending from the receiver, a horizontal pipe connected to the lower end of the depending pipe and having outlet-openings in its under side for the escape of sand and water, and a rod or connection whereby the receiver and pipes are swung upon said pivot, substantially as herein described.



3. The sand and water distributer herein described, consisting of an elevated receiver, a pipe leading downward therefrom, a horizontal pipe with which the lower end of the downwardly-extending pipe communicates and which has outlets at intervals in its length, and a trough within which the horizontal pipe and its outlets deliver and

the sides of which converge to form a narrow slot at the bottom, substantially as herein specified.

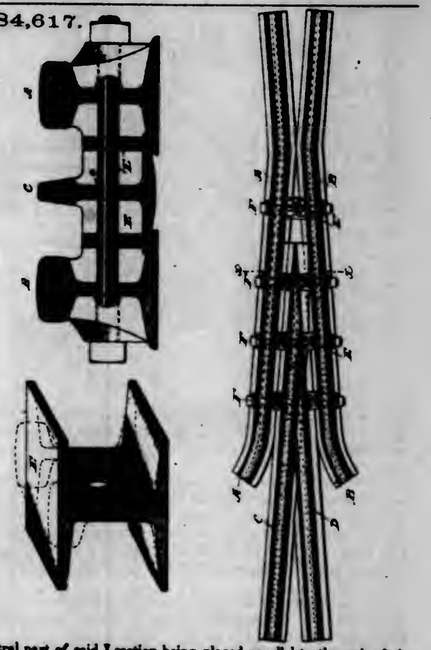
4. The sand and water distributer herein described, consisting of a receiver, E, a pipe leading therefrom, the cross-pipe F^3, having outlets f^3, and the trough G, the sides of which converge downward to form the narrow delivery-slot h, and which is provided with abutments H opposite the several outlets, substantially as herein specified.

384,616. CLOTHES-DRIER. WILLIAM I. GALE, Memphis, Mo.

Filed Sept. 6, 1887. Serial No. 248,970. (No model.)

Claim.—1. The combination of the stationary cylinder, the movable cylinder sliding thereon, the operating-cord having one end secured to the bottom of the movable cylinder, then passing up to and around a pulley on the lower end of the stationary cylinder, and then passing down through the bottom of the movable cylinder and having its free end provided with a ring, and the sleeve sliding on the movable cylinder and carrying the drier-arms, one of said drier-arms being provided with a hook adapted to be engaged by the ring on the end of the operating-rope, substantially as set forth.

2. The combination of the stationary cylinder A, having a pulley, a, on its lower end, the movable cylinder sliding on the stationary cylinder and provided in its bottom with the opening D and the slot d, extending therefrom, and the cord C, secured at one end to the bottom of said movable cylinder, thence passing over the pulley a, and thence through the opening D, the said cord being provided with a stop which can pass through the opening D, but not through the slot d, as and for the purpose specified.



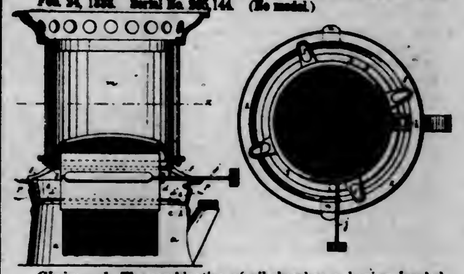
3. The combination of the stationary cylinder having the grooves a', the movable cylinder sliding thereon and having the rollers g at its upper end, the sleeve mounted on said movable cylinder and carrying the drier-arms, the cord G, having its opposite ends secured, respectively, to the said sleeve and the bottom of the stationary cylinder and its intermediate portion passing over the pulley g, and the operating-cord, arranged as set forth, substantially as described.

384,617. RAILWAY-FROG. THOMAS A. GRUVER, Chicago, Ill.

Filed Mar. 15, 1883. Serial No. 267,293. (No model.)

Claim.—1. In a built-up railway-frog, the filling-piece of I-section interposed between the point and wing rails of the frog, the head and foot of said I-section each extending transversely from rail to rail and having its edges shaped to fit the rail, as shown and described.

2. In a built-up railway frog, the filling-piece of I-section interposed between the point and wing rails of the frog, the head and foot of said I-section each extending transversely from rail to rail and having its edges shaped to fit the rail, as shown and described, the



central part of said I-section being placed parallel to the web of the rails and pierced transversely for the passage of the holding-bolts.

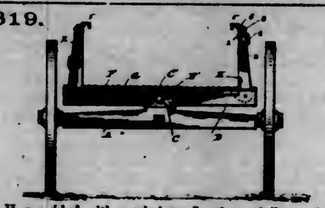
3. In a built-up railway-frog, the wrought-metal filling-pieces of I-section, formed by forging out the head of a rail-section and fitting the edges of the piece so formed to conform to the rail composing the frog, substantially as described.

4. A railway-frog having filling-pieces of I-section interposed between the rails composing the frog at the points through which the holding-bolts pass, said filling-pieces being formed by forging out the head of a rail-section and fitting the edges of the piece so formed to conform to the rails composing the frog, substantially as described.

384,618. OIL-STOVE. PAUL J. GRIEBEL, New York, N. Y. Filed Feb. 24, 1888. Serial No. 265,144. (No model.)

Claim.—1. The combination of oil-chamber *a*, having beaded flange *b*, with the water-pan *d*, having flanged bottom *d'*, substantially as specified.

2. The combination of oil-chamber *a* and water-pan *d*, having flange *c*, with the arms *f*, secured to such flange and supporting frame *g*, and with the gauze *h*, wick-tube *i*, and dome *m*, that is hinged to frame *g*, substantially as specified.



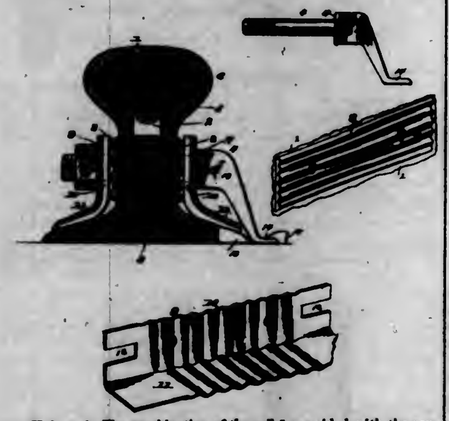
3. The combination of oil-chamber *a* with the water-pan *d*, having flange *c*, such flange being provided with the eyes *p*, and with the spring-hooks *n*, secured to oil-chamber *a* and engaging said eyes, substantially as specified.

384,619. WAGON-BOLSTER. JACOB HAHN, De Kalb, Ill. Filed Feb. 22, 1888. Serial No. 265,030. (No model.)

Claim.—1. The bolster B, provided on its upper surface with the corrugated angle-iron F, substantially as shown, and for the purpose described.

2. The combination of the bolster B, provided with angle-iron F,

384,619.



said box H, provided with angle-iron J, substantially as shown, and for the purpose described.

3. The combination of the box H, the bolster B, and stakes K, provided with inwardly-extending flanges K', and pivotally seated in the respective ends of said bolster, substantially as shown, and for the purpose described.

4. The combination of the hook I, provided with corrugated shank 2, stake K, provided with ways 7 and slot 6, and the eccentrically-seated lever 4, substantially as shown, and for the purpose described.

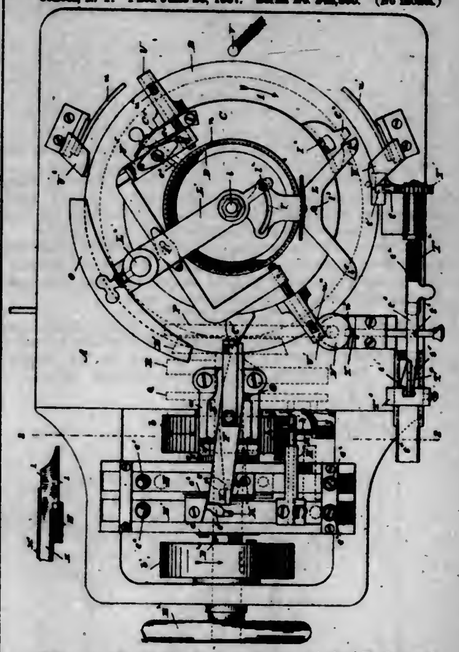
384,620. RAILROAD-TRACK. JAMES HAHN, De Kalb, Ill. Filed Mar. 19, 1888. Serial No. 267,602. (No model.)

Claim.—1. The combination of the rail 1, provided with the central longitudinal vertical slot, 2, a rope, 5, bar 3, and bolts 4, substantially as shown, and for the purpose described.

2. The combination of the rails 1, provided with central longitudinal vertical slots, 2, the bar 3, the interposed block 6, and the bolts 4, substantially as shown, and for the purpose described.

3. The combination of the rails 1, provided with central longitudinal vertical slot, 2, the bar 3, the rope 5, and bolts 4, and the interposed block 6, provided with slot 2, substantially as shown, and for the purpose described.

4. The combination of the rails 1, provided with the corrugations 8 and slot 2, the bar 3, bolts 4, and the plates 9, provided with corrugations 10, substantially as shown, and for the purpose described.



5. The combination of the rails 1, provided with corrugations 8, plates 9, provided with corrugations 10 and slots 12, bolts 4, provided with eccentric heads 13, tie 7, and spike 15, substantially as shown, and for the purpose described.

6. The combination of the rails 1, provided with corrugations 8, fish-plates 9, provided with transverse corrugations 10, and with end slots 12, bolts 4, provided with eccentric heads 13 and lateral shoulders 17, tie 7, and spike 15, substantially as shown, and for the purpose described.

7. The combination of the rails 1, provided with lateral longitudinal corrugations 8 near the ends thereof, and external flange, 11, and slot 16 therein, the plates 9, provided with corrugations 10, bolts 4, provided with eccentric heads 13 and lateral shoulders 17, spike 15, and tie 7, substantially as shown, and for the purpose described.

8. The combination of the rails 1, provided with central recess, 2, corrugations 8, and lateral flanges 11, fish-plates 9, provided with corrugations 10, and adapted to cross and be drawn against the corrugations 8, bolts 4, having eccentric heads 13, adapted to rest upon the tie 7 or flange 11 and external flange, 14, and spike 15, adapted to clamp the flange 14 of bolt 4 and hold the same rigidly upon the tie 7, substantially as shown, and for the purpose described.

384,621. CIRCULAR-KNITTING MACHINE. SAMUEL C. HALL, Osborn, N. Y. Filed June 20, 1887. Serial No. 242,205. (No model.)

Claim.—1. The combination, with the hinged plate F, the mechanism for controlling the position of the same, the stop M, carried by said plate, the lever F, mounted also on said plate, and the reversing mechanism controlled by said lever, of the needle-cylinder, the rotary cam-cylinder and needle-cam carried thereby, the driving devices between the cam-cylinder and the reversing mechanism, the shifting thread-guide adapted to take a position and to deliver thread to the needles at either side of the cam, and the stop O^3, carried by said cam-cylinder, substantially as and for the purposes hereinbefore set forth.

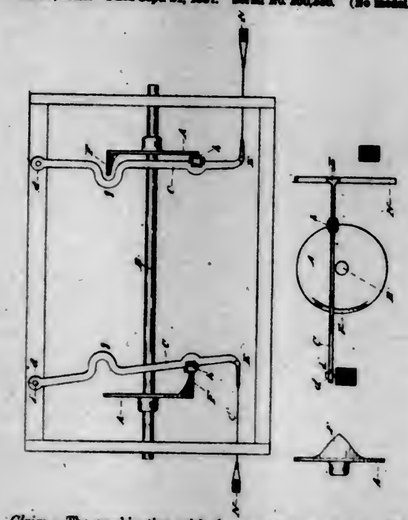
2. The combination, with the needle-cylinder, of the rotary cylinder provided with a horizontal internal groove, I, with portions of the top and bottom walls of the groove removed, so as to leave a vertical passage extending from the top to the bottom of the cylinder of the same depth as the groove, in combination with the slide O^2, provided with filling-plugs c^3 c^4, and a detent, c^5, as and for the purposes hereinbefore set forth.

3. The combination, with the pattern mechanism by which the sequence and duration of the movements of the cam-cylinder are determined and controlled, of a detent or trigger by which said mechanism is held in inoperative position, and trigger actuating and controlling mechanism, whereby said trigger is actuated at predetermined times to release and permit the operation of the pattern mechanism, substantially as and for the purposes hereinbefore set forth.

4. The combination, with the needle-cylinder, the rotating cam-cylinder having cam-plate O, and the mechanism for actuating said last-named cylinder, of the ratchet-wheel P for operating the pattern-cams, the depressible rod N and its pawl N^2 and spring N', the trigger T for locking the rod N in depressed position, where it will not be acted on by cam-plate O, and the mechanism whereby said trigger is disengaged from and caused to release the rod N at the times and in the manner substantially as hereinbefore set forth.

5. The combination, with the needle-cylinder, the rotary cam-cylinder provided with stops $C' C^2$, and the power mechanism for actuating said last-named cylinder, of the pattern cam-wheel Q, provided with surfaces q q' q^3 q^3, the rod G, the hinged plate F', the lever F, and the reversing devices operated on by said lever, substantially as and for the purposes hereinbefore set forth.

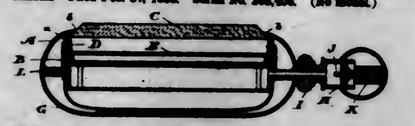
6. The combination, with the needle-cylinder, the rotary cam-cylinder having stops $C' C^2$, and cam-plate O, the lever F, its hinged supporting-plate, the clutch-slides E E', the reversing-clutch mechanism controlled by the same, and the bolt H, of the lifter-rod G, the lever S, the pattern-cam Q, provided with surfaces q q' q^3 q^4 and pins S' S^2,



the depressible rod N, pawl N², spring N', and ratchet P, the trigger T for locking said rod N in depressed condition, and the mechanism whereby said trigger is caused to release said rod, substantially as and for the purposes hereinbefore set forth.

7. The combination, with the pattern-cam and the stop P', carried by said cam or some part moving in unison therewith, of the driving-shaft, the reversing mechanism, the fast and slow pulleys W' W², loose on said shaft, the clutch for connecting one or the other of said pulleys with the driving-shaft, the system of shifting-levers for said clutch, the link W⁴, spring X, stop o^5, and the link W³, connected to said system and arranged and adapted to be operated by the stop P' at the time and in the manner substantially as hereinbefore set forth.

8. The combination, with the devices for feeding the needle-lifters and the grooved needle-cylinder, of a supporting-bracket for the latter and clamping devices for adjusting the needle-cylinder upon its support relative to said feeding devices, substantially as set forth.

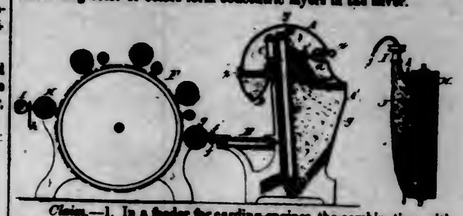


9. The combination, with the ratchets and pawls for feeding the needle-lifters, the bar R², and the bars R' R³, of the double-incline cam-plate r^4, engaging the bars R' R³ and adapted to operate them positively in either direction, substantially as set forth.

384,622. LOOM PICKING MECHANISM. SYLVANUS HAMBLIN and REUBEN M. HAMBLIN, Plymouth, Mass., assignors, by direct and mesne assignments, to Roswell S. Douglass, same place, and Henry Sawyer, Boston, Mass. Filed Sept. 21, 1887. Serial No. 250,258. (No model.)

Claim.—The combination, with the cam-shaft and the cam-disks on the said shaft provided with laterally-projecting V-shaped cams, of picking-levers pivoted at the rear of said cam-shaft and bent or curved at the rear of the said shaft to permit unobstructed passage of the cam projections, the cam projections engaging with the said levers at points in front of the cam-shaft and between the said shaft and forward ends of the said levers, as described, the picker-staffs, and straps connecting the said staffs with the front ends of the said levers, as and for the purpose set forth.

384,623. WATCH-CASE. EDWARD F. EDWARDSEN, Toronto, Ontario, Canada. Filed Feb. 27, 1888. Serial No. 265,606. (No model.)

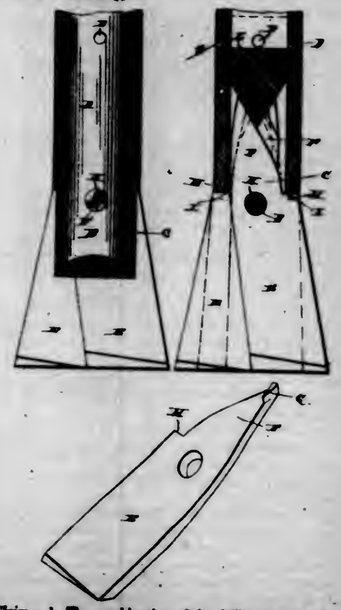


Claim.—1. An open-faced cover having an annular wall extending from a point near the inner edge of the opening, and screw-threaded on its outer circumference to fit a thread formed on the inner circumference of the movement-ring, in combination with the dial-glass fitted within the annular wall to butt against the inner edge of the opening, and having an inwardly-projecting flange to butt against the dial-plate when the movement-ring is moved into the open-faced cover, substantially as and for the purpose specified.

2. A movement-ring screwed into an annular wall formed around the opening in the open-faced cover, and having a thread cut on its outer circumference to receive a ring screwed onto it to butt against the edge of the front cover, in combination with a back cover screwed or snapped onto the said ring, so as to inclose the space surrounding the annular wall, substantially as and for the purpose specified.

3. A cone-shaped ring, H, screwed tightly into the pendant I, and having a hole through it to fit the stem J, in combination with a cap or crown, K, having a soft seat formed on its inner surface, substantially as and for the purpose specified.

384,624. MACHINE FOR MAKING SLIVERS FOR THE PRODUCTION OF CLOUDED YARN. JAMES P. HUNEY, Little Falls, N. Y., assignor of one-half to Walter W. Whitman, same place. Filed June 2, 1887. Serial No. 239,651. (No model.)

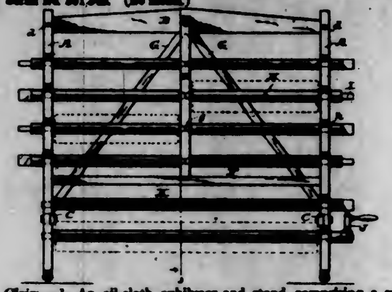


Brief.—The feed-box is divided into compartments for the reception of differently-colored staples, which are fed forward and carded side by side and simultaneously. The formation of the sliver is such that the color first removed from the doffer forms the core, and the succeeding color or colors form concentric layers in the sliver.

Claim.—1. In a feeder for carding-engines, the combination, with the elevating-apron, of several feed-boxes arranged side by side in front of the elevating-apron, whereby fibers of different colors or kinds are simultaneously fed to the elevating-apron side by side, substantially as set forth.

2. In a feeder for carding-engines, the combination, with the elevating-apron, of a fiber-receptacle provided with a longitudinal partition in front of said apron and separate combs arranged in said receptacle on opposite sides of said partition, substantially as set forth.

384,625. SELF-EXPANDING DRILL-BLADE. TALLEF HERRESS and OLAF HERRESS, Henderson, Minn. Filed Aug. 20, 1887. Serial No. 247,405. (No model.)

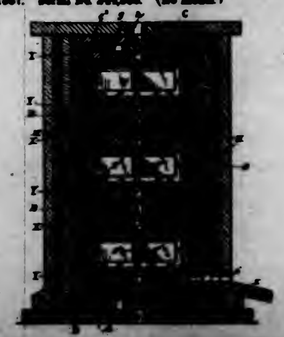


Claim.—1. The combination of the drill-rod having the cam B at its lower end, the drill-blades arranged in the lower end of the drill-rod and pivoted between the cam B, said drill-blades having the upwardly-extending arms F, and being provided with the shoulders H, adapted to come in contact with the shoulders at the lower end of the drill-rod, and the vertically-movable plunger L in the lower end of the drill-rod, and adapted to expand the drill-blades by forcing their arms F apart between the cam and relieve the pivotal bolt or pin of strain, substantially as described.

2. The combination of the drill-rod having the discharge-openings D, the drill-blades pivoted in the lower end of the drill-rod, adapted to be expanded, said drill-blades having the upwardly-extending arms F, and the vertically-movable plunger arranged in the drill-rod and adapted to be forced downward therein by the pressure of the water in the drill-rod, so as to expand the drill-blades by forcing their arms apart, substantially as described.

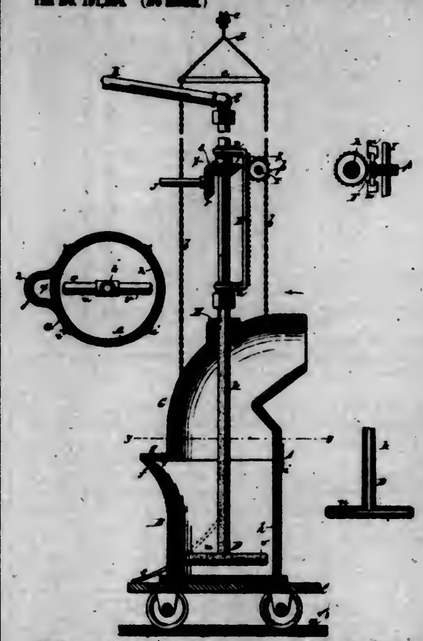
3. The combination of the drill-rod having the discharge-openings D and the cam B at its lower end, the drill-blades pivoted between the said cam B and having the upwardly-extending arms F, entering the lower end of the drill-rod and provided with the oppositely-extending lugs G, and the vertically-movable plunger arranged in the drill-rod, and having the conical end adapted to force the drill-blades apart by entering in the space between the lugs, substantially as described.

384,626. OIL-CLOTH EXHIBITOR AND STAND. RICHARD W. HILLIARD and JESSE F. PURDUM, Warrenton, Va. Filed Jan. 19, 1888. Serial No. 261,262. (No model.)



Claim.—1. An oil-cloth exhibitor and stand, comprising a supporting-frame divided horizontally by fixed supports into upper and lower portions, and provided with a double series of single-length spindles, H, at its upper portion and with double-length spindles K at its lower portion, substantially as described.

2. An oil-cloth exhibitor and stand, comprising a V-shaped frame united by horizontal supporting-pieces F F and a central truss, D, central supports, E E, extending between the piece D and the pieces F F, a double set of single-length spindles, H, rotatably mounted between the end and center pieces, and a series of double-length spindles, K, supported between the end pieces below the horizontal supports F, substantially as described.

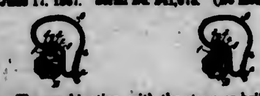


3. An oil-cloth exhibitor and stand, comprising triangular end frames, A A B B, and braces C, a central truss, D, horizontal supports F F, located between the pieces D and the lower extremities of the end pieces, central supports, E E, secured to the pieces D and resting upon and secured to the horizontal pieces F F, and diagonal struts extending from the center of the piece D to and resting upon the cross-pieces C, and a series of single-length spindles, H, rotatably mounted between the end pieces and the center pieces, and an additional series of double-length spindles, K, rotatably mounted between the end pieces and below the horizontal supports F, substantially as described.

384,627. BEE-HIVE. JAMES H. HOWE, Prairieville, Ky. Filed July 16, 1887. Serial No. 244,302. (No model.)

Claim.—In a bee-hive, a suitable supporting frame-work provided with apertures in its base and top and a series of boxes or drawers removably placed therein one over the other, each of said boxes or drawers having apertures in its top and bottom, said apertures being so located that when said boxes are in position in the frame-work they may communicate with each other and also with the exterior of the hive through said apertures in the base and top of the frame-work, and separate cut-off slides for the apertures in the base of the hive and for the top and bottom apertures in each box, said slides being so constructed that when pushed in as far as possible the apertures in the base and top of the frame-work are closed, but all the apertures between the boxes are opened, so that the boxes are in communication with each other, in combination with an inclosing-casing which is placed over the frame-work and boxes, which casing can only be so placed when all the said slides are pushed in as far as possible, substantially as set forth.

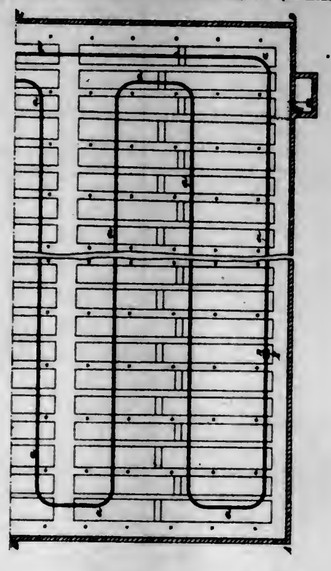
384,628. CONVERTER FOR REFINING MOLTEN IRON. ISAAC S. JENNINGS, Spuyten Duyvil, New York, N. Y. Filed Feb. 8, 1888. Serial No. 263,334. (No model.)



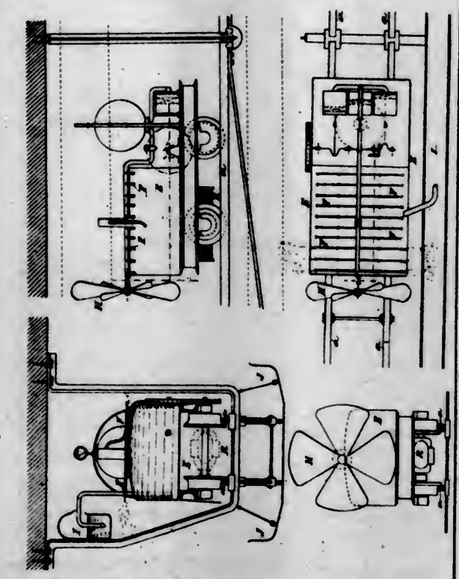
Claim.—1. The combination, in a converter, of a kettle movable upon rails, a hood fitted to the upper end of the kettle and removable bodily therefrom, a tuyere passing through the hood, and mechanism, substantially as described, for both revolving the tuyere and for adjusting it vertically without moving the hood, substantially as set forth.

2. The combination, in a converter, of a kettle mounted upon wheels and carried on rails, a hood fitted thereto, mechanism, substantially as described, for vertically withdrawing the hood bodily from the kettle, a revolving tuyere passing through said hood and moving independently thereof, and mechanism, substantially as described, for simultaneously revolving and vertically adjusting said tuyere, as set forth.

3. The combination, in a converter, of the kettle B, hood C, fitted to said kettle, means, substantially as described, for vertically adjusting the hood, a revolving tuyere having one or more projecting arms, miter-gears E S for revolving the tuyere, said miter-gear S being vertically adjustable on the stem, and mechanism for elevating and depressing the tuyere, all substantially as described.



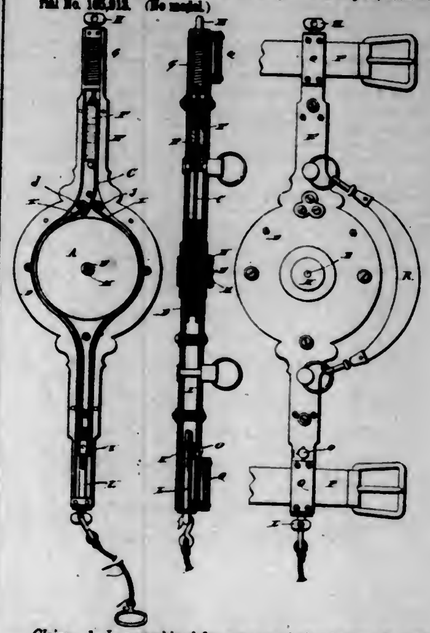
384,629. PENDANT-SETTING. JOHN T. JOYCE, Plainville, Mass. Filed June 17, 1887. Serial No. 241,673. (No model.)



Claim.—The combination, with the stone or brilliant, of the open setting formed in one piece of sheet metal, the arms of the setting being folded over to the stone or brilliant from the flat side of the stock, one of the said arms being provided with an open holding-

notch and a ring or eye which loosely embraces the said arm at the notch, substantially as described.

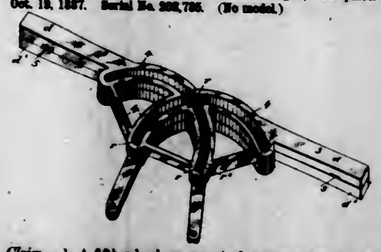
384,630. APPARATUS FOR MOISTENING THE ATMOSPHERE IN MILLS, FACTORIES, &c. ALBERT KESSELUS, Mülheim, Almen, Germany. Filed Sept. 7, 1886. Serial No. 212,893. (No model.)



Claim.—1. The combination, in a room, of the carriage E and its spray-pipes F F, with the endless track *a*, and mechanism, substantially as described, for moving said carriage continuously along the endless track and spraying the whole room, substantially as herein shown and described.

2. The combination, in a room, of the carriage E, having a water-tank, spray-pipes F, and fan H, with the endless track *a*, and with the continuous trough I, adapted to keep up a continuous supply of water to the tank, as set forth.

384,631. SHAWL-STRAP AND FIRE-ESCAPE. JOSEPH D. LEE, Dallas, and JOHN H. ASTON, Portland, Oreg. Filed May 13, 1888. Serial No. 165,913. (No model.)



Claim.—1. In a combined fire-escape and shawl-strap, the combination of the casing having the arms E, the reel arranged centrally in the casing, the soft rubber F in one of the arms, and the cable wound on the reel and passing outward through the soft rubber, as set forth.

2. The combination of the casing having the arms E, the reel arranged centrally in the casing, the cable wound on the reel and passing out through one of the arms, the spring-brakes secured within the casing and bearing upon the reel, and then passing out into the other arm E, the nut secured to the ends of said brakes, and a set-screw mounted in the end of said arm and meshing with said nut to adjust the tension of the spring-brakes, as set forth.

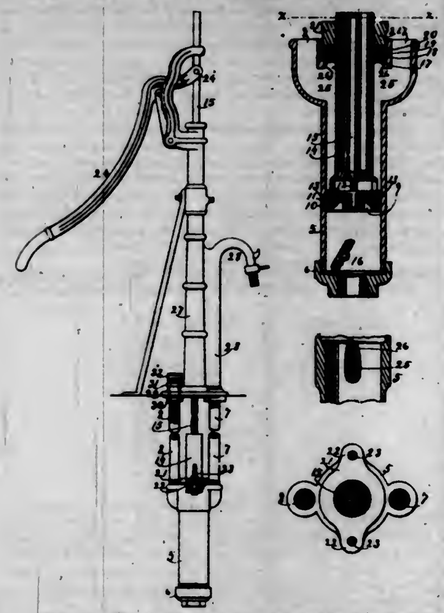
3. The combined fire-escape and shawl-strap herein described and shown, comprising the casing having the arms E, the straps P at the ends of said arms, the handle R, secured to the casing, the reel arranged centrally in the casing, the soft rubber F, arranged in one arm of the casing, the cable wound on the reel, passed out through the rubber F, and coiled at the end of the arm, the spring-brakes secured in the casing, passing around and bearing against the reel, the nut secured to the ends of the spring-brakes, and the set-screw mounted in the casing and meshing with said nut, substantially as specified.

384,632. FIFTH-WHEEL. FRED LEES, Syracuse, N. Y., assignor of two-thirds to Frank Hisley and Martin J. Hogan, same place. Filed Oct. 19, 1887. Serial No. 252,736. (No model.)

Claim.—1. A fifth-wheel composed of two parts having two pivotal centers, substantially as and for the purpose set forth.

2. A fifth-wheel composed of intersecting segmental guide-links having ways for friction-rollers, and friction-rollers running in said ways when the vehicle is cramped or turned, substantially as and for the purpose set forth.

3. A fifth-wheel having a guideway composed of segmental links and moving pivot-centers, substantially as and for the purpose set forth.



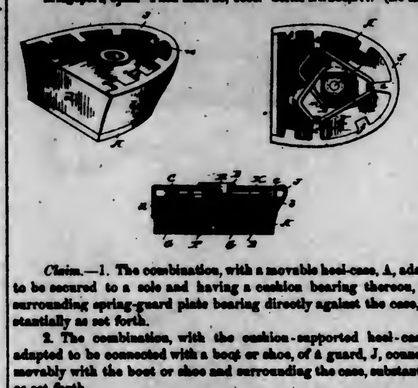
4. A fifth-wheel composed of two segmental guide-links bipeating each other and two corresponding segment-plates having friction-rollers engaging the guide-links, the said friction-rollers being arranged at the angles of an equilateral triangle in relation to each other, substantially as and for the purpose set forth.

5. The combination of the part 3, having bars *d d*, segmental guide-links 4 4, and the part 6, having segmental plates 7 7, friction-rollers *r r r*, and caps 1, substantially as and for the purpose set forth.

6. The part 6, having segmental plates 7, rollers *r*, and links 8, in combination with the segmental guide-links 4, substantially as and for the purpose set forth.

7. The combination, with a vehicle-axle, of the two-part segmental fifth-wheel having moving pivot-centers and a head-block, substantially as and for the purpose set forth.

384,633. FORCE-PUMP. EMERSON M. LOWRIE, Keokuk, Iowa. Filed May 12, 1887. Serial No. 237,941. (No model.)



Claim.—1. The combination of a pump-cylinder having an enlarged bore at its upper end terminating in an abrupt shoulder and forming a stuffing-box, a piston having a head fitted to the said bore, a plunger of about one-half the cross-sectional area of the piston and secured to the piston, a packing-ring in one piece of material fitted to the lower circumferential corner of the said stuffing-box and part way up its sides, a metallic ring fitting loosely around the plunger and closely above and within the said packing-ring and conically dished in its upper side, fibrous packing material located around the plunger and above the said metallic ring and packing-ring, a gland conically dished on its lower side located above the said fibrous packing and provided with perforated ears, and screw-bolts removably connecting the said ears with the pump-cylinder, substantially as shown and described.

2. The combination of a pump-cylinder, a standard provided with a base-flange, a pipe screwed at one end into the said cylinder and screwed at the other end into the said flange and rigidly connecting the two, a second pipe screwed into the cylinder at the opposite side thereof to the first-named pipe and screw-threaded along its other end and passing freely through a hole in the said flange to open air above and serving as an air-chamber to the cylinder below, and two nuts screwed upon the said second pipe, one above and the other below the said base-flange, substantially as shown and described, whereby the second pipe may be adjusted to the distance between the cylinder and flange as rigidly fixed by the first pipe, the two pipes thus constituting a frame to support the cylinder in line with the standard, and whereby the second pipe constitutes an air-chamber which is accessible at the top of the well.

3. The combination of a pump-cylinder adapted to be located down in a well, a pump-standard adapted to be located at the top of the well and provided with a base-flange, a pipe to serve as an air-chamber, adapted to be screwed down into the said cylinder and provided with a long screw-thread along its upper end, and two nuts and a cap screwed upon the said long screw, substantially as shown and described.

4. The combination of the pump-cylinder 5, a pump-standard, 27, the connection 7, screwed at one end into the cylinder and at the other end secured to the standard, the connection 8, screwed at one end into the cylinder and screw-threaded along its other end and passing freely through a portion of the said standard, and two screw-nuts, 30 and 31, threaded upon the connection 8, the one below the said portion of the standard and the other above it, substantially as shown and described.

384,634. HEEL FOR BOOTS OR SHOES. CHARLES H. MANTER, Bridgeport, Conn. Filed Mar. 26, 1888. Serial No. 268,277. (No model.)

Claim.—1. The combination, with a movable heel-case, A, adapted to be secured to a sole and having a cushion bearing thereon, of a surrounding spring-guard plate bearing directly against the case, substantially as set forth.

2. The combination, with the cushion-supported heel-case A, adapted to be connected with a boot or shoe, of a guard, J, connected movably with the boot or shoe and surrounding the case, substantially as set forth.

3. The combination, with a shoe having a movable heel-case, A, of a spring-guard, J, adapted to be connected with the shoe to move to a limited extent horizontally and bearing against the outer curved face of the heel-case, substantially as set forth.

4. The combination of the movable heel-case, a surrounding independent guard inclosing the upper portion of the case, and a spring contracting the guard upon the case, substantially as set forth.

5. The combination, with the plate C, heel-case A, connected movably to said plate and interposed cushion, of a guard, J, having a limited horizontal movement in respect to said plate C, and a spring bearing upon the guard and contracting it upon the case, substantially as set forth.

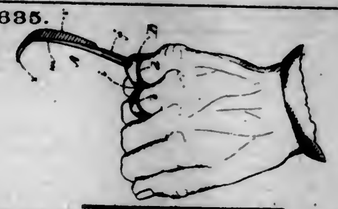
6. The combination, in a cushioned heel, of a plate, C, for attaching the shoe, a heel-case, A, connected movably with the plate C, interposed cushion and a guard, J, provided with inwardly-extending arms *e*, and a spring connected with said arms to contract the guard, substantially as set forth.

7. The combination of the plate C, socket-block D, having a flange, a nut, E, having a head and fitted to the socket-block, screw F, extending through the heel-case into the nut, and cushion interposed between the case and the plate C, substantially as set forth.

8. The combination, in a cushion-heel, of a plate, C, adapted to be connected with the shoe and having a downwardly-extending flange, *d*, a movable heel-case, A, having a recess, *r*, to receive the flange *d* and interposed cushion, substantially as set forth.

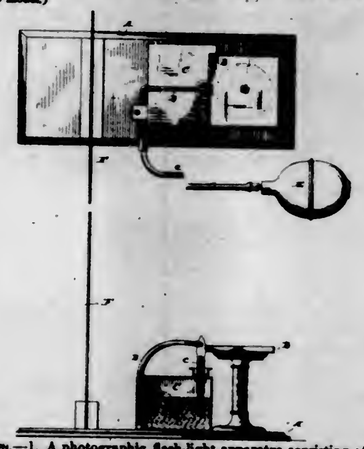
9. The combination, in a cushioned heel, of the case A, plate C, supporting a separate block, D, and a screw passing through the block and connecting with the case, substantially as described.

10. The combination of the case, plate C, separate block D, screw F, and nut, substantially as described.



11. The combination of the case, plate having a flange, *b*, springs G, and perforated pad B of elastic material, substantially as described.

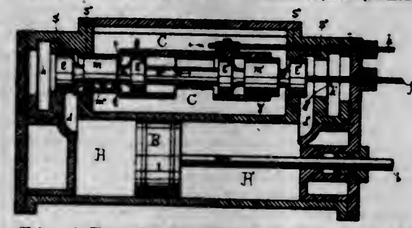
12. The combination of the case A, containing an elastic support, and the plate C, having projections *s*, substantially as described.



384,635. WEEDING-TOOL. CHARLES MAYNARD, Montague, Mass. Filed Mar. 16, 1883. Serial No. 267,203. (No model.)

Claim.—In a weeding-tool, the rings *b d*, arranged side by side and rigidly connected, said rings being adapted to fit adjacent fingers of the hand, in combination with the curved rod *f*, provided with the curved blade *v*, having the point *z*, said rod being rigidly secured at its inner end to one of said rings, substantially as set forth.

384,635.

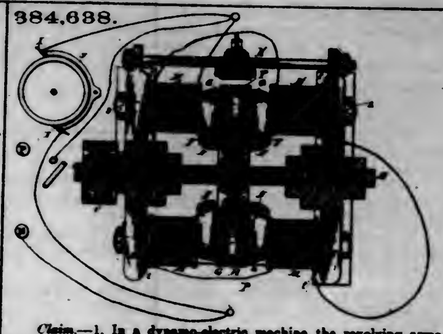


384,636. PHOTOGRAPHIC FLASH-LIGHT APPARATUS. THOMAS H. MCCOLLIN, Philadelphia, Pa. Filed Feb. 20, 1888. Serial No. 265,742. (No model.)

Claim.—1. A photographic flash-light apparatus consisting of a holder for flashing material, a lamp, an air-tube, and a pumping device connected to said air-tube, the burner of said lamp being located between said holder and said air-tube, said parts being combined substantially as and for the purpose set forth.

2. In a flash-light apparatus, the combination, with a receptacle for containing ignitible material, and a lamp or burner, of a pneumatic tube having its nozzle arranged above the burner and adjacent to the material, whereby the air in said tube is heated to a high degree and directed with the flame to the material, thus instantly igniting the same, substantially as described.

384,637. VALVE FOR STEAM-ENGINES. JOHN R. MCDYER, Auburn, N. Y. Filed May 20, 1887. Serial No. 238,295. (No model.)



Claim.—1. The combination, with the main valve consisting of the connected but separated disks c c^2 c^3 c' and the hollow cylindrical parts m and m', the former cylindrical part being between the disks c and c^2 and the latter between the disks c^2 and c', of the hollow cylindrical cut-off valve fitted to slide upon the said disks, and the cylindrical parts n and n', and of proper length to extend from the part m to the part m', substantially as shown and described.

2. The combination, with a main valve consisting of a series of connected disks and two hollow cylindrical parts, one near each end of the valve, of a hollow cylindrical cut-off valve supported interiorly upon the said main valve, and two separate and independently-operating rods, one for operating the main valve and the other for operating the cut-off valve, substantially as shown and described.

384,638. DYNAMO-ELECTRIC MACHINE. BENJ. OLIVER, Alpena, Mich. Filed June 2, 1887. Serial No. 240,093. (No model.)

384,638.

Claim.—1. In a dynamo-electric machine, the revolving armature-disk consisting of a skeleton wheel provided with a series of rectangular recesses, a series of generating-bobbins secured within said recesses, retaining-plates secured to the sides of the armature-core, an insulating-ring secured to the rim of the skeleton wheel, and commutator-strips secured to the face of the insulating-ring, all substantially as described.

2. In a dynamo-electric machine, the combination of a revolving armature-disk carrying a series of commutator-strips secured to the rim thereof, separately-removable generating-bobbins secured in rectangular recesses of the iron core of the armature-disk, sectional retaining-plates removably secured to the sides of the armature-disk, and a field-magnet consisting of separately adjustable and removable magnets provided with detachable pole-pieces and arranged in pairs upon opposite sides of the armature, substantially as described.

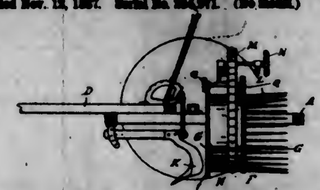
384,639. BUTTON-LOOP AND SAFETY-PIN. BELLE PRICHARDS, Islington, Mass. Filed Mar. 1, 1888. Serial No. 265,787. (No model.)

Claim.—1. In a combined button-loop and safety-pin, a metallic frame provided with an opening to form a button-loop, through which a button on a garment is adapted to be passed to secure the said loop to the garment, combined with a safety-pin permanently attached to the said metallic frame and adapted to remain inoperative or disengaged from the said garment while the button remains attached thereto, substantially as described.

2. In a combined button-loop and safety-pin, a metallic frame having a button-receiving and a button-holding eye separated by a contracted throat to form a button-loop, combined with a safety-pin permanently attached to the said frame and adapted to remain inoperative or disengaged from the said garment while the button remains attached thereto, substantially as described.

3. The combination, with a metallic button-loop consisting of a frame having independently-movable arms a', bent to form a contracted throat, and leaving an opposite oldes of said throat a button-receiving and a button-holding eye, of a safety-pin, substantially as described.

384,640. WATCH-CASE. ROBERT J. GRESLEY, Toronto, Ontario, Canada. Filed Feb. 9, 1888. Serial No. 263,672. (No model.)

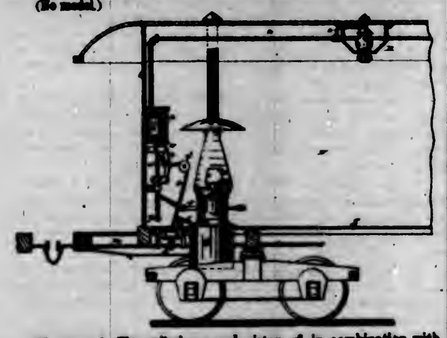


Claim.—1. In a watch-case, the combination of the following elements: a coster of greater width than the movement-ring and threaded on its interior circumference, a movement-ring screw-threaded on its periphery and screwed into the coster, and the back and bezel engaging the coster and permitting adjustment of the movement-ring, substantially as and for the purpose specified.

2. A watch-case having a thread cut in the interior circumference of its coster which is made sufficiently wide to receive the movement-

ring, and screwed projections a, formed on the back C and bezel D, in combination with divided or double movement-ring B, substantially as and for the purpose specified.

384,641. POTATO-DIGGER. ORRIN ROBBINS, Three Rivers, Mich. Filed Nov. 12, 1887. Serial No. 254,971. (No model.)



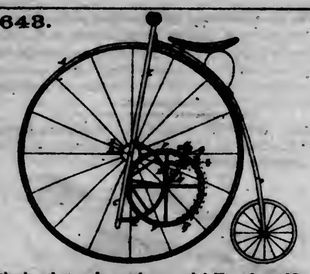
Claim.—1. The combination, with a revolving cage of a potato-digger, of circumferential bearings supporting said cage in position, a drive-chain passing around the head of the cage, and a sprocket-wheel on top of the cage, a hinged frame upon which said sprocket-wheel is journaled, and a lever for raising and lowering said hinged frame, substantially as described.

2. In a potato-digger, a revolving cage or drum, consisting of the annular head and of spring-tines secured thereto and projecting rearwardly from that head, with their rear ends free and having gradually-tapering enlarging interstices between the tines, substantially as described.

3. In a potato-digger, the combination of the drive-wheels, the frame supporting the parts, a scoop-plow provided with devices for independently raising and lowering it, a hinged frame, and a revolving drum supported on circumferential bearings or rollers, and provided with means for vertically adjusting it independent of the plow, substantially as described.

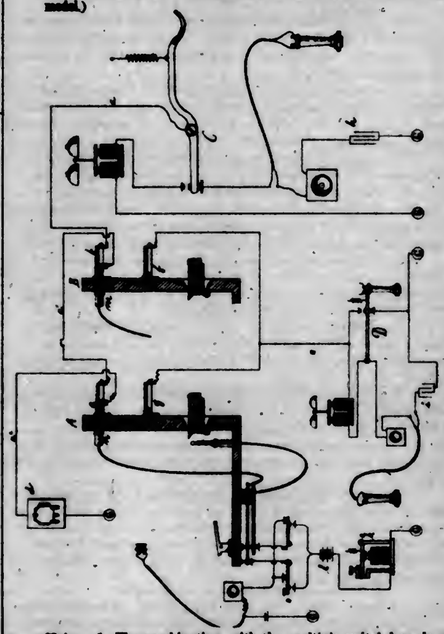
384,642. FIRE-EXTINGUISHER FOR CAR-HEATERS. GEORGE W. RAYMOND, Marshall, Mich. Filed Sept. 27, 1887. Serial No. 250,946. (No model.)

Claim.—1. The cylinder a and piston a', in combination with pipe n, extending from said cylinder to a lamp, a spring, c, which tends to actuate said piston and force air through said pipe, the piston-rod a', provided with a stud, a fixed stud, x, on the body of the car, a jointed bar, p, attached at its ends to said studs, and a chain and rod extending from said jointed bar to the next car, substantially as set forth.



2. A cylinder, piston, piston-rod, said pipe for conducting the expelled air to a lamp, in combination with a spring which tends to force said piston toward said pipe, a lever, k, which engages said rod to retract said piston against the tension of said spring, a device for holding said piston thus retracted, and a chain attached to said device to release it, for the purpose set forth.

3. The longitudinally-movable rod m, attached to one car and connected with a similar rod of another car, in combination with chains 1 and 2 and their pulleys, a hinged grate, a catch for holding said grate horizontal, released by said chains, a reservoir beneath said grate, an automatic air-forcing device for extinguishing lamps, and a bar for holding said air-forcing device out of operation, chain 2 being connected to said bar and serving to release said piston, substantially as set forth.

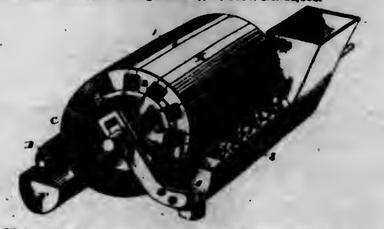


384,643. VELOCIPEDE. FRANCIS ROOKE, London, Ontario, Canada. Filed July 23, 1887. Serial No. 245,145. (No model.)

Claim.—The combination, with the wheel A, axle B, having a pinion, D, and the fork C, extended below the axle, of the bracket E, supported by the fork, an externally and internally cogged spur-wheel, F, journaled in said bracket, an upward-projecting bar, G, pivoted to the bracket and carrying a pedal, H, and pawl I, and a spring, J, having one end attached to the bracket E and the other end to the bar G, substantially as described.

384,643.

384,644. MULTIPLE SWITCH-BOARD TELEPHONE APPARATUS. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1884. Serial No. 151,362. (No model.)



Claim.—1. The combination, with the multiple switch-boards of a telephone-exchange, of telephone-lines connected therewith and each extending to a subscriber's station, a condenser permanently connected in the branch wire containing the telephone between the telephone and ground at each subscriber's station, a telephone-switch at each subscriber's station for bringing the telephone and condenser into the circuit of the line when the telephone is removed from the switch-lever, a battery and signaling instrument or sounder at the different switch-boards at the central office, and switching apparatus, whereby it may be determined at any of the boards whether the telephone of any station is on or off the switch.

2. A telephone-line extending from ground at a subscriber's station through a condenser and a telephone to a switch at said station and thence to the central office, said line being connected at the central office with a spring-jack switch on each of two or more switch-boards and thence to ground, in combination with a sounder or signaling device and battery in a ground-circuit at one of the switch-boards, and switching apparatus for connecting said ground-circuit with said telephone-line at the switch of said board, whereby it may be determined whether the line is open at the spring-jack of said line at any other of the boards, substantially as described.

3. The combination, with the bell, telephone-switch, and telephone at a subscriber's station, of a condenser included in the branch of the switch which includes the telephone, the telephone-line permanently

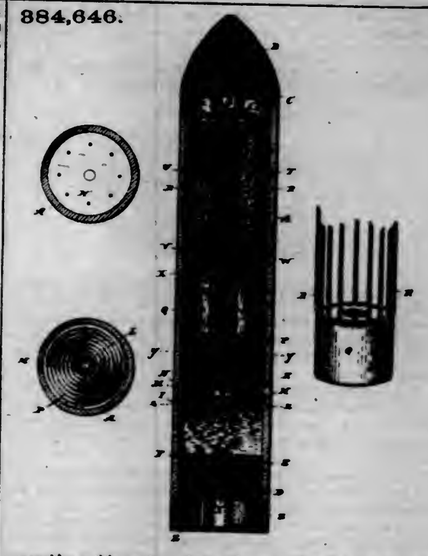
connected with the switch-lever and extending through a spring-jack on each of two or more multiple switch-boards at the subscriber's station, a sounder and battery in a normally-open ground-circuit at each of the switch-boards, and switching apparatus whereby the position of the switch at the subscriber's station may be determined, substantially as and for the purpose specified.

384,645. MAGNETIC SEPARATOR. M. HOLROYD SMITH, Halifax, County of York, England. Filed Oct. 20, 1887. Serial No. 252,705. (No model.) Patented in England Aug. 8, 1887. No. 12,022.

Claim.—1. In a magnetic separator, the combination of a magnetic cylinder and a trough provided with propellers, whereby the material to be separated is successively brought into contact with the cylinder, substantially as described.

2. In a magnetic separator, the combination of a rotating cylinder having its face made up of a series of magnets, a trough arranged along the face of the cylinder, and a series of propellers in said trough, substantially as described.

3. In a magnetic separator, the combination of a rotating cylinder the face of which is made up of electro-magnets, a trough arranged along the face of the cylinder and having a series of partitions, and a propeller-shaft carrying a series of vanes in said trough and operating to bring the material to be separated in successive contact with the magnets and propel it through the trough, substantially as described.



4. In a magnetic separator, the combination, with a magnetic cylinder, of a distributer-trough having propellers arrranged to bring the material repeatedly in contact with different portions of the magnetic cylinder, substantially as described.

5. In a magnetic separator, the combination of a rotating magnetic cylinder and a trough arranged along the surface thereof, the trough being hinged to the shaft of the cylinder, substantially as described.

6. In a magnetic separator, the combination of a rotating magnetic cylinder, a trough having propellers arranged parallel with the axle of the cylinder, supplying material thereto and causing it to traverse the face of the cylinder, and a brush arranged to discharge from the cylinder the iron extracted from the material, substantially as described.

7. In a magnetic separator, the combination, with a magnetic cylinder, of a trough arranged along the face thereof, the said trough being divided into compartments by partitions, the edges of which are cut away adjacent to the cylinder to admit of the passage of the material through the successive compartments and in contact with the cylinder, substantially as described.

384,646. SHELL FOR HIGH EXPLOSIVES. WILLIAM T. SMITH, Birmingham, Ala. Filed Mar. 3, 1888. Serial No. 266,544. (No model.)

Claim.—1. The combination, with a projectile, of an explosive movably mounted therein, an air-chamber at the rear of said explosive, and a liquid-containing chamber at the rear of said air-chamber, and having its front wall elastically connected with the front of the projectile.

2. The combination, with a projectile, of an explosive movably mounted therein, an air-chamber at the rear of said explosive, a liquid-containing chamber at the rear of said air-chamber, a chamber at the rear of said liquid-containing chamber containing a vacuum and formed on its top with an aperture opening communication therewith from the liquid-containing chamber, and a plug normally closing the said aperture.

3. The combination, with a projectile, of an explosive movably mounted therein and inclosed between flexible air-containing chambers, and a series of flexible tubes connecting the said chambers.

4. The combination, with a projectile and an explosive charge located therein, of air-cushions to either side of the said charge, a liquid-containing chamber behind the lower air-cushion, and a vacuum-chamber behind the liquid-containing chamber and having a perforation, and a plug normally closing said perforation and adapted to be displaced by the shock consequent upon the projectile forcibly leaving the gun.

5. The combination, with a projectile and the charge movably mounted therein, of an air-chamber at the rear of said charge, having a movable partition or base-plate at the rear end, and springs connecting the said partition with the front of the projectile.

6. The combination, with a projectile and the charge movably mounted therein, of an air-chamber at the rear of said charge, a liquid-containing chamber at the rear of said air-chamber, and a movable partition dividing said chambers, and a vacuum-chamber at the rear of said liquid-containing chamber and normally separated therefrom by a plug adapted to be displaced by the shock imparted to the projectile in firing the gun.

7. The combination, with a projectile and the charge movably mounted therein, of an air-chamber at the rear of said charge, a movable partition beneath the said charge, and layers consisting of an elastic, felt and hair, and another elastic between the said charge and movable partition.

8. The combination, with a projectile provided with partitions dividing the shell into compartments, of a yielding connection between two of the partitions, said yielding connection passing through the charge and its mountings and firmly yet yieldingly holding them in place.

9. The combination, with the projectile and the charge mounted therein, of an air-cushion at the rear of said charge, and a movable partition at the rear of said air-chamber and having yielding connection with the front of the projectile.

10. The combination, with a projectile and the charge, of an air-cushion supporting the said charge, an elastic packing at the rear of said cushion, a fluid-containing chamber at the rear of said packing, a movable partition between the said packing and fluid-containing chamber, a vacuum-chamber the front wall of which is formed with a perforation, and a plug normally closing said perforation.

11. The combination, with the projectile and its charge movably mounted therein, a movable partition at the rear of said charge, springs connecting the said partition with the front of the projectile, and a tube surrounding the said springs, whereby the same will not come into contact with the charge.

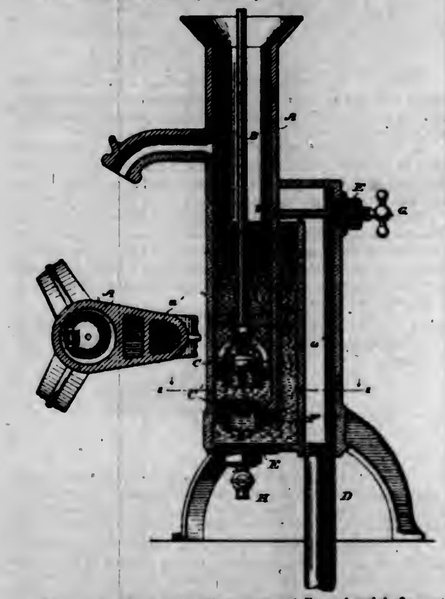
12. The combination, with the projectile and the charge, of air-cushions at the front and rear of said charge, flexible tubes connecting the said cushions, and a movable partition at the rear of the lower air-cushion and having elastic connection with the front of the projectile.

13. The combination, with the projectile and the charge, of air-cushions at the front and rear of said charge, flexible tubes connecting the said cushions, movable partition at the rear of the lower air-cushion having elastic connection with the front of the projectile, and an elastic packing between the said movable partition and air-cushion.

14. The combination, with the projectile and the charge, of a wool packing surrounding the charge, air-cushions at the front and rear of the said charge, flexible tubes connecting the said air-cushions, movable partition at the rear of the lower air-cushion, spring connecting the said partition with the front of the projectile, and a flexible tube surrounding the said spring.

15. The combination, with the projectile, charge, air-cushions at either side of said charge, flexible tubes connecting said air-cushions, and an elastic packing immediately to the rear of the lower air-cushion, of a fluid-containing chamber to the rear of said packing, a movable partition dividing the said chamber and packing, spring connecting the said partition with the front of the projectile, flexible tube surrounding the said spring, a vacuum-chamber at the rear of the fluid-containing chamber and having a perforation in its front wall, and a plug normally closing the said perforation.

16. The combination, with a projectile and the charge movably mounted therein, of an air-chamber at the rear of said charge, a movable partition at the rear of said air-chamber, and having elastic connection with the front of the projectile, and layers consisting of an elastic, felt and hair, and another elastic between the said charge and movable partition.

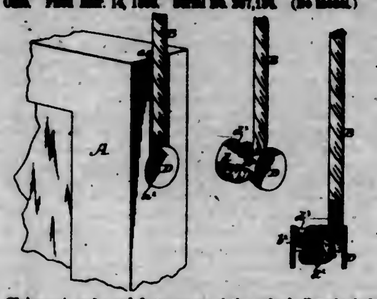


384,647. SPRING ATTACHMENT FOR ROCKING-CHAIRS. ADDIS B. SEVERS, New Bridge, N. J., assignor, by mesne assignments, to the Rocker Spring Company, Chicago, Ill. Filed Jan. 26, 1888. Serial No. 262,033. (No model.)

Claim.—1. The combination of the bracket-bases, the spiral spring, the spring-receiving portions *b'*, having sockets *f*, the laterally-projecting arms *b* of the bracket-bases, and a pin or its described equivalent to unite them, substantially as described.

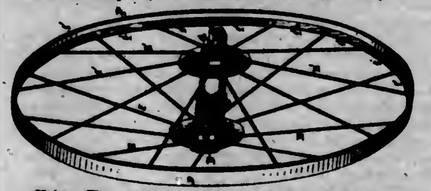
2. A bracket for spring attachments for base-rockers, having an arm thicker on one side than the other—that is to say, with its bottom beveled or inclined—in combination with the detachable spring-retaining member to give the latter a cant to compensate for the spirality of the spring, substantially as described.

384,648. PUMP. JOHN STEVENS, Neenah, Wis. Filed Feb. 1, 1888. Serial No. 263,712. (No model.)



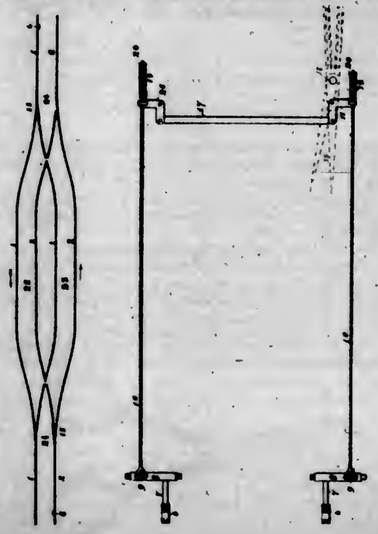
Claim.—1. The combination, substantially as hereinbefore set forth, of a pump-barrel, a siphon supply-pipe the shorter leg of which communicates with the bottom of said barrel beneath the lower valve, an air-duct between the chamber of said barrel and the upper part of the siphon, and a stop-cock to positively close said duct against the passage of air, whereby the pump may be reprimed.

2. The combination, substantially as hereinbefore set forth, of a pump-barrel, a siphon supply-pipe the shorter leg of which communicates with the bottom of the barrel, an air-duct between said barrel and the upper bend of the siphon, a stop-cock to positively shut off the communication of air between the two through said duct, and a discharge-cock at the foot of the shorter leg of said siphon.



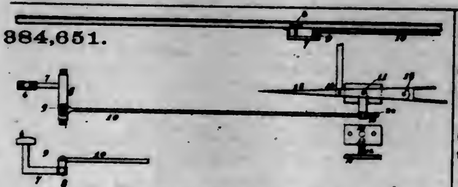
3. The combination, substantially as hereinbefore set forth, with the pump-barrel and two siphon-conduits cast integrally therewith and having the flaring aperture in the dividing-wall between the barrel and upper bend of the siphon, of the beveled screw-plug or cock for closing said aperture at will.

384,649. SASH-CORD FASTENER. LOUIS STRASSER, Columbus, Ohio. Filed Mar. 14, 1888. Serial No. 267,194. (No model.)



Claim.—A sash-cord fastener consisting of a hollow body having closed ends, perforations d^3 in the side for the passage of a cord, and a diametrically-located pin, substantially as and for the purpose described.

384,650. VEHICLE-WHEEL. JOHN V. STERLING, Westminster, S. C. Filed Sept. 15, 1887. Serial No. 249,742. (No model.)



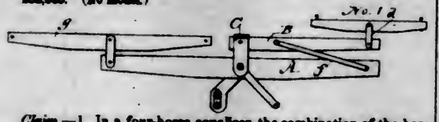
Claim.—The combination of the hub or sleeve B, having a shoulder, *b*, the sleeve B', threaded on the exterior and temporarily secured to the point-band D by a pin, the set-screw *b'*, the sand-band G, the disks C C', the suspension-rods E E', secured to the disks, and the ribbed tire F.

384,651. AUTOMATIC SWITCH FOR RAILROADS. JAMES M. SWAN, Denver, Colo., assignor to the Swan Automatic Switch Company, same place. Filed Nov. 4, 1887. Serial No. 254,357. (No model.)

884,651.

Claim.—1. The combination of a switch-point, the bell-crank lever, pivoted as described, the three-sided lever and pivoted bar, the connecting-rod and spring, and adjusting-nut upon the extension of the connecting-rod, substantially as set forth.

2. The combination of the main rail of a track deflected outwardly at or near the switching-point, an interior guard-rail at such point of enlarged gage, a head or lug of a lever projecting between the main and guard rails at such point, and adapted to be acted on by a passing wheel, and switching mechanism, substantially such as described, controlled thereby, substantially as set forth.



3. The combination of the main rail of a track, a guard-rail at or near a switching-point, a bed-plate common to both rails, a three-sided lever having its outer end projecting as a head or lug through such bed-plate and between the main and guard rails, a switch-point, a bell-crank lever pivoted thereto, and a rod connecting the two levers, substantially as set forth.

4. The combination of a main rail deflected outwardly at or near a switching-point, an interior guard-rail therout, a bed-plate common to both rails, a three-sided lever, as described, having its head projecting upwardly through such bed-plate and between the main and guard rails, and adapted to be acted on by a passing wheel, a switch-tongue, a bell-crank lever pivoted thereto, and a rod connecting the two levers, substantially as set forth.

5. The combination of the main rail of a track deflected outwardly near a switching-point, interior guard-rails therout, and duplicate switching mechanisms, one on either side, each consisting of a three-sided lever, as described, having a head projecting upwardly between the main and guard rails, and adapted to be acted on by a passing wheel, rods connected thereto at one end and at the other to one arm of a double bell-crank lever, the latter being connected by its central arm to the switch-point, and the single switch-point, substantially as set forth.

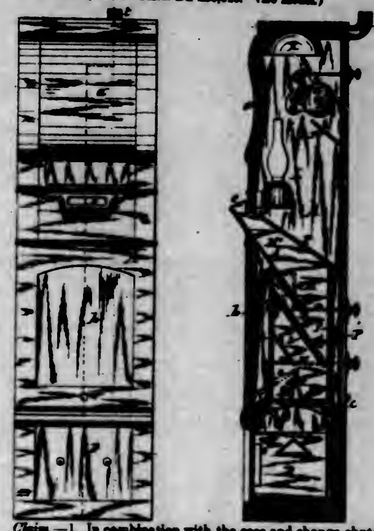
6. The combination of the main rail of a track, an interior guard-rail, the right-angled lever 7, having head 6 projecting upwardly between such rails, pivoted bar 8, to which lever 7 is attached, having upright arm 9, the bell-crank lever 11, pivoted at its angle to a fixed base, and at one end to the switch-point and at the other to the connecting-rod 10, the connecting-rod pivoted to the arm 9 and lever 11, and the switch-point, all arranged and operating substantially as set forth.

884,652. FOUR-HORSE EQUALIZER. JAMES A. M. TYLER and JAMES S. THOMAS, Plum Creek, Nebr. Filed Oct. 14, 1887. Serial No. 252,389. (No model.)

Claim.—1. In a four-horse equalizer, the combination of the bars A and B, the yoke C, and metal straps *f*, substantially as shown and described, for the purposes stated.

2. The adjustable coupling device consisting of the plate *m*, hinge-iron *n*, and straps *r*, in combination with the bar A, substantially as and for the purposes stated.

3. In a four-horse equalizer, the combination of the bars A and B, the yoke C, and metal straps *f*, and a singletree, and a three-horse evener composed of a bar, *g*, two levers, *h*, two clevises, *i*, two bars, *k*, and three singletrees, arranged and combined to operate in the manner set forth, for the purposes stated.

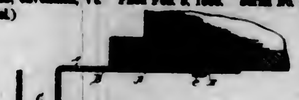


884,653. BUTTON-HOLE CUTTER. WILLIAM P. VROOMAN, Fremont, Ohio. Filed Sept. 29, 1887. Serial No. 251,047. (No model.)

Claim.—1. The combination, with a pair of button-hole cutters, of a stop adjustably attached to one of the handles thereof and movable lengthwise of the said handle, said stop being provided with a set-screw, by which it is positively retained in adjusted positions, and being also provided with a projecting portion extending toward the handle opposite that to which it is attached, substantially as set forth.

2. The combination, with a pair of button-hole cutters, of the head C, having overlapping perforated ends, the stop-block D, having a threaded hole, and the set-screw E, substantially as set forth.

884,654. FARE-BOX CHUTE. WALTER S. WALSH, Syracuse, N. Y. Filed Feb. 6, 1887. Serial No. 226,615. (No model.)



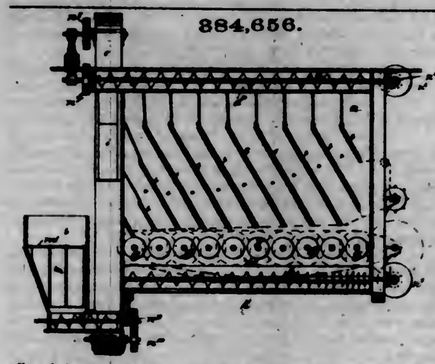
Claim.—1. In combination with the case and change-chute inside thereof, and both provided with transparent fronts, a transparent gate across the interior of the change-chute, and a reflector back of said gate, substantially as and for the purpose set forth.

2. In combination with the case and change-chute inside thereof, and both provided with transparent fronts, a transparent gate across the interior of the change-chute, a reflector back of said gate, and a lamp above the change-chute, substantially as set forth and shown.

3. In combination with the case and change-chute inside thereof, and both provided with transparent fronts, a transparent gate across the interior of the change-chute, a reflector back of said gate, a transparent plate across the top of the change-chute, a lamp in the case above the change-chute, and a reflector above the lamp, substantially as described and shown.

884,655. LINK AND PIN HOLDER FOR CARS. CHARLES L. WARD, Cavendish, Vt. Filed Feb. 3, 1888. Serial No. 262,493. (No model.)

Claim.—1. A coupling-link and coupling-pin holder consisting of a metal strap secured to the end of the car at a proper point by a bolt, and having an opening, D, to receive the pin, and with its free end formed into a hook, C, upon which to hang the link.



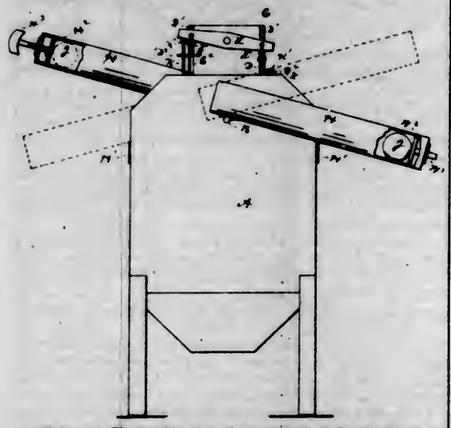
2. The herein-described coupling-link and coupling-pin holder, consisting of the hook C and the plate portion or shank B, having the coupling-pin opening D and the bolt-opening E, and separated from the hook by the lateral shoulders *b b*, substantially as described.

884,656. MACHINE FOR MIXING FLOUR. REINHARD A. WEBER and JOHANN G. ZEISLER, Gratz, Germany. Filed Nov. 6, 1886. Serial No. 218,142. (No model.)

Claim.—1. In flour-mixing machines, the combination, in a chamber, of a series of inclined plates, *f f*, with a series of rollers, *g g*, under said plates, the said rollers being journaled in a substantially horizontal plane, and with their axes parallel to the plane of the plates.

2. The combination, in a chamber, of a series of inclined plates, *f f*, with a series of rollers forming a floor below said plates, the said

884,656.



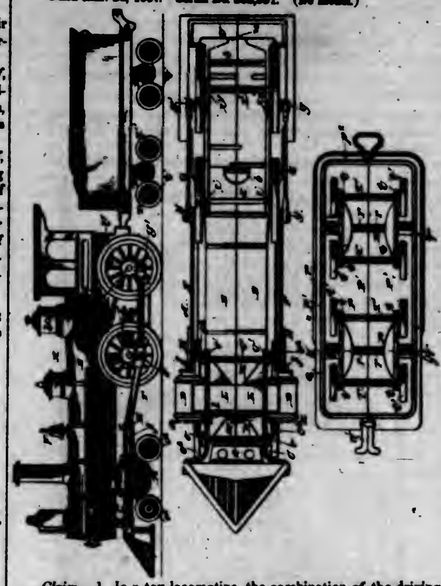
rollers being journaled in a substantially horizontal plane with their axes parallel to said plates, together with vertically-adjustable bearings for alternate rollers, for the purpose set forth.

3. The combination, as set forth, of adjustably-inclined plates *f f*, a horizontal roller-bottom, *g g*, below said plates, the axes of the rollers being parallel to the plane of said plates, spirals *d* above said plates, and spirals *h* under said roller-bottom, the feed-direction of said spirals *d h* being in a direction crosswise of the axes of the rollers.

4. The combination, as set forth, of adjustably-inclined plates *f f*, a horizontal roller-bottom, *g g*, thereunder, the axes of the rollers being parallel to the plane of said plates, means for rendering the axes of alternate rollers vertically adjustable, troughs *d'*, with perforated bottoms *d²* above said plates, spirals *d* in said troughs *d'*, and spirals *h* under said roller-bottom, the feed-direction of said spirals being crosswise of the axes of said rollers, troughs *h'* for said spirals *h*, and shed *h²*, dividing said troughs, the said spirals *h* having increasing pitch and decreasing conical axles in the direction of their feed.

884,657. AUTOMATIC WEIGHING-MACHINE FOR GRAIN. DE WITT WISE, Tampico, Ill. Filed Oct. 31, 1887. Serial No. 253,894. (No model.)

Claim.—1. The combination of the rock-shaft B, suitably journaled in the frame A, hollow levers H, attached at one end to said shaft and projected, respectively, in opposite directions therefrom, movable weights J, placed within said levers H and respectively adapted to roll to and from shaft B from opposite sides of the latter alternately, beams E, attached centrally to said shaft, and buckets F, pivotally attached to said beams at opposite sides, respectively, of said shaft, substantially as shown, and for the purpose described.



2. The combination of the rock-shaft B, suitably journaled in the frame A, weight-levers H, attached to said shaft and projected therefrom in opposite directions perpendicular thereto, adjustable weights J, stops H', beams E, attached to said shaft, buckets F, suspended to said beams, receiving-box C, provided with discharge-port C², gates D, rods K, walking-beams L, and links L', substantially as shown, and for the purpose described.

3. The buckets F, adapted to receive and discharge grain, consisting of the halves F', pivotally suspended from a common point and provided on their exteriors, respectively, with diagonal flanges M, the frame A, provided with triangular cam N, and the spring G, substantially as shown, and for the purpose described.

4. The combination of the rock-shaft B, suitably journaled in the frame A, hollow levers H, attached at one end to said shaft and projected, respectively, in opposite directions therefrom, movable weights J, placed within said levers H and adapted, respectively, to roll to and from shaft B from opposite sides of the latter alternately, and buckets F, suitably suspended upon said shaft on opposite sides thereof, respectively, substantially as shown, and for the purpose specified.

5. The combination of the rock-shaft B, suitably journaled in the frame A, hollow levers H, attached at one end to said shaft and projected, respectively, in opposite directions therefrom, movable weights J, placed within said levers H and adapted, respectively, to roll to and from shaft B from opposite sides of the latter alternately, buckets F, suitably suspended upon said shaft on opposite sides thereof, respectively, and means, substantially as shown, for admitting grain to and discharging it from said buckets, for the purpose described.

884,658. TOY LOCOMOTIVE. JAMES S. WHEELER, Jr., Keene, N. H. Filed Mar. 26, 1887. Serial No. 232,501. (No model.)

Claim.—1. In a toy locomotive, the combination of the driving-wheels, the cylinder, the fixed guide in rear of the cylinder, having the horizontal longitudinal slot *e*, and the connecting-rod connected with the driving-wheels, and having its front end curved and extended through the slot *e*, and provided with a vertical cross-head, *f*, bearing against one side of the guide, substantially as described.

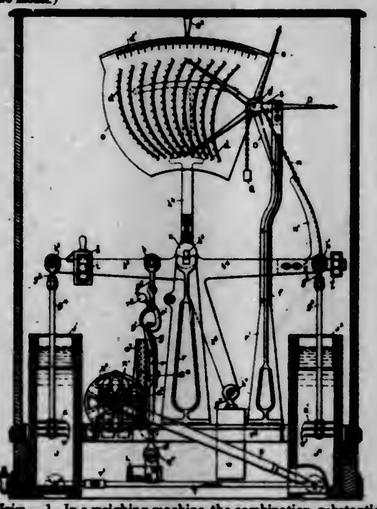
2. In a toy locomotive, the combination of a cylinder having a longitudinally-slotted guide extending rearwardly therefrom, the front and rear driving-wheels, each having the crank-pins, the front connecting-rod pivoted to the crank-pin of the front driving-wheel, and having its front end curved and extended through the slot in the guide, and provided with a cross-head, *f*, bearing against one side of the guide, and the rear connecting-rod connected at its ends to the crank-pins on the front and rear driving-wheels, as and for the purpose described.

3. In a toy locomotive, the divided truck having the supporting-wheels, both sections of the truck being pivoted to the body of the locomotive and adapted to turn or swing independently in a longitudinal direction, as set forth.

4. In a toy locomotive, the divided truck having the supporting-wheels, each section of the truck carrying a front and a rear wheel, and said sections being pivoted to the body of the locomotive, so as to have an independent movement, as set forth.

5. A toy locomotive formed of two sections secured together and having fixed aligned bearings on its under side, the transverse shaft fitted rigidly in the bearings, and the oscillating divided truck journaled on the said shaft, and each section of the truck carrying the front and rear wheels, whereby said truck-sections are caused to act independently, as set forth.

6. In a toy locomotive, the combination, with a transverse shaft or rod supported beneath the boiler at the front end thereof, of a swinging truck having the bearings in its lower side and pivoted upon the shaft or rod, and the axles fitted in the bearings and carrying the supporting-wheels, as and for the purpose described.



7. A toy locomotive having the depending flange at its rear side provided with the vertical central open slot, in combination with the tender having the integral forward-projecting arm U', provided with the T-shaped head at its front end to engage the slotted flange of the locomotive and couple the tender thereto, substantially as described.

8. A tender for locomotives formed of two longitudinal sections bolted together, embodying the T-headed hook U' at its front end, one portion of the hook being carried by each section of the tender, so that when the sections are connected together a complete hook, U', is formed, as set forth.

9. A toy locomotive formed of two longitudinal sections secured together and having fixed aligned bearings on its under side, the transverse shaft fitted rigidly at its ends in the bearings of the sections, and the oscillating trucks journaled on the transverse shaft A between the said bearings and carrying the supporting-wheels, whereby the trucks are enabled to swing or oscillate longitudinally, as set forth.

10. A toy locomotive formed of two longitudinal sections, B, placed in alignment with each other and secured together, and a bell-frame having the depending headed stud provided with an annular flange to receive the proximate edges of the sections, as and for the purpose described.

384,659. WEIGHING-MACHINE. ROBERT WILSON, Liverpool, County of Lancaster, England. Filed Nov. 6, 1886. Serial No. 218,179. (No model.)

Claim.—1. In a weighing-machine, the combination, substantially such as described, of metal corner-box brackets B^3, with the wooden dovetailed sides B^4, and plates B^5, let into the said brackets and secured with bolts to the same, substantially as shown, whereby a considerable amount of metal is saved.

2. In a weighing-machine substantially such as shown, the combination, with the levers C C', of the platform resting thereon, the links c^3, in which said levers rest, and a rod, c^4, connecting said links.

3. In a weighing-machine, the combination of a diagonal lever, C, having its respective arm L_1 provided with a hollow arm, C^2, capable on the pattern of being placed at any point on the said arm L_1, and fitted with a muff, C^3, a knife-edge, E^3, fitted within on the bottom side of the said muff and fixed to the said arm C^2 by an adjusting device, C^7, at any desired position, whereby machines of different lengths can be supplied with levers to suit them, all cast from the same patterns.

4. In a weighing-machine substantially such as shown, the combination, with the arm L_1 of the arms L_1 and L^2, (the latter being placed centrally on the hanger-shaped ends G,) knife-edges c' and c^2, located on opposite sides of the arm L^2, and stays L^3, L^4, and L^5, connecting the arms L_1 and L^2, substantially as shown.

5. In a weighing-machine, the combination of a minor lever, C', having its arm L^2 capable of being made shorter or longer to suit different lengths of machines, and provided with a hollow extension, C^2, and a muff, C^3, having a knife-edge, c^2, fitted within on the top side of the said muff, and an adjusting device, C^7, whereby the muff C^3 can be fixed in any desired position to adapt itself to the adjustment of the levers.

6. In combination with the major lever C, comprising arms L_1 and L^2 and braces L^3 L^4 L^5, the minor lever C', comprising similar arms, L^7 L^8, and similar braces, L^9 L^{10} L^{11}, the parts of the minor lever corresponding but opposite in arrangement to the parts of the major lever.

7. The combination, with the platform of a weighing-machine, of an indicator-lever having arms h^2 h^4, the knife-edges h' and h^3, and the pistons K and K', formed of a number of plates a little apart from each other, suspended from the knife-edges and working in the plunger-boxes J and J^2, filled with liquid, whereby the liquid forms a sort of hydraulic packing and a slow and steady motion is insured, substantially as and for the purpose described.

8. In a weighing-machine, the combination, with the platform and the dash-pots, of the lever H, provided with an indicator-plate and with dash-pot arms h^2 h^4, a pointer adapted for use in connection with the indicator-plate, an indicator-wheel, and weights I and I', applied to the arms h^2 h^4, all substantially as shown, whereby the arms h^2 h^4 may be used to take the tare instead of having an independent arm therefor.

9. The combination, with the lever H, having laterally-extending arms h^2 and h^4 and vertical arm h^5, of a dial, D, secured to arm h^5, and provided with indicator-scales d' and d, and indicator O, placed to one side of the dial-plate, whereby the main weights can be read off on a scale placed centrally and horizontally, and the smaller weights on another scale placed centrally and vertically.

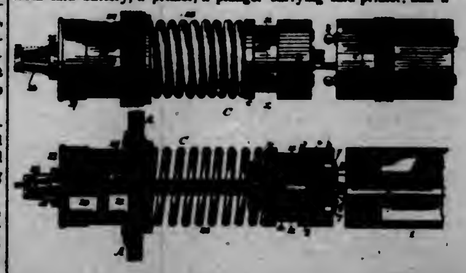
10. In a weighing-machine, substantially as described, the combination, with the platform and the lever H and its indicator, of the pistons K K', carried by the lever H, and the plunger-boxes J and J^2, having box-formed covers J' and J^2, provided with holes to allow the piston-rods to pass through, whereby the liquid in the plunger-boxes is steadied and cushioned when the movements of the different parts of the indicator take place, thereby avoiding jars and concussions.

11. In a weighing-machine, the combination, with the platform and the lever H, connected therewith and provided with pistons K K', of the plunger-boxes J J^2, and a pipe, T, connecting the boxes and provided with a valve.

12. In combination with the suspension-rod G^2 of a weighing-machine, a shaft, E', provided with a handle, R, and cam-wheel R^3, a shaft, G^3, provided with a pinion, G^4, and with a wheel, R^4, to be actuated by the wheel R^3, and a rack, G^5, adapted to be engaged by wheel G^4, and provided with a bracket, G^6, to engage the rod G^2.

13. In combination with the suspension-rod G^2 of a weighing-machine, a projection or shoulder, *r*, formed thereon, and an adjustable bracket, G^2, adapted to engage said shoulder and to receive the weight of the platform.

14. In combination with the suspension-rod G^2 of a weighing-machine, a shackle, *g*, a hook, *r'*, adapted to engage the hook, a projection, *r*, upon the rod G^2, a guard, *g'*, and a bracket or stop, G^6, adapted to engage the projection *r*.



15. In combination with the suspension-rod G^2 of a weighing-machine, a bracket, G^2, adapted to engage the same, shackle *g*, provided with foot f^2, guard-link *g'*, and a pivoted balance-hook, *r'*, adapted to engage the shackle *g*.

16. In combination with the lever-arm h^2 and the rod g^2, a knife-edge, *h*, upon the lever-arm, a shackle, g^2, suspended therefrom, guard-link *g'*, carried by the shackle g^2, balanced pivoted hook *r'*, and a shackle, *g*, carried by the arm G^2.

384,660. SHELL. EDWARD I. ZALINSKI, U. S. ARMY. Filed Oct. 26, 1887. Serial No. 253,207. (No model.)

Claim.—1. In a shell, an electric battery, metallic connections from said battery to a primer of the character described, and a plunger connected to the primer operated by gas-pressure in the bore of the gun when the gun is discharged to hold the primer out of circuit with the battery while the projectile is in the gun.

2. In a shell, an electric battery, a metallic connection extending from said battery, a primer, a plunger carrying said primer, and a

detent which holds the primer out of circuit until released by the action of the gas-pressure in the gun.

3. In a shell, an electric battery, a primer in circuit to be ignited thereby, and an adjustable column of slow-burning compound connecting said primer with the explosive charge.

4. In a shell having an electric fuse, a circuit-breaker having a movable plunger, a piston on said plunger, and a cylinder containing said piston to which cylinder gas is admitted to force back the plunger, as set forth.

5. In a shell, an electric battery, metallic connections therefrom, a spring-plunger carrying primers having a path of movement toward the battery-connections, and a detent for said plunger, which detent is released by the gas-pressure in the bore of the gun when the piece is discharged.

6. An explosive shell, an electric fuse therefor, a metallic connection from said fuse to a front insulated portion of the shell, and a collapsible shield or point in metallic connection with the body of the shell, whereby the collapse of the point will close circuit, as set forth.

7. A shell having an inclosed weighting piece of easily-fusible metal near the front thereof and extending across the front of a charge of high explosive, substantially as described.

8. In a shell, the combination, with a plunger provided with a mechanism for forcing the same forward to close circuit, of a plurality of primers carried by said plunger, and separate batteries having connections in position to close circuit with each of the primers.

9. In a shell, a plunger carrying a plurality of primers, separate battery-connections to each primer, and a single electric connection whereby all the circuits are grounded in the wall of the shell, all in combination, substantially as described.

10. In a shell-fuse, the combination, with a battery inclosed in a casing, of a plurality of partitions between the battery and outer opening in the casing, said partitions having perforations out of line with each other, as set forth.

11. In a shell-fuse, an electric battery provided with a perforated partition, a cover outside of said partition, and retaining-catches for said cover adapted for release by the gas-pressure in the gun.

12. In a shell having an electric fuse, a detachable circuit-breaker which moves a primer carried thereby into circuit with the battery, and a detonator in position to be ignited from the primer, said detonator removably attached to the circuit-breaker, in combination substantially as described.

13. In a shell of the character described, a circuit-breaker in position to move and close the electric circuit, a primer and a detonator, and a delay-action fuse having a connection with the circuit-breaker interposed between the primer and detonator, all combined as stated.

14. In a shell having an electric fuse, an electric battery and a primer, and suitable electric connections between the same, substantially as described, a spring circuit breaker and closer, the spring tending normally to close circuit between the battery and primer, but being forced back by the gas from the propelling charge while under such pressure in the gun, the combination being and operating substantially as described.

15. In a shell having an electric fuse, a circuit breaking and closing plunger, a spring for forcing the same to closed position, a detent operating to hold the spring compressed, and connections to the gas charge, whereby the plunger is held back against the spring-pressure while the projectile is in the gun, substantially as described.

16. In a shell having a fuse containing a chemical which will be thrown into chemical action by the entrance of water, a cover for said fuse, a holder on the shell retaining said cover in place while the shell is in the gun, and mechanism connected with the shell for automatically opening the cover after the shell leaves the gun, combined substantially as described.

17. A shell having a fuse containing a chemical which is made active by the entrance of water, a cover for said fuse, and mechanism on the shell for rupturing said cover by impact with water.

18. The combination, in a shell-fuse and connected to the primer thereof, of a sensitized and a non-sensitized battery, the latter forming part of the circuit of the former, as set forth.

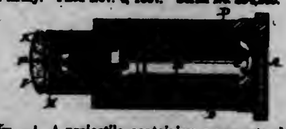
19. In a shell-fuse, a metallic casing having a plurality of electric batteries or cells inclosed, one cell or battery being non-sensitized, but adapted to be thrown into operation by the entrance of water, said non-sensitized battery forming part of the circuit and until made active serving as a circuit-breaker to the other batteries or cells.

384,660.

384,661. SHELL FOR HIGH EXPLOSIVES. EDWARD I. ZALINSKI, U. S. Army. Filed Oct. 31, 1887. Serial No. 253,891. (No model.)

Claim.—1. In a projectile, a cylindrical core-section of high explosive, such as dynamite, an absorbent covering for the same, a surrounding annular body of less sensitive explosive, such as nitro-gelatine, an absorbent covering therefor, and an outer casing forming the body of the projectile, all in combination substantially as described.

2. In a projectile, the combination of a casing, an absorbent envelope containing an alkali, and an inclosed explosive charge of nitro-gelatine or similar high-explosive compound, substantially as described.



3. In a projectile, the combination of a central core, such as dynamite, an envelope for the same containing an alkali, an explosive compound, such as nitro-gelatine, surrounding said envelope, and an inclosing-casing for the same forming the body of the projectile, whereby the explosive compounds are divided by an absorbent and acid-neutralizing partition, all substantially as stated.

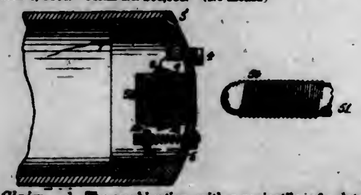
4. In a projectile, the combination of a central core of dynamite or similar high explosive, a surrounding body of nitro-gelatine or similar high explosive of a less sensitive character, a covering of asbestus, and an outer casing constituting the body of the shell, whereby the more sensitive compound at the center is protected from the outside influence of concussion and conducted heat, substantially as described.

5. In a shell or torpedo, a charge of high explosive, consisting of a sensitive core, a surrounding body of a less sensitive explodent, and a front section of a still less sensitive character, and a detonator at the rear of the charge, all combined substantially as stated.

6. A shell or torpedo having a charge of high explosive more sensitive at the center, a rear fuse for firing said explosive, and a buffer interposed between the front of the explosive and shell-casing to prevent explosion of the charge by its own impact, as set forth.

384,662. MAGNETO-ELECTRIC FUSE. EDWARD I. ZALINSKI, U. S. Army. Filed Nov. 4, 1887. Serial No. 254,303. (No model.)

Claim.—1. A projectile containing a magneto-electric fuse consisting, essentially, of a magnet and armature movable relatively to each other and an electric circuit closing through a primer, said circuit being closed by the release of the armature from the magnet, the combination being and operating substantially as described.



2. In a shell-fuse, the combination of a coil and magnet and armature movable relatively to each other, and conductors leading from the magnet to an electric primer in the shell.

3. In a shell-fuse, the combination of a coil and magnet, an armature, and a projecting spindle in position to separate the armature and magnet, substantially as described.

4. The combination, in a shell-fuse, of a magnet and a coil of wire in proximity to the same, an electric primer connected to the coil, and an armature acting as a plunger held to the magnet by the magnetic attraction but detached by concussion, as set forth.

5. In combination with the usual elements of a shell-fuse, a detonating-plunger held in position in the shell away from the detonator by magnetic attraction, but in position to be detached and permitted to act as a striker when the shell strikes, as set forth.

384,668. PROJECTILE. EDWARD I. ZALINSKI, U. S. ARMY. Filed Jan. 6, 1888. Serial No. 260,006. (No model.)

Claim.—1. The combination, with a projectile, of a detachable guiding-spindle, and a fuse or primer having an operating-trigger in position to be engaged by said spindle, substantially as described.

2. The combination, with a shell, of a detachable guiding-spindle,

and *d* percussion-detonator in the shell and connected with said spindle.

3. The combination, with a shell, of a detachable guiding-spindle, a detent engaged thereby, and a percussion-detonator held in cocked position by said detent.

4. The combination, with a shell, of a detachable guiding-spindle, a detent or trigger engaged thereby, and a spring-actuated detonator wherein the spring is held under compression by said detent, but released to fire the charge when the guiding-spindle is detached, as set forth.

384,664. SHELL-FUSE. REUBEN L. SALISBURY, U. S. ARMY. Filed Jan. 10, 1888. Serial No. 260,314. (No model.)

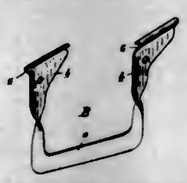
Claim.—1. The combination, with an explosive shell, of a fuse entering the base thereof, said fuse provided with a sharp-edged ring which finds a seat against the base of the shell and serves as a gas-check, substantially as described.

2. In a shell-fuse, a casing consisting of two parts, one part slightly movable longitudinally relatively to the other under the pressure of the firing-charge in the gun, and a ring in one section closing into a groove in the other to serve as a gas-check, the combination being and operating substantially as described.

3. In a shell-fuse, a two-part casing, one of the parts being slightly movable in a longitudinal direction relatively to the other under the pressure of the gas in the gun, and a gas-check covering the joint between the sections, in combination, substantially as described.

4. In a shell-fuse, a casing having a time composition inclosed therein, a portion of the casing covering said composition being movable relatively to the other part, so as to compress the composition while under the pressure of the firing-charge in the gun.

5. The combination, in a shell-fuse, of a casing having a groove in which a slow-burning composition is placed, and a movable section to said casing having a projection corresponding to said groove, whereby the pressure of the firing-charge against the movable section compresses the same onto the composition, as set forth.

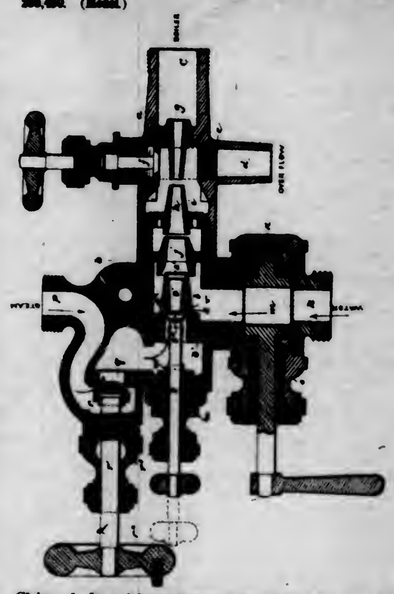


6. In a shell-fuse, the combination of the inclosing-casing, the time-charge of slow-burning compound, and a separate inclosing-envelope for the latter consisting of asbestus or equivalent non-combustible and slow-conducting material, substantially as described.

7. In a shell-fuse, the combination of an electric primer, an electric battery in position to move toward said primer, and an explosive charge in rear of said battery and in position to shoot the battery forward to close circuit with the primer, as set forth.

8. In a shell-fuse, an electric battery, an electric primer in line therewith, an explosive charge in rear of said battery in position to shoot the battery toward the primer, and a time-fuse for igniting said charge, the combination being and operating substantially as described.

9. In a shell time-fuse, the combination of a casing, and a perforated and movable firing-pin extending through said casing to the vicinity of the time composition, and having longitudinal movement, so as to puncture said composition when pressed forward by the explosion of the charge in the gun, substantially as stated.



384,665. SCRAPER ATTACHMENT FOR VEHICLE-STEPS. OMAR BATES, Sandusky, Ohio. Filed Sept. 17, 1887. Serial No. 249,904. (No model.)

Claim.—1. The combination, with a vehicle-step, of a foot-scraper consisting of a scraper-bar suspended by hangers below said step, substantially as described.

2. As a new article of manufacture, a foot-scraper for vehicle-steps, consisting of a scraper-bar formed integrally with hangers for suspending it below the vehicle-step, and means for securing such hangers to the edges of the step, substantially as described.

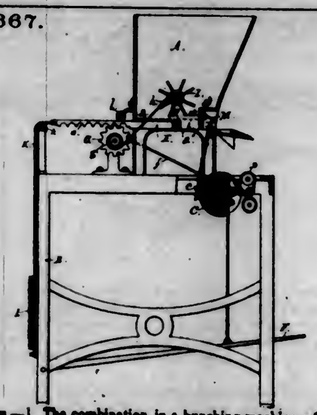
384,666. INJECTOR. EDWIN J. YOUNG and ALBERT LANDERS, Wadsworth, and HIRAM R. FISHER, Cleveland, assignors to the Garfield Injector Company, Wadsworth, Ohio. Filed Oct. 26, 1887. Serial No. 253,492. (Model.)

Claim.—1. In an injector having a steam-inlet, water-supply connections, a suction or lifting tube, *j*, and a steam-jet or forcing-tube, a solid steam-spreading plug provided with a collar and stop and held in place in said jet or tube by the pressure of the steam to throw the steam in a flaring hollow or tubular form into the section or lifting tube, substantially as described.

2. In an injector having a steam-inlet, water-connections, and suction or lifting tube *j*, a forcing-tube having a forwardly-flaring passage opening into the suction or lifting tube, combined with a plug fitted to work in said forcing-tube and make in it an annular passage-way, so as to give a distinctive impact to the outgoing tubular column of steam against the suction or lifting tube and thereby clear the pipes of accumulated water, and provided with a collar and stop against which the steam acts to hold said plug in place, substantially as described.

3. In an injector having a steam-inlet, water-supply connections, a suction or lifting tube, *j*, and a steam-jet or forcing-tube arranged substantially as shown, a plug arranged in the steam-jet and provided with a collar against which the steam acts to hold the said plug in positions of use and disuse, substantially as described.

4. The combination, with the plug *t*, having the collar t^5, of a bonnet provided with a seat to receive the plug's collar, the said plug being held to its seat by steam-pressure and at the same time excluding the waste and leakage of steam through the bonnet, substantially as described.



5. The section *b*, provided with a steam-valve seat and also a water-valve seat, combined with and receiving in itself the steam-valve, water-valve, or cock, the forcing-tube, and the plug *t*, substantially as set forth.

6. In an injector, a lifting-tube, *j*, and a forcing-tube aligned with said lifting-tube, and a plug of less diameter than and of substantially or approximately the same contour as the steam-passage in the forcing-tube and stopping short of the outlet of said forcing-tube, whereby is insured the delivery of the steam to the lifting-tube in a tubular column, substantially as described.

7. In an injector, a combining-tube, a separate lifting-tube, *j*, and a forcing-tube, all arranged in alignment, in combination with a plug arranged in the forcing-tube and of less diameter and substantially or approximately the same contour as the passage in said forcing-tube and stopping short of the outlet of said forcing-tube, substantially as and for the purpose set forth.

384,667. CIGAR-BUNCHING MACHINE. JOHN H. ABRAHAM and EDWIN K. MARTIN, Lancaster, Pa., assignors to the Conestoga Cigar Company, same place. Filed Aug. 30, 1887. Serial No. 248,205. (No model.)

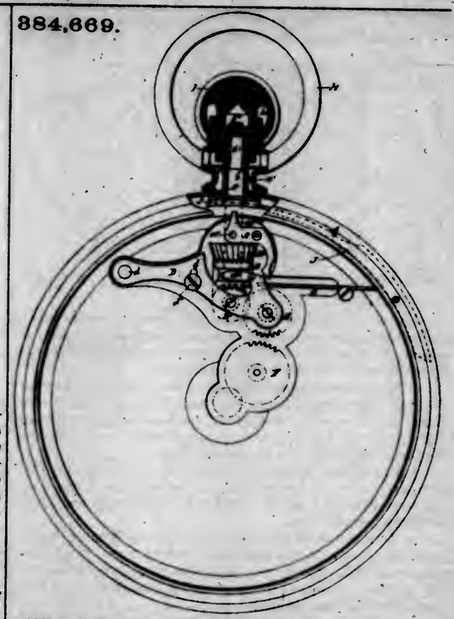
384,667.

Claim.—1. The combination, in a bunching-machine, of the hopper having its bottom formed of the two plates a a^5 and provided with an opening, *i*, between the two plates, the bed-plate a', a swinging gate which closes the opening X in the side of the hopper, the plunger provided with a rack, and which forces the tobacco from the bed-plate through the opening in the side of the hopper, a gear which meshes with the rack of the plunger, a belt connected with the shaft of said gear, the stirrer and a belt for operating the same, a spring for retracting the plunger, a device for rolling the filler in the binder, and a treadle which is connected to the belt which passes around the shaft of the gear which operates the plunger, substantially as specified.

2. The combination of the hopper having its bottom formed of the two plates a a^5 and having an opening, *i*, between the plates for the discharge of the tobacco, and an opening, X, through its side under the plate a^5, through which the tobacco is forced by the plunger, the bed-plate a', upon which the tobacco falls from the hopper, and a stirring device placed in the hopper, the belt for operating the stirrer, the plunger provided with a rack, the spring connected to the rear end of the rack, a gear for moving the plunger, a device for rolling the filler in the binder, the treadle, and the belt *f*, which connects the treadle with the shaft *g*, substantially as described.

3. The combination, in a bunching-machine, of the hopper having its bottom formed of the plates a a^5 and having the opening *i* between the plates, and an opening, X, through its side for the discharge of the tobacco by the plunger, the stirrer placed in the hopper, and a belt for operating it, the bed-plate placed a suitable distance below the bottom of the hopper, upon which the tobacco falls through the opening *i*, and the swinging gate located in the opening X, and which keeps the tobacco in position upon the bed-plate, with the plunger provided with a rack, a gear for operating the rack, the spring for returning the plunger to position, and belt extending from the shaft of the gear to the treadle, the treadle, and the device for rolling the filler in the binder, substantially as set forth.

384,668. WATCH HAIR-SPRING STUD. LEO ABBY, Columbus, Ohio. Filed Jan. 10, 1888. Serial No. 260,341. (No model.)



Claim.—In a watch, the combination of a balance-bridge formed with an annular hole or bearing, a cylindrical hair-spring-supporting stud provided with a collet and a vertical V-shaped groove, and a set-screw tapped through the side of said balance-bridge and provided with a conical point adapted to fit within said V-shaped groove, substantially as and for the purpose described.

384,669. STEM WINDING AND SETTING WATCH. LEO ABBY, Columbus, Ohio. Filed Jan. 10, 1888. Serial No. 260,342. (No model.)

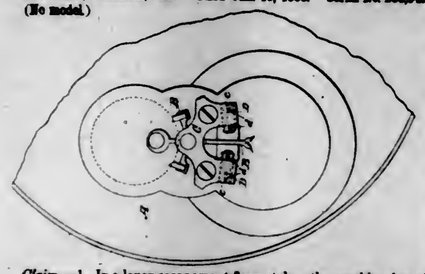
Claim.—1. In a stem winding and setting watch, the combination of the dial-wheels and the setting wheel or wheels with an end-pivoted setting-bar carrying said setting wheel or wheels and the sliding stem and clutch-pinions for actuating said bar for throwing said setting and dial wheels into and out of mesh, substantially as and for the purpose described.

2. In a stem winding and setting watch, the combination of the dial-wheels and one or more setting-wheels with an end-pivoted setting-bar carrying said setting wheel or wheels, and provided near its

384,669.

middle with an elongated slot, a screw passing said slot and acting to limit the depth of mesh of the cogs or teeth of said setting and dial wheels, and devices for moving said wheels into and out of mesh, substantially as described.

3. In a stem winding and setting watch, the combination of the dial and setting wheels, the end-pivoted bar carrying said setting-wheels and provided with an upwardly and horizontally extending projection, the spring supporting the inner end of said bar with an upward pressure, the pivoted setting-lever, and the endwise-movable stem, substantially as described.



4. In a stem winding and setting watch, the combination of the dial and setting wheels, the end-pivoted bar carrying said setting-wheels and provided with an upwardly and horizontally extending projection, the spring supporting the inner end of said bar with an upward pressure, the setting-lever having a pin on its horizontal arm, the adjustable or screw pivot for said lever, and the stem formed with an annular groove in which said pin engages, substantially as described.

5. In a stem winding and setting watch, the combination of the pillar-plate, the potence or crutch firmly secured to said pillar-plate and provided with a step or extension, the exteriorly and interiorly square sleeve rigidly fitted at its lower end upon said step or extension and provided at its upper end with the angle-pinion, the sliding clutch-pinions, and the stem having a square lower portion fitting in said sleeve, the parts being so constructed and arranged as to retain said pinions in fixed position during the removal and insertion of said stem, substantially as described.

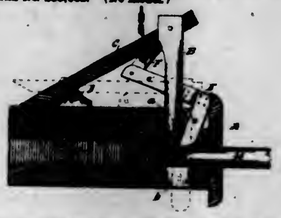
6. In a stem winding and setting watch, the combination of the dial and setting wheels, the spring-controlled end-pivoted setting-bar D, having the projection d^3, the stem A', the clutch-pinions, the pivoted setting-lever A, having the projection or point d^{3*}, and the case-spring J, arranged to have its head *j* in contact with said projection d^{3*}, the construction and arrangement of said projection and case-spring being such as to prevent the outward movement of the stem when the case is closed to permit the outward movement of said stem for setting the hands when the case is open and to automatically force said stem inward and secure the normal or winding position of the parts in closing the case, substantially as described.

7. In a stem winding and setting watch, the combination of the case having the hollow pendant, the crown provided with an interiorly-threaded tubular portion, the exteriorly-threaded sleeve formed interiorly square along its upper portion and provided with an interior shoulder, the case-spring upon which the lower end of said sleeve rests, and the stem provided with a square upper portion of greater length than the interior square portion of said sleeve and having a set upon its upper end, whereby the necessary play for actuating the case-spring and opening the case is effected without affecting the setting mechanism, substantially as described.

384,670. BANKING DEVICE FOR TIME-PIECE ESCAPEMENTS. LEO ARNY, Columbus, Ohio. Filed Jan. 10, 1888. Serial No. 260,242. (No model.)

Claim.—1. In a lever-escapement for watches, the combination of a pillar-plate and a lever with two independent adjustable banking devices arranged parallel to said pillar-plate and having their ends pointing toward said lever, substantially as described.

2. In a lever-escapement for watches, the combination of a pillar-plate and lever with two independent adjustable banking devices arranged parallel to said pillar-plate and at a slight angle or inclination to said lever, and having their inner ends pointing toward the same, substantially as and for the purpose described.



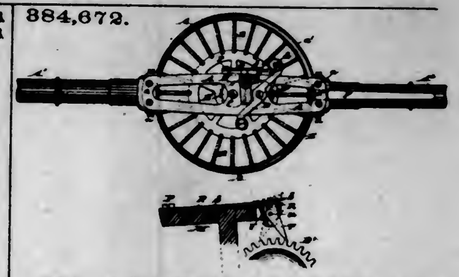
3. In a lever-escapement for watches, the combination of a pillar-plate and a lever with two independent banking-screws arranged parallel to said pillar-plate and at a slight angle or inclination to said lever, substantially as described.

4. In a lever-escapement for watches, the combination of a pillar-plate and a lever with two independent banking-screws arranged parallel to said pillar-plate and at a slight angle or inclination to said lever and provided with holes for pins for moving them forward and backward, substantially as described.

5. In a lever-escapement for watches, the combination of a pillar-plate, a lever, and a lever-bridge provided with wings, with two adjustable banking-screws passing through said wings and arranged parallel to said pillar-plate and at a slight angle or inclination to said lever, substantially as described.

6. In a lever-escapement for watches, the combination of a pillar-plate, a lever, and a lever-bridge provided with split wings, with two adjustable banking-screws passing through said wings and arranged parallel to said pillar-plate and at a slight angle or inclination to said lever, substantially as described.

384,671. CAR-COUPLING. JOHN G. B. ARNEMAN, Pinkville, assignor of one-half to John W. Fuller, Kilbourn City, Wis. Filed Oct. 31, 1887. Serial No. 253,882. (No model.)

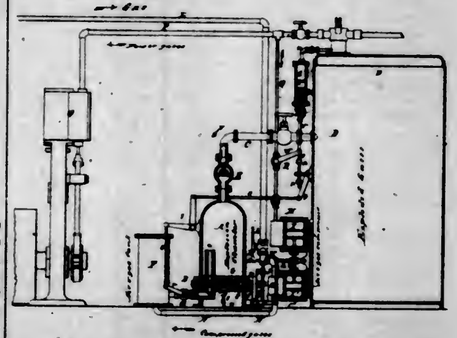


Claim.—1. The combination, with the draw-bar, the pin and the pin-carrying lever extending lengthwise of and pivotally supported on the draw-bar, of the bell-crank trip-lever having its horizontal branch extending beneath and adapted to bear against the pin-carrying lever, and the link connecting the inner end of said branch of the trip-lever with the outer end of the pin-carrying lever, substantially as described.

2. The combination, with the draw-bar, the coupling-pin, the pin-carrying lever pivotally supported between brackets and having its rear end extended beyond its pivotal support, and adapted to bear on the draw-bar for limiting the vertical movement of the pin, the trip-lever, and the link connecting the trip-lever with the pin-carrying lever, substantially as described.

3. The combination, with the draw-bar, the coupling-pin, the pin-carrying lever, the trip-lever having its vertical branch forming a bed for the pin, and its horizontal branch adapted to bear against the under side of the pin-carrying lever, and the link connecting the inner end of the horizontal branch of the trip-lever with the outer end of the pin-carrying lever, substantially as described.

384,672. FISHING-REEL. ALFRED F. BRAENAN, Brooklyn, N. Y., assignor, by mesne assignments, to Sarah J. Burnham, same place. Filed Jan. 6, 1888. Serial No. 259,969. (No model.)



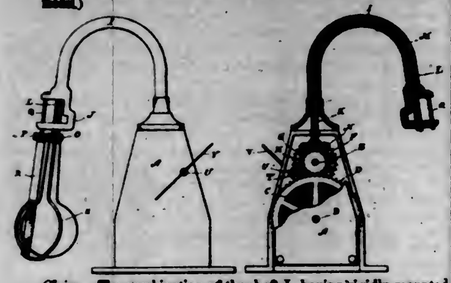
Claim.—1. In a fishing-reel, the frame M, forked at one end, triangular pawl T, pivoted in said fork, and spring S, secured to said frame and normally bearing upon one arm of said pawl, in combination with the toothed wheel D', whose teeth engage the other arm of said pawl, and means for rotating said wheel, as and for the purpose set forth.

2. In a fishing-reel, the frame M, forked at one end, the open-front case U, pivoted in said fork, the triangular pawl T, pivoted in said case, the strong spring R, forked at its front end, whereby it normally bears upon said case in rear of said pivot, but straddles said pawl, the weak spring S, lying upon said strong spring and normally bearing upon one arm of said pawl forward of the pivot, and the screw P, for securing said springs in position, in combination with the toothed wheel D', whose teeth engage the other arm of said pawl, and means for rotating said wheel, as and for the purpose specified.

3. In a fishing-reel, the combination, with the frame A, having slot a^2, the reel B, having gear-wheel B', the gear-wheel D' engaging it, and means for rotating said gear D', of the frame M, exterior slide, N, pin *m*, connecting said frame and slide through said slot, and the spring-actuated pawl T, pivoted in said frame and normally engaging the teeth of said gear D', as and for the purpose specified.

4. In a fishing-reel, the combination, with the reel B and means for rotating it, the frame A, and nearly-straight spring E, one end of which is secured to said frame and the free end of which carries a shoe, E', of the bell-crank lever F, pivoted at its angle to said frame, the long operating-arm of said lever extending along the fish-pole, and the short arm thereof being adapted to impart a radial motion to said shoe toward the center of said reel, as and for the purpose herein specified.

384,673. GAS-MOTOR. REINHOLD ROSELIUS, Brooklyn, N. Y. Filed Aug. 31, 1886. Renewed Sept. 24, 1887. Serial No. 250,580. (No model.)



Claim.—1. The combination, with a motor or engine, of a receiver, D, a chamber, A, and a pump, H, and slide-valve B, substantially as and for the purpose herein stated.

2. The combination, with the motor or engine O, of the receiver D and the chamber A and its openings *a* and *b*, with the check-valve E and pipe C, and the pump H, with the pipe L and its cock M and air-inlet K, and the pipe Q, with the valve R, and the tank F, with the pipe N and valve G, and the slide-valve B and its ports *c*, *d*, and *f*, and the gas-jet *e*, substantially as and for the purpose herein mentioned.

3. The combination, with the motor or engine O, of the receiver D and chamber A and the pump H and tank F, with the slide-valve B and its gearing, with the pump H and its ports *c*, *d*, and *f*, with the pipe C and check-valve E, and the pipe P, Q, N, and L, and the air-inlet K, and the valves G, M, and R, and the cylinder S, the piston T, the spring U, and the gearing herein shown and connected with the valves R and G, substantially for automatic operation of the production of the motive power herein set forth.

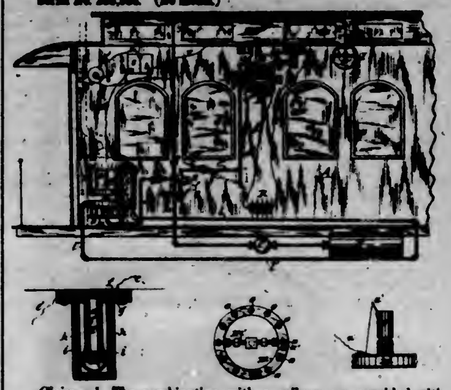
384,674. MEANS FOR OPERATING EGG-BEATERS. MARY F. BUNNY, Bridgeport, Conn. Filed Feb. 21, 1883. Serial No. 264,726. (No model.)

Claim.—The combination of the shaft L, having rigidly mounted thereon the cog O, the cog P, rigid on the short shaft Q, journaled in the head J, the arched neck I, connecting said head and casing A, the shaft K, extending from the casing within the said neck, the coil-spring connecting the shafts L K, the beveled gear N, mounted on the lower end of the shaft K, the cog-wheels H F, secured on the short shaft E, journaled within the casing, the power-transmitting cog D, and spring C, substantially as and for the purposes set forth.

384,675. CAR-COUPLING. MARION T. BRADY, Bertha, Ind. Filed Sept. 15, 1887. Serial No. 249,880. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw-head thereof, of a movable carriage mounted therein and provided with a link-operating lever and a pin-operating lever, a shaft for operating the pin-lever, and arms for connecting the pin and link operating levers, substantially as specified.

2. In a car-coupler, the combination, with the draw-head thereof, of a longitudinally-movable carriage carrying pin and link operating levers, a hand-wheel for operating the pin-operating lever, arms pivoted in the link-operating lever and adapted to connect the same with the pin-operating lever, and a rope or chain connecting the pin-operating lever with the pin, substantially as specified.



3. In a car-coupler, the combination, with the draw-head thereof, of a longitudinally-movable carriage mounted therein and provided with a notched and grooved pin-operating lever rigidly mounted on an operating-shaft, a link-operating lever pivoted below the first-mentioned lever, arms for connecting the two levers, a bail for limiting the movement of said arms, and a transverse bar for raising the arms for connection with the pin-operating lever, substantially as described.

4. In a car-coupler, the combination, with the draw-head thereof, of a longitudinally-movable carriage mounted therein and provided with pin and link operating levers, the latter being bifurcated to receive the link at its front end and weighted and provided with arms at its rear and adapted to take into shoulders formed in the pin-lever and normally hold from connection therewith, substantially as specified.

5. The combination of the head A with the carriage B, mounted for movement therein and provided with the shaft C, having the lever D mounted rigidly thereon, and with the lever E, pivoted, as at F, bifurcated, as at F^2, weighted, as at F^3, and carrying the arms E^4, for connection with the lever D, substantially as specified.

6. The draw-head A, having the openings A' A^2 A^3 A^4, with the carriage B, mounted for movement within the same and having the shaft C, carrying the hand-wheel C', and lever D, grooved and notched at its rear end, as at D' D^2 D^3, and with the lever E, weighted, as at F^3, and bifurcated, as at F^2, the arms E^4, for connecting the levers, the pulleys A^5, A^6, and A^7, the rope or chain H, and the link G, substantially as specified.

384,676. AUTOMATIC ELECTRIC GAS CUT-OFF FOR RAILROAD-CARS. FREDERICK C. BROWNE, Syracuse, N. Y. Filed Apr. 30, 1887. Serial No. 236,263. (No model.)

Claim.—1. The combination, with a railway-car provided with gas-burners, gas-reservoir, and gas-supply pipe leading from said reservoir to the burners, a stop-cock connected with said gas-pipe and held normally closed, a latch adapted to hold said stop-cock in its open position, a tripper adapted to throw the latch out of engagement with the stop-cock, electro-magnets, an armature adapted to retain the tripper, a battery, a mercury-containing receptacle rigidly secured to the car, an electric conductor extending from the magnets into the mercury-receptacle and terminating a short distance above the mercury, and an electric conductor leading from the battery to the magnets, substantially as and for the purpose set forth.

2. The combination, with a railway-car, of a heater, gas-burners for generating the heat, a gas-reservoir, gas-supply pipes leading from said reservoir to the burners, the stop-cock *a*, arm *b*, projecting from the spigot of the stop-cock, a weight or spring actuating the said arm to automatically close the stop-cock, the latch *c*, adapted to detain the arm *b* in its open position, the vertical guide *d*, weight D, sliding on said guide, magnets M, the armature O, provided with a hook for supporting the weight D, the battery B, the mercury-containing tube T, the wire *e*, extending from the mercury to the battery, the wire *e'*, extending from above the mercury to the magnets, and the wire *e''*, extending from the magnets to the battery, substantially as described and shown.

384,677. METHOD OF MANUFACTURING SPOOLS. REUBEN P. BROWNELL, Beebe Plain, Quebec, Canada. Filed Feb. 10, 1888. Serial No. 263,562. (No model.)

Claim.—1. The improved method of making spools and similar articles, consisting in first cutting longitudinally into the blank to give the proper circumferential shape to the ends and then cutting the central body portion away to less diameter than the ends, substantially as described.

2. The improved method of making spools and similar articles, consisting in cutting longitudinally into the blank from opposite directions distances equal to or greater than the thickness of the edges of the flanges and subsequently cutting the central body portion of the spool down on lines intersecting said cuts to a diameter less than that of said ends, substantially as described.

3. The improved method of making spools and similar articles, consisting in cutting longitudinally into the ends of the blank from opposite directions to give the proper circumferential shape thereto and simultaneously embossing or stamping suitable figures on the face of such ends, substantially as described.

4. The improved method of making spools and similar articles, consisting in forcing annular cutters into the ends of the blank from opposite directions, to give the same the proper circumferential shape, and embossing or stamping suitable figures on the faces of such ends while within the cutters, substantially as described.

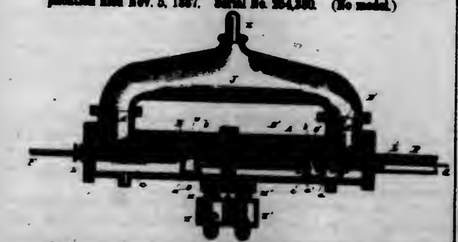
5. The improved method of making spools, consisting in first boring the blank, then cutting longitudinally into it to shape the ends and stamping figures on the faces of said ends, and subsequently turning

the central body portion down on lines intersecting the cuts made from the ends to a diameter less than such ends, substantially as described.

6. The herein-described method of making spools and similar articles, consisting, first, in boring the blank; second, facing or turning the ends; third, stamping designs in the ends, or either of them, and simultaneously cutting longitudinally into the blank to shape the ends, and, finally, turning the spool-body down to proper shape on lines intersecting the cuts previously made, as set forth.

7. The herein-described step in the manufacture of spools and similar articles, consisting in cutting longitudinally into the blank by means of a circumferentially-corrugated die, thereby shaping the ends, and subsequently turning the body of the spool down on lines intersecting the cuts previously made.

384,678. PUMP. HENRY M. CLARK, Beaver Falls, Pa. Filed Apr. 13, 1887. Serial No. 234,660. (No model.)



Claim.—1. In a device for transferring liquids from a lower to a higher level, a double-chambered cylinder having inlet and outlet ports in each chamber, a hollow neutral cylinder or piston of smaller diameter, except the heads, which fit the main or double-chambered cylinder, and valves located in the heads of the piston to open and close the ports, said valves being provided with a central opening, so as to leave the neutral cylinder open, as described, whereby the columns of water will rest against each other within the piston or neutral cylinder to balance the same at any point within the main or double-chambered cylinder, as set forth.

2. In a device for raising liquids from a lower to a higher level, a double-chambered cylinder having outlet-pipes at each outer end and inlet-pipes at each inner end of said chambers, and a neutral cylinder or hollow piston provided with valves, as described, and of smaller diameter, except the ends thereof, working within said cylinder, the ends of the piston being open and provided with valves which open and close alternately at each stroke of the neutral cylinder or piston to admit or shut off the water-supply from the space around the piston to the double chambers of the cylinder, as set forth.

3. In a device for transferring liquids from a lower to a higher level, a double-chambered cylinder having inlet and outlet pipes in each chamber, and a hollow neutral cylinder or piston of smaller diameter, except the heads, working within the double-chambered cylinder, the outlet-pipes being open or free from valves, as described, whereby the columns of liquid above the piston will rest against each other within the piston, as set forth.

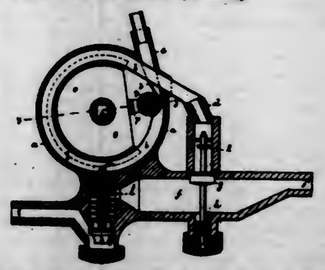
4. In a pump of the character described, the combination of the double cylinder A and the hollow open-ended neutral cylinder or piston B, reduced between the heads to form a chamber on each side of the partition in the main cylinder, said neutral cylinder or piston being provided with the valves E and E', with the supply-pipes M M', pipes C, and dome or exit-pipe J, as set forth.

384,679. PUMP. HENRY M. CLARK, Beaver Falls, Pa. Original application filed Apr. 13, 1887, Serial No. 234,673. Divided and this application filed Nov. 5, 1887. Serial No. 254,380. (No model.)

Claim.—1. In a device for transferring liquids from a lower to a higher level, a double-chambered cylinder having outlet-pipes in the outer ends and an inlet-pipe at the inner end of each of said chambers, and a hollow piston or neutral cylinder of smaller diameter, except at the ends, working within said cylinder, said piston being provided with automatically-operated valves to close the ends of the piston, as set forth, whereby the column of liquid being raised is caused to rest against the heads or valves of the piston at each alternate stroke of the same and balance the piston or neutral cylinder at any point within the double-chambered cylinder.

2. In a device for transferring liquids from a lower to a higher level, a main exit-pipe divided at its lower end into two branches, each communicating with the outer ends of a double-chambered cylinder, in combination with a piston or neutral cylinder having automatically-operated valves at each end thereof, whereby the column of liquid to be raised is divided into two columns, each of which rests against one or the other of the heads of the neutral cylinder or piston alternately, as set forth.

3. In a device for transferring liquids from a lower to a higher level, a double-chambered cylinder, the piston or neutral cylinder B, with heads which work snugly within the cylinder, and with the main body reduced, a partition through which the reduced portion of the piston works, forming with the heads a space between the outer walls of the piston and the inner walls of the chambered cylinder, supply-pipes communicating with the space in each chamber, and the check-valves and automatically-operated valves in the ends of said piston, as set forth, whereby a vacuum-chamber is formed for the inflow of water in one or the other chamber at each stroke of the piston, as set forth.



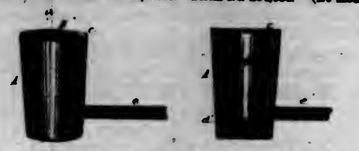
4. In a device for raising or transferring liquids from a lower to a higher level, a divided cylinder having an opening through its partition, a double hollow piston having a reduced portion connecting the heads fitting the opening in the partition to reciprocate therein, and with the heads fitting the cylinder to form chambers between the partition and heads, and the valves, ducts, or ports forming communicating passages between the chambers and the hollow piston, substantially as set forth.

5. In a device for raising liquids, a double-chambered cylinder, the inlet and outlet pipes communicating with each chamber, a double hollow piston or neutral cylinder working therein, and the valved ports in the ends of the piston acting to automatically and alternately open and close to admit and discharge the liquids around the piston or neutral cylinder, substantially as set forth.

6. In a device for raising liquids, a divided cylinder having an opening through its partition, a double hollow piston having a reduced portion connecting the heads, fitting the opening in the partition to reciprocate therein, and the heads fitting the cylinder and forming chambers between the partition and heads, the ends of said piston made hollow, the inner and outer walls of both being provided with valved openings forming communications between the chambers and hollow piston and the hollow piston and outlet, and acting automatically and alternately to admit and discharge the water from the inlet to the outlet, substantially as set forth.

7. In a device for raising liquids, a double-chambered cylinder, A, a double hollow piston or neutral cylinder, B, having the chambers O O', one at each end, and the inlet and outlet pipes, in combination with valves E E', and the rod G for opening the valves automatically in the reciprocation of the piston or neutral cylinder, and the valves D and D', substantially as set forth.

384,680. SHOT-GAGE. JOSEPH CHEVER, New York, N. Y. Filed Jan. 27, 1886. Serial No. 209,142. (No model.)



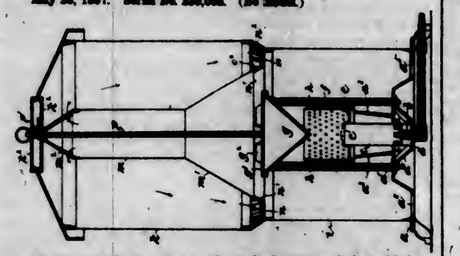
Claim.—1. The combination of drum a with the flexible tube b contained therein, and with a revolving shaft carrying roller g and provided with handle f, carrying cam x, and with a mixing-chamber, f, having a pair of inlet-ports, the port for admitting drop communicating with the flexible tube b, and with a pair of valves controlling the inlet-ports, the valve in the port for admitting charged liquid being operated by cam x on the revolving handle f, substantially as specified.

2. The combination of a drum having a central shaft with a handle for rotating said shaft and carrying a cam, and with a flexible tube and a roller for compressing said tube, and with a mixing-chamber having two inlet-ports, one of which communicates with the flexible tube, while the other port is provided with a valve having a projecting valve-stem that is engaged by the cam, substantially as specified.

3. The combination of drum a with the flexible tube b, and with central squared shaft n, hung across the drum and carrying roller g, and with the block r, having nose c, and fitted on shaft n, and with the handle f, hung loosely on said shaft, and with a mixing-chamber having two inlet-ports, one of which communicates with the flexible tube, while the other port is provided with a valve having a projecting stem that is engaged by the cam, substantially as specified.

4. The combination of a roller with a crank-axle and revolving cam, and with a flexible tube, and with a mixing-chamber connected therewith, and having an inlet-port and valve that is operated by the revolving cam, substantially as specified.

384,681. TOBACCO-PIPE. CHARLES H. DARLING and HENRY PERRY, Lewiston, Me. Filed Feb. 20, 1888. Serial No. 264,692. (No model.)

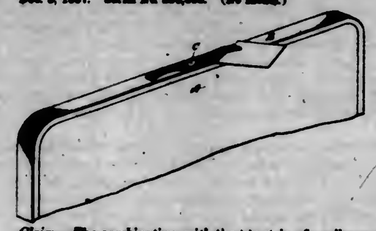


Claim.—The herein-described pipe-bowl, having its interior lined with asbestus, a metal plate located in the bottom thereof, and an interiorly-flanged cap or ring located at the mouth thereof, said cap or ring having holes near its inner edge for the reception of pins for securing the said ring or cap to the mouth of the bowl, thereby retaining the asbestus lining in place, substantially as set forth.

384,682. PROCESS OF OBTAINING THE PRECIOUS METALS FROM SPEISS. LEWIS W. DAVIS, Bucks, Nev. Filed Nov. 16, 1887. Serial No. 255,230. (No specimens.)

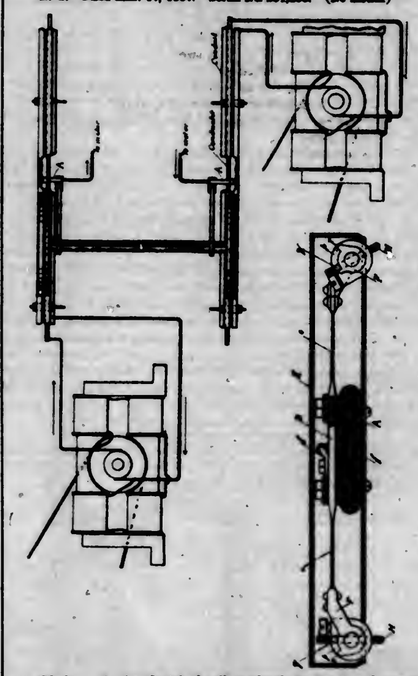
Claim.—The method of separating precious metals from speiss, which consists in melting the speiss, then injecting molten lead into the molten speiss, then thoroughly mixing them together, and, finally, allowing the mixture to stand until the lead and precious metals have been precipitated and are ready for removal, as described.

384,683. GAS-STOVE. ALFRED S. DEBERNEE, Boston, Mass. Filed May 28, 1887. Serial No. 239,092. (No model.)



Claim.—1. In a gas-stove, the main frame consisting of a base and uprights supported thereon, combined with a flame-spreading and distributing device of substantially conical shape, having its base tightly held upon said uprights with its apex projecting down between them, and a burner consisting of a tube that receives gas and air at its lower end and is provided with a lateral flange near its upper end, and a perforated chimney of larger diameter than said tube supported on said flange, the said burner being held in supports that engage the lower end of the burner-tube and the flange thereof, whereby the said burner-tube is removable laterally from between the base and spreading device, substantially as and for the purpose set forth.

2. The combination of the main frame composed of a base provided with uprights, with a burner composed of a tube that receives air and gas near its lower end, a lateral flange near the upper end of the said tube, and a perforated chimney on said flange, the said burner being held in a socket near its lower end, and the flange at the upper end of the said tube being seated on uprights supported from the base, and an inverted cone tightly fastened on uprights connected with said base and having its apex extend downward into the said chimney, substantially as described.



3. The main frame composed of a base provided with standards or uprights, combined with an inverted cone tightly fastened upon said uprights and provided with a plate attached to its base portion for supporting cooking utensils, and a burner composed of a tube provided with a flange near its upper end, and a perforated chimney of larger diameter than said tube connected with said flange, the said burner being supported in the frame beneath the inverted cone and being laterally removable from between the cone and base of the frame-work, substantially as and for the purpose set forth.

384,684. TICKET-HOLDER. HENRY PERRY, Bridgeport, Conn. Filed Dec. 3, 1887. Serial No. 256,602. (No model.)

Claim.—The combination, with the top strip of a railway-car seat, of a flat spring-metal ticket-holder secured directly upon said strip and carved from this point of attachment away from said strip to the end or holding-point, which latter lies closely against the strip, substantially as set forth.

384,685. ELECTRIC RAILWAY. STEPHEN D. FIELD, Yonkers, N. Y. Filed Mar. 17, 1887. Serial No. 231,205. (No model.)

Claim.—1. An electrical railway having a source of energy at each end of the line connected by their opposite terminals with two conductors, returns for said sources of energy, and connections for completing the circuit through a locomotor between said conductors, for the purpose specified, whereby the potential of the system is maintained constant.

2. In an electrical railway, two parallel conductors for supplying current to a locomotor, a source of electricity at each end of the line, connected each to one of said conductors, and a return for the remaining terminals of said sources of electricity, whereby the potential remains the same, whatever be the location of the locomotor.

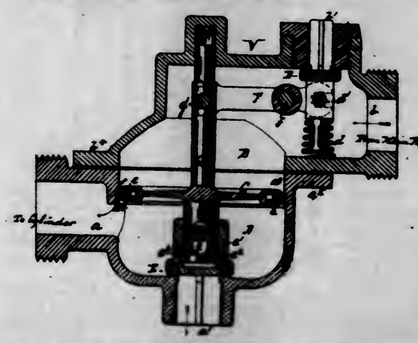
3. The combination, in an electrical railway, of two sources of electrical energy, conductors connected to two opposite terminals of said sources of electrical energy and suitably insulated, a locomotor, electrical connections for completing the circuit between said conductors through said locomotor, a return for the remaining terminals of said sources of electrical energy, a terminal for said return located upon the locomotor, and a switch, also upon the locomotor, for con-

necting the terminals of said locomotor with one or the other or both sources of electric energy at will.

4. In an electric railway, two sources of electric energy connected to conductors by their opposite poles, respectively, a conduit, within which said conductors are suitably insulated, a motor located upon a car traveling upon the exposed portion of said conduit, circuit-completing connections carried by said car, a lead from the other terminals of said sources of electrical power connected to said conduits, and switches for completing the circuit at either side of the motor through the wheels to the conduit or return-circuit, so that either source of power can be used exclusive of the other whenever desired.

5. An electrical railway having two sources of electrical energy, conductors arranged along the way permanently connected to each respective source, returns for said sources of electricity, and electrical connections on the locomotor adapted to complete the circuit between said conductors through the motor on the car, or to put either terminal of the motor in communication with its respective return, whereby either source of energy or both may be drawn on at will.

6. The combination of a car, as C, carrying an electric motor, two conduits upon the exposed portions of which said car is adapted to travel, two insulated conductors in said conduits, a generator in electrical communication with each of said conductors connected by opposite poles, the remaining poles being connected to the conduit, and electrical connections completing the circuit between said conductors through the motor.



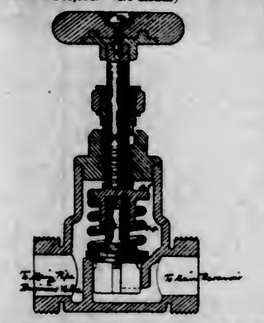
7. The combination, in a railway, of a plow-arm, as A, for transmitting the electric power to the car, two pieces, as *a b*, grooved to accommodate the axle and bolted to said plow-arm, a device for holding the same to the axle, and an extension of the part *a* and guide-pieces *c c*, within which said extension works, whereby the action of the springs of the car is not interfered with and the plow-arm is held in the required position.

8. The combination, as a contacting device movable along an electric circuit, of a metal piece, as B, bolted to a supporting-piece, A, two carriers, F F, attached at each end thereof, and a swiveled carriage, G, mounted in each carrier and carrying the brushes H H.

9. The combination, as a brush-contact device for an electric circuit, of a supporting-arm, as A, a metal plate, as B, bolted thereto but insulated therefrom, a conductor, as *f*, in electrical connection with B and passing through A, from which it is insulated, a carrier, F, at each end of said plate B, a swiveled brush-carrying device, G, borne by each carrier, and means for regulating the play of said brush and carrier, so as to give the brush a lead when traveling in either direction.

10. The combination of a circuit-completing device, as B, adapted to travel in a conduit and having a brush at each end thereof, said brushes being separated by the space described, and an insulating box or housing, K, for said device, having slots therein, through which the brushes protrude, whereby the device is prevented from establishing an electrical connection, except through the brushes.

884,686. VALVE FOR AIR-BRAKES. HERMAN GUMA, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Oct 28, 1887. Serial No. 253,637. (No model.)



Claim.—1. In an automatic valve for air-brakes, the combination of a piston-valve, a port which is opened and closed thereby, an exhaust-valve, and a lever for actuating the exhaust-valve from the stem of the piston-valve, the connection between the piston-stem and lever being loose to allow of an interval of motion for the valve-stem before it actuates the lever and exhaust-valve, whereby the port of the piston-valve is closed before the exhaust-valve is opened, substantially as and for the purposes specified.

2. In an automatic valve for air-brakes, the combination of a piston valve, an exhaust-valve for the train-pipe loosely connected to the stem of the piston-valve to permit an interval of movement of the piston before it actuates the train-pipe exhaust-valve, and an exhaust-valve for the cylinder loosely connected to the stem of the piston-valve to permit an interval of movement in the piston-valve before it actuates the cylinder exhaust-valve, substantially as and for the purposes specified.

3. In an automatic valve for air-brakes, the combination, with a piston-valve, of a puppet exhaust-valve for the train-pipe and a puppet exhaust-valve for the cylinder, said exhaust-valves connected with and actuated from the stem of the piston-valve, and said valves relatively arranged within the valve-shell, so as to be held on their seats by the pressure in the train-pipe, substantially as and for the purposes specified.

4. In an automatic valve for air-brakes, the combination of a shell composed of two sections, A B, each having an exhaust-port, two exhaust-valves to control said ports, and an intermediate balanced valve for controlling the exhaust-valves, substantially as and for the purposes specified.

384,687. AIR-BRAKE SYSTEM. HERMAN GUMA, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Oct. 28, 1887. Serial No. 253,638. (No model.)

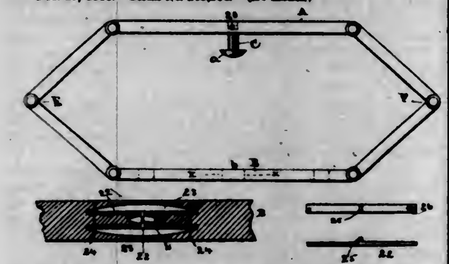
Claim.—1. In an air-brake system, the combination, with a balanced valve, of an exhaust-valve for the cylinder and an exhaust-valve for the train-pipe, said exhaust-valves independent of each other but connected with and actuated by the balanced valve, substantially as and for the purposes specified.

2. In an air-brake system, the combination, with a cylinder, an expansion-chamber, and a main (or train) pipe, of an exhaust-valve arranged to open the cylinder for applying the brakes and a check-valve-operating device arranged to operate the check-valve and equalize the pressure in the cylinder and expansion-chamber when the pressure in the main pipe is raised to release the brakes, substantially as and for the purposes specified.

3. In an air-brake system, the combination, with a cylinder, an expansion-chamber, and a main (or train) pipe for supplying air under pressure to the cylinder and expansion-chamber, of a check-valve-operating device having diaphragms of unequal area, the opposite sides of said diaphragms connected by a port and arranged in the pipe or passage leading to the expansion-chamber to multiply the pressure in the main (or train) pipe sufficiently to overcome the check-valve when the pressure in the expansion-chamber is greater than the pressure in the main supply-pipe, substantially as and for the purposes specified.

4. In an air-brake system, the combination of a cylinder, an expansion-chamber having a check-valve, and a main (or train) pipe for supplying air under pressure to the cylinder and expansion-chamber, of two diaphragms of unequal area connected by a tubular stem and arranged in the port or passage leading to the expansion-chamber, whereby the pressure in the main air-supply pipe is multiplied and applied to operate the check-valve, substantially as and for the purposes specified.

5. In an air-brake system, the combination, with a cylinder, an expansion-chamber, and a main air-supply (or train) pipe, of a reduction-valve, an exhaust-valve arranged to open the cylinder, an exhaust-valve arranged to open the train-pipe, and a check-valve-operating device arranged to operate the check-valve of the expansion-chamber when the pressure is raised in the main pipe to release the brakes, substantially as and for the purposes specified.



6. In an air-brake system, the combination, with a brake-cylinder and a main air-supply or train pipe, of a valve-chamber having a diaphragm provided with a valve-seat, a valve thereafter, and two exhaust-valves, one for the main air-supply pipe, and one for the cylinder, said valves connected with the diaphragm so as to be actuated thereby, substantially as and for the purposes specified.

7. In an air-brake system, the combination, with a brake-cylinder and a main air-supply or train pipe, of a valve-chamber having a flexible diaphragm provided with a valve-seat, a valve therefor, an exhaust-valve for the cylinder connected directly to the stem of the diaphragm-valve, and an exhaust-valve for the main air-supply or train pipe, connected to the diaphragm-valve stem by an interposed lever having a fulcrum, substantially as and for the purposes specified.

8. In an air-brake system, the combination, with a cylinder, an expansion-chamber, and a main (or train) pipe, of an exhaust-valve arranged to open the train-pipe and a check-valve-operating device arranged to operate the check-valve and equalize the pressure in the cylinder and expansion-chamber when the pressure in the train-pipe is raised to release the brakes, substantially as and for the purposes specified.

9. In an air-brake system, the combination, with a cylinder, an expansion-chamber, and a main supply or train pipe, of a check-valve-operating device arranged to be actuated by the pressure in the main pipe to operate the check-valve of the expansion-chamber when the pressure in the main pipe is lower than that of the expansion-chamber, substantially as and for the purposes specified.

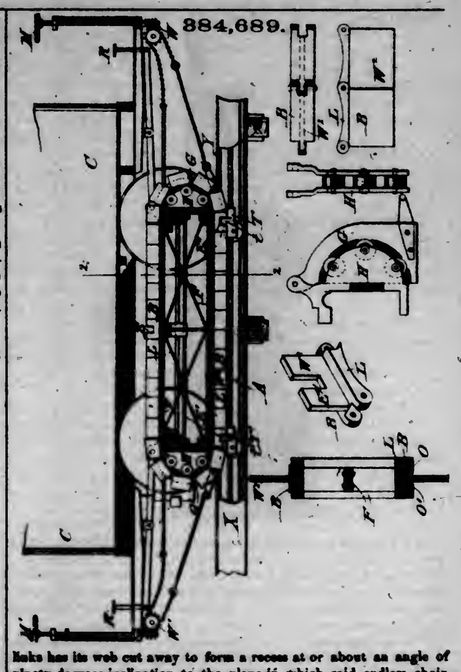
884,688. BAG-LOCK. THOMAS W. HARDESTY, Topeka, Kans. Filed Feb. 25, 1888. Serial No. 265,561. (No model.)

Claim.—1. In a bag-lock, the combination, with the side A and the side B, having an oblong opening, of the lock-bolt C, having an oblong head, and a spring having a locking-leg which is adapted to engage with the said bolt, substantially as and for the purpose described.

2. The combination, with the side A, the side B, the lock-bolt having a longitudinal opening and side openings, and the springs having locking-lugs, of the key composed of two members pivoted together and having oppositely-disposed extensions to enter the lateral openings in the said bolt, substantially as and for the purpose described.

3. The combination, with the side A and the side B, having the oblong opening *b*, the recesses 22, and the lateral openings *b'*, of the springs 22, having locking-lugs, and the lock-bolt having openings in its side to receive the said locking-lugs, substantially as and for the purpose described.

4. The combination of the sides A and B, the springs 22, having locking-lugs, the lock-bolt having a longitudinal bore and lateral openings, and the key composed of two members pivotally connected together midway of their ends, the front ends of the members extending parallel and terminating in oppositely-disposed extensions, and the rear ends of the members curving in opposite directions to form a circle, one end having a socket and a spring and the other end having a tenon which is adapted to enter the said socket, substantially as and for the purpose described.



884,689. CHAIN-GRIP FOR CABLE ROADS. WILLIAM HEMENWAY, Yonkers, N. Y., assignor to Benjamin Butterworth, trustee, Cincinnati, Ohio. Filed Apr. 20, 1888. Serial No. 271,202. (No model.)

Claim.—1. In a grip for traction-cable railroads, the combination of a cable having suitable projections and an endless chain carried by the car, having suitable recesses into which the said projections on the cable may be inserted, substantially as described.

2. In a grip for traction-cable railroads, the combination of a cable having suitable projections, a vertically-adjustable frame upon the car, an endless chain running around said frame and having suitable recesses or indentations into which the said projections on the cable may be inserted, together with a friction apparatus by which the chain may be temporarily locked to the adjustable frame and rendered immovable with relation thereto, substantially as described.

3. In a traction-cable railroad, the combination of the cable-conduit and the endless chain adjustably attached to the car, each link in the lower half of which chain has its larger portion within the cable-conduit, substantially as described.

4. In a chain-grip for traction-cable railroads, an endless chain composed of links, each of which links has a long thin web reaching far down into the slot of the cable-conduit, and one or more of which

links has its web cut away to form a recess at or about an angle of ninety degrees inclination to the plane in which said endless chain travels, substantially as described.

884,690. METHOD OF MAKING SLIVERS FOR THE PRODUCTION OF CLOUDED YARN. JAMES F. HENRY, Little Falls, N. Y., assignor of one-half to Walter W. Whitman, same place. Filed June 2, 1887. Serial No. 240,080. (No model.)

Claim.—The herein-described method of producing a sliver composed of concentric layers of different fibers, which consists in feeding loose fibers of different colors or kinds as contradistinguished from slivers or rovings to the carding-engine simultaneously and separately side by side, carding the several colors or kinds of fibers simultaneously side by side, and removing the several colors or kinds of fiber successively from the doffer and forming the same into a single sliver, one color or kind forming the core of the sliver and the following kinds or colors forming successive concentric layers around said core, substantially as set forth.

884,691. CASH INDICATOR AND REGISTER. CARL P. HARKER, Louisville, Ky. Filed Dec. 13, 1886. Serial No. 221,945. (No model.)

Claim.—1. In combination with the upper and lower guide-bars provided with the series of corresponding guide-notches, the indicator-rods guided in such notches and having the forwardly-extending arms at or near their lower ends, plates on such arms parallel to the rods, a fixed plate engaging such plates, and means for holding the upper ends of the rods in the notches of the upper bar, substantially as and for the purpose shown.

2. In combination with the upper and lower bars provided with corresponding notches in their front sides, the indicator-rods guided in such notches and having at or near their lower ends the forwardly-extending arms, the upright plates on such arms, and the fixed plate engaging the front sides of the indicator-bars near their upper ends, substantially as and for the purpose set forth.

3. In combination with the upper and the lower notched guide-

384,691.

bars and the bar in front of the upper one, the indicator-rods sliding in the notches in the upper and lower bars and having arms extending forward from near their lower ends, the slotted plate F, the plates on the arms of the indicator-rods, and the keys rigidly attached to such arms and extending through the slots in plate F, substantially as and for the purpose described.

4. In combination with the locking-bar provided with guide-arms, the open-sided guide-sockets for the arms on the locking-bar, and the swinging plates adapted to close with their ends the open sides of the sockets, substantially as and for the purpose shown.

5. In combination with the locking-bar having the upper and lower arms or lugs at its ends, the sockets for receiving and guiding the lower arms, the sockets for receiving the upper arms, open at one side, and the movable pieces for engaging the upper arms on the open sides of such sockets, substantially as and for the purpose set forth.

6. In combination with the locking-bar having the upper and lower guide-arms on its ends, the guide-sockets for the lower arms, open on their upper sides, the open-sided sockets for the upper guide-arms, and the swinging stops adapted to engage with their ends the sides of the upper guide-arms not engaged by the sockets, substantially as and for the purpose described.

7. In combination with the sliding locking-bar K, the swinging plate adapted to engage a portion of the bar end, and the lock provided with the bolt having the inclined face adapted to engage the plate, substantially as and for the purpose specified.

8. In combination with the sliding bar K, the means for locking the same, consisting of the swinging plate provided with the inwardly-projecting portion adapted to engage a lug or arm on the bar, and the lock having the movable bolt provided with a cam-face or incline to engage the plate, substantially as and for the purpose shown.

9. In combination with the series of indicator-rods having the key-arms, and the short arms *e e* on their lower ends below the key-arms, the swinging frame U, extending over and engaging these lower arms, and a spring suitably connected with the frame to draw it downward, substantially as and for the purpose set forth.

10. In combination with the alarm mechanism and the drawer, a locking device for the latter connected with the alarm mechanism, so as to be operated thereby, substantially as and for the purpose described.

11. In combination with the alarm mechanism and the drawer, the locking device for the latter, and means connected with the alarm mechanism to trip the locking device as the alarm mechanism moves to give the alarm, substantially as and for the purpose specified.

12. In combination with the alarm-striking lever, the drawer, and a locking device for the latter, means whereby the striking-lever in moving to strike the alarm actuates the locking device to unlock the drawer, substantially as and for the purpose shown.

13. In combination with the drawer and a locking device therefor, the lever connected with such device, and the bell-hammer lever adapted to engage and move the locking-device lever, substantially as and for the purpose set forth.

14. In combination with the drawer and the bolt for locking the same, the lever connected with the bolt, and the bell-hammer lever adapted to strike and actuate the bolt-lever, substantially as and for the purpose described.

15. In combination with the drawer-locking bolt and the lever connected therewith, the bell-hammer lever provided with a pin or lug to engage the bolt-lever, substantially as and for the purpose specified.

16. In combination with the drawer-locking bolt, the lever connected therewith, the spring engaging this lever, and the bell-hammer lever of the alarm mechanism, provided with means for engaging the bolt-lever, substantially as and for the purpose shown.

17. In an indicator, in combination with the drawer, the indicating devices, and an alarm mechanism connected with the indicating devices to give an alarm as an indication is made, the drawer-locking device adapted to be actuated by the alarm mechanism to unlock the drawer, substantially as and for the purpose set forth.

18. In an indicator, in combination with the drawer, the indicating devices, and the alarm mechanism connected with the indicating devices, so as to be operated thereby, the locking-bolt and the lever connected therewith adapted to be actuated by the alarm-striking lever of the alarm mechanism as such lever moves to strike the alarm, substantially as and for the purpose described.

19. In combination with the series of indicating devices, the alarm mechanism having the bell-hammer lever for striking the alarm, said lever having a pin or lug, connecting mechanism between the indicating devices and the alarm mechanism, the locking-bolt, the lever connected therewith adapted to be engaged by the pin or lug on the hammer-lever, and the spring engaging the bolt-lever, substantially as and for the purpose specified.

20. In combination with the locking-bolt, the lever for operating the same, having the spring-arm and the inclined portion or projection thereon, and the hammer-lever provided with means for engaging the lever, substantially as and for the purpose shown.

21. In combination with the swinging bell-lever provided with a lug or pin, the locking-bolt and the lever connected therewith having the yielding arm provided with an inclined face to be engaged by the pin on the hammer-lever as the latter draws back for a stroke, and with a portion adapted to stand normally in the track of the said pin, substantially as and for the purpose set forth.

22. In combination with the locking-bolt, the drawer, the swinging plate thereon provided with an incline on its rear end to be engaged by the bolt and with the bolt-engaging notch, the swinging plate above such notched plate having its rear end inclined, and means for swinging such plates inward toward each other, substantially as and for the purpose described.

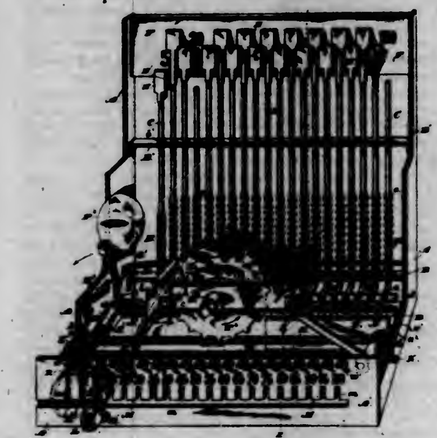
23. In combination with the bolt and the drawer, the two swinging plates on the drawer, one above the other, having oppositely-inclined surfaces at their rear ends to engage the bolt as the drawer is being closed, and the lower one having a notch on its inner side, and means for normally swinging the plates inward toward each other, so that the upper plate covers the notch in the lower one, substantially as and for the purpose specified.

24. In combination with the lower swinging plate having the notch on its inner side and the inclined surface at its end, the upper swinging plate adapted to cover the notch in the lower plate when the two plates are swung inward toward each other, and having at its end an incline opposite to that on the other plate, and the spring acting to swing the plates toward each other, substantially as and for the purpose shown.

25. In combination with the locking-bolt, the drawer, and the plate thereon provided with a slot, the upper and lower plates pivoted under the slotted plate, so as to swing inward across the slot, having the opposite inclines at their rear ends, and the lower plate having the notch to engage the bolt, suitable stops to limit the inward swing of the plates, and the spring adapted to swing them inward, substantially as and for the purpose set forth.

26. In combination with the two series of register-wheels, the pawl-supporting rod or bar, the pawls pivoted thereon in pairs, of which one pawl engages the teeth of a wheel in one series and the other those of a wheel in the other series, the arms on the respective pawls of each pair, and the spiral springs connected at their opposite ends with such arms, substantially as and for the purpose described.

27. In combination with a series of hollow register-wheels, each provided within, on one side, with a fixed lug having an incline on its forward side with relation to the rotation of the wheel, the longitudinally-movable and rotary shaft provided with the series of pins, substantially as and for the purpose shown.



28. In combination with a register-wheel shaft, the means for shifting the shaft and holding the same as shifted, said means consisting of the independent cam-levers engaging the opposite ends of the shaft, substantially as and for the purpose set forth.

29. In combination with the two register-wheel shafts and the supports for their ends, a lever pivoted between the bearings of the shaft ends and provided with the two inclined or cam faces adapted to engage both the shafts, substantially as and for the purpose described.

30. In combination with the two register-shafts and suitable supports for the opposite ends thereof, the two cam-levers, each provided with the two inclines or cams to engage the corresponding ends of the two shafts as the levers are swung on their pivots, substantially as and for the purpose specified.

31. In combination with the two series of register-wheels provided with lugs, the two shafts for supporting the wheels, made longitudinally movable as well as rotary, and the two cam-levers for engaging the opposite ends of the shafts, each having the two cam-surfaces to engage the ends of both shafts at once, substantially as and for the purpose shown.

384,692. CASH REGISTERING AND INDICATING APPARATUS. CASH B. HOWELL, Louisville, Ky. Filed Mar. 10, 1887. Serial No. 230,455. (No model.)

Claim.—1. In combination with the plate provided with the series of numbers or indicating-marks on its opposite sides, the series of movable rods provided with the number-hiding plates, situated on both sides of the numbered plate, substantially as and for the purpose shown.

2. In an indicator, in combination with a plate provided with the series of indicating-numbers, the series of rods below, a plate on each of the rods adapted to hide the numbers on the plate when the rods are raised, and suitable springs for raising the rods and holding them raised, substantially as and for the purpose set forth.

3. In combination with the numbered plate or surface, the indicator-rods below such plate or surface provided with plates to cover the numbers when the rods are raised, spiral springs surrounding the rods and forcing them upward, and suitable stops for limiting the upward travel of the rods, substantially as and for the purpose described.

4. In combination with the plate or surface provided with the series of numbers, the rods provided with plates for hiding the numbers, and with arms or projections, the springs for actuating the rods in one direction, and a lever adapted to be brought at will into engagement with any one of the projections or arms on the rods, substantially as and for the purpose specified.

5. In combination with the series of rods provided with arms or projections, the lever-supporting shaft and the lever supported thereon so as to be capable of being slid along the shaft, with its end passing over the series of arms on the rods, and of being rocked on the shaft, substantially as and for the purpose shown.

6. In combination with the series of rods provided with arms or projections, the shaft parallel to the series of arms and the lever supported on the shaft so as to be free to be moved along the same and rocked thereon, as desired, substantially as and for the purpose set forth.

7. In combination with the series of arms or projections, the key-lever adapted to be moved along the series and rocked to engage any desired one of the arms, and means, substantially as described, for returning the lever to its starting-point when it is released, substantially as and for the purpose shown and described.

8. In combination with the series of indicator-rods and arms or projections thereon, the lever-supporting shaft, the loose sleeve thereon, and the lever carried by the sleeve, the spring-drum, and the cord connected with the drum and the lever, substantially as and for the purpose specified.

9. In combination with the series of indicator-rods provided with portions adapted to be engaged by a lever, the sliding and swinging lever, the swinging frame having the bar under the lever, and the springs for raising the frame, substantially as and for the purpose shown.

10. In combination with the series of indicator-rods provided with portions adapted to be engaged by a lever, the sliding and rocking lever adapted to be moved along the series and rocked to actuate any one of the rods, the rotary drum, a spring for rotating the same, and a cord attached to the drum and to the lever, substantially as and for the purpose set forth.

11. In combination with the sliding and rocking key-lever, the swinging frame having the bar extending across below the lever and a pawl for locking the frame in an elevated position, substantially as and for the purpose described.

12. In combination with the series of indicator-rods and the sliding and rocking lever for actuating them, the swinging frame having the bar extending across in front of the rods and below the lever, and bell-striking mechanism connected with the frame, so as to be operated thereby as it is swung down by the lever, substantially as and for the purpose specified.

13. In combination with the sliding and rocking key-lever, the swinging frame having the bar engaging the lever, the springs connected with the frame, a bell-striking lever, and a tripping device for the same on the frame, substantially as and for the purpose shown.

14. In combination with the series of indicating devices in an indicator and the sliding and rocking lever adapted to actuate any one of such devices, as desired, a swinging frame adapted to hold the lever out of engagement with the indicating devices, a spring-dog for locking the frame, and suitable means on the lever for tripping such dog when the lever is at its starting-point, substantially as and for the purpose set forth.

15. In combination with the series of indicating devices and the sliding and rocking lever for actuating the same, the frame having the bar extending under the lever, the springs for raising such frame to support the lever, a spring-dog adapted to lock the frame in its elevated position when it has been depressed and allowed to rise again, and a suitable trip on the lever for tripping such dog, substantially as and for the purpose described.

16. In combination with the swinging frame and the lug or lip thereon, the swinging pawl provided with a notch to engage the lug and having its notched portion made yielding, so that it can be pushed off of the lug, and the spring for swinging the pawl, substantially as and for the purpose specified.

17. In combination with the swinging frame and the lug thereon, the swinging pawl adapted to engage the rear edge of the lug and having its engaging portion made yielding, so that it can be pushed off of the lug, and the spring for swinging the pawl into engagement with the lug, substantially as and for the purpose shown.

18. In combination with the swinging frame and the lug thereon, the pawl pivoted to swing toward and from the edge of the lug and made yielding in a direction at right angles to its swing, and the spring for swinging the pawl against the edge of the lug, substantially as and for the purpose set forth.

19. In combination with the swinging frame and the lug thereon, the swinging pawl having its lower portion made of spring material to yield in a direction at right angles to its swing, and having its lug-engaging edge notched and cut away below the notch to a point beyond the arc of movement of the lug as the frame swings, and the pawl-spring, substantially as and for the purpose described.

20. In combination with the swinging pawl having its lower portion made of spring material adapted to yield in a direction at right angles to the plane of its swing, a stop adapted to limit its swing, and also the springing of its lower end, and the spring for swinging the pawl, substantially as and for the purpose specified.

21. In combination with the swinging frame and the key thereon, the swinging pawl, whose lower end is of spring material and normally tends to stand out in position to be swung against the rear edge of the key, and is provided with a lug-engaging notch and below such notch is cut away or inclined rearward beyond the path of the rear edge of the lug, and the pawl-actuating spring, substantially as and for the purpose shown.

22. In combination with the swinging frame and means for automatically locking the same in elevated position when the frame has swung down and risen again, one or more springs for raising the frame, and the sliding key-lever provided with means for tripping the frame-locking device when the lever is slid to its starting-point, substantially as and for the purpose set forth.

23. In combination with the series of indicator-rods and the springs for raising and holding them up, arms or shoulders on the rods, and the swinging wing or pawl-plate, substantially as and for the purpose described.

24. In combination with the series of indicator-rods having the arms on their lower ends, the springs for raising the rods and holding them up, the swinging plate, and a spring or springs acting to hold the plate with its lower edge in the path of the arms on the rods as such rods are depressed, substantially as and for the purpose specified.

25. In combination with the series of indicating devices and the sliding and rocking lever adapted to be moved into position to actuate any of the indicating devices and rocked or swung to engage and move such device, the plate having the longitudinal slot along which the lever is moved and the series of upright slots to allow movement of the lever to actuate the different indicating devices, substantially as and for the purpose shown.

26. In combination with the series of indicating devices and the sliding and rocking lever for actuating the same, the plate provided with the longitudinal slot through which the lever projects, and with the series of upright slots extending up from such slot, so situated that when the lever is below any one of them it will be in position to actuate one of the indicating devices and numbered to agree with the indicating-numbers, substantially as and for the purpose set forth.

27. In combination with the sliding and rocking key-lever, the plate provided with the longitudinal slot and the series of upright numbered slots extending up from the upper edge of the longitudinal slot, and sliding gages or stops on the plate beside the upright slots adapted to be moved separately, so as to project down across the longitudinal slot in the plate, substantially as and for the purpose described.

28. In combination with the series of indicating devices and the sliding and rocking key-lever, the plate provided with the longitudinal slot, and with the upright slots extending up from such slot, so situated as to allow the lever to be rocked when it has been slid into position to actuate any of the indicating devices, and suitable movable stops adapted to be moved into position to stop the lever under any of the upright slots, substantially as and for the purpose specified.

29. In combination with the plate having the longitudinal slot and the series of upright slots at the upper side thereof, the sliding gage plates or stops on the slotted plate close beside the upright slots and adapted to be moved in position across the longitudinal slot, substantially as and for the purpose shown.

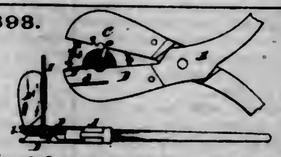
30. In combination with the plate provided with the longitudinal slot and the series of slots at right angles thereto, the sliding stops on the plate close beside the several slots of the series, provided with projections adapted to stand across such slots when the stops are moved to cause their ends to stand across the longitudinal slot in the plate, substantially as and for the purpose set forth.

31. In combination with the sliding and rocking lever, the plate slotted longitudinally and provided with the series of upright slots extending up from said slot, the series of stops or gages, each adapted to be moved to stand across the longitudinal slot close beside one of the upright slots, and provided with an arm or projection extending over across the upright slot when the stop is so moved, substantially as and for the purpose described.

32. In combination with the series of indicating devices and the sliding and rocking lever for actuating the same, the longitudinally-slotted plate provided with the series of upright slots up which the lever is moved to actuate the different indicating devices, and the stops or gages alongside the respective slots, each having a suitable handle, and being marked with a number corresponding to the number on the indicating device which will be actuated if the lever be raised up the slot under which the gage stops the lever in its movement along the longitudinal slot in the plate, substantially as and for the purpose specified.

33. In combination with the sliding and rocking key-lever, the registering mechanism and suitable connections between the same and the lever, whereby as the latter is slid in one direction the registering mechanism is actuated, substantially as and for the purpose shown.

34. In combination with the lever pivot-shaft and the lever rocking and sliding thereon, registering mechanism and the band connected with the lever and adapted to actuate the registering mechanism, substantially as and for the purpose set forth.



35. In combination with the lever-supporting rod or shaft and the key-lever adapted to be slid along the same, the chain attached to the lever and passing around suitable pulleys, and the registering mechanism having a toothed wheel to mesh with the chain, substantially as and for the purpose described.

36. In combination with the registering-wheels proper and the toothed wheel connected therewith by a pawl-and-ratchet connection, the chain, the two pulleys around which the chain passes, and the sliding key-lever connected with the chain, substantially as and for the purpose specified.

37. In combination with the register-wheel shaft and the toothed register-wheel fixed thereto, the spring-pawl on the wheel, two or more toothed register-wheels loosely journaled on the shaft, and each provided on its one side with one or more ratchet-shaped projections and on its other side with a spring-pawl to engage the projection on the next wheel, one or more teeth projecting out from the periphery of each wheel close to the series of teeth on the next wheel, the carrying-wheels, and the pawls engaging the series of teeth on the several wheels, substantially as and for the purpose described.

384,698. RUBY-PIN SETTER. FRANK HYDE, Sioux Falls, Dak. Filed Sept. 24, 1887. Serial No. 250,256. (No model.)

384,698.

Claim.—1. In a jewel-setting device of the class specified, the blades adapted to hold the balance-staff, and the wing-piece formed on one of said blades and adapted to communicate heat applied thereto to the roller-table resting on said blades, substantially as and for the purpose set forth.

2. In a jewel-setting device, the combination of two hinged blades adapted to pass between the balance-wheel and the roller-table and hold the balance-staff in position, and a wing-piece forming a portion of one of the blades, but separated from the main body thereof by a slot, whereby heat applied to the wing-piece is communicated to the contiguous portion of the blade and the roller-table supported thereby without overheating the other parts, substantially as specified.

3. In a jewel-setting device of the class specified, the combination of two hinged blades adapted to pass between the balance-wheel and the roller-table, a wing-piece formed on one of the blades to receive and communicate heat to the roller-table, and a lower blade adapted to support the stud, substantially as set forth.

4. In a jewel-setting device of the class specified, the combination of two hinged blades adapted to pass between the balance-wheel and the roller-table and hold the same in position, a wing-piece formed on one of said blades, a vertical rod mounted on said wing, said rod having a socket at its lower end adapted to hold the jewel and being free to move vertically, substantially as and for the purpose set forth.

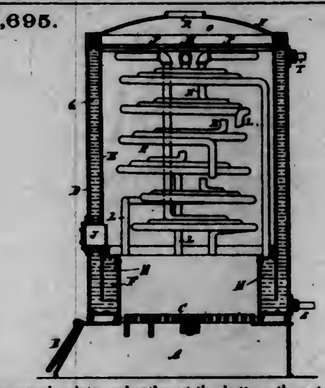
5. In a jewel-setting device of the class specified, the combination of two hinged blades having notches forming the hole *a*, the notch or hole *c*, the wing-piece B', and the slot *d*, substantially as and for the purpose set forth.

6. In a jewel-setting device of the class specified, the combination of the blade B, having the wing-piece B', and the rod E, mounted thereon and having at its lower end the hole to receive the jewel A, and a tongue, *j*, adapted to hold the jewel in position by spring-pressure, said rod having a free vertical movement, substantially as and for the purpose set forth.

384,694. METAL-CUTTER. ALBERT G. IRVIEN, Boston, Mass., assignor to William Smith, same place. Filed Nov. 17, 1887. Serial No. 255,443. (No model.)

Claim.—1. The combination and arrangement of the standard-plate, the lever, and the lower-blade bar with the upper-blade bar divided into two arms at its left-hand end, said arms passing, respectively, on each side of a projection from the lower-blade bar and the standard-plate, all constructed and arranged substantially as shown and described.

2. The combination and arrangement of the two blade-bars with their respective blades, and the standard or supporting plate, and the working-lever provided with segmental gear carrying round-top cogs, and the corresponding segmental gear on the lower-blade bar, all constructed and arranged substantially as shown and described.

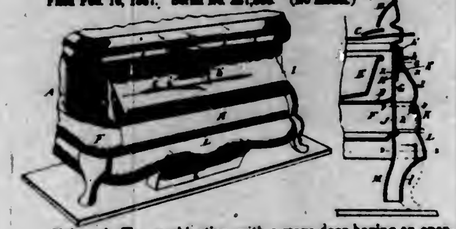


384,695. WATER-HEATER. CHARLES G. JEWETT, Howell, Mich. Filed Feb. 2, 1888. Serial No. 262,739. (No model.)

Claim.—1. In a water heater and circulator, the combination of three concentric shells arranged to form two annular water-chambers communicating with each other at the bottom, the outer chamber extending the height of the heater and the inner chamber the height of the furnace, and heating-coils connecting the top of the inner chamber with the top of the outer one, substantially as described.

2. In a water heater and circulator, the combination of three concentric shells arranged to form an outer and an inner annular water-chamber opening into each other at the bottom, the outer chamber extending to the top of the heater and the inner one to the top of the furnace-chamber, and helical heating-coils in vertical series and arranged to connect the tops of the two water-chambers, substantially as described.

3. In a water heater and circulator, the combination of three concentric shells arranged to form an outer and an inner annular water-



384,695.

chamber opening into each other at the bottom, the outer chamber extending the height of the heater and the inner one the height of the furnace, a ledge formed on top of the inner chamber, and heating-coils arranged in vertical series, said coils consisting of conical helices terminating in downwardly-extending risers at the outer ends which connect with the top of the inner chamber, and in upwardly-extending risers at their inner ends which extend upwardly and then laterally to connect with the top of the outer chamber, substantially as described.

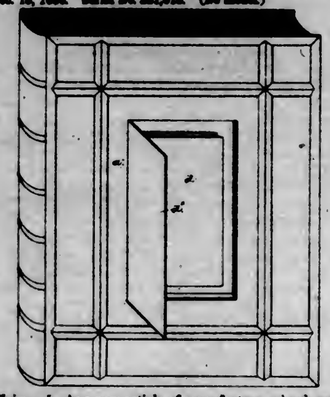
4. In a water heater and circulator, the combination, with the annular water chamber or chambers, of a series of substantially horizontal circulating heating-coils arranged in a vertical series, each coil having its inner end extended upwardly and connected to the top of the water-chamber and its outer end extending downwardly and connected to the bottom of the water-chamber, substantially as described.

384,696. VENTILATING-FLUE FOR STOVES. WILLIAM J. KEEP, Detroit, Mich., assignor to the Michigan Stove Company, same place. Filed Feb. 16, 1887. Serial No. 227,993. (No model.)

Claim.—1. The combination, with a stove-door having an opening communicating with the interior of the stove, of a hood attached thereto and projecting down below the bottom edge of the opening in the door, said door and hood forming a ventilating-flue open at the bottom and terminating above at the opening in the stove-door, substantially as described.

2. The combination, with a stove-door having an opening communicating with the interior of the stove and a damper closing said opening, of a hood connected to the upper part of the door and projecting downward sufficiently to hide the damper and the bottom edge of the stove-door, said door and hood forming a ventilating-passage open at the bottom and terminating above at the opening in the stove-door, substantially as described.

3. The combination, in a stove and with its ash-pit door having an aperture communicating with the interior of the stove, of a damper for closing the same, a hood covering said aperture from sight, said door and hood forming a ventilating-passage open at the bottom and terminating above at the opening in the ash-pit door, and said hood having an opening for a connection with the damper, and a slide closing said opening, substantially as described.



4. The combination, in a stove and with its ash-pit door having an aperture communicating with the interior of the stove, of a damper for closing the same, a hood covering said aperture from sight, said door and hood forming a ventilating-passage open at the bottom and terminating above at the opening in the ash-pit door, and said hood having an opening for a connection with the damper, a slide closing said opening, and an index for indicating the position of the damper, substantially as described.

5. In a stove having an ash-pit, a smoke-flue under the same, and a ventilating-flue communicating with the interior of the stove at top and with the atmosphere at the bottom, a pivoted door dividing said ventilating and smoke flues, and an opening in the outer wall of the ventilating-flue through which access may be had to said door, substantially as described.

6. In a stove having a ventilating-flue communicating with the interior of the stove at top and with the atmosphere at the bottom, the combination of a movable door above an opening in said ventilating-flue with a pivoted door forming one side of the flue and dropping over and bridging said opening, substantially as described.

7. In a stove, a ventilating-flue formed of the door G, provided with suitable openings, the plate I, attached thereto, the wall of the bottom flue-base, the plate K, the leg-base L, the extension *l* thereof, and the plate M, substantially as shown and described.

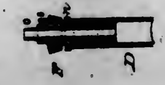
384,697. BOOK-COVER. THOMAS KELLY, New York, N. Y. Filed Dec. 15, 1886. Serial No. 221,618. (No model.)

Claim.—1. As a new article of manufacture, a book-cover having a box or receptacle within it, an opening at the end of the cover to gain access to the said box or receptacle, and a tongue to conceal the opening, substantially as described.

2. As a new article of manufacture, a book-cover having a box or receptacle within it, a lid, as *d'*, to expose the box or receptacle, and a tongue, as *c*, to also expose or gain access to the box or receptacle, substantially as described.

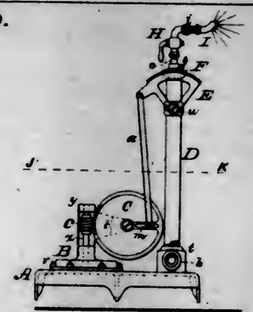
384,698. LETTER-BOX. JAMES W. LANSFORD, Nashville, Tenn. Filed Mar. 7, 1888. Serial No. 266,464. (No model.)

Claim.—1. In a letter-box, the combination, with the base, sides, and front, of a sloping top having a flanged aperture therein, a sloping cover lying over said top with flanges extending down on the sides and front of the box, and a bolt on which said cover hinges passing through said flanges and the top of the box, substantially as described.



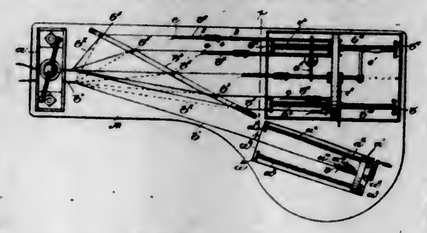
2. The combination, with a letter-box, of a front section extending below the bottom of the box, and a receptacle for newspapers, packages, &c., located behind said extension, substantially as described.

3. The combination, with a letter-box, of a front section extended down below the bottom of the box on a plane slightly back of the general plane of the front, whereby a step is formed on the inside upon which the front edge of the bottom rests, substantially as described.

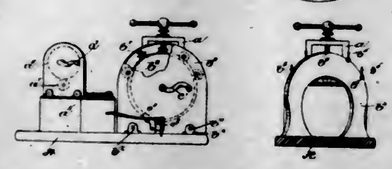


4. The combination, with a letter-box and a front section extending below the bottom of the same, of a tubular receptacle located behind said extension, substantially as described.

384,699. LAWN-SPRINKLER. WILLIAM W. LEE, Northampton, Mass. Filed Apr. 1, 1887. Serial No. 233,280. (No model.)



Claim.—In combination, base A, vertical pipe D, water-motor B, swiveling-pipe *e*, elbow H, nozzle I, and mechanism C *a* E F, connecting water-motor B with pipe *e*, the axis of pipe *e* being the continuation of that of vertical pipe D, all substantially as and for the purpose set forth.



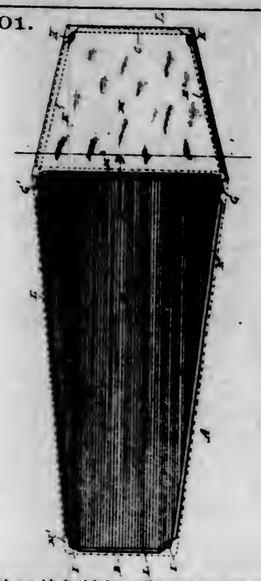
384,699.

384,700. WAX-END MACHINE. ROBERT M. MACINTOSH, Boston, Mass. Filed Jan. 12, 1888. Serial No. 260,510. (No model.)

Claim.—1. In a wax-end-forming machine, a thread holder or clamp to hold the thread at or near one end of the machine and a plurality of spindles or strand-holding devices, combined with a bridge or support intermediate of the said clamp and spindles, and to which the individual strands are secured, the said clamp, bridge, and spindles being arranged with relation to each other to obtain a substantial parallelism between the said bridge and spindles, the said strands being untwisted only between the said spindles and bridge, substantially as described.

2. In a wax-end-forming machine, a thread-holder and a bridge oblique or inclined with relation to said holder, combined with a plurality of spindles or thread-holding devices and means to rotate said spindles, the latter having their ends in a line substantially parallel to the said bridge, substantially as described.

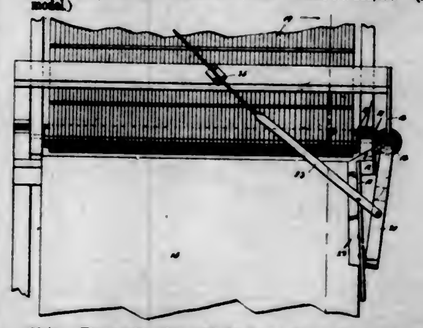
3. In a wax-end-forming machine, a thread-holder and a bridge oblique or inclined with relation to said holder, combined with a plurality of adjustable spindles or thread-holding devices and means to rotate said adjustable spindles, the latter having their ends in a line substantially parallel to the said bridge, substantially as described.



384,701. COFFIN. JAMES P. MARSH and JOHN S. MARSH, New York, N. Y. Filed Feb. 17, 1888. Serial No. 264,264. (No model.)

Claim.—1. In a metallic coffin, the combination, with the body, of a sectional sliding lid, the sections thereof overlapping each other and provided at their overlapped ends with beads engaging each other, substantially as described.

2. In an improved coffin, consisting of a body having its bottom, head, and foot end walls and the forward and rearward converging side walls formed of separate pieces of sheet metal, secured together by lap-joints and provided with guide-flanges on their upper edges, and



384,701.

a sectional lid provided with inwardly-turned edges, and with beads at their overlapped ends, substantially as herein shown and described.

384,702. GRAIN-ADJUSTER FOR BINDERS. FREDERICK R. B. MALER, Chrisney, Ind. Filed Jan. 9, 1888. Serial No. 260,150. (No model.)

Claim.—The combination, with the frame, the receiving-table 15, the bracket 16, and the crank-shaft 13, journaled in the said bracket, of the butt-board 10, having a block, 12, on the outer side of its inner end loosely connected with the crank of the shaft 13, the frame 20, having arms 21, pivoting on the ends of the shaft 13 beyond its crank and against the inner face of which the board 10 slides, the adjusting-rod 23, and the plate 22, projecting from the lower edge of the frame 20 inwardly under the lower edge of the board 10, substantially as set forth.

384,703. DOUBLE-HARNESS SADDLE AND YOKE. LOUIS A. MARSH, Montclair, N. J. Filed Oct. 1, 1887. Serial No. 251,293. (No model.)

Claim.—1. A double-harness saddle and yoke device consisting of a connecting bar or rod, swiveled pieces or plates adapted to slide thereon and detachably connected thereto, yokes pivoted to the swiveled plates, and saddle-trees pivoted to the yokes to rock laterally and having securing-straps, substantially as described.

2. In the double-harness saddle and yoke device herein described, the combination, with a saddle-tree, of a yoke secured thereto by a removable pin or bolt, substantially as described.

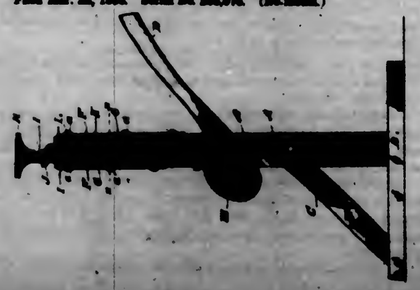
3. In the double-harness saddle and yoke device herein described, a yoke bar or rod connecting the saddle-trees, and having a frame adapted to swing laterally and supporting an adjustable clevis, substantially as described.

4. In the double-harness saddle and yoke device herein described,

384,703.

a yoke bar or rod connecting the saddle-trees, and having a frame carrying pivoted bars and a clevis adjustable in slots in said bars, substantially as described.

5. The combination, with connecting-rod 2, of saddle-trees 1, pivoted pads 10, bolt 7, yoke 3, hook 9, and swiveled piece 4, having hook 5 and link 6, substantially as described.



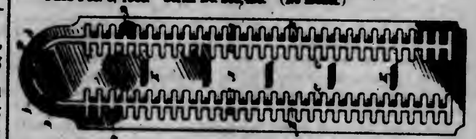
6. The combination, with rod 2 and saddle-trees 1, connected thereto, of a frame and pivoted slotted bars 28, and a clevis consisting of cross-bar 32, having headed ends engaging slots 31 and arms 34, and pivoted bar 36, engaging an arm, 34, substantially as described.

384,704. MACHINE FOR CUTTING WOOD. WILLIAM RUSSELL, East Saginaw, Mich., assignor of one-half to S. S. HOUK, same place. Filed Nov. 23, 1887. Serial No. 255,321. (No model.)

Claim.—In a machine for cutting rotten wood, a knife-bearing wheel having a V-shaped periphery and slots to snugly receive knives, with knives fitting in the close slots, and having cavities in face of wheel under the knives for clearance of chips.

384,705. WAGON-JACK. ANDREAS P. HILLSPANNER, Burton, Ohio. Filed Mar. 22, 1888. Serial No. 268,078. (No model.)

Claim.—In a wagon-jack, the combination, with a slide-bar adapted to be raised and lowered, of a notched axle-support interior of said bar, and a yoke supported by said bar and having teeth adapted to engage with said notches, whereby said yoke and support are secured together in various adjustments, substantially as and for the purposes hereinbefore set forth.



384,706. PUMP. JOHN A. HUBBAT, Yuma, Ariz. Filed Dec. 1, 1887. Serial No. 256,702. (No model.)

Claim.—1. In a pump, a valved plunger or piston consisting of the metal body-band H, having upwardly-extending side wings, the wings h' and c', seated on said side wings, the leather band h^2, encircling the body-band, the ring h^3, bolted to said body-band and confining the leather band, and the stirrup h^4, having its ends bolted within the body-band, substantially as described.

2. In a pump, the combination, with a single cylinder, of a valved plunger or piston having a hollow stem or rod, a second valved plunger or piston below the first with its stem or rod passing through the stem or rod of the first plunger, said rod being flattened where it passes through the upper valve and having its lengths joined by screw-threads cut in opposite directions from those which unite the lengths of the upper piston-rods, substantially as herein described.

384,707. GAME-COUNTER. FRANK G. HAM, San Francisco, Cal. Filed Feb. 8, 1888. Serial No. 263,620. (No model.)

Claim.—1. A counting or scoring board consisting of a plate having a longitudinal slot or slots forming the ways for the scoring-pegs, and cross-slots opening out from each side thereof, and pegs fitted to the plate to move in the way-slots and enter the scoring-slots, substantially as herein described.

2. A counting or scoring board consisting of a plate having longitudinal slots forming ways for the scoring-pegs, and cross-slots opening out from each side thereof, and pegs having turned-down centers fitting and sliding in the slots, and enlarged heads or ends, whereby said pegs are confined in the slots, substantially as herein described.

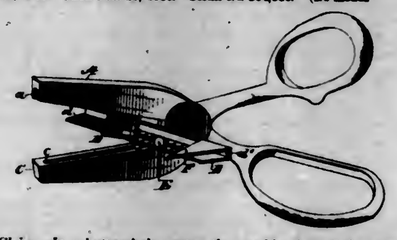
3. A counting or scoring board consisting of a plate having a plural number of longitudinal slots forming ways for the scoring-pegs, and cross-slots opening out from each side thereof, said cross-slots having an upgrade to the way-slots for preventing the pegs from being jarred from place, and scoring-pegs fitted to the plates to move in the way-slots and enter the scoring-slots, substantially as herein described.

4. A counting or scoring board consisting of a plate having a plural number of longitudinal way-slots, and cross scoring-slots opening out therefrom, said cross-slots having an upgrade to the way-slots, scoring-pegs having turned-down centers fitting and sliding in the slots, and enlarged heads or ends, whereby said pegs are confined in the slots, substantially as herein described.

5. The counting or scoring board consisting of a plate, A, having the way-slots B, with extension-slots *b* at one end, and cross scoring-slots C, opening out from each side of the way-slots, said cross-slots having an upgrade to the way-slots, and the sliding pegs D, fitted in the slots and having enlarged heads or ends, whereby they are confined, substantially as herein described.

384,708. BUMP-CAR. JOSEPH GRIMSHAW, Trinidad, Colo., assignor of three-fourths to Simeon S. Wallace, Frank Gorrell, and Matthew Hewson, same place. Filed Feb. 4, 1888. Serial No. 263,267. (No model.)

Claim.—1. The combination, with a car-body and a gate hinged at its upper edge to the sides of the car, of a chain extended along and above the bottom of the car inside the same, and fastened at one end to the bottom of the car near its middle, and having at the other end fastening devices for connecting with the lower free end of gate, and adapted to hold the gate against swinging open, substantially as described.



2. The combination of a car-body, a gate hinged at its upper edge to the car-body, and having a slot, *b*, and a pivoted latch with spur *a*, and a chain connected at one end to the bottom of the car inside the same, and bearing at its other end a perforated bar or link, *c*, adapted to pass through the slot in the gate and receive the locking-spur of the latch, substantially as and for the purpose described.

384,709. ALLOY. CHARLES A. PAILLARD, Geneva, Switzerland. Filed Nov. 23, 1887. Serial No. 255,993. (No specimens.)

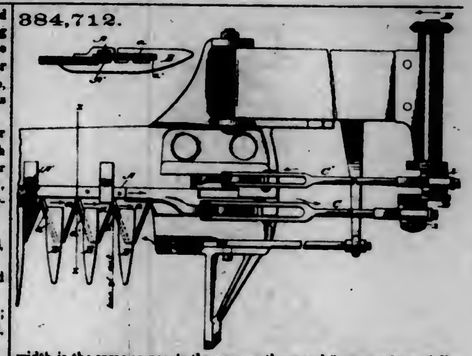
Claim.—1. An alloy composed of palladium, copper, silver, and steel, in about the proportions stated.

2. An alloy composed of palladium, twenty-five to forty-five parts; copper, thirty to sixty parts; silver, five to twenty parts, and steel, two to five parts, substantially as described.

384,710. BUTTON-HOLE CUTTER. GEORGE W. PETERS, Lancaster, Ohio. Filed Feb. 23, 1888. Serial No. 264,880. (No model.)

Claim.—In a button-hole cutter, the combination of the upper jaw, A, having a slot formed therein, a cutter, B, provided with an arm, *b*, formed at right angles with the said cutter, a lower jaw, C, carrying an adjustable gage, D, having a flange, *d'*, and a pointer, F, formed upon the upper edge thereof and bent parallel with the said gage, and a bolt, E, passing through the slot in the gage and through the longitudinal slot in the lower jaw, substantially as herein described and set forth.

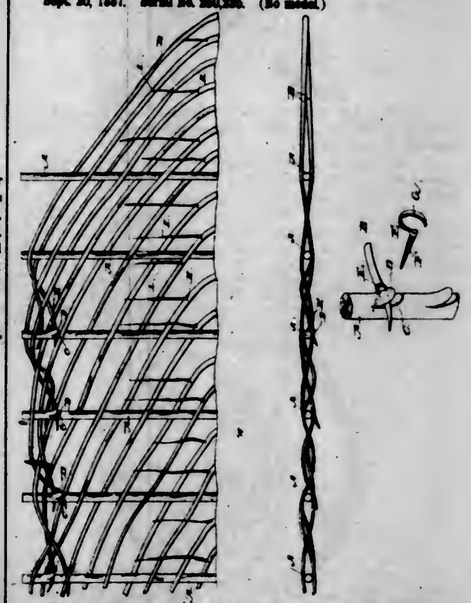
384,711. TRAY FOR COLLECTING COIN. SAMUEL R. PRATT, Boston, Mass. Filed Feb. 13, 1888. Serial No. 263,773. (No model.)



Claim.—The herein-described coin-collecting tray, consisting, essentially, of the main portion or floor A, having suitable upturned edges and one or more raised guiding noses or spouts, B, extending therefrom, said noses or spouts being turned up at an angle with said floor and provided with suitable sides, substantially as and for the purpose set forth.

384,712. MOWER. ALBERT L. GUILLIAN, Chateaugay, N. Y. Filed Nov. 15, 1887. Serial No. 255,218. (No model.)

Claim.—1. In a cutting apparatus of the class hereinbefore indicated, the combination of the double crank whose wrist-pins are set out of alignment with each other and the axis, and at unequal distances from the latter, to wit, five-eighths of an inch and three-eighths of an inch, respectively, a series of guard-fingers placed about two inches apart, and a series of upper cutters and a series of under cutters whose

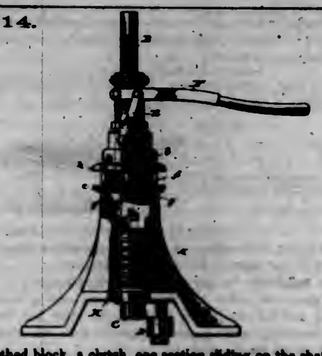


width is the same or nearly the same as the guard-fingers, substantially as shown and described, for the purpose specified.

2. The detachable double crank D, having wrist-pins 1 and 2 set out of alignment with each other and the axis, and at unequal distances from the latter, as shown and described.

384,713. HEDGE FENCE. JOHN H. RACER, Bellbrook, Ohio. Filed Sept. 20, 1887. Serial No. 250,226. (No model.)

Claim.—The combination, in a hedge fence, of the vertically-growing aligned plants A, having lips made by upwardly-inclined incisions in their sides, the inclined plants B, bent across said vertical plants and having their end portions inserted in the wounds formed by said incisions, and the retaining-hooks having their shanks driven into the vertical plants and embracing the inclined plants, for the purpose of preventing the latter from spreading the wounds in the vertically plants, substantially as specified.

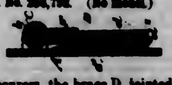


384,714. SWITCH-STAND. WILLIAM A. RHODES, New York, assignor to Fred W. Snow, Hilburn, N. Y. Filed Mar. 1, 1888. Serial No. 265,890. (Model.)

Claim.—1. The combination, in a switch-stand having a target-shaft and sliding toothed block, of a clutch, one section provided with teeth engaging those of the block, and a lock directly engaging the two sections of the clutch, substantially as described.

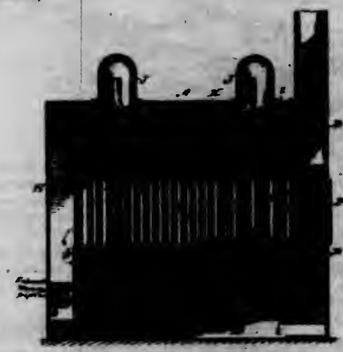
2. The combination of the stand-frame, sliding toothed block resting on a spring, target-shaft, and clutch, one section sliding on and turning with the shaft, the other with teeth engaging those of the block, and a lock directly engaging with the two sections, substantially as described.

3. The combination of the stand-frame, target-shaft, spring, and



384,714.

sliding toothed block, a clutch, one section sliding on the shaft and a lever for sliding it, the other section having teeth engaging with those of the block, and a projection on one section fitting a slot in the other and recessed to receive a locking-bolt, substantially as set forth.

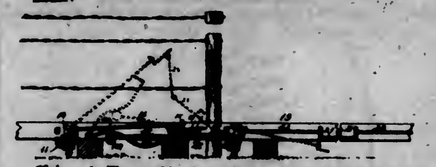


4. The sections of the clutch upon the target-shaft, one section having a series of slots and the other section a series of ears extending through and beyond the slots, substantially as and for the purpose described.

384,715. DOOR-CHECK. RICHARD A. REESE, St. Louis, Mo. Filed Dec. 2, 1887. Serial No. 256,792. (No model.)

Claim.—In door-securers, the brass D, jointed at d^3, pivoted to a door-bracket and provided with a sliding sheath, said sheath being pivotally connected with the bracket, and adapted to be used, substantially as set forth.

384,716. STEAM-BOILER. NORTHERN R. REYNOLDS, Norman, Dak. Filed Aug. 15, 1887. Renewed May 19, 1888. Serial No. 274,373. (No model.)



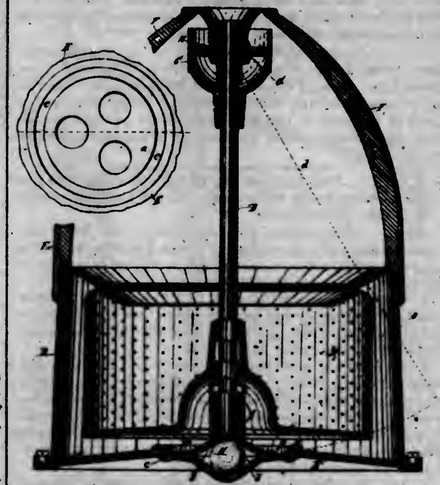
Claim.—1. A steam-boiler consisting of the combination of an upper and lower cylinder with fire-flues through the same, side pipes connecting the boilers, a grate and fire-box placed between the cylinders, a casing or breeching connecting the rear ends of the fire-flues of the two cylinders with the combustion-chamber, and a casing or breeching connecting the fire-flues at the front end of the boiler with the smoke-stack, substantially as shown and described.

2. A steam-boiler consisting of the combination of an upper cylinder having fire-flues *a*, a lower cylinder having fire-flues *b* and exhaust-steam flue *b'*, side pipes connecting the cylinders, a grate and fire-box placed between the cylinders, and the end casings connecting the fire-flues and having chambers b^2 b^2, communicating with the exhaust-steam pipes of the lower cylinder, substantially as and for the purpose described.

3. The combination, with the upper and lower cylinders, of side pipes, C, connecting the two cylindrical boilers and having blow-off cocks or valves C^3 at top and bottom, as shown and described.

4. The combination, with the upper and lower cylinders, of the side pipes, C, connecting the same, hollow-grate bars connecting the side pipes to form the fire-box, and reducer-couplings at the junction of the grate-bars and side pipes, as and for the purpose described.

384,717. RAILWAY-RAIL CROSSING. JAMES RAE, Prairie Creek, Ind., assignor of one-half to Bennet T. De Bean and John M. Talbott, both of same place. Filed Apr. 7, 1888. Serial No. 269,990. (No model.)

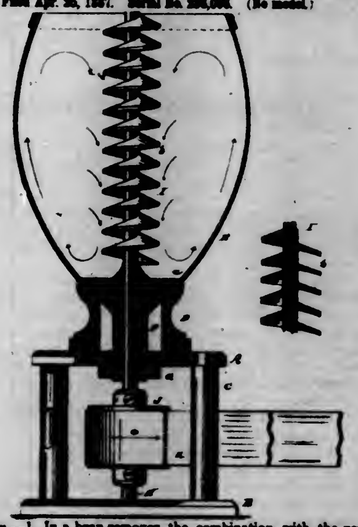


Claim.—1. The combination, with a rock-shaft journaled transversely beneath the track, and trip plates or platforms attached at one end to said rock-shaft, having their other ends unsupported, of a second rock-shaft, also journaled beneath the track to the rear of the first rock-shaft, gates pivoted upon the second rock-shaft, aprons connecting the trip-platforms and gates, and means, substantially as shown and described, for elevating the gates from the trip-platforms, as and for the purpose specified.

2. The combination, with a rock-shaft journaled transversely beneath the track, trip plates or platforms secured upon said rock-shaft, and a yoke projecting lengthwise of the track upon the same, of a second yoke attached centrally between the track, resting upon the yoke of the rock-shaft, a second rock-shaft journaled beneath the track in front of the latter yoke, gates secured to the second rock-shaft, and aprons connecting the trip-platforms and gates, substantially as shown and described.

3. The combination, with a rock-shaft journaled transversely beneath the track, and trip plates or platforms attached at one end to said rock-shaft, having their other ends unsupported, of a second rock-shaft, also journaled beneath the track to the rear of the first rock-shaft, gates pivoted at one end upon the second rock-shaft and provided with barbed points at their free ends, aprons connecting the trip-platforms and gates, and means, substantially as shown and described, for elevating the gates from the trip-platforms, as and for the purpose specified.

384,718. CENTRIFUGAL MACHINE. FRANK H. RICHARDS, Troy, N. Y. Filed May 3, 1886. Serial No. 272,626. (No model.)



Claim.—1. In a centrifugal machine, the basket-shaft, combined with a movable step at its bottom, a universal joint at its top, and an elastic ball or balls for regulating the travel of the step, substantially as and for the purposes set forth.

2. In a centrifugal machine, the basket-shaft, combined with a movable step at its bottom and a universal joint at its top, said step being mounted and arranged to travel upon a curved surface of which the center is in the center of the universal joint, and an elastic ball or balls interposed between the step and base, substantially as set forth.

3. In a centrifugal machine, the basket-shaft, combined with a movable step at its bottom, and an elastic ball or balls for regulating the travel of the step, the step being mounted upon a curved surface, substantially as and for the purposes set forth.

4. In a centrifugal machine, the combination of the base and the movable stop mounted thereon, said base and stop being provided with recesses for receiving an elastic ball or balls, substantially as explained.

384,719. BRAN-REMOVER. GEORGE W. H. SAFELY, New Orleans La. Filed Apr. 25, 1887. Serial No. 236,004. (No model.)

Claim.—1. In a bran-remover, the combination, with the vessel E, of a vertical shaft provided with screw-threads downwardly inclined on radii of the axis of the shaft, substantially as described.

2. In a bran-remover, the combination of a vessel having approximately the form of the frustum of a hollow ellipsoid, a shaft journaled axially in the said vessel, and a screw provided with threads downwardly inclined on radii of the axis of the shaft, carried by or formed upon the said shaft, substantially as described.

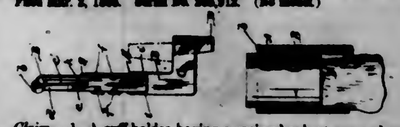
3. In a bran-remover, the combination of the vessel E, having the form of the frustum of an ellipsoid, the collar D, the sleeve F, provided with the concaved flange *a*, the shaft H, the screw I, carried thereby and provided with threads downwardly inclined from radii of the axis of the shaft H, and means, substantially as shown and described, for securing the vessel E and sleeve F to the supporting-frame of the machine.

384,720. FOOD PACKAGE AND PROCESS OF PREPARING THE SAME. HENRY SALEBE, Baltimore, Md. Filed Sept. 26, 1887. Serial No. 250,788. (No specimens.)

Claim.—1. The process of preserving meat or other food article by inclosing the same in an envelope of animal membrane, heating in a vessel containing vaseline, and inclosing in a protective wrapper of gauze coated with plaster-of-paris, substantially as described.

2. The process of preparing meat for preservation by inclosing the same in a wrapper of animal membrane, after disinfecting the latter, and then applying a coating of vaseline combined with a small quantity of paraffine, substantially as described.

3. The process of preserving meat or other food article by first treating the same to destroy bacilli or dangerous organisms, inclosing in a wrapper of animal membrane, after disinfecting the latter, heating in a bath of vaseline and paraffine, cooling without removal from the bath, and finally inclosing the article surrounded with its coating of vaseline and paraffine in a protective wrapper of gauze, after disinfecting the same, substantially as described.



4. As a new article of manufacture, a case or package consisting of an animal intestine having a coating of vaseline and a protective covering of plaster-of-paris and gauze and containing an article of food, substantially as described.

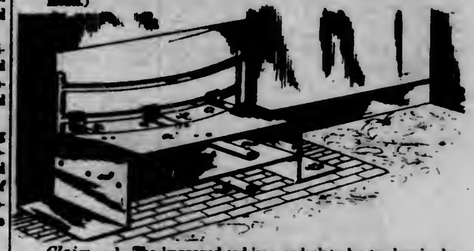
384,721. METHOD OF PRESERVING FOOD. HENRY SALEBE, Baltimore, Md. Filed Mar. 22, 1888. Serial No. 268,002. (No specimens.)

Claim.—1. The method of preserving a food article by inclosing it in an expansible wrapper, heating to reduce its bulk and destroy dangerous germs, coating with plaster-of-paris, drying, immersing in a bath of a plastic substance, such as vaseline, subjecting to heat therein, and cooling and removing from the bath, substantially as described.

2. The method of preserving a food article by inclosing the same in an expansible envelope, heating, coating with plaster-of-paris, immersing in a bath of vaseline or like substance and heating the same, removing from the bath after cooling, and finally dipping in melted paraffine, substantially as described.

384,722. CUFF-HOLDER. ANDREW W. SAWYER, Providence, R. I. Filed Mar. 3, 1888. Serial No. 265,912. (No model.)

Claim.—1. A cuff-holder having a spring-hook at one end and a fastening device at the other end, which consists of two parallel tongues extending in the opposite direction from the hook.



2. A cuff-holder having two shanks which are longitudinally adjustable upon each other, one shank having a spring-hook upon its outer end, and the other shank having at its outer end two parallel tongues extending in the opposite direction from the hook, all substantially as and for the purposes described.

3. A cuff-holder having a spring-hook at one end, a lateral offset extending from its other end, and a tongue extending from the inner edge of said offset and longitudinally outward from the shank, substantially as and for the purposes described.

4. A cuff-holder having two shanks which are longitudinally adjustable upon each other, one shank having a spring-hook upon its outer end and the other shank having a lateral offset extending from its outer end, and a tongue extending from the inner edge of said offset and longitudinally outward from the shank, all substantially as shown, and for the purposes described.

5. The combination, with the two shanks A and B, of the lips *f f*, tongue *h*, slot *d'*, and projections *i i*, all substantially as shown, and for the purposes described.

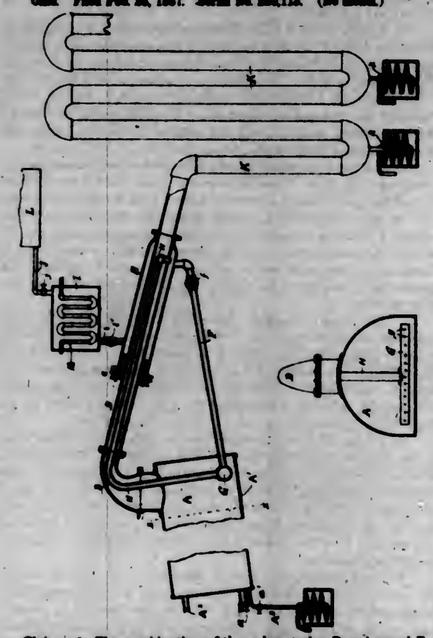
384,723. SAD-IRON AND PLATE HEATER. ROBT SHARER, West Point, Miss. Filed June 21, 1887. Serial No. 242,033. (No model.)

Claim.—1. The improved sad-iron and plate heater herein described and shown, comprising the top *a'* and back *a²*, the rearwardly-projecting supporting-hooks *a*, the sides *a³* at the ends of the top, and the steps A^5 at the lower ends of the sides to support the irons or plates, substantially as specified.

2. The improved sad-iron and plate heater, comprising the top *a'*, the hooks *a*, the sides *a³* at the ends of the top, the feet A^5 at the lower ends of the sides and arranged at an acute angle thereto, and the closed sides *a⁵*, substantially as specified.

384,724. BOB-SLEIGH. JOSEPH W. SHERMAN, Rockford, Wis. Filed Mar. 24, 1888. Serial No. 268,417. (No model.)

Claim.—1. In a bob-sleigh, the combination, with the runner, of the knee attached to the runner and comprising the converging sides or legs *m m*, the beam, and the wear-plate secured to the beam and having a keeper engaging the upper end of the knee, substantially as specified.



2. In a bob-sleigh, the combination of the wear-plate secured to the beam and having a depending apertured ear, K, the keeper I on the plate, the knee secured to the runner and having the converging legs *m m* mounted at their upper ends on the keeper I, and the brace N, having a hook, *n*, engaging the apertured ear K, and divergent arms O O, attached to the runner, substantially as and for the purpose specified.

3. In a bob-sleigh, the combination, with the front and rear beams mounted on the runners, as described, of the front bolster having keepers D on its rear side, the side raves, B, having loops on their front ends engaged in the keepers, and the rear bolsters attached to the raves, substantially as specified.

4. In a bob-sleigh, the combination, with the beams and the runners, of the side raves loosely connected or pivoted to the sleigh and adapted to be removed, substantially as specified.

5. In a bob-sleigh, the combination of the front and rear beams having the runners attached thereto, the reach attached at its front end to the front beam, the half-circle attached to the rear beam and having a tapped aperture at its center, and the bolt passing through the reach and engaging the said tapped aperture, substantially as and for the purpose specified.

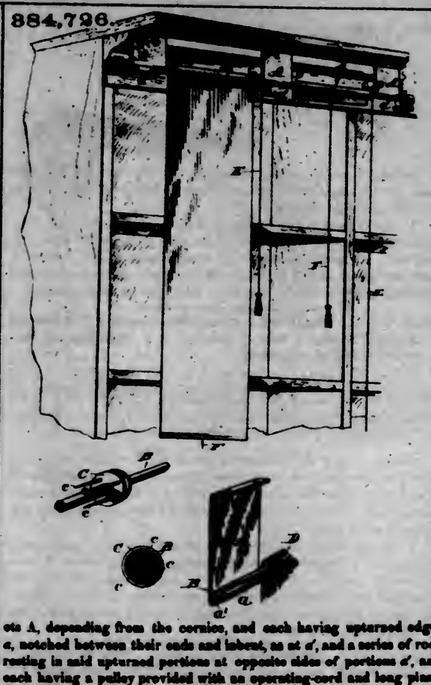
384,725. APPARATUS FOR DISTILLING FATTY ACIDS. PAUL STERNBY, Hoboken, assignor of one-half to James H. Gamble, Hamilton, Ohio. Filed Feb. 20, 1887. Serial No. 228,113. (No model.)

Claim.—1. The combination of the exhaust-pipe D and vessel E, surrounding the exhaust-pipe and rigidly attached thereto at one end and provided with an expansion-joint at the other end, and also provided with inlet and outlet pipes, substantially as and for the purposes specified.

2. In combination with a still, the outlet-pipe D, vessel E, surrounding pipe D, pipe F, communicating with the still from vessel E, and inlet to vessel E, substantially as specified.

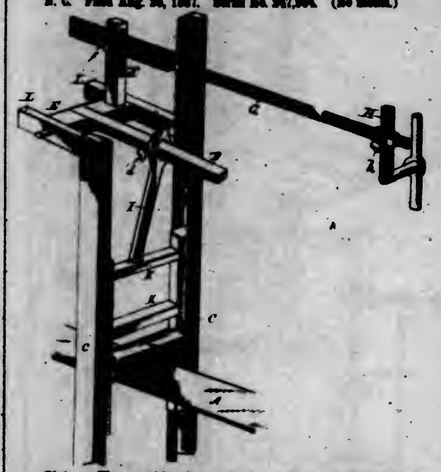
3. In combination with a still, the outlet-pipe D, vessel E, surrounding pipe D, pipe H, communicating with the still from vessel E and passing into the still through pipe D, and inlet to vessel E, substantially as specified.

4. In combination with a still, the outlet-pipe D, vessel E, surrounding outlet-pipe D, pipes F and H, communicating with the still from vessel E, the latter pipe passing into the still through the pipe D, and inlet to vessel E, substantially as specified.



5. In combination with a still, the outlet-pipe D, vessel E, surrounding pipe D, pipe H, passing from vessel E through pipe D into the still, pipe F, passing from vessel E into the still, pipe G, provided with openings *g* and communicating with pipes F and H, and inlet to vessel E, substantially as specified.

6. In combination with a still, heating-box I, containing steam-pipe M, outlet-pipe D, vessel E, surrounding pipe D, pipe *i*, connecting box I and vessel E, and pipe from vessel E communicating with the interior of the still, substantially as specified.



384,726. WALL-PAPER EXHIBITOR. H. OTTO SMITH, Creighton, Mo. Filed Apr. 2, 1888. Serial No. 269,260. (No model.)

Claim.—The combination, with the shelving having a forwardly-projecting cornice at its top, of the several horizontally-aligned bracket-arms A, depending from the cornice, and each having upturned edges *c*, notched between their ends and inbent, as at *c'*, and a series of rods resting in said upturned portions at opposite sides of portions *c'*, and each having a pulley provided with an operating-cord and long pins on its inner face, substantially as set forth.

384,726.

384,727. STEAM-REGULATOR. JOHN W. TAYLOR, Pittsborough, N. C. Filed Aug. 26, 1887. Serial No. 247,994. (No model.)

Claim.—The combination, with the roller journaled in a frame working in vertical guides and resting on and controlled in its movements by the driving-belt and the throttle-valve lever, of the rock-shaft having vertical and horizontal branches, the arm pivotally connected at its lower end with the roller-carrying frame and adjustably connected at its other end with the horizontal branch, and the connecting-rod adjustably connected at one end with said lever and adjustable vertically and horizontally with said vertical branch, substantially as set forth.

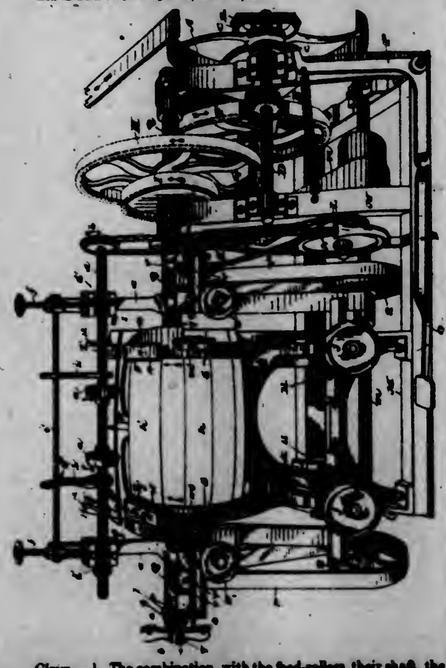
384,728. SPREADER FOR HAMMOCKS. THEODORE B. THOMAS, Galway, Minn. Filed Mar. 8, 1888. Serial No. 266,703. (No model.)

Claim.—1. The hammock A, its ends B B looped at *a*, and the slotted spreader C, through which the said ends pass, combined with

384,728.

the fastening-cords D, located in said loops transversely of the hammock, and the suspensory cords c c, which encircle said spreader, substantially as herein described.

2. In a hammock having looped ends, as stated, a spreader composed of two pieces disposed on opposite sides of the looped end, combined with a fastening cord or rod transversely of said hammock within the looped end, said cord resting lengthwise of the spreader, and the whipping-cords which encircle the latter, for purposes specified.



384,729. GRATE-BAR. RICHARD THOMPSON, New York, assignor of one-half to John S. Bushnell, Brooklyn, N. Y. Filed Sept. 20, 1887. Serial No. 251,013. (No model.)

Claim.—1. A grate-bar consisting of an apertured top transversely divided into sections, and longitudinal supporting-ribs connected to the under side of said sectional top and increased in thickness or strength-ened adjacent to the open spaces between the sections of the top, substantially as set forth.

2. In a grate-bar, in combination, an apertured top composed of sections, each comprising the cross-bars *a a* and longitudinal ties *b b*, and having slots *c c* at its ends, and the longitudinal supporting-ribs *c c*, secured to the under side of the apertured top, and having thick-ened parts *d d* adjacent to the open spaces between the sections of the top, substantially as set forth.

384,730. BARREL-MAKING MACHINE. WILLIAM T. VALE, Toronto, Ontario, Canada, assignor to Joshua George Beard, same place. Filed July 20, 1886. Serial No. 208,468. (No model.) Patented in Canada Aug. 28, 1886, No. 24,750; in England Oct. 5, 1886, No. 12,068, and in France Feb. 9, 1887, No. 178,982.

Claim.—1. The combination, with the feed-rollers, their shaft, the shaft Q, and the former carried thereby, of the shaft D, parallel with said shaft Q, driving-pulley A and friction-clutches thereon, gear-wheel E on the shaft D, wheel I on the shaft Q, and intermediate gearing, substantially as described, between the shafts D and Q, sprocket-wheels L N K, the latter driven from the wheel I, and connections with the shaft of the feed-rollers, as and for the purpose specified.

2. The feed-rollers *a* and *a* and a drum or barrel-former, R, driven substantially as specified and fed with staves by the feed-rollers *a*, in combination with hand-levers i on the shaft of said feed-rollers, substantially as and for the purpose specified.

3. The shaft *m*, standards *c*, shaft *d*, and the feed-rollers *a*, located on the shaft *d*, which is journaled in bearing-boxes on the standards *c*, pivoted on the shaft *m*, combined with the barrel-former R, substantially as and for the purpose specified.

4. The standards *c*, spindle *d*, and the rollers *a*, located on the spindle *d*, journaled in bearing-boxes adjustably held on the standards *c*, in combination with the barrel-former R, and the screw-spindles *f*, arranged to adjust the feed-rollers *a* vertically, substantially as and for the purpose specified.

5. A shaft, Q, and a shaft, D, friction-clutches B and C, and barrel-former or drum R, set upon the shaft Q and connected by a series of spur-wheels, H, G, F, and E, to the shaft D, on the end of which the friction-clutches B and C are situated, in combination with the bell-crank P, the pin *c* on said bell-crank, and a lever, O, pivoted on the bed-plate and arranged to bring said pin *c* against the hub of the main driving-pulley A, so as to bring the clutches B and C into gear, substantially as and for the purpose specified.

6. A shaft, Q, a barrel-former, R, carried on said shaft, a series of spur-wheels, H, G, F, and E, connecting said shaft Q to the shaft D, and the gear-wheels I J, in combination with the sprocket-wheels *b*, L, N, and K, the shaft D, spindle *d*, and the feed-rollers *a* on the spindle *d*, which is caused to revolve by the sprocket-wheels *b*, L, N, and K, connected together by sprocket-chain, the sprocket-wheel K being on the same shaft as the gear-wheel J, which is driven by the gear-wheel I, located on the shaft Q, substantially as and for the pur-pose specified.

7. The cutter U, the slide *v*, the end *u* of which fits into the recess between the collars *r* on the cutter spindle or shaft *q*, said shaft *q* and the sliding block *s*, in which it is journaled, in combination with the collars *r* on said shaft, the screw-spindle *x*, bracket V, set-screw *y*, and the hand-wheel *w*, operating the screw-spindle *x*, which projects through the set-screw *y*, extending into the block *s*, situated on the bracket V, substantially as and for the purpose specified.

8. A barrel-former, R, divided into sections W and connected to collars Y on the shaft Q by the arms X, in combination with said arms, shaft, and collars, the spindle 4, key 2, handle 5, and the collar Z, con-nected by the arms 3, slotted, as described, to the arms X of one of the collars Y, the said collar Z being connected to the spindle 4 by the flat key 2, and so arranged that when the handle 5 is drawn out the sections W of the former R will collapse, substantially as and for the purpose specified.

9. The slotted arms 3, arms X, provided with pins 9, the sections W, and the collar Z, connected to the sections W by the arms 3, pro-vided with slots 10, within which the pins 9 on the arms X work or slide to permit the collapse of the sections W, in combination with the spindle 4, connected to the collar Z, the shaft Q, and the handle 5, for operating said collar longitudinally on the shaft Q, substantially as and for the purpose specified.

10. A collar, Z, arms 3, bell-crank 6, and a barrel-former, R, hav-ing sections W, connected by the arms 3 to the collar Z, shaft Q, hav-ing recess 7, and the rod 4, having handle 5, said collar constructed to hold the former or drum R expanded during the time the end of the bell-crank 6, pivoted to the handle 5, fits into the recess 7, sub-stantially as and for the purpose specified.

11. The combination, with the shaft *m*, and the barrel-former R, rotated from said shaft, of the standards *c*, pivoted at their lower ends on said shaft, spindle *d*, journaled in bearings on said standards, feed-rollers carried by said spindle, and means for vertically adjusting said spindle, substantially as and for the purpose specified.

384,731. ALLOY. CHARLES W. WARD, New York, N. Y. Filed Nov. 28, 1887. Serial No. 256,904. (No specimens.)

Claim.—1. An alloy composed of platinum, silver, bismuth, and steel, substantially as described.

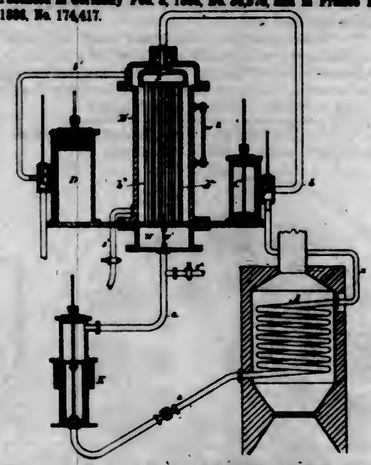
2. An alloy composed of platinum, silver, bismuth, and steel, in about the proportions as herein described, as set forth.

3. An alloy composed of platinum, twenty to forty parts; silver, twenty to forty parts; bismuth, twenty to forty parts, and steel, one to ten parts, substantially as described.

384,732. CAR-COUPLING. ROBERT WILSON, Grahville, Mo. Filed Feb. 1, 1888. Serial No. 262,602. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head having the lateral perforation 8 extending vertically through it, of the vertically-arranged coupling-pin 9, and spring arranged in a hori-zontal plane and bearing normally on said pin for the purpose of hold-

384,732.



ing it, and links having hooks and lying in a horizontal plane, substan-tially as shown and described.

2. In a car-coupling, the combination, with a draw-head having a recess in its upper and lower sides and a vertical coupling-pin slot or perforation, of spring-actuated arms located in such recesses and adapted to bear against and hold a coupling-pin in position at one end of the said slot, substantially as described.

3. In a car-coupling, the draw-head 1, having recesses 2 at top and bottom, the top recess having extended portion 7, and the perforation 8, with lateral recess 10, located at the corner of said slots 2, and the spring-actuated arms 3, secured by means of the bolt 4 and nut 5, in combination with the link 11, having hooked ends formed with the beveled portion 12, elongated slots 13, and the openings 14, and coup-ling-pin 9, substantially as described.

384,733. MEANS FOR UTILIZING EXHAUST. SAMUEL WALKER, Rochester, Kent. Filed Oct. 7, 1887. Serial No. 251,794. (No model.) Patented in Germany Feb. 3, 1886, No. 36,570, and in France Feb. 20, 1886, No. 174,417.

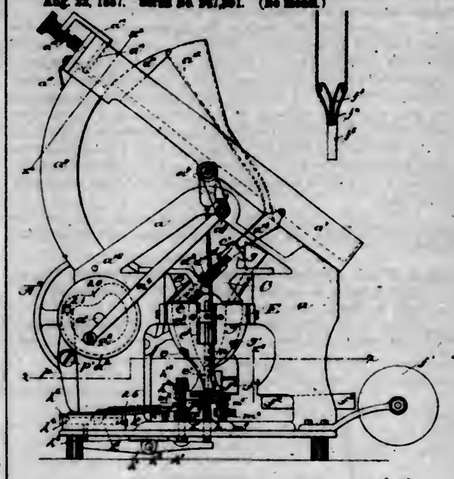
Claim.—1. The combination of the generator A, the tube *c*, the cylinder C, connecting therewith, the tube *b*, the low-pressure boiler B', connecting therewith, the water-vessel W at the lower end of the boiler, the tubes *e* and *a*, and the pump E, connected therewith to return the condensed water to the generator, all substantially as described.

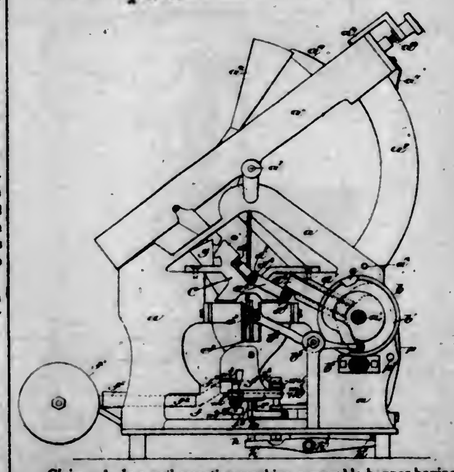
2. The combination of the cylinders C and D and their connecting-tubes with the generator A, the low-pressure boiler B', having a water vessel or chamber, as described, and the tubes and pump to return the condensed water to the generator, and the generator, substantially as described.

384,734. PLUME, TASSEL, &c. RALPH W. H. ALLEN, North-ampton, Mass. Filed Nov. 11, 1887. Serial No. 254,902. (No model.)

Claim.—1. The combination herein described, with a cap or head support, of a strip of hide having the wool or hair thereon bent upon itself, wool or hair outside to form a body having two contiguous edges united, the said body being adapted for engagement with said cap or head support at one end, substantially as shown and described.

2. A plume or tassel consisting of the tubular body formed of a strip of hide united at its longitudinal edges, and having the hair or





384,734.

wool on the outer side, the link D, passed partly into said body and secured thereto, and the cap E, having a slot, *e*, through which the exposed end of the link passes, substantially as set forth.

384,735. NAIL-ASSORTING MACHINE. EDWARD R. ALLEN, Portland, Me., assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Aug. 22, 1887. Serial No. 247,551. (No model.)

Claim.—1. In a nail-assorting machine, a movable hopper having a pocket at one end and a rest to enter said pocket, combined with a

chute carried by the said hopper and into which each nail deposited upon the rest is delivered singly, substantially as set forth.

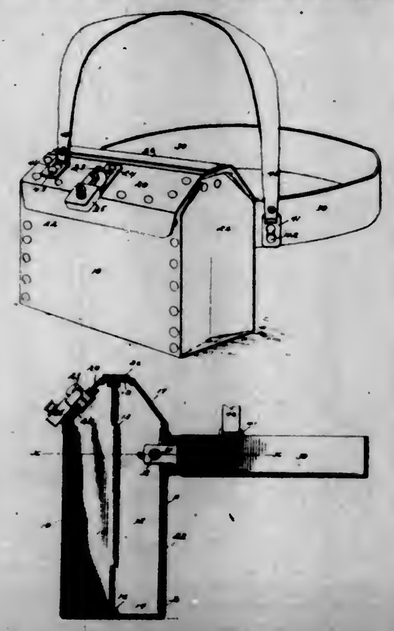
2. The oscillating hopper, its guide, the chute connected to its upper side, and the chute extended from its lower side, combined with the rest adapted to work through a slot or pocket in the bottom of the said hopper, substantially as described.

3. The oscillating hopper a^{xi}, having a slotted pocket or recess at one end for the retention of one or more nails, combined with an adjustable end plate to graduate the length of the recess to the length of the nail to be used, substantially as described.

4. In a nail-assorting machine, a beveled guide and a hollow spindle having spring-jaws reciprocating in the said guide, combined with a chute to deliver the said nails to the said spindle, and with a block having a guide-passage in communication with the said spindle for the reception of such nails as pass point foremost through the said spindle, substantially as described.

5. In a nail-assorting machine, a hollow spindle having spring-jaws, a beveled guide therefor, and a chute to deliver nails to the said spindle singly, combined with an auxiliary chute into which the said spindle rejects the nails delivered to it with the head end foremost, substantially as described.

6. In a nail-assorting machine, a reciprocating hollow spindle having spring-jaws, a bearing beveled at its upper end in which the said spindle slides, and a chute to deliver nails to the said spindle, combined with an auxiliary chute into which such nails as are delivered to the spindle head end foremost are rejected, the nails delivered to the spindle point foremost being permitted to pass through the said hollow spindle at its next ascent, substantially as described.



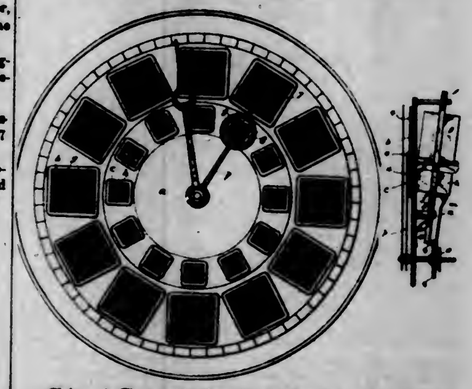
7. In a nail-assorting machine, the guide to hold and present a strip of flexible material for the reception of nails, the nail-driver to drive nails point foremost into the said strip, and the movable anvil, combined with a strip-feeding mechanism, substantially as described, and means to connect the said anvil and feeding mechanism, whereby the latter is set into operation by the movement of the anvil when acted upon by the point of the driven nail, substantially as described.

8. The vibrating lever, the carriage, its latch, and feeding mechanism, substantially as described, actuated by it, combined with a lever, A^{9}, and an anvil which is depressed intermittingly by the point of the driven nail.

9. The guide f^{9} and its open slotted leg or tube, and a spring-arm guard, combined with the anvil A, to operate substantially as described.

384,736. MAIL-POUCH. GEORGE J. BENSON, Anamosa, Iowa, assignor to Amelia B. Lockwood, East Orange, N. J. Filed Oct. 20, 1887. Serial No. 253,073. (No model.)

Claim.—1. The combination, with a pouch, of a metal bolt provided with apertures at one end, an eyebolt carried at the other end



of the bolt and arranged to pass through one of the apertures of the bolt, and a bolt carried by the pouch, said bolt being mounted to cross an aperture formed in the pouch and arranged to engage the eyebolt when such eyebolt is passed through the pouch-aperture, substantially as described.

2. The combination, with a metal-lined pouch, of a metal bolt provided with apertures at one end, an eyebolt carried at the other end of the bolt and arranged to pass through one of the apertures of the bolt, and a bolt carried by the pouch and arranged to engage with the eyebolt, substantially as described.

3. The combination, with a metal-lined pouch, of a metal bolt provided with apertures at one end, an eyebolt carried at the other end of the bolt and arranged to pass through one of the apertures of the bolt, a bolt carried by the pouch and arranged to engage with the eyebolt, and a thumb-screw arranged in connection with the bolt, substantially as described.

4. The combination, with a metal-lined pouch, of a metal bolt provided with apertures at one end, an eyebolt and a turn-button carried at the other end of the bolt and arranged to pass through the apertures of the bolt, and a bolt carried by the pouch and arranged to engage with the eyebolt, substantially as described.

384,737. TIRE-PIECE. CHARLES BEDFORD, Boston, Mass. Filed Jan. 13, 1888. Serial No. 260,854. (No model.)

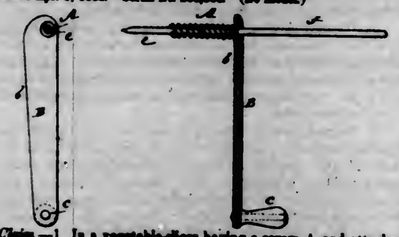
Claim.—1. The combination of a dial having openings arranged concentrically, a series of levers arranged radially at the inner side of the dial and pivoted to swing from and toward the dial, means for oscillating said levers successively at predetermined intervals, and rotary blocks or character-holders supported by said levers and rotated by the movement of the levers away from the dial, substantially as set forth.

2. The combination of a dial having openings arranged concentrically, a series of oscillatory levers which are oscillated at regular intervals, as described, a series of rotatable blocks or character-holders supported by said levers and partially rotated by the forward movement of the levers, and locking devices, substantially as described, whereby said blocks are locked to the levers after each partial rotation, as set forth.

3. The combination of a dial having openings concentrically arranged and formed with seats at the rear side of the dial, a series of pivoted levers radially arranged at the inner side of the dial, and a series of rotatable blocks or character-holders supported by said levers and formed to fit said seats when the levers are in their normal positions, as set forth.

4. The combination of a dial having concentrically-arranged openings, a series of radial levers pivoted to supports at the inner side of the dial, a series of rotary blocks journaled in said levers and provided with pinions, the flexibly-supported racks engaged with said pinions, whereby the blocks are rotated when the levers are moved away from

the dial, and the inclined ribs on the racks, and the studs or pins on the levers co-operating with said ribs, whereby the racks are prevented from rotating the blocks backwardly, as set forth.

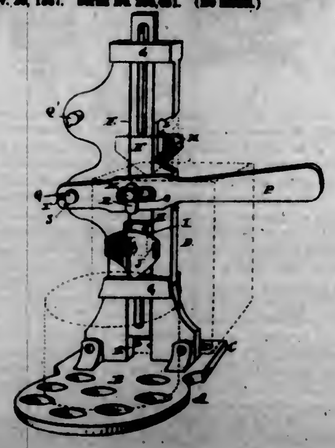


5. The combination of a dial having concentrically-arranged openings, a series of radial levers arranged at the inner side of the dial and pivoted near their inner ends to fixed supports, rotary blocks supported by said levers, a cam impelled by the time-movement and arranged to bear successively against the inner ends of said levers and force the blocks away from the dial, means, as described, whereby the blocks are rotated while being moved by said cam, and springs whereby the levers are forced toward the dial when released by the cam, as set forth.

6. The combination of a dial having two concentric series of openings, one within the other, a series of pivoted levers radially arranged within the dial, two series of rotary blocks supported by said levers, and means, substantially as described, for rotating said blocks simultaneously at predetermined periods, as set forth.

7. The combination of a dial having two concentric series of openings, a series of radial levers pivoted to fixed supports at the rear of the dial, two series of rotary blocks supported by said levers, an arm having a gear-segment revolved by the time mechanism and arranged to successively engage pinions on the blocks of the inner series, a cam also rotated by the time mechanism and arranged to successively swing said levers inwardly from the dial, racks secured to a fixed support and engaged with pinions on the blocks of the outer series, whereby said blocks are rotated when the levers are moved inwardly, devices for disengaging said racks from the block-pinions during the return movement of the levers, and springs to return the levers to their normal positions after they are released by the cam, as set forth.

8. The combination, with a dial having openings concentrically arranged, of a series of radially-arranged pivoted levers and blocks or character-holders detachably secured to said levers, as set forth.



384,738. VEGETABLE-SLICER. VERMEY REMM, Greenville, N. J. Filed Apr. 9, 1888. Serial No. 269,902. (No model.)

Claim.—1. In a vegetable-slicer having a screw, A, and attached knife B, the screw A, provided with an elongated arm or extension, *f*, at its back and in rear of the knife, in axial relation with the screw, essentially as and for the purpose herein set forth.

2. In a vegetable-slicer operating substantially as described, the combination of the screw A, having a forward smooth extension, *e*, the knife B, and the elongated arm or extension *f* in axial relation with the screw, back of the knife, essentially as shown and described.

384,739. CAN-OPENER. JAMES BLACKLER, Story City, Iowa. Filed Nov. 30, 1887. Serial No. 256,651. (No model.)

Claim.—1. In a can-opener, the combination of a standard having guides and a fixed stud formed with a lateral nib, a movable knife-carrier having a projecting pin, a lever having a pivot-hole and a slot for reception of the nibbed stud, and a slot for the pin on the carrier, and a button pivoted to said pin outside the carrier and constructed to pass through the slot in the cams, substantially as described.

2. In a can-opener, a base forming a front can-rest and a rear can-rest, in combination with a slotted standard erected on the base between said front and rear rests, and a carrier mounted to slide vertically in said slot, and having a curved knife on one face and a straight knife on its opposite face working over said front and rear rests, respectively, substantially as described.

384,740. PLOW. THOMAS A. BLANCHARD, Appleg. Ga. Filed Nov. 14, 1887. Serial No. 255,602. (No model.)

Claim.—1. The combination, with a plow-beam provided with a downwardly-projecting plate, of a plow-standard pivoted to the said plate, and an eccentrically-apertured block secured to the rear end of the standard and engaging the rear edge of the said plate, substantially as herein shown and described.

2. The combination, with a plow-beam provided with the downwardly-projecting plate B, and the plate C, secured to the beam in rear of the plate B, of the standard C, pivoted to the plate B, and the eccentrically-apertured block F, secured to the standard and provided with the notches 1 2 3 4, and the laterally-projecting lug f^{3}, substantially as herein shown and described.

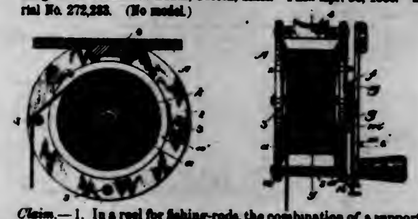
3. The eccentrically-apertured block F, having a series of notches, 1 2 3 4, of varying depths, and provided with the laterally-projecting lug f^{3}, substantially as described.

4. The combination, with the mold-board, of a block adjustably secured to the mold-board and having two wedge-shaped face portions with the point of one overlapping the blunt end of the other, and sweeps secured to the mold-board and having their inner ends engaging the said block, substantially as herein shown and described.

5. A sweep-adjusting block having two wedge-shaped face portions with the point of one overlapping the blunt end of the other and provided with the slot *l*, substantially as described.

6. The slotted block L, having two wedge-shaped face portions with the point of one overlapping the blunt end of the other, the blunt ends of the wedge-shaped faces being concave, substantially as herein shown and described.

384,741. SAW-HANDLE ATTACHMENT. LARS P. RASMUS, Marshall, Wis. Filed Oct. 6, 1887. Serial No. 251,955. (No model.)

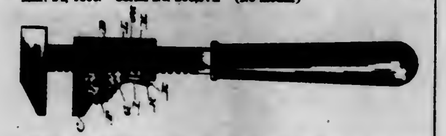


Claim.—1. A removable handle attachment for crescent-saws, consisting of a saw-blade holder formed with an inwardly-extending projection at its lower end and a vertical slot extending through the projection and the holder to receive the entire end of a saw-blade, a step at its upper end adapted to bear against the upper edge of the saw-blade, a slot extending through the sides of the holder and opening into the first-named slot, and a vertically-movable transverse pin or bolt located in the slot, extending through the sides of the holder, and adapted to wedge against the end of the saw-blade and secure it in position, substantially as described.

2. A handle attachment for saw-blades, consisting of a holder, 1,

to hold the end of a saw-blade, having a socket, 2, to receive a handle, an adjustable stop, 15, with convex slots 16, to bear against the upper edge of a saw-blade, a vertical slot, 5, to receive the end of a saw-blade and extending to the end of curved portion 4, a vertical slot, 7, extending transversely through slot 5 and having a circular opening, 8, with projection 12, and a pin, 9, adapted to slide in slot 7 and having heads 10, one of which has a V-shaped slot, 11, adapted to pass over projection 12, substantially as described.

384,742. FISHING-REEL. CHARLES K. BRADFORD, Lynnfield, assignor to William F. Kakas, Boston, Mass. Filed Apr. 30, 1888. Serial No. 272,283. (No model.)



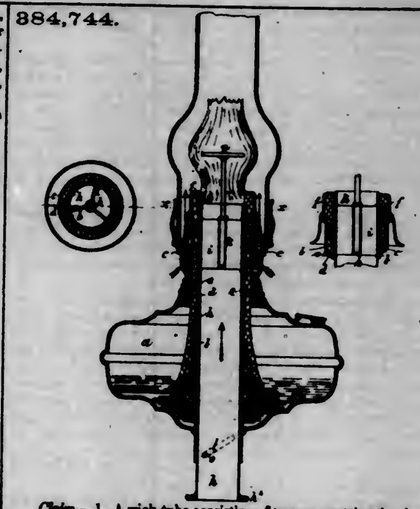
Claim.—1. In a reel for fishing-rods, the combination of a supporting-frame, a shaft journaled in said frame, a drum or barrel mounted to rotate loosely on said shaft, a coiled spring engaged at its inner end with the shaft and at its outer end with the barrel, a crank or handle affixed to the shaft, whereby the operator may hold the shaft and the end of the spring engaged therewith, and thereby enable the spring to rotate the barrel independently of the crank, and a movable locking device, whereby the crank or handle may be locked to the barrel, to enable the latter to be rotated by the crank instead of by the spring, as set forth.

2. The combination of a supporting-frame, a shaft, *h*, journaled therein and provided with a slot or pocket, *j*, a barrel or drum mounted to rotate loosely on the shaft, and a spring having a hook at its inner end detachably engaged with the pocket of the shaft, and having its outer end operatively engaged with the barrel, the described engagement of the inner end of the spring with the shaft enabling the spring to be disconnected from the shaft by a backward rotation of the latter, as set forth.

3. The combination of a supporting-frame, a shaft, *h*, journaled therein, a barrel or drum mounted to rotate loosely on the shaft, and a spring having its inner end engaged with said shaft and its outer portion in frictional contact with the inner surface of the barrel, whereby the spring may slip on the barrel when fully wound, as set forth.

4. The combination of the supporting-frame, a shaft journaled therein and provided with a crank or handle, a barrel or drum mounted to rotate loosely on the shaft and provided with a hub having pins or projections *g*, the spring operatively engaged with the barrel and shaft, and a bolt adapted to slide on the handle of the shaft into or out of engagement with the projections *g* of the barrel, as set forth.

384,743. WRENCH. BERLIN T. BEYAN, Evansville, Wis. Filed Mar. 24, 1888. Serial No. 268,371. (No model.)



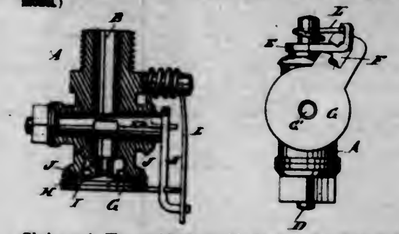
Claim.—1. In a wrench, the combination, with the toothed shank having a jaw rigid therewith, of the sliding jaw, the pinion mounted thereon and engaging the toothed shank, the ratchet-wheels rigidly attached to the pinion, and the pawl engaging the ratchet-wheels, substantially as specified.

2. In a wrench, the combination, with the toothed shank having a jaw rigid therewith, of the sliding jaw, the pinion mounted thereon and having the ratchet-wheels attached thereto, the pawl engaging the ratchet-wheels and having a thumb-hold, and the actuating-spring attached to the pawl and adapted to normally hold it in the engaging position, substantially as specified.

3. In a wrench, the combination, with the toothed shank having a jaw rigid therewith, of the sliding jaw, the pinion mounted on the jaw and engaging the teeth on the shank, the ratchet-wheel attached rigidly to the pinion and having a longer diameter than the pinion, and the spring-actuated pawl engaging the ratchet-wheels, substantially as specified.

384,744. LAMP-BURNER. ARTHUR CAPITIN, Berlin, Germany, assignor to Carl Patzky, same place. Filed Feb. 15, 1887. Serial No. 227,674. (No model.) Patented in Belgium Dec. 15, 1886, No. 73,897.

384,744.



Claim.—1. A wick-tube consisting of two concentric tubes having a space between them forming a wick-chamber, one of the said tubes projecting through the lamp-body and the other projecting above the tube extending through the lamp-body, and provided with a flange covering the wick-chamber, in combination with a regulating-tube sliding in the inner tube, substantially as described.

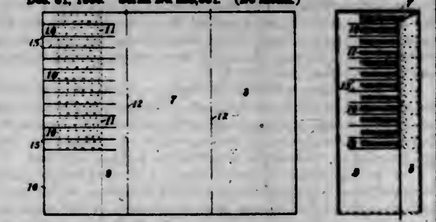
2. The combination, with a lamp-body and a wick-tube projecting through the same, of a tube secured to the lamp-body and carrying a cap projecting above the first-named tube, with its flange covering the space between the said tubes, and a regulating-tube adjustably held in the tube projecting through the lamp-body, substantially as shown and described.

3. The combination, with the receptacle *a*, provided with the tube *b*, having inclined slot *l*, of the tube *c*, secured to the top of the said receptacle and carrying the cap *f*, projecting above the tube *b*, and having its flange covering the space between the tubes *b c*, and the tube A, fitting in the tube *b* and provided with the pin *a*, working in the slot *l* of the said tube *b*, substantially as herein shown and described.

384,745. COCK FOR FIRE-EXTINGUISHERS. CHARLES C. CORNELL, Haydenville, Mass. Filed Mar. 31, 1887. Serial No. 233,160. (No model.)

Claim.—1. The combination, with the body A, provided with a passage, B, and a valve, D, having a lever bent outward at its lower end, of the plate G, soldered to the body and having a notch, F, into which the arm extends, and the spring I, secured to the body and engaging the outward-bent end, substantially as set forth.

2. In a cock for fire-extinguishers, the combination, with the body having a valve and a sprinkler held on the lower part of said body, of a lever held on the said valve and provided with a spring, and a plate soldered at one end to said sprinkler and at its other end connected with the said lever, so that when heat is applied the said solder melts and disconnects the said plate from the sprinkler, whereby the lever is set free and the valve is opened by the action of the spring, substantially as shown and described.

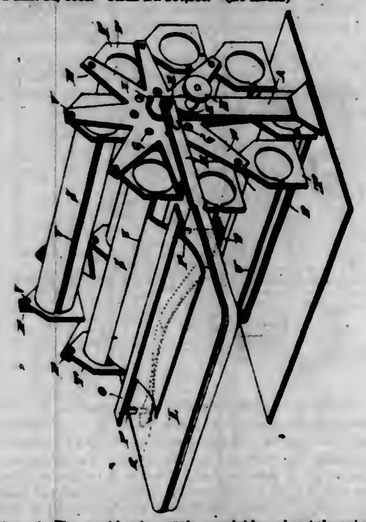


3. In a cock for fire-extinguishers, the sprinkler H, formed of the cone-shaped disk I, having the upward-projecting screw-threaded arms K, the aperture K', leading through said arms, and the flaring central aperture, I', formed in the disk I, and with which the apertures K' communicate, substantially as shown and described.

4. In a cock for fire-extinguishers, the combination, with the body having a concave, J, in its end and internally threaded at J', of the

sprinkler H, comprising the apertured cone-shaped disk I, having the threaded arms K, engaging the threaded part J', and provided with apertures K', leading to the said central aperture in the disk I, substantially as shown and described.

5. In a cock for fire-extinguishers, the combination, with the body having a conical seat on its outer end, of a valve operating in the said body, a lever secured to one outer end of the said valve, a spring pressing on the said lever, a plate for holding the said lever in such a position that the valve is closed, a sprinkler on which the said plate is soldered, provided with a conical disk held out of contact with the said conical seat on the body, and also provided with arms screwing in the body, and having apertures leading into a conical central aperture in the said disk, substantially as shown and described.



384,746. SCRAP-BOOK. HENRY CHESBRO, Bristol, R. I. Filed Dec. 31, 1886. Serial No. 223,661. (No model.)

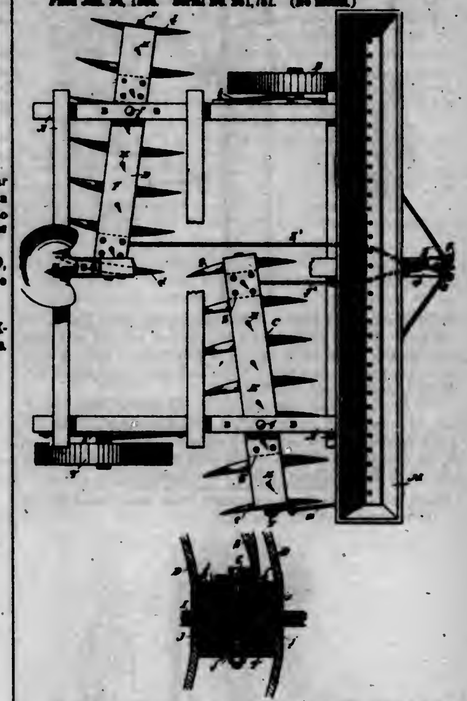
Claim.—1. A scrap-book consisting of a sheet of paper or similar material folded into three parts, the surface of one part covered by an adhesive substance and divided into horizontal strips constructed to receive scraps, the whole arranged to fold together, substantially as described.

2. A scrap-book made up of a series of the folded sheets 7 8 9, one of the divisions, 7 or 9, having one surface covered with adhesive material and divided into horizontal strips, as described.

384,747. APPARATUS FOR STORING, MEASURING, AND RE-REELING DRY-GOODS, &c. WILLIAM DOERFLINGER, La Crosse, Wis. Filed Mar. 20, 1883. Serial No. 267,810. (No model.)

Claim.—1. The combination of the revolvable reel and the tubular pendent holders pivotally suspended therefrom and thereby prevented from rotating axially when the reel is turned and having the longitudinal slits, substantially as described.

2. The combination of the revolvable reel and the tubular holders suspended eccentrically therefrom and having the open ends and the longitudinal slits, substantially as described.



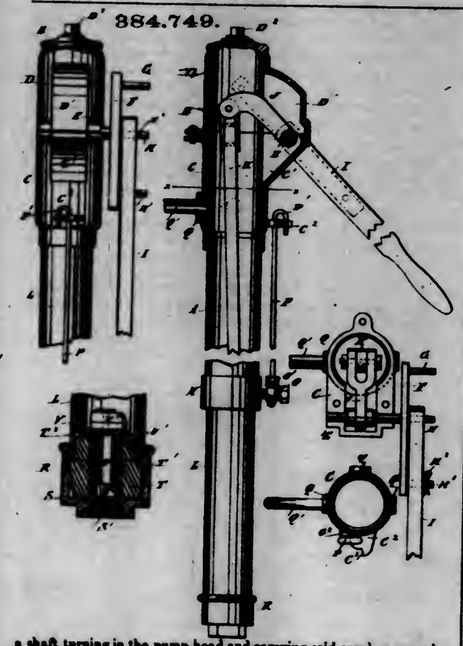
3. The combination of the standards, the reel journaled therein, the holders suspended eccentrically from the outer ends of the reel-arms, and the measuring-board L, having the arms M pivoted to the standards, substantially as described.

4. The combination of the standards having the stops I K on opposite sides of the axis of the reel, the reel journaled in the said standards, the holders suspended from the outer ends of the reel-arms, and the measuring board or table having the arms pivoted to the standards on the axis of the reel and adapted to be supported in a vertical or horizontal position by the stops I K, substantially as described.

5. The combination, with the standards and the reel journaled therein and having the eccentrically-suspended holders, of the measuring table or board supported on one side of the reel, the ruler O arranged transversely over the same and having the arms P arranged and guided in openings in the board or table, and the spring R, secured to the board or table and bearing against the arms P to normally elevate the ruler, substantially as described.

6. In combination with the revolvable reel, the tubular holders pivotally suspended therefrom and arranged eccentrically, and having the longitudinal slits and the measuring-board arranged on one side of the reel and adapted to receive the goods from the holders.

384,748. DISK CULTIVATOR AND SEEDER. RAHL C. DOBBY, Tulare, assignor of one-half to William L. Morrow, San Luis Obispo, Cal. Filed Jan. 24, 1888. Serial No. 261,781. (No model.)

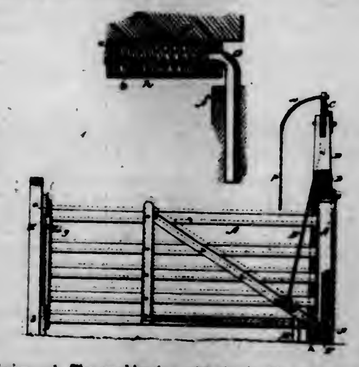


Claim.—1. A disk cultivator and seeder consisting of the frame A, made of longitudinal and transverse bars, the carrying-wheels, one on each side and located at diagonally-opposite corners, the oppositely-inclined bars E F, pivoted to the sides of the frame, the lever and connections for varying and fixing the inclination of the bars, the shafts I, supported from standards carried by the inclined bars, and the disk-gangs carried by the shafts, said gangs having smaller and less concaved disks on each end, and the cleaning-spikes secured to and projecting downwardly from the inclined bars and between the disks, all arranged and adapted to operate substantially as described.

2. In a disk cultivator and seeder, the wheeled frame, the oppositely-inclined pivoted bars E F, and the shafts I, with their disk-gangs, having enlarged journals J, with an encircling groove, in combination with the connection between the gangs and the inclined bars, consisting of the standards S, bolted up under the bars and having a bent foot with an oil-hole, *s'*, and the two-part boxes T, having an oil-hole connecting the oil-holes *s'* with the grooves of the journals J, said boxes encircling the journals J and bolted to the standard-feet, substantially as described.

384,749. PUMP. JOHN B. DRAKE, Goshen, Ind. Filed July 2, 1887. Serial No. 243,269. (No model.)

Claim.—1. In a pump, the combination, with the pitman carrying the plunger, of a crank-arm pivotally connected with said pitman,



384,749.

a shaft turning in the pump-head and carrying said crank-arm, and an arm secured to the outer end of said shaft and provided with three crank-pins, of which one is adapted to be connected with the windmill-rod and on the other two of which is secured a pump-handle, substantially as shown and described.

2. In a pump, the combination with the shaft E, of the arm F, secured on said shaft, the crank-pin G, secured to one end of said arm F and adapted to be connected with the windmill-rod, the pins H and H', also secured to said arm F, and the pump-handle I, fastened on said pins H and H', substantially as shown and described.

384,750. GATE. JOHN FLEMMER, Boling, Kans. Filed Mar. 16, 1888. Serial No. 267,419. (No model.)

Claim.—1. The combination, with the working-levers and connecting-rods, of a vertically-tilting gate and a compound hinge for said gate having an axis upon which the gate tilts, and a sliding adjustment to permit a retractile initial movement of the gate, substantially as and for the purpose described.

2. The combination, with the gate and its posts, of the compound hinge composed of plate F, with barrel A, the bent rod G, having a head or nut, *n*, and a spiral spring, *t*, the said gate being arranged to turn upon the journal formed by the bent rod.

3. The combination, with the working-levers, in a lever-gate, and the rope for operating them, of a flexible semi-stiff connection for projecting the rope into easy reach from the path of the vehicle, substantially as and for the purpose described.

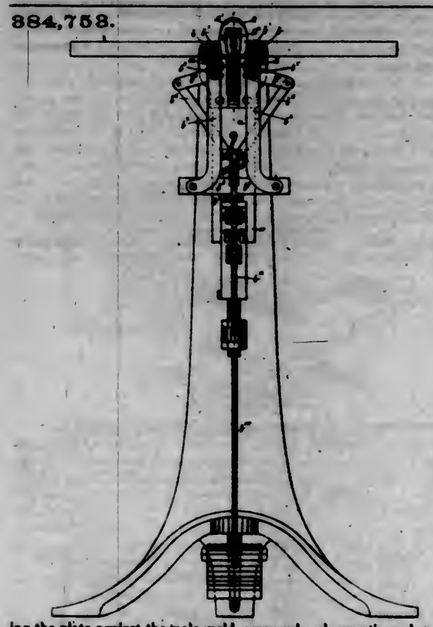
384,751. DIE FOR FORGING. HENRY H. FOSTER, Pittsburg, Pa. Filed Mar. 1, 1888. Serial No. 265,810. (No model.)

Claim.—1. An improvement in dies for forging or swaging, which consists in the combination of dies whose opposing faces are provided with suitable working-cavities made substantially in arcs of a circle, the general contour of the conjoined die-cavities when the dies are most nearly together being substantially circular, the edges of the cavities of the dies being separated by lateral recesses, substantially as and for the purposes described.

2. An improvement in dies for forging or swaging straight metal articles, which consists in the combination of dies whose opposing faces are suitably formed and steps whereby the motion of the movable die is limited and the edges of the working-faces are prevented from coming into contact, substantially as and for the purposes described.

3. An improvement in dies for forging or swaging straight metal articles circular in cross-section and either of constant or varying longitudinal section, which consists in the combination of dies whose opposing faces are provided with cavities, the cavity of one of the dies having flaring extensions, substantially as and for the purposes described.

384,752. BURGLAR-ALARM. SCOTT C. FREEMAN and JOHN B. SOWARD, Novada, Mo. Filed Mar. 6, 1888. Serial No. 266,394. (No model.)



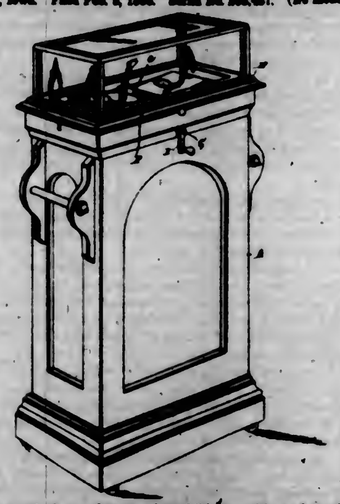
Claim.—In a burglar-alarm, the combination, with the bell, its striking mechanism, and a suitable frame, A', of the detent-lever D, pivoted between its ends on a post, C, and having a hooked inner end, *d*, engaging the ratchet b^9 on said striking mechanism, and a cross piece or rod, *d'*, at its outer end, a spring, d^2, holding said ratchet and hook engaged, the lever F, pivoted between its ends and engaging the bar or rod *d'*, to throw the hooked end thereof out of engagement with said ratchet, the spring-catch *e*, secured to the frame A' adjacent to the lever D, to snap into engagement therewith and hold its hooked end away from the ratchet to allow the striking mechanism to operate until it runs down, and the rod or handle for moving the spring-catch away from the said lever to reset the alarm, substantially as set forth.

384,753. RISE-SUPPORTER MACHINE. GEORGE A. FULLERTON, Boston, Mass. Filed July 30, 1888. Serial No. 282,281. (No model.)

Claim.—1. In a molding-machine, the combination of the male mold or former A with the nippers B, arranged and operating substantially as described.

2. In combination, the male mold or former A, the nippers B, and the plate A', and means, substantially such as are described, for clamping the plate against the male mold, arranged and operating substantially as described.

384,753.



3. The former A, in combination with the jaws *b b'*, levers b^3 b^4, and cross-heads b^5 b^6, arranged and operating substantially as described, so that the power applied through cross-head b^5 acts first to close the jaws *b b'* and then is transmitted through the levers b^3 b^4 to cross-head b^6.

4. The male mold A and the grippers B, in combination with slotted plate *d* and the pins b^7, substantially as described.

5. The cross-head b^5, carrying the levers b^3 b^4 and their jaws *b b'*, in combination with the links b^8, cross-head b^6, and catch b^{10}, all substantially as described.

384,754. PHOTOGRAPHIC CABINET. FRED A. GARRISON, Fort Dodge, Iowa. Filed Feb. 8, 1888. Serial No. 263,457. (No model.)

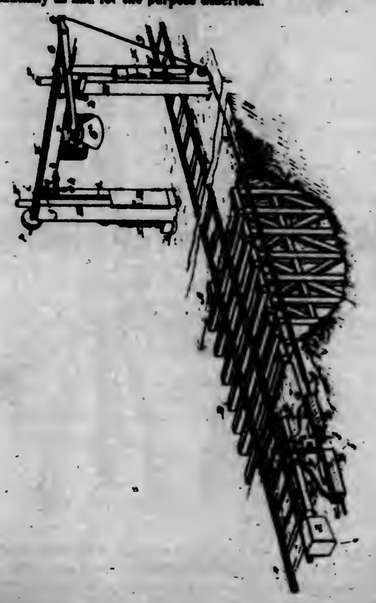
Claim.—1. In a photograph-exhibiting cabinet, the roller C, mounted in a suitable case near its top, the roller D, mounted therein near the bottom and having a pulley, F, the shaft G, mounted in the case and provided with a handle or crank, I, on its outer end and a pulley, H, on its inner end, the belt K, mounted on the pulleys F and H, and the belt E, mounted on the rollers C and D and having the holders for the photographs attached thereto, substantially as and for the purpose specified.

2. In a photograph-exhibiting cabinet, the combination, with the endless belt E, of the holders comprising the standard M, attached at its inner end to the belt and having clips on its outer end, and the lateral arms on the said standard having clips on their ends, all constructed and arranged substantially as specified.

3. In a photograph-exhibitor, the combination, with the belt E, of the holders attached at intervals thereto and comprising the rigid arms N, N', and O, having clips on their ends, and the arm O', having an extension provided with clips, substantially as and for the purpose specified.

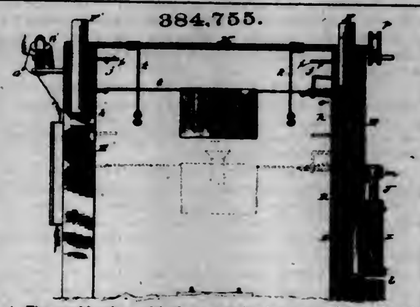
4. In a photograph-exhibitor, the combination, with an endless belt, of the holders comprising the arm N, having apertured ears P P on its free end adapted to be secured to the belt, and the hook-shaped clips between the ears, the arms N' and O, having hook-shaped clips on their outer ends, and the arm O', provided with an extension having clips on its end, substantially as specified.

5. In a photograph-exhibitor, the combination, with the endless belt, of the holder L, attached thereto and having the arms N, N', and O, provided with hook-shaped clips at their ends, the arm O', having guide-clips *o'* on its end, and the extension-arm Q, operating in the said guide-clips and having the clips *g* on its outer end similar to the clips on the arms N, N', and O, and the guide-clips o^2 o^3 on its inner end embracing the arm O, substantially as specified.



6. As a new article of manufacture, the holder comprising the arms N N', having clips *n n'* on their ends, the lateral arm O, having the clips *o* on its outer end, the arm O', and the extension-arm Q, mounted on the arm O' and having clips *g* on its outer end, the said extension-arm being adapted to be extended to engage a card or photograph in the said clips on the ends of the arms, substantially as specified.

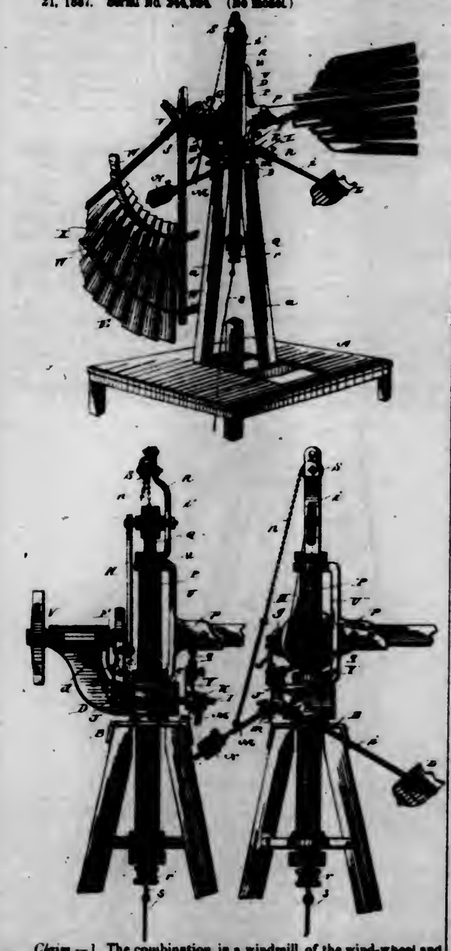
384,755. DANGER-SIGNAL FOR BRIDGES. MILES O. GORDON, Monrovia, Cal. Filed Mar. 2, 1888. Serial No. 265,961. (No model.)



Claim.—1. The combination, with a cord, C, adapted to be distended along the railroad-track, of the bar D, having groove *a*, weighted lever D^2, distending the cord, the trigger-extension *e*, said a hooked kno-wire extending to a distance and provided with signaling devices, substantially as and for the purpose described.

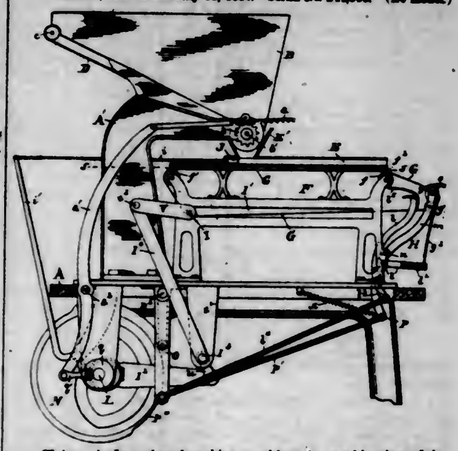
2. The combination, with a combustible cord arranged upon a bridge, of signaling devices connected to and operated at a distance from the bridge by the burning of said cord.

3. The combination of the tripping device, the tension-wire *g*, and the signaling device, consisting of a rock-shaft with a lever connected to the wire and two arms, vertical posts having sliding weights arranged in grooves in the posts and supported by the arms of the rock-shaft, and a cross-connection for the two weights bearing a signal, substantially as and for the purpose described.



384,755.

4. The combination, with the percussion-hammer, of a catch-rod arranged in one of the posts, the sliding weights, one of which is provided with a spring-hook arranged to release the catch-rod, and a connecting-wire for the two weights, one end of which is attached to the spring-hook to release the percussion-hammer, as described.



384,756. **WINDMILL.** JOHN B. GORRELL, La Otto, Ind., assignor of two-thirds to W. J. Hague and F. A. Hague, same place. Filed July 21, 1887. Serial No. 244,994. (No model.)

Claim.—1. The combination, in a windmill, of the wind-wheel and the friction-disk on the shaft thereof, the horizontal shaft I, the arm secured to one end thereof and a brake secured to the said arm adapted to engage the friction-disk, and the tri-branched casting on the opposite end of the shaft to receive, respectively, a counter-balance weight, a governor-vane, and a connection for the rudder-vane, substantially as specified.

2. In a windmill, the combination, with the wheel-shaft, of the vertical pipe, the hollow rod passing through the same, the disk on the wheel-shaft, the pitman connecting the said disk with the hollow rod, the pull-rod and chain passing through the said rod, the horizontal shaft I, having an arm secured to one end carrying a brake-shoe, the tri-branched casting secured to the opposite end of this shaft and receiving, respectively, a governor-vane, a counterbalance-weight, and a rod connected with the rudder-vane, and the pull-chain connected to the arm carrying the counterbalance-weight, substantially as specified.

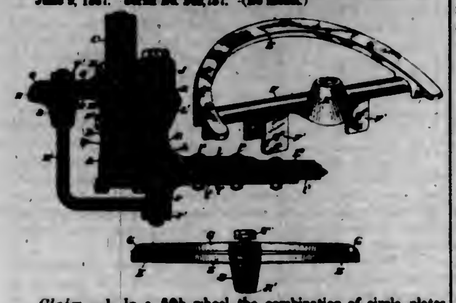
384,757. **CIGAR-BUNCHING MACHINE.** Moses Grunewald, Baltimore, Md. Filed July 18, 1887. Serial No. 244,860. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of the hopper B, having an inclined bottom, B', an oscillating feed-cylinder having a cavity therein and located in the bottom of the hopper, a feed-bolt, D, traveling above the inclined bottom, a bunch-guide, E, beneath the hopper, and a reciprocating pusher, J, in the guide, as set forth.

2. In a cigar-machine, the combination of the hopper B, a feed-cylinder having a cavity therein and located in the bottom of the hopper, a bunch-guide, E, beneath the hopper, a reciprocating pusher, J, in said guide, stationary rollers *f f'*, a pivoted frame, H, having a roller, *g*, and an apron, G, passed over said rollers, the slack thereof forming a bight between one of the stationary rollers and the roller on the pivoted frame, as set forth.

3. In a cigar-bunching machine, the combination of the hopper B, an oscillating feed-cylinder having a cavity and located in the bottom of the hopper, a bunch-guide, E, beneath the hopper, a reciprocating pusher, J, in the guide, a frame having slots I', a bar, I, movable back and forth in the slots, rollers *f f g g'*, the frame H, and an apron, G, passed over the rollers and connected to said bar, substantially as described.

4. In a cigar-bunching machine, the combination of a tubular guide, E, and a pusher in the guide, comprising a cross-head, *j*, and a flexible bar, *j'*, attached to the cross-head, and means whereby the shape of said bar may be changed, as set forth.



5. In a cigar-bunching machine, the combination of a frame having slots I', a bar, I, movable back and forth in the slots, rollers *f f g g'*, an apron, G, passed over the rollers and connected to the said bar, a pivoted frame, H, and pivoted upright arms *l*, provided at their upper end with flat springs l^3, which are in contact with one of the said rollers, for the purpose set forth.

6. In a cigar-bunching machine, the combination of a frame having slots I', a bar, I, movable back and forth in the slots, rollers *f f g g'*, an apron, G, passed over the rollers and connected to the said bar, and a pivoted frame, H, provided with a rest or support, O, for the leaf or wrapper, as set forth.

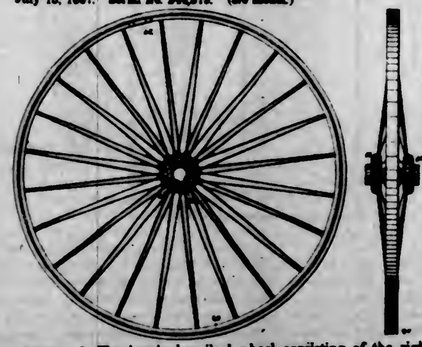
7. In a cigar-bunching machine, the combination of a frame having slots I', a bar, I, movable back and forth in the slots, rollers *f f g g'*, an apron, G, passed over the rollers and connected to the said bar, a pivoted frame, H, and pivoted upright arms *l*, having a spring, g^6, which bears against the apron and presses it in contact with the pivoted frame, as set forth.

8. In a cigar-bunching machine, the combination of a frame having slots I', a bar, I, movable back and forth in the slots, rollers *f f g g'*, the frame H, an apron, G, passed over the rollers and connected to the said bar, a pivoted frame, H, and pivoted upright arms *l*, having a spring, g^6, which bears against the apron and presses it in contact with the pivoted frame, as set forth.

384,758. **FIFTH-WHEEL.** William W. Gunn, Baldwin, Pa. Filed June 9, 1887. Serial No. 240,737. (No model.)

Claim.—1. In a fifth-wheel, the combination of circle-plates adapted for receiving the head-block and axle-bed and provided with rearward extensions for the king-bolt, a king-bolt which is situated back of and is independent of the axle and head-block, and a king-bolt brace which connects the circle-plate with the lower end of the king-bolt and the lower end of the king-bolt with the reach, whereby the king-bolt is supported against the strain from the axle and perch, substantially as and for the purposes specified.

2. In a fifth-wheel, the combination of the fifth-wheel plates adapted to receive the head-block and axle-bed and provided with rearward extensions for the king-bolt, a king-bolt brace which connects the front of the circle-plates with the reach and is provided with a socket for the reception of the lower end of the king-bolt, and a king-bolt situate back of and independent of the axle, and which connects the rear of the circle-plates with the brace which extends from the front of the circle-plates to the reach, substantially as and for the purposes specified.



3. In a fifth-wheel, the combination, with the circle-plate, of a brace extending therefrom and a shoe screwed on the brace and supporting the lower circle-plate, substantially as and for the purposes described.

4. In a fifth-wheel, circle-plates the meeting faces of which are bowed or separated, substantially as and for the purposes described.

5. In a fifth-wheel, the combination, with the axle and a king-bolt situate in the rear thereof, of a plug interposed between the king-bolt and axle, substantially as and for the purposes described.

6. In a fifth-wheel, the combination of circle-plates adapted to receive the head-block and axle-bed and provided with rearward extensions for the king-bolt, a brace which extends from the front of the circle-plates to the reach, a king-bolt situated back of and independent of the axle, and which connects the rear of the circle-plates with the brace, and a perch-hanger having a king-bolt socket and which extends from the rear extension of the circle-plates to the brace, substantially as and for the purposes specified.

384,759. **WHEEL.** Abbott J. Haines, Wilmington, Ohio. Filed July 15, 1887. Serial No. 244,379. (No model.)

Claim.—1. The herein-described wheel, consisting of the right and left hand threaded sleeve 70, the disks 65 and 66, the disks 65 being provided with the lugs 66 and the apertures 67 and the disks 68 with the flanges 69, the grooved and apertured felly 60, the spokes formed of a single piece of wire and provided with loops or eyes *a b*, pins for securing the spokes to the felly, and the tire 80, provided with the rib 81, fitting in the groove of the felly, as specified.

2. In a wheel, the combination of the right and left hand threaded sleeve 70, the disks 65, provided with the apertures 67 and the lugs 66, the disks 68, provided with the flanges 69, and the dust-guard 71, fitted on the sleeve between the disks 65, substantially as herein shown and described.

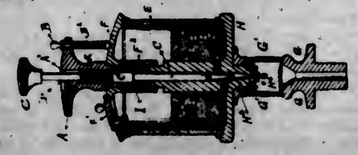
384,760. **ALARM-BOLT FOR DOORS.** Eleazer Harbon, Baltimore, Md. Filed Feb. 17, 1888. Serial No. 264,388. (No model.)

Claim.—1. In an alarm door-bolt, the combination of a movable bolt, A, an alarm device, a hammer suitably mounted to strike said alarm device, a movable bar, E, one end of which is detachably connected with the bolt and is provided at the other end with a trigger which projects in the path of the said hammer, and a knob movable endwise on the bolt and connected with a cam-arm, *d*, which will press on the said connecting-bar and disengage it from the bolt, whereby on grasping the movable knob the bolt may be shifted without sounding the alarm, but if the bolt be moved without using the knob an alarm will be given.

2. In an alarm door-bolt, the combination of a movable bolt, A, an alarm device, a hammer suitably mounted to strike said alarm device, a movable bar, E, one end of which is detachably connected with the bolt and is provided at the other end with a trigger which projects in the path of the said hammer, and a sleeve, C, surrounding the bolt loosely and having a limited movement thereon and provided with a cam, *d*, to disengage the said connecting-bar from the bolt.

3. In an alarm door-bolt, the combination of a movable bolt, A, an alarm device, a hammer suitably mounted to strike said alarm device, a movable bar, E, one end of which is detachably connected with the bolt and is provided at the other end with a trigger which projects in the path of the said hammer, a knob movable endwise on the bolt and connected with a cam-arm, *d*, which will press the said connecting-bar and disengage it from the bolt, and a locking-arm attached to the bolt and capable of being moved to render said knob immovable with respect to the bolt.

384,761. **ALARM-BOLT.** Eleazer Harbon, Baltimore, Md. Filed Feb. 17, 1888. Serial No. 264,390. (No model.)



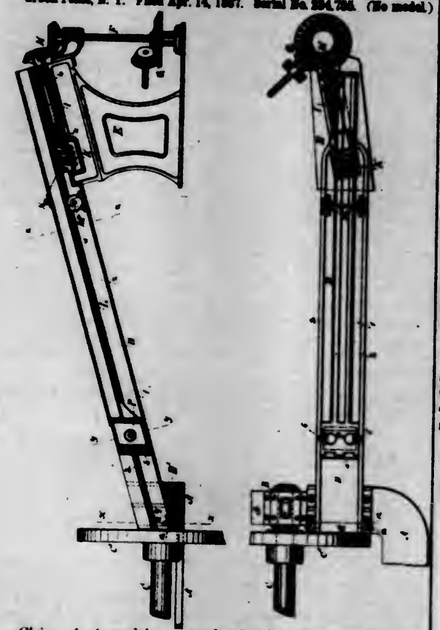
Claim.—1. An alarm-bolt having a reciprocating curvilinear movement, a trigger connected with the inner end of said bolt, the outer end of the same being turned at an angle for engagement with a keeper located in a plane at right angles to the position of the bolt, substantially as shown and described.

2. An alarm-bolt having a longitudinal recess therein, a retracting-spring located in said recess, and a strut-spring and locking-wedge engaging with opposite sides of the bolt, substantially as specified.

3. An alarm-bolt having a recessed lower side, a retracting-spring, a strut-spring engaging with one side of the bolt to give it a lateral thrust, and a locking-wedge on the opposite side thereof, substantially as specified.

4. A locking-bolt having its outer end terminating in an angle and its under side recessed and containing a retracting-spring, a trigger on the inner end of and engaging with a gong-hammer, a keeper located in a plane at right angles to the path of the bolt, and a locking-wedge engaging the side of the bolt and locking the same in the keeper, substantially as specified.

384,762. **OILER.** Peter D. Hay, Detroit, Mich., assignor to the Michigan Lubricator Company. Filed Jan. 17, 1888. Serial No. 261,066. (Model.)



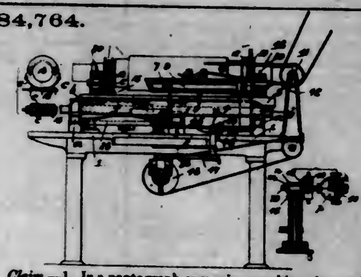
Claim.—1. In combination with the oil-chamber provided with a valve-seat in the oil-passage, the cap F, having a tubular stem, F^3, a plug, A, having a groove, A', and adjustably connected to the cap, and a central needle-valve, C, having a pin, D, substantially as set forth.

2. In combination with the oil-chamber provided with a valve-seat in the oil-passage, the cap F, having a tubular stem, F^3, a plug, A, having a groove, A', and adjustably connected to the cap, a central needle-valve, C, having a pin, D, and a spring, K, acting on the needle, substantially as set forth.

3. In combination with the oil-chamber provided with a valve-seat in the oil-passage, the cap F, having a tubular stem, F^3, the adjustable plug A, having a groove, A', a spring-pressed pin, B, and a central needle-valve, C, having a pin, D, substantially as set forth.

4. In combination with a glass-inclosed chamber, E, the cap F, having a tubular stem, F^3, the bottom plate, H, formed with a tubular stem, H', oil-hole H^3, and a valve-seat, H^2, the spring I, the plug A, having a groove, A', and the central needle-valve, C, having a pin, D, substantially as set forth.

384,763. MACHINERY FOR CUTTING LOGS. JOHN J. HAYES, Green Point, N. Y. Filed Apr. 14, 1887. Serial No. 234,726. (No model.)



Claim.—1. A revolving cutter-head and the frame for the same and an inclined trough for the reception of the log to be acted upon and having a channel across the lower end of the bottom of the trough and mortises in the sides of the trough, in combination with the removable nose-piece filling the channel and passing through the mortises, and screws for holding down the removable nose-piece, substantially as set forth.

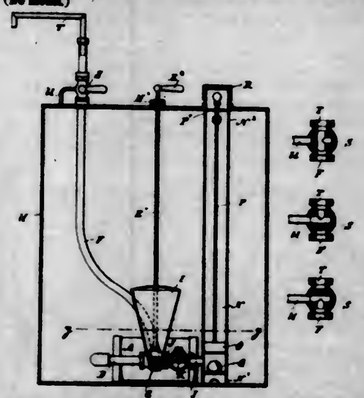
2. The combination, in a machine for cutting logs transversely, of a revolving head with knives, a frame and journal-boxes for supporting the same, an inclined trough for receiving the log to be cut, a head and bar within the trough, and teeth on the under side of the bar, and a screw-pinion below such bar for acting directly upon the teeth, a shaft for revolving the screw-pinion, and rollers above such rack-bar for holding the same down, substantially as set forth.

3. The rack-bar having teeth on its under surface and the screw-pinion for moving the rack-bar endwise, in combination with the trough having longitudinal grooves in its inner faces, the supporting-wheels M below the rack and the rollers N above such rack to hold the same down, the head P, connected to the rack and having holdfast projections 5 upon its front surface, and the guide-rollers 6 upon the sides of the head and within the longitudinal grooves in the inner faces of the trough, substantially as set forth.

384,764. PANTOGRAPHIC ENGRAVING-MACHINE. GARDNER B. HUSSEY, Bradley, Mount Pendleton, Manchester, County of Lancaster, England. Filed Mar. 30, 1883. Serial No. 230,494. (No model.) Patented in England Jan. 12, 1883, No. 494; in France Oct. 13, 1883, No. 170,088, and in Germany Oct. 30, 1883, No. 29,154.

Claim.—1. In a pantograph engraving-machine, the combination, with the drills mounted in stationary supports, of the compound carriage whose parts have motions in different directions, the supporting-blocks for the roller on said carriage, and the pantograph-frame coupled to the compound carriage and giving motion to said roller, substantially as described.

2. The combination, with the pantograph-frame and compound carriage coupled thereto for supporting the roller to be engraved, of the means for maintaining the roller rigid under the action of the drills, said means consisting in friction-wheels, one having a fixed position and the other pressing on the roller by spring-pressure, substantially as described.



3. The combination, with the drills, compound carriage, pantograph-frame, and tracing-point, of the weighted levers exerting pressure on the drills, the rocking bar or rail for acting on said weighted levers and regulating the depth of action of the drills, and the compound system of levers for communicating the motion of said tracing-point to said rocking bar or rail, substantially as described.

4. In a pantograph-engraving machine, the combination, with the tracer, of a longitudinally-movable rod connected therewith, and a pivoted arm carrying said rod, by the combined movements of which rod and arm the tracer can be moved over the whole surface of the pattern-plate, and the reversing-gear and connections for moving said tracer, substantially as described.

5. A pantograph engraving-machine comprising the following elements in combination: a compound carriage for the article to be engraved, the pantograph-frame coupled to said compound carriage, the drills or graving tools, the system of levers for controlling the depth of action of said drills from said pantograph-frame, the tracer, and the means for guiding said tracer by power, substantially as described.

384,765. WITHDRAWN.

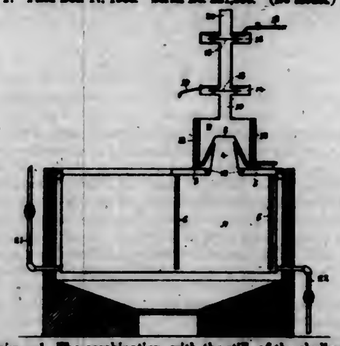
384,766. FLUID DRAWING AND MEASURING DEVICE. JOHN A. KENDALL, Maysville, Mo. Filed July 26, 1887. Serial No. 245,202. (No model.)

Claim.—1. In a fluid drawing and measuring device, the combination, with a tank, of a cylinder located in said tank, a piston operating in said cylinder, a four-way cock connected with the ends of said cylinder, and a pump located in said tank and connected by a pipe and intermediate chamber with said four-way cock, said pipe having a check-valve and said four-way cock connecting with a discharge-pipe, substantially as set forth.

2. In a fluid drawing and measuring device, the combination, with a tank, of a cylinder located in said tank, a piston operating in said cylinder, a four-way cock connected with the ends of said cylinder, a reservoir connected with said four-way cock, a pipe provided with a check-valve and connected with said reservoir, a pump connected with said pipe and located in said tank, and a discharge-pipe connected with said four-way cock, substantially as shown and described.

3. In a fluid drawing and measuring device, the combination, with a tank, of a cylinder located in said tank, a piston operating in said cylinder, a four-way cock connected with the ends of said cylinder, a reservoir connected with said four-way cock, a pipe provided with a check-valve and connected with said reservoir, a pump connected with said pipe and located in said tank, and a discharge-pipe connected with said four-way cock, substantially as shown and described.

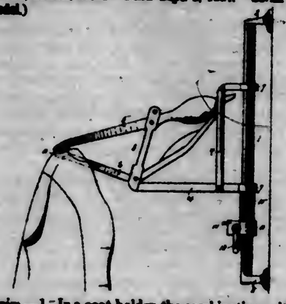
4. In a fluid drawing and measuring device, the combination, with a tank, of a cylinder disposed in said tank, a piston operating in said cylinder, a four-way cock connected with the ends of said cylinder, a reservoir connected with said four-way cock, a pipe provided with a check-valve and connected with said reservoir, a pump connected with said pipe and located in said tank, a discharge-pipe connected with said four-way cock, a drip-pipe connecting with said tank and discharge-pipe, and a three-way cock applied to said discharge-pipe at the point of intersection therewith of the drip-pipe, substantially as set forth.



384,767. NUT-LOCK. ANDREW B. KERR, Logan's Ferry, Pa. Filed Feb. 28, 1888. Serial No. 265,602. (No model.)

Claim.—1. As a nut-lock for confining the nuts of adjacent bolts, the combination of a spring-plate which extends between the bolts, a stud or boss which projects from the back of the plate and bears against the surface back of it, so as to hold out the middle of the spring-plate while the ends are forced in by the nuts, and a second plate, which is secured to the spring-plate and which bears against the nuts, substantially as and for the purposes described.

2. As a nut-lock for confining the nuts of adjacent bolts, a spring-plate which extends between the bolts, a rivet extending through the plate having a head projecting from the face of the spring-plate and having a boss which bears against the surface back of the spring-plate, so as to hold out the middle of the said plate while the ends are forced in by the nuts, and a second plate having locking-lips which is removably attached to the rivet back of the head, substantially as and for the purposes described.



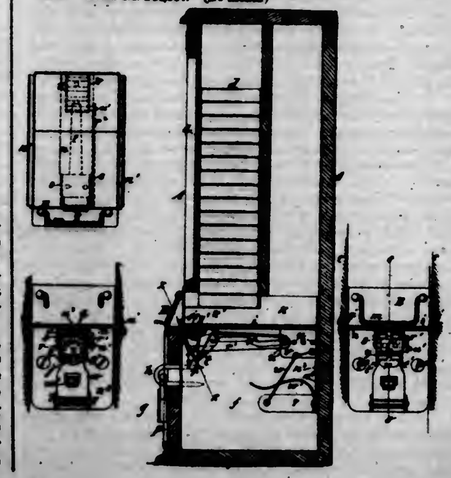
384,768. APPARATUS FOR VAPORIZING LIQUIDS. J. MORRIS KEENAN, Brooklyn, assignor to the Hyatts Oil Company, New York, N. Y. Filed Dec. 17, 1886. Serial No. 221,869. (No model.)

Claim.—1. The combination, with the still, of the shallow chamber above the still and contiguous thereto, the vapor-chamber, the pipe 4, leading from the still to the vapor-chamber, the arresting-cap above pipe for arresting the current of vapor and projecting it downward, the pipes leading from the shallow chamber to the upper part of the vapor-chamber, and the return-pipes leading from the shallow chamber to the still, substantially as described.

2. In a petroleum-distilling apparatus, the combination of the still, the dome or discharge-pipe, the shallow chamber, above the still, the vapor-chamber above the shallow chamber, the pipes leading from the shallow chamber to the top of the vapor-chamber, means, such as the arresting-cap 8 and return-pipes 12 and 6, for arresting and returning the principal portion of the heavy vapors and unevaporated liquid, the series of vessels having concave tops and level rims, forming basins or traps, arranged one above the other, so that water overflowing the top basin will trickle down the sides of the vessel and the intervening pipe to the next beneath, a pipe for flowing cold water on to the upper trap, and a pipe for carrying it away from the lower one, substantially as described.

384,769. COAT-ADJUSTER. RICHARD LAGOMBE and CHARLES LAGOMBE, Bristol, Conn. Filed Sept. 5, 1887. Serial No. 248,801. (No model.)

Claim.—1. In a coat-holder, the combination, with a standard and a frame consisting of collars engaging the standard, an arm, 9, having a slot, and an arm, 8, of upper and lower bifurcated holding-arms, pivoted to arm 8 and adapted to oscillate in the vertical plane, the rear ends of said arms engaging the slot in arm 9, and having weights, as shown, whereby when a coat is placed between the holding-arms they close together, holding the coat in position to receive the arms of the wearer, and when the coat is removed the holding-arms return to the open position.



2. The combination, with the standard, bracket 11, adjustable thereon, and spring 15 above said bracket, of the frame engaging the standard and resting on the spring, and bifurcated holding-arms pivoted to the frame to oscillate in the vertical plane and weighted at their rear ends, whereby a coat placed between the holding-arms is held in position to receive the arms of the wearer, the spring acting to throw the coat off from the holding-arms upon the shoulders of the wearer.

3. The standard having rack-teeth and the sliding bracket having a pinion engaging the teeth, and a locking-pawl, in combination with a frame supported by said sliding bracket and pivoted holding-arms carried by the frame.

4. In a coat-holder, the combination, with a frame, of upper and lower pivoted arms, the forward ends of which are bifurcated and provided with holding-pads, and the rear ends of which are weighted, substantially as described.

5. In a coat-holder, the combination, with the standard, sliding bracket 11, and spring 15, of a frame adapted to slide on the standard and rest against the spring and pivoted holding-arms carried by the frame.

384,770. SELLING-MACHINE. FRANK M. LEAVITT, Brooklyn, N. Y., assignor to the R. W. Hoe Company, same place. Filed July 18, 1887. Serial No. 244,567. (No model.)

Claim.—1. In a selling-machine, the combination, with an inclosing-case having a reservoir for packages or articles and a drawer sliding in relation thereto, of a guiding base or way plate for said drawer, and locking mechanism mounted wholly on said drawer and way-plate, said drawer, with its way-plate and locking mechanism, being bodily attachable and removable to and from said case, substantially as herein set forth.

2. In a selling-machine, an inclosing-case having compartments for containing the packages of articles to be sold, each of said compartments having at its lower end grooves in its sides, in combination with a way-plate at the bottom of each compartment fitting in the grooves thereof, said way-plate being itself formed with guide grooves or ways, and a drawer for each compartment resting and sliding on the way-plate for such compartment, said drawer having side flanges which engage the guide-grooves in said way-plate, substantially as set forth.

3. In a selling-machine, an inclosing-case having compartments for containing the packages or articles to be sold, each of said compartments having at its lower end grooves in its sides, in combination with a way-plate at the bottom of each compartment fitting and sliding in the grooves thereof and removably secured in position therein, said way-plate having its edges within said grooves bent over to constitute guide grooves or ways, and a drawer for each compartment resting and sliding on the way-plate for such compartment, said drawer having side flanges which engage and slide in the guide grooves or ways in said way-plate, substantially as set forth.

4. The package-drawer for a selling-machine having a block with a recess at its front end and a raised platform at its rear end, in combination with a metallic bottom plate secured to said block having its ends turned up against the ends of said block, and having its side edges projecting beyond the sides of said block, substantially as set forth.

5. In a selling-machine, the drawer B, in combination with the way-plate *n*, underlying the drawer, having ways in which the drawer slides, with one end of the plate projecting beyond the front of the drawer and containing the coin-slot *q*, with locking mechanism controlling the locking and unlocking of the drawer arranged beneath said slotted way-plate, substantially as herein set forth.

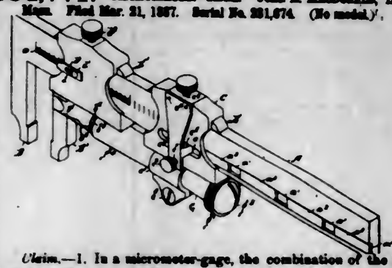
6. In a selling-machine, a drawer resting and adapted to slide on a guiding base or way plate, in combination with said guiding base or way plate having a coin-slot therein at the front edge of said drawer, and which slot is covered when said drawer is drawn out, and remains covered until said drawer is again fully closed, substantially as set forth.

7. In a selling-machine, the combination, with the reservoir-case and movable drawer, of the movable coin-slide *r*, arranged adjacent to the coin-slot, a locking device arranged in juxtaposition to the said slide, the cam-lever *r'*, attached to said slide *r*, and a projection on the drawer engaging said lever, substantially as and for the purpose set forth.

8. In a selling-machine in which the deposit of a coin releases locking mechanism to allow the opening of a package-drawer, a plate having a coin-slot, a coin-slide leading therefrom, and locking devices, in combination with a pivoted escapement-lever located immediately beneath said coin-slot and between it and the locking device, said escapement-lever having two arms, the upper of which is normally out of the path of the coin and the lower of which stands normally across the coin-slide in the path of the coin and is adapted to be struck by a coin when inserted, whereby the upper arm is swung across the slide immediately beneath the coin-slot, said upper arm, when so swung across the coin-slide, being closer to the exterior mouth of the coin-slot than the diameter of the coin which operates the machine, whereby the insertion of such a coin is prevented, substantially as set forth.

9. In a selling-machine in which the deposit of a coin releases locking mechanism to allow the opening of a package-drawer, a plate having the depositing coin-slot, the detent mechanism, a locking-lever, and a coin-slide for conducting the coin from the coin-slot to said lever, in combination with an escapement-lever pivoted immediately beneath the coin-slot and between it and said locking-lever, said escapement-lever having two arms, the upper of which is normally out of the path of the coin and the lower of which stands normally across the coin-slide in the path of the coin and is adapted to be struck by a coin when inserted, whereby the escapement-lever is tilted and the upper arm is swung across the coin-slide to close the same and the lower arm is swung away from said coin-slide to permit the coin to strike the locking-lever to tilt the same, said upper arm of the escapement-lever being closer to the exterior mouth of the coin-slot than the diameter of the coin which operates the machine, and the lower arm of said lever being nearer to the locking-lever when the same is depressed than the diameter of the coin, whereby, when the coin rests on said locking-lever, it holds said escapement-lever with its upper arm across the coin-slide, substantially as set forth.

10. In a selling-machine in which the deposit of a coin releases locking mechanism to allow the opening of a package-drawer, a plate having the depositing coin-slot, the package-drawer sliding on said plate across said coin-slot, the detent locking mechanism, a locking-lever, and a coin-slide for conducting the coin from the coin-slot to said lever, in combination with an escapement-lever pivoted immediately beneath the coin-slot and between it and said locking-lever, said escapement-lever having two arms, the upper of which is normally out of the path of the coin and the lower of which stands normally across the coin-slide in the path of the coin and is adapted to be struck by a coin when inserted, whereby the escapement-lever is tilted and the upper arm is swung across the coin-slide to close the same and the lower arm is swung away from said coin-slide to permit the coin to strike the locking-lever to tilt the same, said upper arm of the escapement-lever being closer to the exterior mouth of the coin-slot than the diameter of the coin which operates the machine, and the lower arm of said lever being nearer to the locking-lever when the same is depressed than the diameter of the coin, whereby, when the coin rests on said locking-lever, it holds said escapement-lever with its upper arm across the coin-slide, substantially as set forth.



11. In a machine, substantially such as set forth, the combination, with the drawer, of the coin-slide *r*, balanced locking-lever *t*, dumping-lever *r'*, and engaging-pins *w w'*, fixed to the drawer, substantially as shown and described.

12. In a selling-machine, the combination, with the reservoir-case and the movable drawer, of the toggle *w*, having one end fastened to the drawer and the other to the case, and a spring acting on the toggle, substantially as and for the purpose set forth.

13. A selling-machine comprising the following features: an inclosing-case having a package-compartment, a drawer, such as B, to fit said compartment, a way or guiding-base, such as *n*, in which said drawer is mounted, fastening devices securing such base to the case, and a door, such as *p*, closing up against the front end of said guiding-base, whereby, when said door is opened, the drawer and its guide-base can be bodily removed from the case, substantially as herein set forth.

14. A selling-machine comprising the inclosing-case and the package-compartment therein, the drawer B, fitting said compartment, guide-base *n*, in which said drawer is mounted, prolongation *n'* of said base secured to the case, chamber *f*, below said drawer and guide-base, and door *b* to said chamber, substantially as herein shown and described.

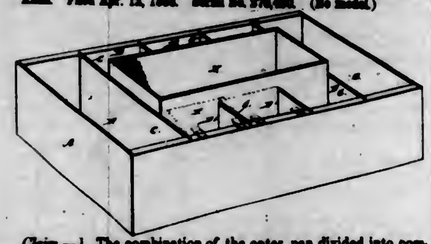
884,771. MICROMETER-GAGE. JOHN A. MACDONALD, Lowell, Mass. Filed Mar. 21, 1887. Serial No. 231,674. (No model.)

Claim.—1. In a micrometer-gage, the combination of the beam provided with a jaw rigidly secured thereto, a slide provided with a clamp and adapted to be moved on said beam, or to be immovably secured thereon, a jaw sliding on said beam and provided with a screw, a sleeve turning without advancing in said clamp, and being internally threaded, and said screw being externally threaded and entering and engaging said sleeve, as and for the purpose specified.

2. In a micrometer-gage, the combination of the beam provided with a jaw rigidly secured thereto, a slide provided with a clamp and adapted to be secured on said beam, a jaw sliding on said beam and provided with a screw, a sleeve provided with external annular grooves and projections to receive and fit corresponding annular projections and grooves within said clamp and being internally threaded, and said screw being externally threaded and entering and engaging said sleeve, as and for the purpose specified.

3. The combination of two sleeves, one arranged around the other and adapted to slide the one upon the other, one of said sleeves being provided with a micrometer-screw and the other of said sleeves being internally threaded to engage said screw, the outer one of said sleeves being provided with graduation-marks which extend to its central opening, and the other of said sleeves being provided with an index-line, substantially as described, so that turning said sleeves the one upon the other until the same graduation-mark comes a second time over said index-line will cause said sleeves to advance relatively to each other an amount equal to the pitch of said screw, said index-line being determined by experiment and varying from a straight line more or less, according to the errors of said screw, as and for the purpose specified.

4. In a micrometer-gage, the combination of the beam having a jaw rigidly secured thereto, a slide provided with a clamp and adapted to be secured to said beam, a jaw sliding on said beam and provided with a screw, a sleeve turning without advancing in said clamp, and provided with an internal screw-thread and surrounding and engaging said screw, another sleeve surrounding said first-named sleeve and moving with said screw and having an index-line thereon, and a third sleeve secured to said first-named sleeve and moving therewith and surrounding said second-named sleeve, and having its end beveled and marked with graduation-lines, as and for the purpose specified.



5. The combination of the beam, blocks of steel having their ends hardened and ground secured to said beam at equal intervals from each other, a slide movable on said beam, and a projection carried by said slide and adapted to enter the spaces between said blocks and to reach across said intervals, as and for the purpose specified.

6. The combination of the beam provided in its face with a groove, blocks of steel having their ends hardened, ground and fixed in said groove at equal intervals from each other, and a slide movable on said beam, and a projection carried by said slide adapted to enter the spaces between said blocks and to reach across said intervals, as and for the purpose specified.

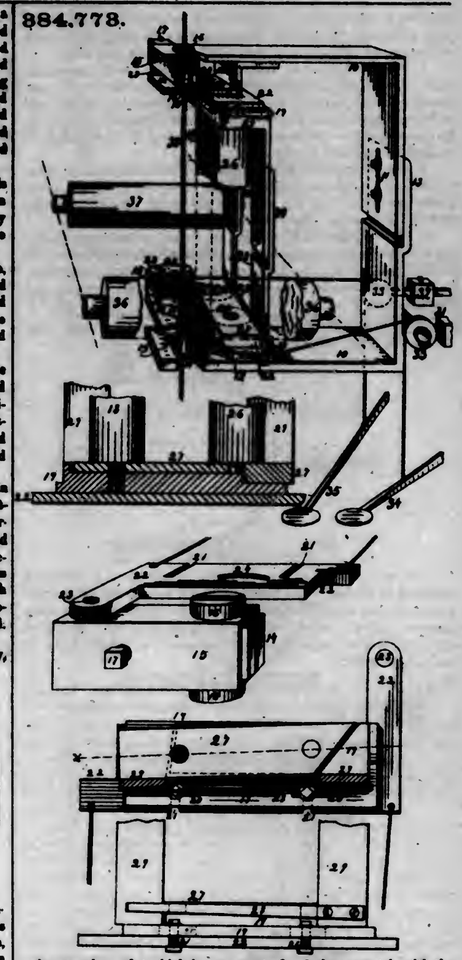
7. In a micrometer-gage, the combination of the slide movable on the beam of said gage, a gib interposed between said beam and said slide and having a notch adapted to receive and fit said slide, a semi-elliptic spring arranged between said gib and said slide, and a set-screw turning in said slide and thrusting against said spring to crowd said spring upon said gib and to hold said gib in contact with said beam, as and for the purpose specified.

8. In a micrometer-gage, a graduated indicating-sleeve formed in two overlapping parts, an end of the larger part being tapering, slotted, and externally screw-threaded, in combination with a nut internally tapering and adapted to engage said screw-threaded end of said larger part, and by contracting the same to prevent said parts by friction on each other from slipping or turning on each other, and when loosened to allow said parts to be moved endwise and turned on each other to bring the starting graduating-mark of said sleeve to correspond with the index-line of said gage, as and for the purpose specified.

884,772. EVAPORATING-PAN. THOMAS MACKENZIE, Mound City, Kans. Filed Apr. 12, 1888. Serial No. 270,692. (No model.)

Claim.—1. The combination of the outer pan divided into communicating compartments by transverse partitions having open spaces cut in their upper edges, with the inner pan seated in said open spaces, rising higher than the outer pan, and having its bottom and sides in contact with its supports only, substantially as specified.

2. The combination of the pan A, having its sides of wood and its bottom and ends of metal, the transverse metal partitions having the openings *c* alternately at their opposing ends, the intermediate partitions having their upper edges cut away to form aligned rectangular spaces D, and the end partitions being complete but for the openings *c*, with the inner pan seated in the spaces D and having its sides resting against the edges of said spaces and its ends resting against the inner faces of the end partitions, as specified.



3. The combination of the outer pan having the partitions C, provided with the alternately-opposite openings *c* adjoining the floor of said pan, and the open spaces D in their upper portions, with the inner pan seated in the spaces D, as set forth.

884,773. SAW-GUIDE. JAMES W. MAXWELL, Louisville, Ky. Filed Dec. 8, 1887. Serial No. 257,249. (No model.)

Claim.—1. The combination, in a saw-guide, of a bearing-block slotted to receive the saw-blade, a box fitted for the said block to slide longitudinally in and hung by means of trunnions journaled in bearings in the machine-frame partially surrounding the saw, means for adjusting the bearing-block longitudinally in the box, the said box constituting an arm extending rearward from its trunnions, and guide-rollers journaled in the deflector-frame connected with the said arm, substantially as shown and described.

2. The combination of a machine-frame, a saw-guide in a box hung upon trunnions therein and provided with an arm extending away from the bearings, a deflector fitted to move in the machine-frame upon

884,778.

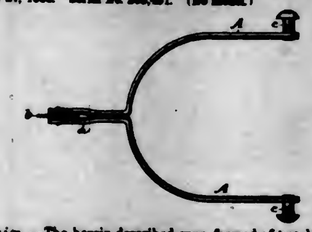
a pin engaging a slot which is a segment of a circle concentric with the said trunnions, the said deflector and frame constituting two members of a sliding joint and the said slot being in one member and the said pin fixed to the other member, the deflector being pivoted to the said arm of the bearing-box, and guide-rollers journaled in the deflector parallel with the saw, substantially as shown and described.

3. The combination of a saw-guide journaled in the machine-frame parallel with the line of the saw, a frame hung in the machine-frame to move concentrically with the said saw-guide, a roller or rollers journaled in bearings fitted to the said movable frame, and means for adjusting the said bearings both longitudinally and transversely in the frame, substantially as shown and described.

4. The combination of saw-guides hung in a frame upon journals which are near to and parallel with the line of the saw, and provided with an extending arm, a deflector freely pivoted to the said arm, a guide roller or rollers journaled parallel with the saw in the deflector, and guides communicating between the deflector and the frame, substantially as shown and described, whereby the deflector is guided to move concentrically with the said saw-bearing journals.

5. The combination of a saw-guide journaled parallel with the line of the saw, two guide-rollers journaled in separate supports or boxes and connected with the saw-guides, one of the said boxes being hung to move toward and away from the saw, and a spring fitted to press the movable roller toward the saw, substantially as shown and described.

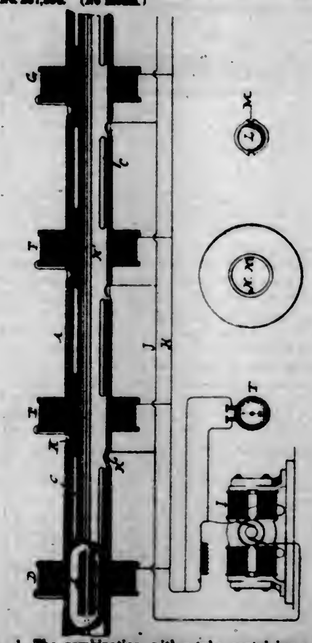
6. The combination of a journaled saw-guide, a frame hung to move concentrically therewith and connected therewith, a guide-roller



journaled in the said frame, another roller journaled in bearings pivotally connected with the said frame, and a spring acting between the said frame and bearings, substantially as shown and described.

7. The combination of a journaled saw-guide, guide-rollers journaled in a deflector connected with the saw-guide, two weights connected with two opposite arms of the deflector, and treadles connected with the weights, substantially as shown and described, whereby the action of either weight may be suspended and the other weight be permitted to act with full force.

8. The combination, with a journaled saw-guide and a roller therefor, of a weight connected with the saw-guide and roller, and a treadle connected with the weight, substantially as shown and described, whereby the action of the weight may be suspended.



9. The combination of a frame, 10, formed in two parts, having an adjustable lapped joint, saw-guides journaled in the same frame, and guide-rollers journaled in a frame concentric with the said saw-guides, the said roller-frame having a lapped joint, substantially as shown and described.

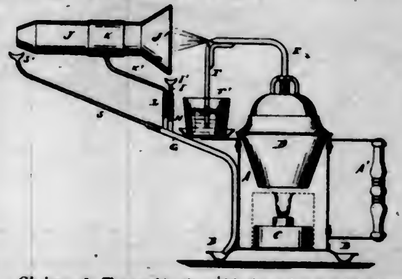
384,774. SPUR. ALFRED McILHENY, New Britain, Conn. Filed Feb. 27, 1888. Serial No. 265,451. (No model.)

Claim.—The herein-described spur, formed of two blanks, each consisting of one-half of the body of the spur and one side of the rearward extension, the outer ends of said rearward extensions being offset, as shown, and the inner ends placed one against the other face to face and mechanically secured together, substantially as described, and for the purpose specified.

384,775. ELECTRO-MAGNETIC PARCEL-CARRIER. MORRIS C. MEIER, New York, N. Y. Filed Oct. 31, 1888. Renewed Mar. 20, 1888. Serial No. 267,896. (No model.)

Claim.—1. The combination, with a tube containing a guide or track and containing slots or air-passages, of a car or carrier formed of a magnetic metal and adapted to slide or travel on said track, coils or helices surrounding the tube, and circuit-closing devices adapted to be operated by the movement of the carrier, whereby the coils are successively brought into and out of circuit, as herein set forth.

2. The combination, with a longitudinally-slotted tubular guide provided with interior longitudinal rails or guides, of a car or carrier of magnetic metal adapted to move on said rails or guides, coils or helices surrounding the tube, and an electric circuit, to one portion of which one end of each coil is connected permanently, and to the other portion of which the opposite ends of the said coils are adapted to be connected successively by circuit-closing springs placed in the path of the carrier and adapted to be operated thereby.



3. The combination, with a tube containing a guide or track and a car or carrier adapted to slide or travel thereon, of coils or helices surrounding said track, an electrical indicator, a circuit or circuits including the indicator and the coils, and circuit-closing devices adapted to be operated by the moving car or carrier, as and for the purpose set forth.

384,776. MEASURING DEVICE FOR ICE-CREAM OR OTHER SIMILAR SUBSTANCES. THOMAS A. HATLER, Baltimore, Md. Filed Feb. 2, 1888. Serial No. 262,982. (No model.)

Claim.—In a device for measuring ice-cream or other similar substances, the combination of a measuring cup or vessel, with a rim or holder for said vessel of such a size as to fit the exterior of said vessel and permit the same to be freely turned therein, with a scraping knife or knives secured to said rim or cup-holder and extending over the edge of the cup and down into its interior, in contact with the sides of the same and conforming in shape thereto.

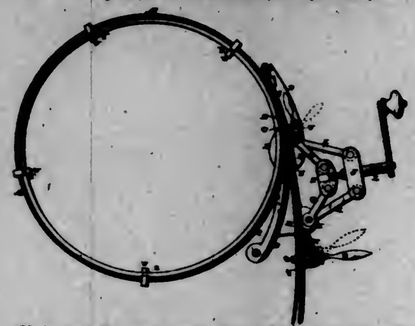
384,777. ATOMIZER. JOHN J. OTIS, Newark, N. J. Filed Mar. 17, 1888. Serial No. 267,470. (No model.)

Claim.—1. The combination, with the casing A, of the base B, forming a gutter, a spraying device, drip-gutters for the spraying device, and a tube leading from the drip-gutters to the gutter in the base, substantially as herein shown and described.

2. The combination, with the casing A, of a spraying device, the guide-tube J, the drip-gutter I' at the wider end of the guide-tube, the conducting-tube G, the tube I of the drip-gutter, and the tubular standard H on the conducting-tube G, substantially as herein shown and described.

3. The combination, with the casing A, of the conducting-tube G, the tubular standards H and L on the same, the tube I in the standard H, the gutter I' on the tube I, the rod K', the sleeve K, and the guide-tube J, supported by said sleeve, substantially as herein shown and described.

4. The combination, with the casing A, of the conducting-tube G, the standards H and L, the gutter I', the conducting-tube S, having one end inserted in the upper end of the conducting-tube G, and the gutter S' on the opposite end of the said conducting-tube S, substantially as herein shown and described.



5. In a mouth-piece, the combination, with a tube and a bell-shaped mouth on the same, of a sliding guard on the tube, and a locking device for locking the guard in place on the tube, substantially as herein shown and described.

6. In a mouth-piece, the combination, with a tube and a bell-shaped mouth on the same, of a nose-clamp, substantially as herein shown and described.

7. In a mouth-piece, the combination, with a tube and a bell-shaped mouth on the same, of the U-shaped nose-clamping spring O, pivoted on the mouth-piece, substantially as herein shown and described.

8. The combination, with a tube and a bell-shaped mouth-piece on the same, of the U-shaped nose-clamping spring O, pivoted on the same, and the retaining-bands T, substantially as herein shown and described.

384,778. TIRE-UPSETTER. WILLIAM H. PALMER, Middletown, N. Y. Filed Apr. 24, 1888. Serial No. 271,716. (No model.)

Claim.—1. In a tire-shrinker, the combination of two or more flexible bands which are rigidly secured together at one end with suitable clamps, which are connected to the bands and by means of which the bands may be made to shrink a fire upon the wheel, substantially as shown.

2. The combination of two or more flexible bands with the two clamps D H, and a mechanism, substantially as shown, for forcing the two clamps apart, substantially as described.

3. The combination of the flexible bands, the clamp D, to which the bands are fastened at one end, and through which the free ends of the bands are passed, the second clamp H, provided with means for holding the bands and the links, the block or arm, the nut, and the screw for forcing the two clamps apart, substantially as set forth.

4. The combination of the clamps D H, the flexible bands A, mechanism, substantially as shown, for separating the two clamps, the wedges N P, and the lever O, substantially as specified.

5. The combination of the two clamps D H, and a mechanism for forcing them apart, wedges connected to the clamp H, the flexible bands, the flexible bearing S, connected to the clamp D, and the operating-lever U, substantially as shown.

6. The combination, with the clamps and the endless bands, of the clamps which are applied directly to the bands and provided with supporting-lugs and bearing-surfaces for the wheel inside of the band, substantially as described.

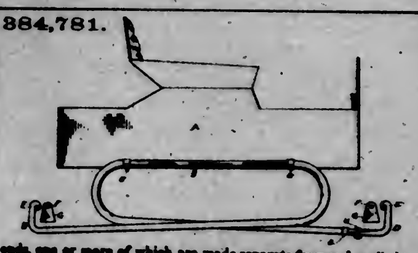
384,779. LOCKING-LEVER FOR CAR-COUPLINGS. FRANCIS W. PARSONS, Philadelphia, Pa. Filed Jan. 21, 1888. Serial No. 262,050. (No model.)

Claim.—1. A locking-lever for car-couplers having an internal chamber provided with a filling, substantially as specified.

2. A locking-lever for car-couplers provided with an internal chamber having a contracted neck and a filling for said chamber, substantially as specified.

3. A locking-lever for car-couplers having an internal chamber formed with internal locking-shoulders and provided with a filling, substantially as specified.

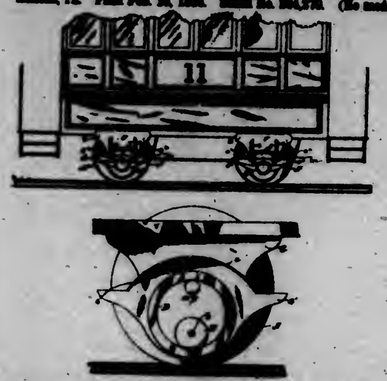
4. A locking-lever for car-couplers formed of cast-steel having an internal chamber provided with a filling of cast-iron, substantially as specified.



5. A locking-lever, A, having trunnions A' and coupling end A^2, and internally chambered, as at A^3, said chamber having contracted neck A^4 and provided with a filling, B, substantially as specified.

384,780. WITHDRAWN.

384,781. VEHICLE-SPRING. WILLIAM G. PERRY, Charlestown, R. I. Filed June 23, 1887. Serial No. 242,722. (No model.)



Claim.—The combination, with a vehicle-body, of a pair of supporting-springs, each formed with a central coil or otherwise and secured at remote points to said body, and with projecting upturned

384,781.

ends, one or more of which are made separate from and applied to the springs, substantially as and for the purposes herein set forth.

384,782. BEARING FOR SCREW-CARS. MORRIS L. PERLEE, Athens, Pa. Filed Feb. 10, 1888. Serial No. 264,272. (No model.)

Claim.—1. The combination, with a railroad-car body, of sectional hangers whose upper parts are rigidly attached and whose lower parts are elastically attached to the car-body and provided with friction-rollers, rings supported by the outer ends of the wheel-axles and supporting in turn said hangers, whereby, by the swinging of said ring, the car-body is capable of longitudinal and vertical movement independent of the movement of the trucks.

2. In combination with a railroad-car body, hangers rigidly attached to the same and provided with friction-rollers, rings supported by the outer ends of the wheel-axles and supporting in turn said hangers, a suitable car-starting device in the rear of the hangers, and brake-shoes whereby when the brakes are applied the momentum of the car-body swings the ring and carries the car-body forward and upward, the brakes holding both body and wheels, and when the brakes are released the weight of the car-body causes the ring to swing back and cause the car-starting device to start the car.

3. In combination with a railroad-car body, hangers rigidly attached to the same and provided with friction-rollers, rings supported by the outer ends of the wheel-axles and supporting in turn said hangers, brake-shoes attached to the car-trucks, and ratchet bar and wheel whereby when the brakes are applied the momentum of the car-body swings the ring and carries the car forward and upward, the brakes and ratchet-bar holding both body and wheels, and when the brakes are released the weight of the car-body causes the ratchet-bar to engage with and rotate the ratchet-wheel and start the car.

4. The combination, with the outer end of a car-axle, of the unelastic ring D and friction-wheel E, substantially as set forth.

5. The combination, with the outer end of a car-axle and a ring and friction-wheel supported thereby, of a hanger, F, made in sections, and springs *e* and *e'*, connecting the same, substantially as set forth.

6. The combination, with the axle, of a hanger, F, elastically attached to the car-body, the unelastic ring D, and friction-wheel E, substantially as set forth.

7. The combination, with the axle, of the ring D and hollow friction-wheel E, substantially as set forth, and for the purpose herein mentioned.

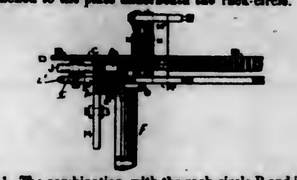
8. The combination, with the main axle B, of the ring D and wheel E, rotating on the slotted axle *b*, substantially as set forth.

9. The combination, with the main axle B, of the cup A, fitting over the end of said axle, substantially as described.

10. The combination, with the axle B, of the hanger F and removable cap *g*, substantially as described.

11. The combination, with the axle B, of the hanger F, cap *g*, and slot or trough *g'*, substantially as set forth.

12. The combination, with the axle B, of the hanger F, cap *g*, trough *g'*, and feeder *f'*, as set forth.



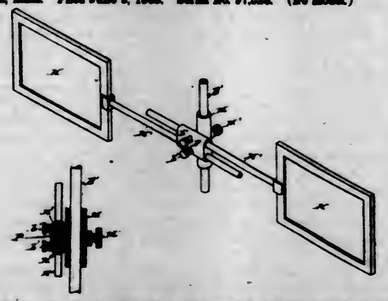
13. The combination, with the axle B, of the ratchet-wheel *k* and ratchet-bar *k'*, substantially as described.

14. The combination, with the axle B and wheel A, of the ratchet-wheel *k*, ratchet-bar *k'*, lever *l*, brake-shoe *m*, projection *m'*, and rod *n*, all arranged substantially as herein set forth, and adapted to operate as described.

15. The combination, with the projection *a*, of the cup *k''* and a cushioning device therein, substantially as set forth.

384,783. COMBING-MACHINE. JOHN PEEL, Bingley, and HENRY W. WHITEHEAD, Leeds, County of York, England. Filed May 11, 1887. Serial No. 237,893. (No model.) Patented in England Mar. 10, 1887, No. 3,663.

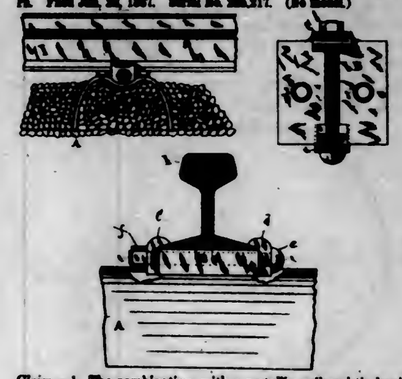
Brief.—A circular plate is supported upon standards underneath the rack-circle, said plate having boxes containing adjustable buffers. Upon the buffers is supported the steam-chest independent of the adjacent parts. The rack-circle has a flange outside of the steam-chest, against which bear adjustable rollers to steady the rack-circle in its rotation. The drawing-off rollers are mounted in a stand carried by a bracket attached to the plate underneath the rack-circle.



Claim.—1. The combination, with the rack-circle B and its downward flange C, of a separate steam chest or pipe, A, between the flange C and the rack, the circular plate E, boxes F, supported by said plate E, a spring and an adjusting-screw to each box, and a buffer between each spring and the steam-chest, substantially as and for the purposes specified.

2. The combination, with the rack-circle B and its flange C, of the separate steam-chest A between the rack and the flange C, the circular plate E below the steam-chest and rack-circle, and means for supporting said steam-chest and the rollers J outside the flange C, and studs for the rollers supported by said circular plate E, and means for adjusting the position of said studs and rollers J, substantially as and for the purposes specified.

3. The combination, with the rack-circle B, a steam-chest separate from said circle, and means for supporting said steam-chest, of a circular plate, E, below said rack and steam-chest, the standards F, for supporting the said plate E, the drawing-off rollers N N, the bracket O, secured to said plate E, and the stand M', for supporting said rollers attached to the bracket O, substantially as and for the purposes specified.



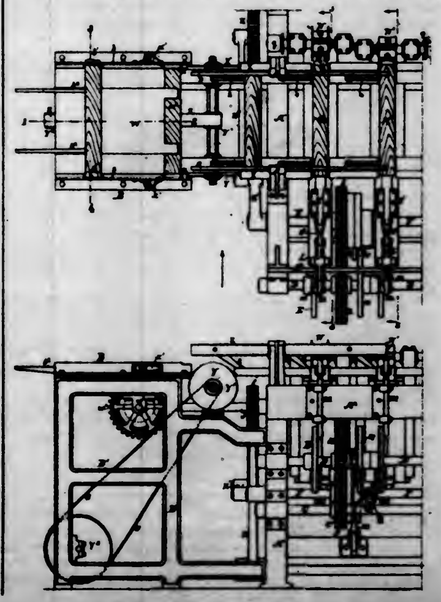
384,784. WINDOW-REFLECTOR. CARL G. A. F. W. R. PIEL, Lowell, Mass. Filed June 9, 1888. Serial No. 97,522. (No model.)

Claim.—1. The combination of the rod, the holder provided with an extension, and the mirror provided with stems, the extension of said holder being drilled through horizontally to receive said stems, as and for the purpose specified.

2. The combination of the rod, mirrors provided with stems, and the holder provided with an extension, the extension of said holder being drilled through horizontally to receive said stems, set-screws turning in threaded holes in said extension and thrusting against said stems, and another set-screw turning in a threaded hole in said holder and thrusting against the vertical rod, as and for the purpose specified.

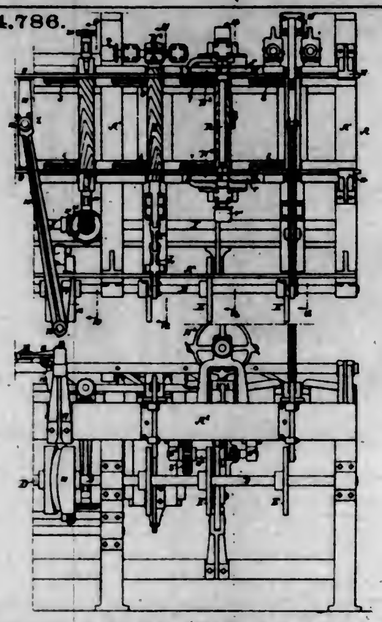
384,785. METALLIC RAILWAY-TIE. JACOB REESE, Pittsburg, Pa. Filed Jan. 28, 1887. Serial No. 226,217. (No model.)

Claim.—1. The combination, with a metallic railroad-tie having a corrugated top and downwardly-extending sides, of a shoe conforming in shape to the upper portion of said tie and firmly secured thereto, and having a stationary jaw at its outer portion, and an adjustable jaw located at the inner portion of the shoe, and held against vertical movement, and a bolt-and-nut connection between the jaws, as set forth.



2. The combination, with the shoe having an opening at its inner portion and a stationary jaw at its outer portion, of a movable jaw having shoulders *d* and working in said opening, and a bolt-and-nut connection between the jaws, as set forth.

384,786. BARREL-STAVE-CUTTING MACHINE. GEORGE REEVES, JOHN G. REEVES, and MARTIN O. REEVES, Philadelphia, Pa., assignors to the American Barrel and Stave Company, Camden, N. J. Filed Feb. 16, 1887. Serial No. 227,781. (No model.)



Claim.—1. The combination of a series of stave-cutters, feeders for the staves, and reversible stave-holders located between successive cutters, by which the staves are reversed side for side between the successive cutters, all substantially as and for the purpose set forth.

2. The combination of a series of cutters, a series of transverse reciprocating stave-holding carriages, feeding devices for directing the staves from one carriage to another, and clamps on each carriage for automatically locking and releasing the staves.

3. The combination, in a stave-cutting machine, of the traveling

384,786.

carriage having a fixed jaw at one end and a movable jaw at the opposite end, a link and lever, forming a toggle, connected to said movable jaw, with a cam moving said lever to lock the blank to or release it from the carriage, all substantially as described.

4. The combination, in a stave-cutting machine, of the traveling carriage having a fixed and a movable jaw, a link and lever, forming a toggle, and a sliding bar and cam for operating said toggle, all substantially as described.

5. The combination, in a stave-cutting machine, of two cutters and platforms therefor with a pair of stave-reversing jaws situated between the platforms and adapted to grasp only the ends of the staves, with devices for feeding the staves into and out of the jaws, substantially as and for the purpose described.

6. The combination of a pair of jaws geared together with devices for turning the jaws and friction-pins for retaining a stave-blank when fed into the jaws, substantially as specified.

7. The combination, in a stave-cutting machine, of concave and convex cutters and reciprocated carriages therefor, stave-feeders, stave-turning jaws between said concave and convex cutters, and devices for simultaneously operating said carriages, stave-feeders, and turning-jaws, substantially as set forth.

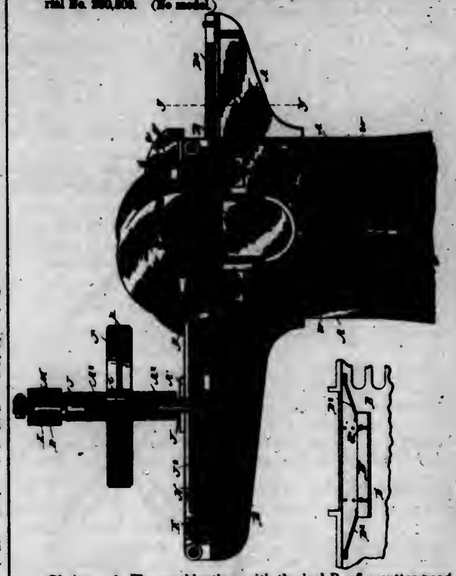
8. The combination, in a stave-cutting machine, of chamfering and crozing cutters, with a platform movable to or from the said cutters, with automatic locks for the stave-blank, and with a reciprocating feeder to carry a stave onto the platform prior to cutting and remove it after cutting, the whole being timed to work automatically, substantially as set forth.

9. The combination of the chamfering and crozing cutters with a sliding platform, a driving-shaft, an eccentric thereon having a slotted rod, and a toggle-joint connection between the eccentric-rod and the platform, a block carrying the pivot of the toggle being adapted to the slot in said rod, all substantially as specified.

10. The combination of chamfering and crozing cutters, a sliding stave-carrying platform, an adjustable bar, *f*⁶, toggle-levers connecting the platform to the bar, and devices for operating said toggle-levers to move the platform toward and from the cutters, substantially as specified.

11. The combination, in a stave-cutting machine, of stave-cutters and stave-holding carriages on which the staves rest, a frame adapted to guides on the machine and having fingers adapted to push the stave-blanks from one carriage to another, and devices for reciprocating the frame, substantially as described.

12. The combination of the cutters, traveling carriages, each provided with a rack, a shaft having pinions gearing into the racks of the carriages, a segmental rack geared to a pinion on said shaft, with devices for intermittently rotating said segmental rack, all substantially as set forth.



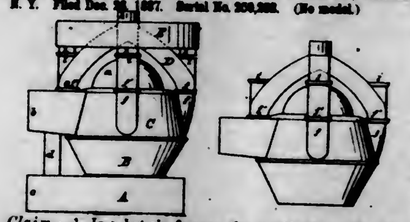
384,787. LAWN-MOWER. IVAN W. REMARIS, Odessa, Md. Filed Apr. 26, 1887. Serial No. 236,027. (No model.)

Claim.—In a lawn-mower, the combination of a frame having the forward-projecting part carrying the cutter-disk and a curved rack-bar at the rear end, a runner pivoted to the under side of the forward-projecting part and extending toward the rear of the frame, a lever, D^2, fulcrumed upon the frame and having a pawl for said rack-bar, and a rod connecting the runner and lever, for the purpose set forth

---

384,788. MACHINE FOR FORMING AND POLISHING DOOR-PANELS. DAVID M. ROBERTS, Chicago, Ill. Filed Jan. 16, 1888. Serial No. 260,809. (No model.)

Claim.—1. The combination, with the bed B, of a cutter-head provided with planing-knives covering the whole surface of the blank and paneling-knives at each side covering the margins along opposite sides of the blank adapted to cut such margins lower than the panel portion, and a sand-paper wheel arranged over said bed at the rear of the cutter-head and adapted to operate on the blank as it passes from said cutter-head in a machine having feed-rollers and operating mechanism, substantially as shown and described.

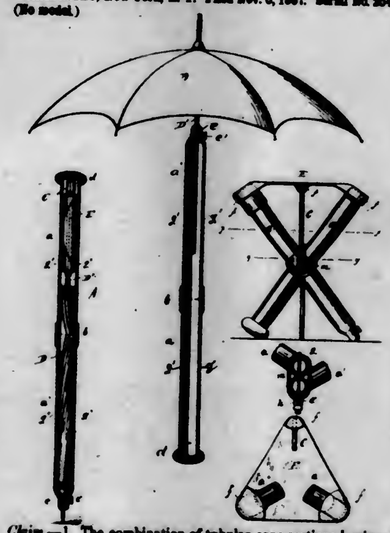


2. The combination, with the bed B, of the cutter-head H, provided with planing-knives *a a* and paneling-knives *a' a'*, and the presser-bar F, having a straight portion adapted to the surface covered by the planing-knives, and a projecting portion at each side of the straight portion adapted to the depressed marginal surfaces covered by the paneling-knives in a machine of the class mentioned provided with feed and operating mechanism, substantially as shown and described.

3. The combination, with the bed B and the bed O, the latter having guide *o*, of the cutter-head H, provided with planing-knives *a a* and paneling-knives *a' a'*, and the cutter-head Q on the same shaft and provided with paneling-knives adapted to form the panel-margin at the end of the panels in a machine of the class mentioned provided with mechanism, substantially as shown and described, for operating said cutter-heads simultaneously, as set forth.

4. A machine for forming panels, consisting of a supporting-frame and bed-plate, B, and supplemental bed O, in combination with a rotary cutter-head, H, provided with planing and paneling knives, a rotary cutter-head, Q, on the same shaft provided with paneling-knives, a sand-paper wheel arranged over the bed B at the rear of cutter-head H, and connected through pulleys K K and J' by a belt running to a pulley on the shaft of said cutter-heads, said machine having feed-

rollers and presser-bar, all arranged to operate substantially as and for the purpose specified.



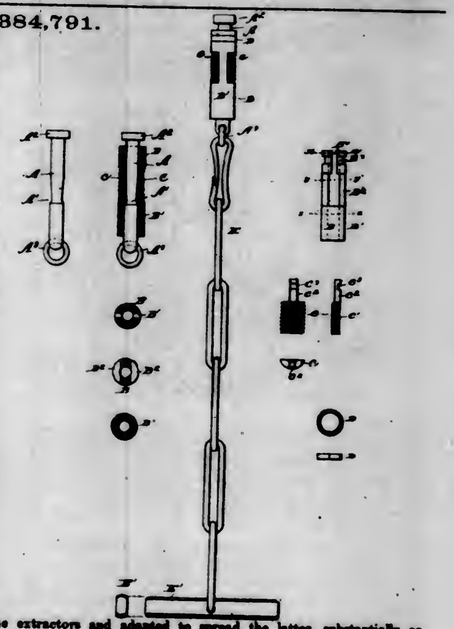
884,789. HOT-AIR FURNACE. GEORGE D. SANFORD, Peekskill, N. Y. Filed Dec. 28, 1887. Serial No. 259,262. (No model.)

Claim.—1. In a hot-air furnace, the combination, with a fire-chamber provided with side flues, *f*, and a dome, *e*, of the radiator D, consisting of tubular arches resting upon the side flues, *f*, and doorway *b*, and uniting centrally above the dome *e*, where they form a chamber which is provided with a pipe-rim, substantially as herein shown and described.

2. In a hot-air furnace, the combination of the tubular arches D, resting upon the side flues, *f*, in the fire-chamber C, and uniting to form a common chamber above the dome *e*, said chamber being provided with a pipe-rim, as shown, and said tubular arches being provided with the outlets *i*, which support and afford communication with the interior of an annular chamber, E, substantially as herein shown and described.

884,790. COMBINED CANE, UMBRELLA, AND CAMP-STOOL. MORITZ SHUPP, New York, N. Y. Filed Nov. 5, 1887. Serial No. 254,265. (No model.)

Claim.—1. The combination of tubular cane-sections having diametrical holes, an extra brace, a flexible seat having pockets for receiving the upper ends of the cane-sections and brace, a pin passing through the holes of the sections, and a fastening-ring connecting the sections and brace, substantially as set forth.



2. The combination of tubular cane-sections, a jointed brace provided with a connecting ferrule or sleeve, a flexible seat having pockets for receiving the outer ends of the cane-sections and brace, and a pin and ring for connecting the cane-sections, substantially as set forth.

884,791. PIPE, TUBE, OR SHELL EXTRACTOR. WALTER S. STOTT, Fort Meade, Dak. Filed Aug. 30, 1887. Serial No. 248,204. (No model.)

Claim.—1. In an extractor of the class described, the combination of an extractor-cylinder recessed at its sides and provided with independent extractors fitted therein, with a spreader mounted between the extractors and adapted to operate the latter, substantially as specified.

2. In an extractor of the class described, the combination, with a hollow extractor-cylinder having recesses at its sides and provided with independent extractors fitted and seated in said recesses, of a spreader having a wedge shape mounted in the cylinder and between

884,791.

the extractors and adapted to spread the latter, substantially as specified.

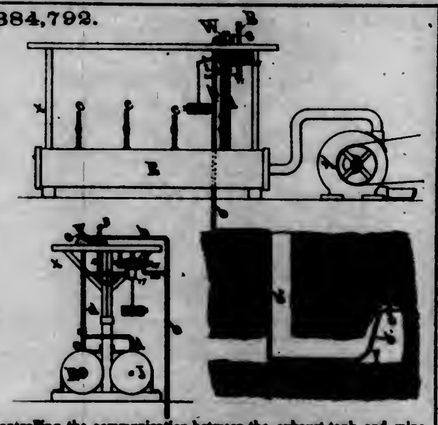
3. In an extractor of the class described, the combination of an extractor-cylinder having a central bore, milled or threaded extractors mounted in recesses formed in said cylinder, with a spreader adapted to fit said bore and spread the extractors, substantially as specified.

4. In an extractor of the class described, the combination of an extractor-cylinder having opposite recesses, an annular groove, and a central bore, with threaded extractors mounted in said recesses and grooved to register with the annular groove of the cylinder, a binding or assembling ring seated in the grooves, and a wedge-shaped spreader mounted in the bore, substantially as specified.

5. The cylinder B, having the extractors C mounted thereon, in combination with the spreader A, having the reduced portion A', head A^2, and ring A^3, and the chain E, connected to said ring, substantially as specified.

6. The bored cylinder B, having the recesses B^2 B^3 and groove B^4, in combination with the extractors C, mounted in the recesses B^2 and having the necks C^2, extending into the recesses B^3 of the cylinder, and having the grooves C^3, registering with those in the cylinder, and the binding-ring D, mounted in the grooves of the cylinder and extractors, substantially as specified.

884,792. SIGNALING APPARATUS. THOMAS SHAW, Philadelphia, Pa. Filed Sept. 2, 1887. Serial No. 248,057. (No model.) Patented in England Mar. 8, 1887, No. 3,881; in France Mar. 8, 1887, No. 183,077; in Germany Mar. 8, 1887, No. 41,886; in Belgium Mar. 9, 1887, No. 76,088, and in Canada Dec. 28, 1887, No. 28,268.



Claim.—1. The combination of a mine, a tube leading from a chamber thereof to a terminal station, an air-exhauster and air-pressure device at such station, and a valve controlling the communication between said tube and the exhauster and pressure devices, substantially as described.

2. The combination, with a pipe leading to a mine-chamber and with an exhauster communicating therewith, of an alarm communicating with the inner end of said pipe, a second alarm near the outer end communicating with an air-tank through a pipe provided with a valve, and a valve-shifter connected with said valve and in line with the communication between the mine-pipe and exhauster, substantially as described.

3. The combination, with the mine-pipe *b*, alarms B C at the terminal station and in the mine, respectively, and air pressure and exhaust pumps, with connections with the pipe *b*, of a valve controlling the flow of air between the exhaust-pump and said pipe and between the pressure-pump and the alarm B, substantially as described.

4. The combination, with the mine-pipe *b*, alarms B C at the terminal station and in the mine, respectively, and air pressure and exhaust pumps, of reservoirs or tanks connected with said pumps, and a valve

884,792.

controlling the communication between the exhaust-tank and mine-pipe and between the pressure-tank and pipe and also with the alarm B, substantially as described.

5. The combination, with the mine pipe and pump connected therewith, and with the alarm at the station end of the pipe, of a chamber communicating with the pipe and provided with a diaphragm and connections between the diaphragm and the alarm whereby the latter is sounded on the movement of the diaphragm under the variation of pressure in the pipe, substantially as described.

6. The combination of a tube leading to a mine, exhaust-pump connected with said tube and with a chamber covered by a diaphragm, a whistle, a valve controlling the passage to the whistle from a reservoir of air under pressure, and a connection between the valve and the diaphragm, and means for interrupting the flow of air through the mine-tube, substantially as described.

7. The combination of the whistle above ground, a whistle in a mine-chamber, connecting-tubes and pump for controlling the flow of air through the mine-tube, a valve for controlling the flow of air to the whistle above ground, a diaphragm in a chamber communicating with the mine-tube and connected to said valve, and a hand-valve constructed to open and close the communication between the exhaust-pump and the mine-tube and also between the exhaust-pump and the chamber covered by the diaphragm, substantially as described.

8. The combination, with a tube leading from a mine-chamber to an outer station, and with a pump controlling the flow of air through said tube, of a valve at the inner end of the pipe, and a signal at the outer end, and a chamber communicating with the tube and having a movable diaphragm connected to operate said signal, substantially as described.

884,793. FENCE-GATE. AUGUSTUS SHEPHERD, Hannepin, Ill. Filed Jan. 3, 1888. Serial No. 259,152. (No model.)

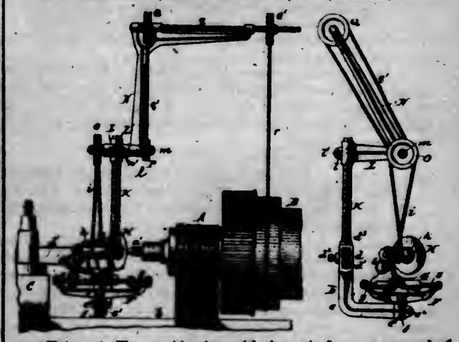
Claim.—1. The combination of a gate hung upon hinges, an opener-shaft vertically journaled to the gate near the hinges and provided with a two-armed lever fixed upon its upper portion and a single arm lower down, a rock-lever pivoted midway to the gate, shoulders or stops at the ends of the path of the said rock-lever, a stiff pitman connecting one arm of the rock-lever with the lower arm of the opener, a latch hung upon the gate, a spring for the latch, an elbow-lever pivoted above the latch, a connection between one arm of the elbow-lever and the latch, a bifurcated connection having flexible legs connecting the other arm of the elbow-lever with the two arms of the said rock-lever, two posts fixed beside the road at a distance from the hinge-post, a cross-lever journaled upon each of the two posts, and connections between the vertical arms of the said cross-levers and two arms of the opener-lever, and chains or cords depending from the horizontal arms of the cross-levers, substantially as shown and described.

2. The combination of a gate, a latch hung thereon, a spring for the latch, a rock-lever pivoted midway to the gate, a flexible bifurcated connection between the latch and the rock-lever, an opener having two upper arms, one lower arm, and a shaft vertically journaled to the gate near its hinges, a stiff connection between the lower arm of the opener and one arm of the rock-lever, and means for operating the opener, substantially as shown and described.

3. The combination of a gate, a rock-lever pivoted midway thereto, a latch hung on the gate, flexible connections between the two arms of the rock-lever and the latch, an opener, substantially as described, journaled to the gate, a stiff pitman connecting an arm of the opener with an arm of the rock-lever, and shoulders or stops fixed at the ends of the path of the latter, substantially as shown and described.

4. A gate hinged upon a post fixed at one side of a road, a latch hung at the outer end of the gate, two catches for the latch fixed in the path thereof, one at each side of the road, a rock-lever pivoted midway to the gate, and stops fixed at each end of its path, flexible connections between the two ends of the rock-lever and the latch, an opener journaled upon the gate, and a stiff connection between the opener and the rock-lever, substantially as shown and described, whereby the action of the opener is to first raise the latch from its catch and then to swing the gate, whether the movement be to open or to close the gate.

884,794. VAPORIZER. GARDNER M. SHERMAN, Springfield, Mass. Filed July 30, 1887. Serial No. 245,611. (No model.)



Claim.—1. The combination, with the supporting-casing, of a porous wheel pivoted therein, said wheel having buckets or pockets arranged to lift a liquid when partially turned, substantially as described.

2. In a vaporizer, the combination of a casing, a register in said casing, and a porous disk within the casing having buckets arranged as described, and a handle connected to the disk and extending outside the casing.

3. A wheel of plaster-of-paris or similar porous material having buckets or pockets extending from the outside or periphery in lines crossing radial lines, substantially as described.

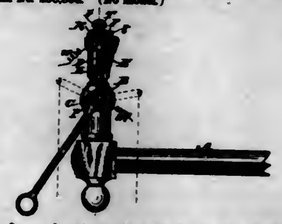
4. The combination, in a vaporizer, of the inclosing-casing having an aperture for filling and orifices for the escape of fumes, a plate having corresponding orifices, a disk or wheel pivoted in the casing, the same being of porous material and having buckets, as described, and a handle for rotating said wheel extending outside the casing, all substantially as described.

884,795. GRINDING-MACHINE. FRANK A. SHOEMAKER, Buffalo, N. Y. Filed Nov. 15, 1886. Serial No. 218,502. (No model.)

Claim.—1. The combination, with the main frame, composed of a socket, *d*, an arm, *c*, extending downwardly and inwardly from said socket *d* and provided at its inner end with a vertical socket, *c'*, and

a post, K, extending upwardly from the socket *d* and carrying a shaft, *m*, provided with a pulley, O, of a horizontal frame, F, provided with a vertical pivot, *f*, seated in the socket *d'*, a grinding-wheel, H, provided with a pulley, *h*, capable of free horizontal movement on the frame F, and an endless belt connecting the pulleys O and *h*, substantially as set forth.

2. The combination, with the grinding-wheel and its supporting-frame D, provided with a post, K, of an arm, L, attached to said post, an arm, N, pivoted to the arm L, and a driving-shaft, *g*, journaled in the arm N, whereby the driving-shaft can be adjusted by swinging the arm N on its pivot, substantially as set forth.



3. The combination, with the grinding-wheel and its supporting-frame D, provided with a post, K, of an arm, L, secured to said post, a counter-shaft, *m*, and an arm, N, journaled concentrically in the arm L, a driving-shaft, *g*, journaled in the arm N, and pulleys and belts whereby the driving-shaft is connected with the counter-shaft and the latter with the grinding-wheel, substantially as set forth.

4. The combination, with the supporting-frame D, provided with a post, K, of a horizontal frame, F, connected with the frame D by a vertical pivot, a sliding frame, G, mounted on the frame F and carrying a grinding-wheel, H, an arm, L, attached to the post K, a counter-shaft, *m*, and arm N, journaled in the arm L, and a driving-shaft, *g*, journaled in the arm N, substantially as set forth.

5. The combination, with the horizontal frame F and the sliding frame G, provided with a cone, *j'*, of a horizontal adjustable arbor, *j*, secured to said frame and provided with a cone, *j²*, and a grinding-wheel, H, provided with a hollow spindle, *h*, mounted on said cones by conical bearings, substantially as set forth.

384,796. ELECTRIC GAS-LIGHTING DEVICE AND GAS-COCK.

WILLIAM TAG and SANFORD G. SMITH, Philadelphia, Pa. Filed Sept. 22, 1887. Serial No. 250,202. (No model.)

Claim.—1. In an electric gas-lighting device, the combination of a stationary electrode, a pivoted movable electrode, and a pivoted rider in the path of said movable electrode, adapted to permit the electrodes to contact in the advance movement of the movable electrode, and to prevent such contact on its retrograde movement, substantially as described.

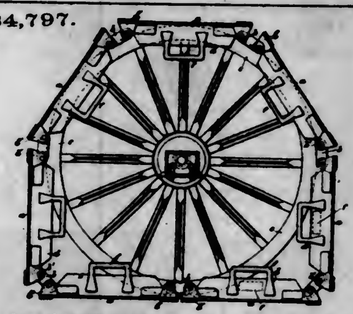
2. In an electric gas-lighter, a fixed electrode and a movable electrode, in combination with a fixed support or arm carrying a weighted rider, for preventing contact of the electrodes on the back action of the movable electrode, substantially as described.

3. In a gas-lighting device, the combination of the fixed electrode and the movable electrode attached on an arm fixed to the gas-cock, with a tilting rider lying in the path of the movable electrode and pivoted to an arm, which in turn has a bearing against the cock and holds it in place, substantially as described.

4. A burner with an adjustable cock, in combination with an insulated fixed electrode secured to said burner, an actuating-arm of the cock carrying the movable electrode, and the adjusting-arm for the cock carrying a pivoted weighted rider, said parts being combined substantially as described.

5. In an electric gas-burner, an insulated fixed electrode, an arm carrying the pivoted weighted rider and having the stops *a* and *b*, and an actuating-arm of the cock carrying the movable electrode and having the lug *d*, said parts being combined substantially as and for the purpose set forth.

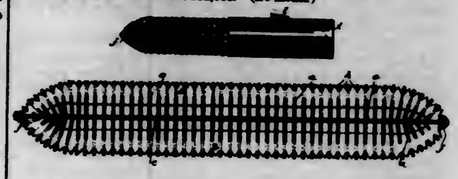
384,797. ENDLESS PLATEWAY FOR WHEELED VEHICLES.



HENRY G. TUTTLE, Kingstown, County of Dublin, Ireland. Filed Mar. 27, 1888. Serial No. 268,612. (No model.) Patented in England Dec. 20, 1886, No. 16,060.

Claim.—1. An endless trackway for wheeled vehicles, consisting of a series of plates, *a*, each having side guides, *d d*, extending nearly the entire length of the plate and adapted to fit over the edges of the wheel, each plate provided at its ends on both sides with socket-pieces *g g*, located outside said guides, a series of links, *b*, and hinge-pins *b'*, connecting the links and socket-pieces, substantially as shown and described.

2. An endless trackway for wheeled vehicles, consisting of a series of plates, *a*, having outwardly-flaring guide-flanges *d d*, and pin-sockets *g g*, located outside said flanges, a series of links, *b*, and hinge-pins *b'*, substantially as shown and described.



3. In self-laying plateways consisting of a series of plates hinged or connected together, as described, the combination of the handles or apertures *f*, substantially as and for the purposes set forth.

384,797.

384,798. CURRY-COMB.

DUD P. TUTTLE, Brownville, Nebr. Filed Oct. 17, 1887. Serial No. 252,602. (No model.)

Claim.—1. A curry-comb with a working-surface of an elongated cylindrical or equivalent form, substantially as shown and described.

2. A curry-comb with a working-surface of an elongated cylindrical or equivalent form, with an end of a conical form, substantially as shown and described.

3. A curry-comb composed of longitudinal toothed strips and toothed cross-plates interlocked therewith, substantially as set forth.

4. A curry-comb having a body of cylindrical or equivalent form in cross-section, composed of detachable strips and plates and provided with a conical end or ends, substantially as set forth.

5. A curry-comb of cylindrical or equivalent form, provided with a handle longitudinally adjustable thereon, substantially as set forth.

6. A curry-comb consisting of detachable toothed strips and disks or plates arranged at angles to each other and means for securing them in place, substantially as set forth.

7. A curry-comb composed of longitudinal strips and cross plates or disks interlocked therewith, some of said strips and plates being provided with saw-shaped teeth and some with teeth formed by corrugations or scallops, substantially as set forth.

8. In a curry-comb, the combination of the longitudinal strips and cross-plates and the handle slipped over said parts and capable of longitudinal adjustment thereon, substantially as set forth.

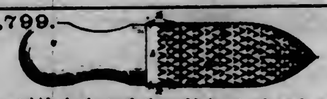
9. In combination with the curry-comb constructed as described, the tubular handle adjustable thereon and the locking pawl or dog carried thereby, substantially as described.

10. In a curry-comb, the combination, with the toothed strips *b*, provided with notches on their lower edges, of slotted cross-plates interlocked therewith and means for securing the said parts together, substantially as set forth.

11. In a curry-comb, the combination of longitudinal and transverse interlocking strips and means for securing the ends of the strips, substantially as set forth.

12. A curry-comb of cylindrical or equivalent form in cross-section, having a cellular body, the sides of the cells being formed by the toothed or operating surface of the comb, substantially as described.

13. In a curry-comb, the combination of the central rod, the toothed disks strung thereon, the longitudinal toothed strips interlocking with the disks, and means for securing said parts together, as set forth.



14. In a curry-comb, the combination of the rod *c*, the toothed plates *a*, having slots *d* strung thereon, the longitudinal toothed strips *b*, having notches *e* and curved ends *b'*, the washers *f*, and the nuts *g*, substantially as described.

384,799. CURRY-COMB.

DUD P. TUTTLE, Brownville, Nebr. Filed Mar. 26, 1888. Serial No. 268,865. (No model.)

Claim.—1. A curry-comb of cylindrical or equivalent form made from a metal blank, the teeth thereof being struck up from the body of said blank, substantially as set forth.

384,799.

2. A curry-comb of cylindrical or equivalent form formed from a metal blank having struck-up teeth and provided with a handle extending from one end thereof, substantially as set forth.

3. A curry-comb of cylindrical or equivalent form formed from a blank of metal having teeth struck up from its body, the end or ends of said blank being gored or cut away, whereby the remaining portions, when pressed together, form a conical end or ends, substantially as set forth.

4. A curry-comb of cylindrical or equivalent form, consisting of an interior former and a blank having struck-up teeth thereon, substantially as set forth.

384,800. CURRY-COMB.

DUD P. TUTTLE, Brownville, Nebr. Filed Mar. 26, 1888. Serial No. 268,863. (No model.)

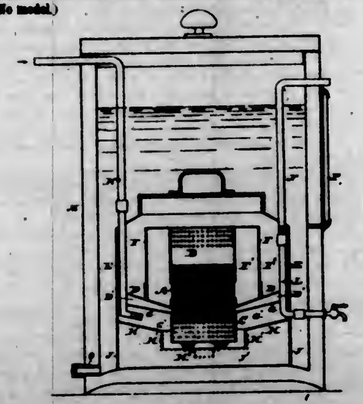
Claim.—1. A curry-comb of cylindrical or equivalent shape formed from toothed rings or bands secured upon a suitable core or former, substantially as shown and described.

2. A curry-comb of cylindrical or equivalent shape formed from toothed rings or bands secured upon a grooved former or core, substantially as shown and described.

3. A curry-comb of cylindrical or equivalent shape formed from toothed rings or bands secured upon a grooved former or core having a conical end, substantially as shown and described.

4. A curry-comb of cylindrical or equivalent shape formed from rings or bands having teeth struck up from their surfaces, said rings or bands being secured upon a core or former, substantially as shown and described.

5. A curry-comb of cylindrical or equivalent shape formed from rings or bands having a double row of teeth formed therefrom, said rings or bands being secured upon a core or former, substantially as shown and described.



6. A curry-comb of cylindrical or equivalent form formed from toothed rings or bands secured upon a former or core, said rings or bands having notches and projections to enter said notches, whereby to prevent independent rotation upon the core or former, substantially as shown and described.

7. In a curry-comb of cylindrical or equivalent shape, the combination of toothed rings or bands with a former or core having a conical end provided with steps or shoulders, substantially as shown and described.

8. A curry-comb of cylindrical or equivalent shape, consisting of a core or former having a handle at one end and a series of toothed rings or bands secured upon said former or core, all substantially as shown and described.

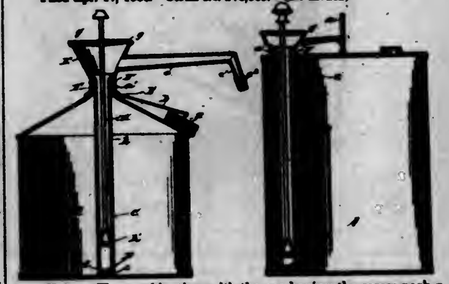
384,801. WATER COOLER AND FILTER.

GERMAIN VAN DER HEYDEN, Philadelphia, Pa., assignor of one-half to Henry F. Lee, same place. Filed Jan. 12, 1887. Renewed Feb. 8, 1888. Serial No. 263,260. (No model.)

Claim.—1. The cylinder A, with perforated ends or caps, the diaphragm G, and the annulus H, having an opening below the cylinder A and formed with a flange, H', said parts being combined and operating substantially as described.

2. The cylinder A, the diaphragm G, and the annulus H, with an opening below said cylinder and a flange, H', in combination with the outer casing, E, having a perforated rim at bottom, substantially as described.

3. A filter, substantially as described, having an inlet-pipe, K, an outlet-pipe, L, and air-pipe N, in combination with a cooler, said filter having a perforated rim, J, which forms a communication between the filter and cooler, substantially as described.



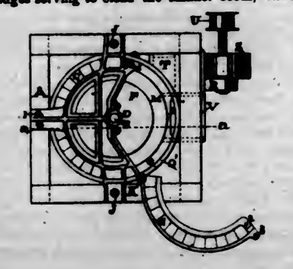
4. The outer casing, E, with an annulus or partition, H, at bottom, and diaphragms G D above the same, forming the chambers G' D', the central cylinder, A, with perforated caps, and the surrounding cylinder F, forming the chambers F' F², said parts being combined and operating substantially as described.

5. A filter consisting of the casing E, with a closed diaphragm, G, perforated diaphragm D, and closed diaphragm H, with flange H' secured thereto and forming chambers G' F' F², the cylinder A, with perforated caps B C, the cylinder F, supported on the diaphragm D, the inlet-pipe K, leading to chamber G', and outlet-pipe L, leading from chamber F², the said casing having caps at top and bottom, all of said parts being arranged and combined substantially as described.

6. A cooler, in combination with a filter inclosed within said cooler, an inlet-pipe leading through said cooler into said filter, an outlet-pipe leading from said filter to outside said cooler, and having an air-pipe connected therewith at its inner end, said filter having the perforated rim J, whereby water-communication is had from said filter to said inclosing-cooler, substantially as described.

384,802. OIL-CAN.

FRANKLIN D. WALPOLE, McKenzie, Tenn. Filed Apr. 17, 1888. Serial No. 270,808. (No model.)



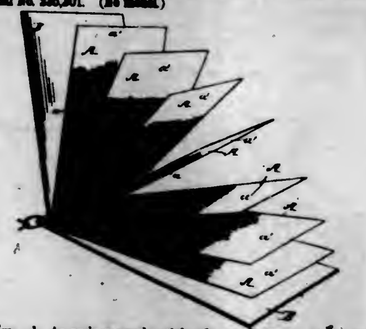
Claim.—The combination, with the can having the screw-neck *a*, of the tube C, extending downward through said neck to the bottom of the can, and having a valve in its lower end, the funnel-shaped enlargement E, secured to the upper end of the tube C, and having the concave top and the depending annular screw-threaded flange F, adapted to engage the screw-neck *a'*, the discharge-spout extending outward and upward from the said enlargements E, and the valved plunger in the tube, having its plunger-rod extending up through the tube C, the enlargement E, and the concave top, substantially as specified.

384,803. COTTON-SEED CLEANER.

JAMES L. WEATHERHEAD and JAMES S. COCHRAN, Philadelphia, Pa. Filed Jan. 3, 1888. Serial No. 259,613. (No model.)

Brief.—The inner cone is carried by a removable section of the driving-shaft and the outer casing is provided with a door, so that the inner cone may be readily removed or access had thereto. Said inner cone is covered with strips of card-clothing arranged spirally and having the wires of different lengths, forming spiral ridges and depressions, the ridges serving to clean the smaller seeds, while the larger

cone are forced into the depressions and acted upon by the shorter wires at the bottoms thereof.



Claim.—1. The combination of the casing G, faced interiorly with a roughened or grated metallic sheathing, with an inner cone, H, provided with a continuous metallic brush having the wires thereof of different lengths and forming spiral ridges and depressions, as described, on the surface of the cone, substantially as described.

2. The combination of the casing G, the interior face of which is provided with a sheathing having projections forming a grating-surface, with a cone, H, provided with a continuous metallic-wire brush having the wires thereof of different lengths and forming spiral ridges and depressions, as described, on the surface of the cone, substantially as described.

3. The combination of a casing, G, provided with the opening flap-section G' and having an inner roughened surface, with the cone H, provided on its outer surface with a brush-clothing, shaft-section E', and detachable shaft-section E, on which said cone H is mounted, whereby when flap-section G' is opened the cone H, with shaft-section E, can be removed through the opening without disturbing the pulleys or other parts, substantially as described.

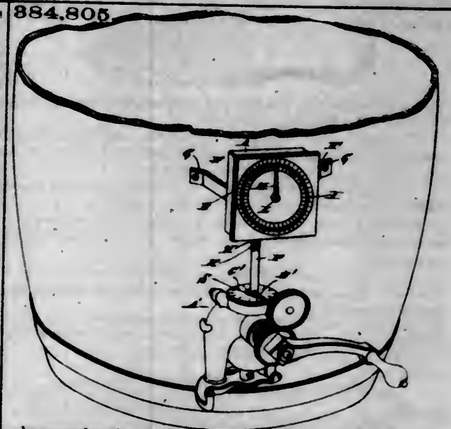
4. The combination of casing G, having a roughened interior surface, and a cone, H, provided with a continuous outer metallic-wire brush having the wires thereof of different lengths and forming spiral ridges and depressions, as described, on the surface of the cone, substantially as described.

884,804. BLUING-PAPER. GEORGE H. WEBB, Newton, Mass., assignor to Carter, Dinsmore & Co., Brooklyn, N. Y. Filed Apr. 19, 1887. Serial No. 235,301. (No model.)

Claim.—1. As an improved article of manufacture, a bluing leaf, sheet, or strip consisting of a leaf, sheet, or strip of paper or other similar material having one section coated or saturated with a bluing composition soluble, or substantially soluble, in water, and having also a section free from bluing, by which it may be handled without soiling the fingers, and adapted to supply the water or fluid with a given amount of bluing, as and for the purposes described.

2. As a new article of manufacture, a blue-book containing a number of strips or leaves of paper or other similar material having the inner sections, *a*, saturated or coated with a bluing composition soluble in water and the outer sections, *a'*, free from bluing, as and for the purposes specified.

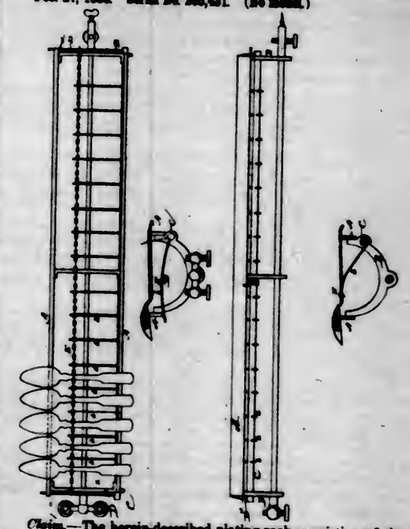
3. The blue-book comprising a number of sheets, leaves, or strips of paper or other material, sections of which are coated or saturated with a bluing composition, and sections of which are uncoated or unsaturated, and which are used for tabs, united together and to their holding-covers, as and for the purposes described.



4. The blue-book comprising the covers B, the blued sheets or leaves A, having the blued sections *a* and the tab ends *a'*, united to each other and to the cover, and having perforations or weakened close to the line of the attaching-seam, as and for the purposes described.

884,805. REGISTERING ATTACHMENT FOR MEASURING-FAUCETS. LEWIS P. WHITE and JAMES D. BERRIER, Terra Alta, W. Va. Filed Mar. 12, 1888. Serial No. 267,060. (No model.)

Claim.—1. The registering device for measuring-faucets, comprising the case or frame having the dial, the worm-wheel journaled in said case or frame and having the hand to sweep over the dial, the shaft N, also journaled in said case or frame and having the screw or worm meshing with the worm-wheel, and the connecting-rod flexibly connected to said shaft and adapted to be attached to the hand or pointer of the measuring-faucet, substantially as described.

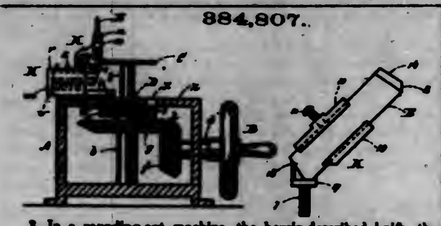


2. The combination of the case or frame having the dial, the worm-wheel journaled in said case or frame and having the hand or pointer to sweep over the dial, the shaft N, journaled in said case or frame and having the worm or screw engaging the worm-wheel, the

884,805

yoke secured to the cone and adapted to be attached to the cask or barrel, and the connecting-rod adapted to connect the hand or pointer of the measuring-faucet with the shaft N, substantially as described.

884,806. RACK FOR ELECTROPLATING. WILLIAM W. WHITE, Waterbury, Conn., assignor to Rogers & Brother, same place. Filed Feb. 27, 1888. Serial No. 265,431. (No model.)



Claim.—The herein-described plating-rack, consisting of the two sides connected at their ends, the said sides forming a support for the articles to be plated, combined with a rock-shaft upon one side, parallel with that side, carrying a series of springs extending toward the opposite side, and with a lever at one or both ends of the shaft adapted to engage with an interlocking device upon the rack, and a connection extending from said lever at one end to the opposite end of the rack and connected with the free ends of the said springs, substantially as described.

884,807. ROUNDING-OUT MACHINE. VESTUS H. WHITTAKER, Bradford, assignor to himself and Ellen V. Whittaker, Gloucester, Mass. Filed Apr. 25, 1888. Serial No. 271,817. (No model.)

Claim.—1. In a rounding-out machine, the herein-described knife having a chisel-shaped edge at one end and a *A*-shaped edge at the opposite end, corresponding corners of said edges being cut off or beveled to adapt it to rest upon the table of the knife-bracket, substantially as set forth.

2. In a rounding-out machine, the herein-described knife having a chisel-edge at one end, a *A*-shaped edge at the opposite end, and longitudinal flanges along the sides of one of its faces, corresponding corners of said edges being cut off or beveled to adapt it to rest upon the table of a knife-bracket, substantially as described.

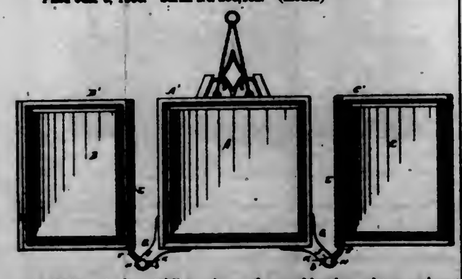
884,807.

3. In a rounding-out machine, the herein-described knife, the same consisting of the body E, having the chisel-edge 13, A-shaped edge 14, beveled corners 16, and flanges 20, constructed and arranged substantially as and for the purpose described.

4. In a rounding-out machine of the character described, the bracket K, having the table 17, stud 7, inclined clamp 10, and screw 12, in combination with the knife E, carriage H, and adjunctive mechanism for actuating said carriage, substantially as set forth.

5. In a rounding-out machine of the character described, the bracket K, having the table 17, stud 7, inclined clamp 10, and screw 12, in combination with the knife E, provided with the edges 13 and 14 and beveled corners 16, and adjunctive mechanism for causing said bracket to move around the pattern and said knife to press thereon, substantially as specified.

884,808. MIRROR. FRITZ WIESMANN, Stapleton, N. Y. Filed Dec. 24, 1887. Serial No. 258,577. (No model.)



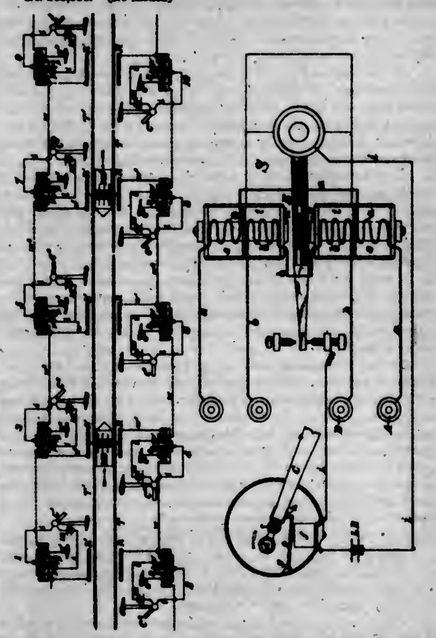
Claim.—1. The combination of a main frame having transverse slots and recesses in its side pieces, wing-mirrors adapted to fold within the opening of the main frame, curved L-shaped hinge-pieces projecting from the inner edges of the frames of the wing-mirrors into the recesses in the side pieces of the main frame, and pintles in the side pieces of the main frame, on which pintles the hinge-pieces turn, substantially as set forth.

2. The combination of a main frame having recesses in the side pieces behind the front faces of the same, and slots in the sides on the inner edges of the side pieces, said slots leading to the recesses, wing-mirrors, L-shaped hinge-pieces on the frames of said wing-mirrors, passed through said slots into the recesses, and pintles in the side pieces of the main frame, on which pintles the hinge-pieces turn, substantially as herein shown and described.

3. The combination of the main frame A and B, composed of the front section, C, having the recesses I and slots K, and the rear section, D, having the recesses L and the rabbet O, the wing-mirrors E and F, having frames E' F', the curved L-shaped hinge-pieces G, secured to the frames of the wing-mirrors at the inner edges and passed through the slots K into the recesses I L, and the pintles P in the side pieces of the main frame, substantially as herein shown and described.

884,809. FOLDING MIRROR. FRITZ WIESMANN, Stapleton, N. Y. Filed Jan. 9, 1888. Serial No. 260,162. (No mdl.)

Claim.—1. In a folding mirror, the combination, with a main or central mirror, of two wing-mirrors pivoted to swing while parallel with the face of the main mirror across the face of the said main mirror in planes parallel with and in close proximity to that of the main mirror, substantially as shown and described.



2. In a folding mirror, the combination of a main mirror and two wing-mirrors mounted to swing while parallel with the face of the main mirror across the face of the said main mirror in planes parallel with and in close proximity to that of the main mirror, and also to swing toward and from the face of the main mirror in planes that are at an angle to the plane of the main mirror, substantially as shown and described.

3. In a folding mirror, the combination of a main mirror, two wing-mirrors, rods hinged to the frame of the main mirror at the sides thereof to swing across the face of the main mirror in planes parallel with and in close proximity to that of the main mirror, the wing-mirrors being hinged on said rods, substantially as shown and described.

4. In a folding mirror, the combination of the main mirror, two wing-mirrors, legs or arms at the lower ends of the sides of the main mirror, and rods pivoted on the arms or legs to swing over the face of the main mirror in planes parallel with and in close proximity to that of the main mirror, said wing-mirrors being hinged on said rods, substantially as shown and described.

5. In a folding mirror, the combination, with a main mirror and two wing-mirrors, of legs or arms on the bottom parts of the sides of the main-mirror frame, and stop-pins on said arms or legs, rods mounted to turn on the ends of said arms or legs and provided at their pivoted ends with enlargements having quadrant-notches into which the stop-pins project, substantially as herein shown and described.

884,810. AUTOMATIC ELECTRIC BLOCK-SIGNAL SYSTEM. THOMAS D. WILLIAMS, Allegheny City, and JOHN S. LEECH, Bellevue, assignors of three-fifths to James W. Clark, George H. Ehrenfeller, and George Harris, all of Allegheny County, Pa. Filed Feb. 8, 1888. Serial No. 263,593. (No model.)

Claim.—1. In a block-signal system for railways, the combination, with a source of electrical energy, of two or more differentially-wound polarized relays, each connected with the line-wires of two adjoining circuits or sections and each arranged in connection with a local battery and circuit to open and close the same for the purpose of operating an electric signal at each end of each circuit or section in the same or opposite directions, according to the windings or coils with which each line-wires are connected, substantially as described.

2. The combination, in a block-signal system for railways, of a battery of line-wires and four or more differentially-wound relays placed on opposite sides of a railway-track, each such relay being connected with and operating an electrically-operated signal, said relays and wires being arranged to run from ground at one station through the lower coil of the first such relay, thence to the next station and through the upper coil of the second such relay, and thence to an insulated

portion of the railroad-track and on the opposite side of said track from an insulated portion thereof to a third differentially-wound polarized relay at the station opposite to that last named and through the upper coil thereof, and thence to a fourth such relay at the next station and through the lower coil thereof to ground, the circuit between the two sides of the track, which is normally broken, being made or completed by the arrival of a train at the point between the second and third stations, substantially as described.

3. The arrangement of two or more line-circuits consisting of line-wires and differentially-wound polarized relays connected together in series by connecting one coil of each such polarized relay at each station with the line-wire of one circuit and the other coil of the same relay with the line-wire of the next adjoining circuit, substantially as and for the purposes described.
